CORDILLER—CORDILLERA (see 7.169).—The total enrolment of regular students in 1950 was 5,785 (including 1,127 women), divided as follows: graduate school, 459; college of arts and sciences, 1,521; college of law, 178; medical college, 312 in New York city and 37 taking freshman work in the Ithaca division of the college; New York state veterinary college, 103; New York state college of agriculture, 1,283; college of architecture, 130; college of civil engineering, 403; Sibley College of mechanical engineering, 1,219; duplicate enrollment, 110. In addition 2,371 students were enrolled in the 1950 summer session (especially for teachers) and 306 in the short winter course in agriculture in 1950. The students came from nearly all the states, territories, and insular possessions of the United States and from 38 foreign countries—e.g., there were 59 students from China, 39 from Europe, 25 from South America, 16 from Cuba, 7 from South Africa, 6 from Japan, 3 from Australia, etc.

In 1919-20 new endowment was pledged to the amount of $5,700,000 to increase teachers' salaries. The same year an anonymous gift was received of $800,000 to build and equip a new laboratory of chemistry; $700,000 from August Heckscher of New York for the endowment of research, and from other sources special gifts aggregating $70,000. Under the will of Goldwin Smith, $683,000 was received in 1911 for the promotion of liberal studies, and from Jacob H. Schiff, in 1912, $100,000 for the promotion of studies in German culture; in 1918 at Mr. Schiff's request the purpose was changed to the promotion of studies in human civilization, and in the same year Baron Charnwood gave 15 lectures on this foundation.

During the decade 1911-21 the university's physical growth continued with the addition of large buildings to the equipment of the two state colleges and built a new armoury for the department of military science; gifts of $350,000 from George F. Baker, a New York banker, and $300,000 from Mrs. Russell Sage provided four residential halls for students; Mrs. Florence Rand Lang of Montclair, New Jersey, added Rand Hall (machine-shop and electrical laboratory) to Sibley College. In 1919 the university's invested funds amounted to $14,075,500, yielding in the fiscal year 1919-20 an income of $778,100; the income from state and nation was $1,397,800, and from tuition fees $371,300. The total value of buildings and equipment was valued at about $8,637,400. The area of the campus (aggregating 59 acres) and that of the experimental farm (adjoining the campus) was about 1,100 acres. The appropriation made by the state to the College of Agriculture for the fiscal year 1920 was $1,800,588; in 1910 it was $412,000. The regular annual tuition fee in 1921 was $200, but in medicine it was $500; tuition in the two state colleges was free to residents of New York state. The university library in 1920 contained about 630,000 volumes. Among the important recent acquisitions were the Charles W. Wason collection of works relating to China and the Chinese, 6,300 volumes presented in 1918; the James Verney Safe collection of books relating to the American Civil War; and the engineering library of the late Emil Kuichling, 2,003 volumes, presented by Mrs. Kuichling in 1919. The Willard Fiske bequests have been described in three important bibliographies: Catalogue of the Ecclesiastical Collection (1914), Catalogue of Rare Literature (1918), both compiled by H. Hermannsson, and Catalogue of the Petrarch Collection (1910), compiled by Mary Fowler. The results of the Cornell expedition to Asia Minor and the Assyro-Babylonian Orient were published in 1911. In 1920 appeared the fifth volume of the Cornell Studies in English, founded in 1916.

The university's annual appropriation to the university's library, in the hands of Dr. Charles H. Schurman's (q.v.) successor, who, at the request of Ezra Cornell, drew up the original plans for organizing the university and served as its first president, died at Ithaca Nov. 4, 1918. Pres. Jacob Gould Schurman (q.v.), resigned in June 1920, and Prof. A. W. Smith, dean of Sibley College, was elected acting-president. Of the 21,445 degrees granted since the founding of the university, 18,092, or more than seven-eighths, were granted during President Schurman's 28 years of service. He was appointed U.S. minister to China by President Harding in 1921. Dr. Livingston Farrand (q.v.) was elected president in June 1921. Dr. Farrand, formerly a professor in Columbia University, was president of the university of Colorado from 1914 to 1919, and was then appointed chairman of the Central Committee of the American Red Cross. For two years he directed the work against tuberculosis in France under the auspices of the International Health Board of the Rockefeller Foundation.

During the World War the university, in cooperation with the
War Department, conducted at Ithaca a school of military aeronautics, a school of aerial photography, a school for military artisans, and a unit of the Students' Army Training Corps, and, at the medical college in New York, a school of röntgenology for officers of the U.S. Army Medical Corps. Many members of the faculty gave professional or technical service to the Government. About 7,000 students and former students of the latter were on the rolls of these schools; 1,168 of these were on the rolls of the röntgenology schools.

CORONEL (German, Santa Maria), the name given to the naval battle fought on Nov. 1, 1914, about 40 m. to the W. of Coronel (Chile), between a British cruiser squadron under Rear-Adm. Sir Christopher Cradock and the German East Asiatic Squadron under Adm. Graf von Spee. The British squadron consisted of the armoured cruisers "Good Hope" (flag, Capt. Philip Francklin: 1902, 14,200 tons, 2 9-2-in., 16 6-in., 21 knots) and "Monmouth" (Capt. Frank Brandt: 1903, 9,800 tons, 14 6-in., 22-3 knots), the light cruiser "Glasgow" (Capt. John Luce: 1910, 4,800 tons, 2 6-in., 10 4-in., 25 knots), and the armed merchant cruiser "Otranto" (Capt. Herbert M. Edwards: 16 knots, 4 6-7-in.). In the case of the first three ships the full sea-going speed is given. The German squadron consisted of the armoured cruisers "Scharnhorst" (flag) and "Gneisenau" (both 1906, 11,420 tons, 8 8-in., 6 5-9-in., 20 1/4 knots) and the light cruisers "Leipzig" (1906, 3,200 tons, 10 4-1-in., 20 knots), "Nürnberg" (1908, 3,960 tons, 10 4-1-in., 22 knots), and "Dresden" (1908, 3,544 tons, 12 4-1-in., 25 knots). The figures, even as they stand, are sufficient to establish a definite German superiority, but they were accentuated by other circumstances. In the heavy weather prevailing at the time the "Good Hope" and the "Monmouth" could not fight their main-deck guns, and their broadside discharge (including "Glasgow") was reduced to 2 9-2-in. and 12 6-in. with a weight of 1,960 lb. against the German 12 8-2-in. with a weight of 2,904 pounds. The Germans in addition had the inestimable advantage of having been in commission over two years and being in a state of prime gunnery efficiency, whereas the "Good Hope" and the "Monmouth" were both 3rd Fleet ships, which had been lying idle in the dockyards, manned entirely with reserve men on the outbreak of war. The "Canopus" (Capt. Heathcoat Grant), another 3rd Fleet ship (with 4 12-in. and 12 6-in. guns), had been relegated by Rear-Adm. Cradock to purposes of convoy, as she could steam only 12 knots, and was 300 m. to the S. escorting two colliers when the action began. There can be little doubt that neither in guns nor in gunnery was the British squadron capable of meeting the enemy, and long before the fatal day it should have been reinforced by at least two cruisers of the 1st Cruiser Squadron, all of which were ships in long commission with good armament. ("Defence" carried 4 9-2-in., "Warrior", "Black Prince", "Duke of Edinburgh," 6 9-2-in.) This measure had been suggested, and even ordered in the case of the "Defence", but had never reached fulfilment. The "Black Prince" and "Duke of Edinburgh" were doing convoy work in the Red Sea and Indian Ocean, and the "Warrior" was at Port Said, while the "Defence" was with Rear-Adm. Stoddart on the east coast of South America.

Cradock left Vallena (Chonos, Chile) with the "Monmouth" on Oct. 30 and proceeded N., leaving the "Canopus" to remedy engine defects and bring on colliers. The "Glasgow" had been sent on to Coronel (Conception) to send and receive telegrams, and a rendezvous had been arranged with her 50 m. W. of Coronel for Nov. 1. The junction took place at 1 p.m., and as the sea was too heavy for boats, the mail was floated to the "Good Hope." It had scarcely been opened, and the rear-admiral was probably just reading his telegrams, when at 1:50 p.m. German wireless sounded loud and clear.

Von Spee had come from Mas-a-Fuera, the last anchorage in his long Pacific trip. On Oct. 30 he had sighted the lofty ranges of the Andes, and the "Prinz Eitel Friedrich," an armed merchantman, had been sent into Valparaiso to coal, while the squadron cruised at slow speed out of sight of the port. At 3 a.m. on Nov. 1 she sent news of the "Glasgow's" visit to Coronel on Oct. 31 and the German admiral steered S. to intercept her.

Cradock, when the report of German wireless came in, had made a signal to spread 15 m. on a line of bearing N.E. by E. (in the order from westward—"Good Hope," "Monmouth," "Otranto" and "Glasgow"), course N.W. by N., 10 knots, to get in touch with the enemy. At 4:30 p.m. the line was not yet completely formed when the "Glasgow," to the E., sighted smoke and altered course N. 80 E. to get in touch with it. At 4:40 p.m. she reported the "Scharnhorst" and "Gneisenau" steering between S.E. and S. She turned at once to S. 65 W., closing at full speed on the "Good Hope," and the whole line began to close rapidly on the flagship. The "Canopus" was 300 m. to the S., toiling with her colliers in a heavy sea. Von Spee had been steering S. at 14 knots. The "Nürnberg" and "Dresden" had been detached to examine passing ships, and the former was 25 m., the latter 12 m. in rear. About 4:15 p.m. von Spee was about 40 m. N. of Arauco Bay when the "Glasgow" was sighted to the W., and he turned and followed, working up to full speed. It had been blowing hard from the S.E. (von Spee says S.), and a heavy sea was running, hurling sheets of spray right over the conning towers; the sun was setting in the south-west. When the "Glasgow" sighted the enemy the "Good Hope" was some 26 m. to W. of her, and turned to the E. to join her squadron, as they came closing in. By 5:10 p.m. the British squadron was in line, with the "Good Hope" leading and the "Monmouth," "Glasgow" and "Otranto" behind, on an easterly course. The enemy were about 11 m. away to the E., steering south-westward (see map). Both squadrons now altered course to the S., and by 6:14 p.m. were steering approximately parallel courses at a range of about 14,765 yards. Cradock then seems to have tried to close in order to force an action while the sun was still high enough to dazzle the enemy, but von Spee turned away and Cradock resumed his southerly course. Had he not been hampered by the...
"Otranto," which could only go 16 knots, it is possible that he might have attempted to fall back on the "Canopus," for the rest of his squadron was faster than von Spee's and he could have slipped away to the S. during the night and picked up the "Canopus" next morning. But this would have meant forsaking one of his ships, and Cradock was not the man to take this course. He decided to fight, and sent the "Canopus" a message to this effect at 6:18 P.M. At 6:20 P.M. he turned towards the enemy, but von Spee turned away an equal amount. He was now about two points before Cradock's beam, biding his time and waiting for the sun to set.

The "Otranto" asked if she was to keep out of range, and not getting a clear reply drew out of line on the "Glasgow's" starboard quarter, a potent reminder that a ship that has no guns to fight and no speed to run away is a delusion and a snare. The sun was setting (sunset at 6:45 P.M.), and as soon as it dipped beneath the horizon (just before 7 P.M.) the English ships were silhouetted sharply against the red glow of the western sky, whilst the Germans were scarcely discernible against the gathering night clouds in the east. About 7:34 P.M. von Spee turned one point towards the enemy to clear the smoke, and opened fire at a gun range of 11,573 yards. The conditions were rendered difficult by spray, heavy sea and smoke driving down the line, but the shot fell only 500 yd. short. The third salvo hit the "Good Hope" forward at about 7:49 P.M. and sent up a burst of flame. The rest of the German squadron joined in, the "Scharnhorst" engaging the "Good Hope," the "Gneisenau" the "Monmouth," and the "Leipzig" the "Glasgow." The "Good Hope" had now opened fire, but in the failing light the splashes could not be seen and her firing was poor and ineffective. In the next quarter of an hour the German gunners found the target again and again, and by half-past seven the British cruisers were obviously in distress. The roof of the "Monmouth's" forecastle 6-in. turret had been blown off and the turret was blazing. She had sheered off to starboard about 7:15 P.M., and the "Glasgow," which continued to follow in the wake of the "Good Hope," had to ease down to avoid masking her fire. A fierce fire had broken out amidships in the "Good Hope" and was increasing in brilliance. It was almost dark. Though the moon had risen about 6:50 P.M. it was still low, but the glare of the fires kindled in the British cruisers offered a sufficient target. At 7:34 P.M. the "Good Hope" was losing speed; the range had closed to about 4,500 yards. About 7:51 P.M. two shells struck her between the bow and forecastle, and shot her bow and a vast column of smoke and fire rose into the air. When it subsided the ship was still afloat, but she was nothing but a guttered hull lighted by a dying glare, and she fired no more. Thirty-five hits had been counted on her by the "Scharnhorst's" guns. By 8 P.M. the fire had died down, quenched by the sea. The "Monmouth" had ceased fire and turned away to the W., followed by the "Glasgow," which had been heavily engaged by the "Leipzig" and "Dresden" and had received five hits. The rising moon shone fitfully through the clouds, and the "Glasgow" continued to fire at any ship that showed up, but as this only betrayed her position she ceased fire at 8 P.M. The "Monmouth," badly down by the bows and listing to port, turned N. at 8:15 P.M. to get stern to sea. But von Spee had now launched his light cruisers to attack and they were hot upon the trail. The "Glasgow" could only leave the stricken field, and she lost sight of the enemy at 8:50 P.M.

It was the "Nürnberg," which had been making frantic efforts to overtake her squadron, that found the unfortunate "Monmouth." She missed her with a torpedo and opened fire at 800 yards. The "Monmouth" was listing so badly that she could not use her port guns. The "Nürnberg" ceased firing for several minutes to allow her to surrender, then gave her a final broadside, and she went down at half-past nine with flag flying. The "Otranto" had fallen out and was now working gradually round to the S. towards Magellan Straits.

The British shooting was poor. The "Scharnhorst" was hit twice with little injury; the "Gneisenau" received three hits, one of which bent the flap of the after turret, an injury of little moment. This deficiency must be attributed partly to failing light and an inferior horizon but also to the fact that the ships had had scant opportunity for training and their fire-control equipment was poor. The squadron was weak in guns and gunnery. When the German squadron sighted it would have been possible to fall back on the "Canopus," but this would have entailed the destruction of the "Otranto," which would have been overtaken by the enemy in two or three hours. Cradock preferred to fight and take the chance of defeating the enemy, and was closely engaged by the 4 guns of the squadron, which was far from any base of refitment and repair. He fought a brave fight, checked von Spee in his onward career, and he and his men take their place in the great roll of naval heroes. His foe was a worthy antagonist. When the Germans at Valparaiso acclaimed him a naval hero, he shook his head. The wide spaces of the Pacific lay behind him, he had fought a famous battle, but the southern waters of the world lay before him, behind loomed the Atlantic, and he knew that Britain's arm stretched far. He found the sequel of his victory at the Falklands (see Falkland Islands Battle). (A. C. D.)

CORSON, HIRAM (1858-1911), American scholar (see 7:264), died in Ithaca, N. Y., June 15 1911.

COSTA RICA (see 7:219).—The internal history of Costa Rica is almost continuously concerned with the presidential office. In 1889 the first comparatively free election seated José Juárez Rodríguez, a clerical Conservative. He ruled practically without assistance from the legislature until he made use of it to seat Rafael Yglesias as his successor. Yglesias was re-elected in 1898, but gave over the power in 1902 to Asunción Esquivel, after which time serious political revolts were infrequent. Fair liberty of the press was enjoyed, and elections were not abnormally corrupt. Cleto González Víquez was chosen president in 1906, and Ricardo Jiménez in 1910, both by popular vote. Alfredo González was named in 1914 by the legislature after the popular vote had failed to indicate a choice. The radical programme of González led to his forced removal by Federico Tinoco, who was elected to the presidency after his coup in 1917. Tinoco's power was minimized by his failure to obtain recognition from the U.S. Government. He was obligated to put down revolts in 1918; in 1919 a popular movement led by Julio Acosta drove him out of the country. Acosta, at first provisional president, was elected and inaugurated in May 1920. Costa Rica prospered under its recent rulers, who promoted public improvements, effected desirable sanitary measures, and promoted education. The landowners, professional men, and habitual politicians controlled the country, their politics being animated by clique and family considerations rather than by genuine differences in policy.

After 1913, the president, members of Congress, and the city officials were popularly elected. The president had large political patronage, dominating Congress. The judiciary was practically independent; its head was the Supreme Court, chosen by Congress. The central Government had more control over local affairs than was usual in Central America. Manhood suffrage was legalized in 1920, and the suffrage was extended to women also. During the World War Costa Rica was among the first of the Hispanic-American countries to evince sympathy with the Allied cause, although the German colony and German influence were strong. On Sept. 21 1917 the Government severed relations with Germany, and on May 23 1918 declared war on Germany. The pact for the Central American Union was signed in Jan. 1921 by Costa Rica, but was later rejected by the National Assembly. For boundary dispute, see PANAMA.

Finance and Economics.—During the period 1910-20 Costa Rican coffee was the heated subject of national prosperity. There was no, however, a large class of rich native landowners. On the plateau the small peasantry was prosperous and industrious, controlled by the Government and commerce. The United Fruit Co. settled numbers of English-speaking people along the E. shore in the banana lands. From 1911 to 1918 the coffee crop ranged from 24,800 to 38,500,000 sacks, valued at from 8,221,000 to 13,759,000 colones (the colon equals $0.6521). In 1920 the coffee export was valued at $4,744,000. In 1918 the banana exportation
was worth 7,129,653 colones. The exportation of the principal variety, maíz sapientum, is about 11,000,000 bunches per annum. In 1914 the foreign trade was $20,004,310. In 1917 the national debt was $25,254,000. The national budget, approved by the President Jan. 7 for the fiscal year 1920, estimated the expenditure at 12,866,553 colones and the revenues at 13,006,000 colones, leaving a probable surplus of $194,477 colones. The estimated pop. in 1910 was 454,993; the area of the republic being about 23,000 sq. miles.

(H. I. P.)

**COST OF LIVING.**—Till recent years the phrase "Cost of Living" was only used loosely by economists when the balance between movements of wages and prices was in question, but from 1914 onwards during the World War the need of a measurement of the rise of prices gradually resulted in making the expression prominent in industrial and statistical discussions. In popular parlance it has since become a recognized economic problem. It has frequently been assumed that the term "Cost of Living" (or "High Cost of Living"—sometimes abbreviated to "H. C. L.") has a unique and definite meaning, and that accurate measurements can be applied to it, but in fact the meaning is vague and the statistical methods appropriate to it are complex and lead to results whose precision is not of a high order.

The phrase may be regarded as an abbreviation for "the cost in a defined region to persons typical of a defined social or industrial class of goods of a kind usually purchased at frequent intervals, by persons of which a certain standard of economic welfare is reached." We may usefully distinguish four cases: (a) where the standard is a physiological minimum; (b) where some conventional or average budget of expenditure is taken and the cost of the items in it is measured at different times or places; (c) where the items are varied but the whole contents of the budget result in an unchanged standard of welfare; (d) where both the contents of the budget are modified and the standard is raised or lowered. Case (b) is that which has in recent years been the subject of measurement, but case (c) is a mixture which may not be appropriate to the problem of measuring or adjusting real wages.

**Case (a).**—Prior to the World War attention was directed by Mr. Seebohm Rowntree (Poverty, A Study of Town Life, 2nd ed. 1902) to the cost of obtaining in York (England) and elsewhere food, clothing, heat, light and shelter sufficient for a family to maintain itself in health and efficiency for work, when all possible economy was practised, subject to the availability of commodities and the legal requirements for housing, decency, etc. The minimum of food was computed in relation to the quantity of calories, carbohydrates and protein calculated by Atwater and others as the necessary for maintaining health and vigour under various conditions of life, and diets were drawn up which contained the minimum constituents at the minimum aggregate cost; to this cost was added the expenditure on clothing, fuel, cleansing materials, etc., and rent, which was found to be customary among persons in regular work at the lowest rates of wages of adult men. The most natural meaning of the cost of living is perhaps the cost of maintaining the minimum standard thus described. The standard is, however, not scientifically definite; apart from questions as to the validity and applicability of the measurement by calories, it is clear that there must be a great difference between the expenditure necessary for work of low and of high efficiency; the Indian, Chinese and Japanese peasants live on a sparser diet and produce a lower output than the English or Americans; definite points are where efficiency is a maximum (which needs a more liberal diet than that considered by Mr. Rowntree) and where the value of additional efficiency exactly equals the cost of the additional food, etc., necessary (for whose ascertainment there are no observations); and Atwater's standard is in fact conventional (see Bowley, Measurement of Social Phenomena, chap. viii., 1913). If we drop the word "minimum" and speak of Mr. Rowntree's conventional standard for demarcating poverty, we can properly measure the change in the cost of living at this standard (if the facts are ascertainable). The varying cost of the official civilian rations, computed in Germany circa 1910, gave a measurement similar to that described. The cost of Mr. Rowntree's standard, and one modified in the direction of ordinary purchasers by Bowley, was worked out for certain English towns in 1913 (Liddell and Penney, 1915). A legal minimum wage could be based on a standard thus defined, but in fact it is generally related to a higher conventional standard.

**Case (b).**—The usual method of measuring the change of the cost of living during and since the war has been as follows. Detailed statements of expenditure having been obtained from a number of working-class households (in most countries at some date prior to 1914), an average budget is formed showing so many pounds of meat, bread, etc., with the prices and expenditure in considerable detail. The average prices of the same foods are ascertained from time to time, and the expenditure necessary to purchase the quantities in the standardized budget accordingly altered. The cost of living (so far as food is concerned) is then taken as having increased or decreased in the same ratio as this standard budget. In many countries a standard of the same kind is established for clothing, fuel, light, rent, cleansing materials and some other articles, and the cost of the aggregate, including food, is computed from time to time. The result obtained (if the process were complete) would be the relative cost of obtaining a defined standard constant in every detail. It is generally expressed as a percentage; thus if the costs were 25%. and 30% at the two dates, the ratio is 100 : 120, the index number at the second date is 120 and the percentage increase 20%.

This method cannot be carried out in its entirety for two reasons, namely, lack of information and change of quality of the commodities in the market. In most countries data of expenditure and prices are only obtained for principal commodities (meat, bread, etc.) and not for those on which little is spent (currants, pepper, etc.); unless owing to shortage of supplies there is a run on the articles not included, these omissions cannot affect the result significantly. In some countries expenditure is not known, but only prices, and then the resulting calculation is generally valueless; and in others currency is so inconvertible that the cost of food is the only thing that can be calculated. In nearly all cases there is no sufficient knowledge of expenditure on clothing either in total or in detail, and it is often difficult to obtain adequate data for fuel and light or for miscellaneous items. The sums included in the calculations, in fact, account for only a part of ordinary household expenditure, but where most care has been given to the question the part is a large proportion of the whole. Classes of expenditure that are not strictly necessary, such as amusements, tobacco, alcohol, etc., are generally omitted, as are occasional expenses (doctors, purchase of furniture, etc.), but in some cases subscriptions to trade unions, etc., insurance payments and travelling expenses are included. The miscellaneous expenses omitted become a large proportion of total expenditure as we go up the scale of incomes. The difficulty due to the change of quality of goods which has been so marked since 1914 is even more fundamental. Over any long period the actual constituents and quality of a pound of bread, a cut of meat, a pair of boots, change considerably, but from some points of view these gradual changes are not important. During the war, however, substitution of one commodity or ingredient for another was sudden and common, and the pre-war quality was unobtainable at any price, or if obtainable had a quite altered position in domestic economy. Consequently the prices included in the calculations were frequently not for the same things at different dates and the precision of the measurement was greatly diminished. After the Armistice there was some return to former qualities, but the change has been sufficient to undermine the foundation of the numbers, and a new basis is necessary, as discussed in the following sections.

It should be added that separate budgets ought to be formed (and in some countries have been formed) for different grades of income and for different classes of occupation, and also for single persons and for married persons with dependents. The structure of the index numbers for the cost of living is shown nearly by algebraic symbols. If \( Q_0, Q_1, Q_2 \ldots \) are the number
of units of the commodities in the standard budget, and \( P_1, P_2, P_3 \ldots \) the prices per unit at the date taken as starting point, and we write \( P_1, P_2, P_3 \ldots = E, F, G \ldots \) where \( E, F, G \ldots \) are the price ratios of commodities, the relations \( E = \frac{p_1}{P_1}, F = \frac{p_2}{P_2}, G = \frac{p_3}{P_3} \ldots \) is the whole expenditure at the first date on the standard budget. Let \( p_1, p_2, p_3 \ldots \) be the prices per unit at a subsequent date, \( Q_1, Q_2, Q_3 \ldots \) are the quantities demanded, and \( e = q_1 + q_2 + q_3 + \ldots \) is the whole expenditure. The ratio of the cost of the standard budget at the second date to that at the first, is \( \frac{e}{E} = \frac{Q_1p_1 + Q_2p_2 + \ldots}{E_1} + \frac{Q_1p_1 + Q_2p_2 + \ldots}{E_1} + \frac{Q_1p_1 + Q_2p_2 + \ldots}{E_1} + \frac{Q_1p_1 + Q_2p_2 + \ldots}{E_1} \ldots \) where \( n_1 = p_1/P_1 \) (the price ratio for the first-named commodity at the two dates), \( n_2 = p_2/P_2 \ldots \) The last expression shows that by this method the ratio of the cost of living is a weighted average in which the price ratios are weighted by the expenditures at the first date; hence we only need to know these expenditures and ratios, and not the actual quantities nor prices. In the official measurement in the United States the quantities \( E, F \) are in fact used; this method is very convenient in dealing with rent (for which there is no natural unit of quantity) and with clothing (for which a general price ratio is obtained without any definition of unit). The general theory of weighted averages shows that a considerable roughness in the estimation of the smaller expenditures is smoothed out in the process of averaging, but that it is important to obtain precision in the case of large items, such as clothing, treated in a single entry, and rent. It is important, however, that the result should be accurately known when they differ much from one another, and the quality of the commodities that are priced should be the same at both dates.

The index number for the second date is \( \frac{e}{E} \times 100 \), and the percentage increase is \( \left( \frac{e}{E} - 1 \right) \times 100 \).

Case (c).—It must be granted that when the cost of living is compared at two places or at two dates we ought not to assume that precisely the same quantities of the same commodities are purchasable in both cases, and in order to make a strict numerical comparison we need a test of equality of standard if not a means of comparing two standards. The problem so stated has not yet been completely solved. A measurement could be made on a strictly nutritive basis and the cost of purchasing in the most economic way the amount of calories (including the necessary protein) considered proper to health and efficiency could be ascertained in both countries or at both periods; but this would only give a theoretical solution, since it ignores the influence of custom and taste in diet, and, in fact, in developed countries relatively few people are compelled to purchase their nutrients in the cheapest possible way. The actual practical question in England in 1921 was what was the cost of maintaining the pre-war standard of living in nutritive power and satisfaction or pleasure derived from food and clothing, allowance being made for changes in prices and available qualities. This statement of the problem is vague and unsatisfactory, and as far as is practicable to define exactly, though some mathematical methods based on economic principles have been suggested for ascertaining its equality in two cases.

It has been suggested (Bowley, "Measurement of Cost of Living," Journal of the Royal Statistical Society, May, 1919, p. 354, and "Cost of Living and Wage Determination," Economic Journal, March, 1920, p. 117) that an approximation could be reached by devising a diet, based on available supplies, as nutritive, as nutritive, and not less attractive than the pre-war diet, and estimate at what price it could now be obtained, or to frame a new budget of goods obtainable, and, in fact, purchased by housekeepers with the same skill of adjusting purchases to desires as in the case of the earlier budgets. Instead of measuring satisfaction by formula, we may recognize that it is subjective and a matter of opinion, and obtain from a representative working-class body of housewives, or from other similar groups, the opinion would now give the same variety and pleasure as a selected budget of 1914, care being taken that the energy value is the same. The objection to the new old-fashioned budget, the ratio of whose cost (to that of the pre-war budget) would give a rough measure of the change of the cost of living. It should be added that this solution would only be definite if the "satisfaction" was obtained as a separate item, being arrived at before the costs and, or the sums of money were laid out to the best advantage. This method would only be satisfactory if fairly close agreement was obtained as to the equality of the new with the old standard.

A definite solution has been used in the Journal of the Board of Trade (United Kingdom) initiated inquires about the cost of living in the United Kingdom, United States, France, Belgium and Germany, and obtained budgets of expenditure in each country; the results are published in the official papers Cd. 3604, Cd. 5699, Cd. 4512, Cd. 5604 and Cd. 4932. A comparison was made between the cost of living in the United Kingdom and Belgium on a double basis, as follows:—it was found that an English housewife purchasing in 1909 in the United States a week's supply of food, as customary in England would have spent 38% more in the first-named country, this was nearly correct, namely 100:138; on the other hand, an American housewife purchasing in England a week's supply of food as customary in America would have found her expenses reduced in the United Kingdom and Belgium to 94% (Cd. 5699, pp. Ixvi, Ixvi). If these ratios had been reciprocals, this would have measured the difference in the cost of living (so far as food is concerned); as it is, their divergence illustrates the want of definiteness in the problem. Bowley has quite fairly attempted to obtain by this method a cost of living index number of the different countries in a way comparable with a pre-war budget and the method just described can be applied. Thus, in the Journal of the Royal Statistical Society, May, 1919, p. 344, details are given of the standard pre-war budgets of the United Kingdom and Belgium, and a committee on the cost of living in the last year of the war, in which the standard of living had been modified and had fallen somewhat. A housewife purchasing in 1918 the same quanities and qualities of food as in 1914 would have increased her expenditure in the ratio 100:212, while if she had purchased in 1914 the same quantities and qualities as in 1918 the ratio of the later to the expenditure would have been 100:202. Both these are possible measurements (the first being identical with case a above), and where the difference between them is so moderate an intermediate number, such as the arithmetic or geometric mean (which are nearly coincident), 100:207 may be a plausible measure of the change.

Another method, allied to that just described, gives perhaps the most practical solution, though its adequacy can hardly be proved. It is founded on the assumption that the changes of expenditure at two dates; compile a new or mean standard of quantities which item by item are the averages of the entries in the budgets; thus, if in one the consumption of 3.3 lb. of bread is stated, in the other 3.5 lb., then in the standard, in the average of these two quantities, which is 3.4 lb., and take the ratio of these costs as the measure of the change in the cost of living. In the example just used this ratio was found to be 100:204. (On the methods formerly used for this problem, see Pigou's "Dictionary of Political Economy," vol. iii., article "Wages, Nominal and Real," p. 640.)

If all prices rose in the same ratio the methods now described would necessarily yield the same result; the need for choice arises from inequalities of increase, including the case where the goods are no longer in the market as one where the price is infinitely great. Now if at one date purchases are made so as to maximize the satisfaction in the outlay of the week's housekeeping allowance, as we may reasonably assume, and prices rise irregularly, it is evident that somewhat less will be bought of the commodities which have risen most and more of those which have risen least, and to obtain the same satisfaction as before is less than increase if exactly the same quantities had been purchased. For example, if oranges are doubled in price and bananas increased only by one-half, many bananas and fewer oranges will be purchased.

If with the notation used above we also write \( q_1, q_2, q_3 \ldots \) for the quantities purchased at the second date, the measurement obtained by using these quantities is \( q_1p_1 + q_2p_2 + \ldots = 1 \), \( q_1p_1 + q_2p_2 + \ldots = 100 I_1 \) (say) instead of \( Q_1p_1 + Q_2p_2 + \ldots = 100 I_1 \) \((\text{as above})\). If the small letters refer to a second place (instead of date), then as between England and America \( I_1 = 138 \) in the illustration \( I_2 = 125 \). For two dates the method illustrated from expenditure on food in England gives \( I_1 = 1212 \) and \( I_2 = 202 \), and the suggested index number is \( \frac{1212}{202} = 600 \). The school recommended is to take

\[ I_1 = \left( \frac{Q_1}{q_1} + p_1 \right) + \left( \frac{Q_2}{q_2} + p_2 \right) + \ldots \times 100 \]

It is easily shown that \( I_1 \) is always intermediate between \( I_1 \) and \( I_2 \), and by a more trouble-some analysis that \( I_1 \) is less than \( I_2 \), when prices in general are rising and quantities consumed of individual goods have increased or diminished according as their prices have risen more or less than the average as measured by

\[ 1 = \frac{100}{1} \times P_1 \]

where \( 100 = I_1 \), and the factors in each term of the numerator are both positive or both negative under the conditions named. Hence, \( I_1 \) satisfies many of the fundamental conditions.
be regarded as the cost of maintaining the standard customary to the social or occupational class concerned at a given time and place. In this sense the cost of living of Chinese labourers is lower than that of the Americans, though they pay the same prices for commodities. When “cost of living” is used in this sense it should always be accompanied by a reference to the standard attained. Thus the British Committee on the Cost of Living in 1918 estimated the average expenditure of working-class families in 1914 and 1918 and at the same time reported on the change of standard. In some of the statistics quoted below a conception of this kind is involved in the figure.

**UNITED KINGDOM**

*(a) Cost of Food.—In the United Kingdom the basis of the official measurement of the cost of living is that of finding the cost of a standard budget of expenditure at various dates (see Labour Gazette, March 1920, p. 118, and Report on Working-Class Rents and Retail Prices, Cd.6555 of 1913, pp. 299 seq.). The standard budget was obtained from a collection of 1,044 records of weekly expenditure made in 1904; the average weekly family expenditure was 36s. 10d., of this 2s. 6d. was spent on food, and of the food 18s. 6d. is accounted for in the standard used prior to the war. A somewhat altered basis was taken in 1914. Rice, tapioca, oatmeal, pork, coffee, cocoa, jam, treacle, marmalade, currants and raisins (the expenditure on all of which was about 2s. 1d. in 1904) were omitted and fish and margarine added (an addition equivalent to 6d. in each case). It was assumed that, though prices had increased between 1904 and 1914, the relative expenditure (which alone enters into the computation) on the different commodities was unchanged; this assumption is too rigid but not unreasonable, and the facts otherwise known about price movements and consumption show that the error introduced is insignificant.

Relative importance being determined, the next step was to ascertain the moviment of prices. Prior to 1914 the records were obtained exclusively for London, but it was shown (Cd. 6955, pp. 299 and 360) that from 1907 to 1912 the average movement was very nearly the same in provincial towns as in London. From Aug. 1914 statements of prices were obtained for 360 towns and villages.

The index numbers of the cost of living, so far as food is concerned, were then obtained by the method *b* described above; prior to 1914, the year 1900 was taken as base and the prices then equated to 100; from the beginning of the war July 1914 was taken as base.

The index number is in the form $100 \times (E_1 + E_2 + \ldots) / (E_1 + E_2 + \ldots)$ where $E_1, E_2, \ldots$ are the expenditures on the separate commodities in the standard budget and $r_1, r_2, \ldots$ are the ratios of the prices at any particular time to the prices at the base date. The values actually taken for the $E_1$'s were as in Table I., being proportional to the expenditure.

One hand that the expenses of the middle class had not increased so much as indicated by the index number based on working-class expenditure, and on the other that the standard of living must be lowered—the higher the income the greater the fall. A similar scale was adopted at nearly the same date for railway officials. We are thus led to consider a conventional standard of living which changes from time to time. When there is no reference to a physiological minimum, the cost of living may

There are certain weaknesses in the method. It is assumed without explicit evidence that expenditure on meat was in the proportion 2s. on beef to 1s. 6d. on mutton, and that British and foreign meat were of equal importance, and the price ratios taken for meat are for four selected joints only; during the period 1913 to 1915 when the relative quantities available varied and relative prices were altered, this assumption affects the index numbers. The weight assigned to margarine is ar-
COST OF LIVING

The number of eggs consumed (about 12 per household per week) is based on summer records and is no doubt higher than the average for the year.

The resulting index numbers were as in Table II—

For the monthly figures from Aug. 1914, see the article Prices.

During the war the validity of these figures was much weakened by the failure of the supplies necessary for the budget to be realized. In 1918 a committee on the cost of living (Cd.6986) collected 1,400 budgets from the urban working-class of a kind comparable with the standard budget already named. Among the differences found were the following (Table III):—

<table>

</tbody>
</table>

The consumption in 1918 practically exhausted the supply, and the calculation of what the 1914 budget would have cost if the quantities had been available at the prices of 1918 was purely theoretical. The committee found that in fact expenditure on food was 90% higher than in 1914 at a date when the above index number showed an increase of 108%. The committee estimated that the nutritive value (measured in calories) of the 1918 budget was only 3% lower than that of 1914. Similarly a committee on the financial results of the occupation of agricultural land and the cost of living of rural workers (Cmd.76 of 1919) reported (p. 43) that the expenditure on food of agricultural labourers had increased 84% since 1914 at a date when the index numbers showed an increase of 108% and that the nutritive value had fallen 3% in the towns. Possible methods of measuring the change of the cost of living under such circumstances have been discussed above; here it is only necessary to say that the official index number is not valid.

After the Armistice supplies tended to return to their pre-war level except in the cases of sugar, eggs, butter and cheese; margarine of an improved quality took the place of butter to a considerable extent. The increase of prices over 1914, however, varied greatly from commodity to commodity; thus in March 1921 British beef and mutton were respectively about 16% and 176%, while hatted beef and mutton were only about 100 and 100% above the level of 1914; sugar had risen 510%, butter 145%, eggs 200%, tea only 7.4% and margarine 67%. With this variation it is certain that an unchanged standard would not be composed of unchanged constituents and that (as argued above) the cost of living had risen less than the index numbers show, unless expensive substitutes had taken the place (e.g.) of sugar. There had been no information obtained, however, as to new arrangement of consumption up to the summer of 1921.

Another Commodity.—Next in importance to food comes rent. The figure included in the index number allows for such increases for rates, repairs, etc., as are legally permissible and is accurate for persons who by remaining in the same house since 1914 have the benefit of the Rents Restriction Acts; the increase for those who have moved must have been very variable and for it no estimate is available.

The cost of clothing, which ranks next to rent in expenditure, is always very difficult to measure owing to the difficulty of defining the garments or stuffs purchased, and of assigning their relative importance in the budget. There was great variability in the qualities in the shops during 1914 to 1921.

The difficulties can be understood by comparing the estimates and method of the Cost of Living Committee (loc. cit., pp. 21–3) with those of the official index number described in the Labour Gazette, April 1921, pp. 178–9; the former found an increase of 96% between July 1914 and the summer of 1918, the latter reaches increases of 210% in June and 240% in Sept. 1918. The differences are partly attributable to the great variability of the increases among the articles in consequence of which the relative importance given to each has great effect, and in this respect the committee's measurement is the more systematic; and partly due to the difficulty of obtaining quotations for the same qualities of goods or in allowing for substitution. The question is too intricate to discuss here; it can only be suggested that the results have little precision, and that the process of obtaining an estimate based on a new budget in which modifications of custom are allowed for is even more necessary than in the case of food.

Fuel and Light present little difficulty when a general average for the country is in question since the retail prices of coal and gas are ascertainable. The variation from month to month in price and consumption and that between winter and summer is not very important, since where coal is dear, gas is used for cooking, and in working-class households one fire is necessary throughout the year for cooking and this also provides heat.

The official index number allows only one-twelfth of the weekly expenditure for all items not already included, or about 15.6d. per household in 1914. This sum is exhausted by cleansing materials with a very small margin for tobacco, newspapers, household replacements, and fares. Insurance and trade-union subscriptions are not included, nor is alcohol.

The five classes of expenditure now named are combined in the following proportions, stated for clearness on the basis of a pre-war urban weekly expenditure of 375.6d. Food 262.6d., rent (including rates) 65., clothing 45.6d., fuel and light 35., sundries 15.6d. Here the proportions on food, rent and light rest on good evidence; that on clothing, for which the expenditure varies greatly according to the income and personnel of the family and for which there has never been a satisfactory investigation, is little more than a guess based on vague estimates; that on sundries is the residuum when other expenses are met and is probably too low.

The results are tabulated in Table IV:—

The statistics are for the beginning of each month.

* Not stated separately at these dates.
The numerical importance of the criticisms indicated may be seen by computing the number for Dec. 1920 with the following alterations: suppose that the modification of diet (margarine instead of butter, decrease of sugar and eggs and increase of other foods) reduces the food index to 260, that the increase in clothing cost is half that shown (as indicated by the Cost of Living Committee for 1918) and the index is 200 instead of 305, and that rent accounts for 20% of all expenditure, food for 50% and sundries for 10%, instead of 16, 60 and 4% respectively, then the index number would be 275 instead of 260. This is, perhaps, an extreme hypothesis, but it has been suggested (Bowley, Prices and Wages in the United Kingdom, 1914-1920, p. 73) that a standard equivalent on the whole, but modified in detail from, that of 1914 might have been attained throughout by an increase of expenditure equal to four-fifths of that officially stated (100+4/5 of 169 = 235 in Dec. 1920).

OTHER COUNTRIES

(a) Cost of Food.—The experience of other countries has been similar to that of the United Kingdom both in the dates of increase and in the difficulties of satisfactory measurement. Table V contains in summary form the index numbers showing the movement of food prices in all the countries which are known to publish official figures based on 1914 prices. Except in Belgium, where the index numbers are the simple average of prices of selected commodities, the measurement is made on the same method as in the United Kingdom and based on the expenditure found from a collection of working-class budgets, though in some countries the number of such budgets is very small. In some cases, noted in the sequel, some changes in commodities are introduced, and in others alternative measurements based on actual expenditure at different dates are given. These numbers are summarized from time to time in the Labour Gazette (London), the Labor Review (Washington), in the International Labour Review (Geneva), and in the Monthly Bulletin of the Supreme Economic Council; they are of course also to be found in the official publications of each country.

Though the movements are by no means uniform, the rise is universal, and, except for a temporary break after the Armistice, continuous in nearly all countries till at least July 1920.

The break in the rise occurred at various dates after June 1920, as shown by figures in Table VI.

*Figures for beginning of following month.

The prices are of course strongly affected by the relative value of the currency in the countries, and some indication of the effect may be seen (Table VII) by converting them to a gold basis by means of the exchange on New York. July 1920 is taken as being near the date of maximum prices. Corresponding figures are also given for Jan. 1921.

*Obtained by converting through London, thus: 258 X 76.6 + 100 = 198.

Thus if an American had come to London with $198 in July 1920 he could have converted them into as many £ currency as would buy as much food as $100 would have purchased in July 1914. In Rome he would have needed only $88.

Table V.

Index Numbers of Retail Prices of Food (based on the official statistics of the various countries).

In every case the prices used are in the currency of the countries in question.

- United Kingdom.*
- France (Paris).
- France (other towns).
- Italy (Rome).
- Italy (Milan).
- Switzerland.*
- Belgium.
- Netherlands (Amsterdam).
- Denmark.
- Sweden.
- Norway.
- Spain.*
- United States.*
- Canada.
- British India (Calcutta).
- South Africa.*
- Australia.
- New Zealand.

*Other countries.
- France, other towns.—The figures include fuel and light; the number 380 relates to June not July 1920.
- Switzerland.—The numbers relate to June not July in each year.
- Belgium.—The base is April 1914.
- Netherlands.—In some accounts 217 is stated for July 1920 instead of 210; the basis in 1914 is the average for the year, not the month of July.
- Spain.—The July figures are for the average April to Sept. and the Jan. figures the average Oct. to March each year.
- South Africa.—The figures for 1914 to 1918 are the averages for the years, not July only.

*Figures for beginning of following month.

The prices are of course strongly affected by the relative value of the currency in the countries, and some indication of the effect may be seen (Table VII) by converting them to a gold basis by means of the exchange on New York. July 1920 is taken as being near the date of maximum prices. Corresponding figures are also given for Jan. 1921.
It is evident that neither the currency reckoning nor a conversion to a gold basis show the real meaning of the increase of prices; we need also to know the change of income accruing to purchasers, on which some information is given below.

In Germany a calculation of a standard food budget based on official maximum prices in 200 localities was made monthly for the years 1914-9 (Deutscher Reichsanzeiger, Dec. 19 1919). Since the foods could not generally be obtained and there was much evasion of regulations the numbers have hardly even academic interest, and the more important information is that given below under cost of living. The numbers in question yield the following figures (Table VIII):

In Finland (Abo Urmerrittler, Feb. 25 1920) it appears that the cost of 1 litre of milk, 5 litres of potatoes and 1 kilo. each of butter, flour, bread, meat, bacon, sugar and coffee rose from 11.68 to 106.23 Finnish marks between 1914 and the beginning of 1920, an increase in the ratio 100:190.

For Japan a correspondent of the London Economist (Aug. 9 1919) gave details showing that the expenditure on food of an ordinary family had doubled in Tokyo between the first quarters of 1916 and 1919.

It is clear that the methods of establishing the original budgets varied greatly from country to country. Since rent has increased little for those who have not moved and clothing has increased greatly in expense a good deal depends on the relative importance allotted to these items.

The various countries have collected information about the cost of living at different dates in rather sporadic ways. Only the United Kingdom has computed a monthly index from the beginning of the war on a uniform system. No doubt the difficulties of measurement and of obtaining data described above have been experienced in all countries and it would require very detailed criticism to ascertain whether the basis of collection was sufficiently wide and whether the prices were typical. The numbers in Table X must only be regarded as approximate both in respect of amount and of date, but they indicate the periods of increase and show in which countries it has been most rapid. In most countries there has been a shortage of houses and a legal restriction on rent; the figures are based in general on rents which have been hindered from rising. Whether the index number of food exhibited in the previous table or that of the cost of living has increased most depends mainly on a balance between rent and the cost of clothing, and the latter must have been uncertain in all countries.

In general the index numbers show a nearly regular increase from 1914 to the end of 1918, stationariness in 1919 and a rapid rise to a maximum at the end of 1920.

Many of the figures have been given from time to time in the Labour Gazette (London) and the Labor Review (Washington) and in similar publications in other countries. For Table X they have been extracted from the originals in the country to which they relate as far as possible.

Average for 1915. The original figures for Amsterdam are based on a calculation which is estimated from other data that prices rose 7% between 1910 and 1914 and the numbers are adjusted on this assumption, but they can only be regarded as approximate when 1914 is compared with other years; for the sequence beginning 1917 the relative numbers are correct.

In some other countries there have been occasional calculations on a similar basis. In Uruguay (Boletin de la Oficina Nacional del Trabajo, Montevideo, May-Aug. 1919) the increase in necessary expenditure from 1913 to 1919 is given as 44% for an unmarried and 36 or 37% for a married labourer. In Argentina (Revista de Economia Argentina, May 1920) the increases in food, rent and other expenses are stated as 32, 16 and 165 respectively from 1914 to 1918 and as 45, 50 and 150% from 1914 to 1919. For Hungary (Labour Gazette, April 1921) a statement is quoted that whole family expenditure was in Jan. 1921 47 times as great in currency as before the war; rent had only increased 65%. For Germany an estimate is given (International Financial Conference, Brussels, 1920, Paper vii., statistics of retail prices) that the index number for food, clothing, rent, fuel, etc., in 28 towns was 373 in April 1919 compared with 100 in Jan. 1914, and if 373 is taken for Frankfort-on-Main in April 1910 subsequent numbers for that town are: Sept. 1919 433, Nov. 1919 466, Jan. 1920 630 and March 1920 740.
In all the tables so far given the index numbers are intended to measure the change in cost of an unchanged and unmodified standard, except that in Denmark there has been a slight change in the relative quantities of butter and other fatty substances. In a few countries, however, the actual change in expenditure \( (100Q_0+\Sigma Q_0P - 100Q_0+\Sigma Q_0P, \) the formula for unchanged standard), and in Amsterdam the index number, has also been calculated by using quantities currently bought instead of the original standard \( (100Q_0+\Sigma Q_0P) \).

For the United Kingdom the Cost of Living Committee of 1918 (Cd.Sg.80) compared the expenditure of a standard artisan family in 1914 and the summer of 1918, and found the increase to be 74% to June 1918 and 89% to Sept. 1918, when the increase on the standard budget was 100 and 110%; the difference was partly due to the methods of treating clothing; for food alone in June 1918 the increase in expenditure was 90% and in the cost of the standard budget 108%. The Ministry of Food also made a computation of the change in the cost of the average quantities of some principal foods consumed in the United Kingdom from time to time, yielding the comparison shown in Table XI:

*The figures in this column are those stated in the Labour Gazette for two months later, but it is known that the computation was in error of the facts, at least at the earlier dates.

1910 if all the foods of the standard budget were included.

The differences point to important modifications of diet under rationing and control of prices; the Cost of Living Committee found that the nutritive value had fallen very little.

In Switzerland an estimate was made by Dr. Jenny (Journal de Statistique et Revue économique suisse, 1918 fascicule 1, pp. 76 seq.) of what he calls the “nominal” and the “effective” increase of cost. The nominal increase, viz. that of an unchanged standard of food, was 92% between 1912 and March 1917; the effective increase, viz. the increase of expenditure when allowance was made for the known or estimated diminution in the consumption of bread, meat and the increase in that of potatoes, was only 56.5%.

In Milan the cost of the food actually consumed has been estimated from time to time, and added to the cost of housing, fuel, clothing, etc., these being taken as an unchanged standard after July 1918. Some of the results are shown in Table XII.

In Holland (Amsterdam) a more elaborate method is used, for not only has the expenditure been ascertained at frequent intervals (unfortunately of only a very small number of families) but it has been computed (see Table XIII) what the quantities actually bought would have cost at pre-war prices.

<table>
<thead>

Table XIII may be thus explained. Expenditure in 1914 was 5% of the 1910-1 figure in Dec. 1919, 10% of the 1920 figure, an increase of 73% (first column). If the same quantities had been bought in 1919 as in 1914 they would have cost 15 of (20Q), an increase of 105% (third column); but if the 1919 quantities had been bought in 1914 they would have cost 500 of (20Q), and the ratio of the actual cost to this is 2, which multiplied by 100 gives the number in the second column. Thus the third column gives the index number 100Q_0+\Sigma Q_0P, the usual type, and the second gives 100Q_0+\Sigma Q_0P (where Q is changed at each date). It is argued above that the true measure of the cost of living lies between the numbers in the second and third columns. It can be seen that considerable modifications of diet took place between 1914 and 1918-9, but that either they had been reversed or that their effect on cost was nil by 1920.1

In Sweden an elaborate investigation (involving about 600 household budgets each kept for three periods of four weeks) was made in 1916, 1917, 1918. Besides calculating actual expenditure (20Q) and the cost of a standard budget (20Q) the food value in calories is computed (see Table XIV).

<table>

</tbody>
</table>

Expenditure thus increased less than the cost of a standard budget, but whereas in 1916 the nutritive value of the diet had increased, owing to some change from meat to cereals which afford more nourishment for the same price, in 1917 and 1918 the dietary was inferior owing to actual dearth and the cost of equal nourishment rose as rapidly as the food index number on the ordinary basis.

In Egypt it was estimated by its statistical department that the cost of living measured by the standard reached in March 1920 was for clerks 15% and for artisans 14% greater than that of the same standard in 1914 (20Q: 20Q). For food, fuel and soap only the increases for artisans and labourers on the same basis were to March, July, Aug., Sept., Oct., and Nov. 1920 respectively 180, 181, 180, 180, 185 and 193% in Cairo; in parts of Egypt there was a fall in Nov. 1920.

Reactions of Prices and Wages

Prior to the war there was in the United Kingdom no direct reaction of retail prices on wages, for wage rates were deter-

1 The double estimate is now given up and the index number is now computed on the standard of March 1920.
mined by the relation of the demand for and supply of labour, the exact rates being settled by the bargaining strength of employers and employed; since, however, real wages (wages expressed in commodities) were believed to be falling in the period 1900 to 1914 the determination of wage-earners to obtain higher money wages was strengthened and supported by a considerable body of public opinion and this no doubt improved their position in negotiations. On the other hand, whatever were the causes that brought about the general rise in prices that began about 1895 under the ordinary play of economic forces the rise, first apparent in wholesale prices, was followed after no long interval by increases in retail prices and in wages, and in general money wages may be expected to change in fairly close accordance with a gradual change in the price level. The immediate effect of rising prices in normal times is to stimulate commercial activity, increase employment (so that earnings rise before wages), and then to increase wage rates.

During the World War a new group of causes had effect. The connexion of currency with gold was broken, new purchasing power was obtained by the sale of securities held abroad, and the British Government was able to increase the amount of currency at will, by ordering goods and issuing new notes with which to pay for them. There was, for example, nothing to prevent the Government paying every week a £1 currency note to every wage-earner who liked to apply for it, and something of this kind was in fact done in the unemployment benefit after the Armistice.

The actual sequence of events appears to have been as follows. The increased demand for labour, due to the simultaneous need for munitions and equipment and the withdrawal of men from civilian occupations, soon resulted in full employment for nearly all persons capable of work; during the first year of the war this complete employment and the patriotic desire not to hinder the successful prosecution of the war (together with the opinion that the disturbance was temporary) deterred wage-earners from pressing for increased rates of wages in spite of the acuteness of the demand for labour. During 1915 it became apparent that retail prices had definitely risen and that there was no immediate prospect of a fall, and that real rates of wages had so far fallen that persons whose hours of work had not increased had suffered a serious fall in the standard of living, and that in the case of unskilled labourers wages were insufficient to purchase necessary food. The ordinary methods of bargaining were to a great extent suspended, partly because the Government was already a very important employer of labour and was provided with a bottomless purse by the printing press.

The first stage was to give a war bonus in many industries, either at a flat rate to all operatives on the ground that all persons required the same minimum ration of food, or on a slightly greater scale to the lowest-paid men on the ground that the better-paid could make more economies. The price of all goods rose to the extent that the wages affected were an element in their cost, with some exceptions, as in the case of railway services, in which the Government bore any loss. Prices of food which depended to a great extent on the world market prices were not directly affected to any great extent, being paid for by the realization of foreign securities, by the export of gold and by loans, but they nevertheless continued to rise.

The second stage was marked by an effort of wage-earners to obtain further increases commensurate with the increased cost of living and in many cases the acuteness of the demand for labour would have resulted in a great rise in wages; but the Government, by its growing importance as a purveyor of goods and its increasing direct control of industries, was in a position to dictate terms in so wide a sphere as to dominate all wages, and it was not strictly bound by the conditions that determined wages before the war. Courts of arbitration were established and by these and other methods wage changes were officially regulated. In determining wages the dominant consideration appears to have been the change in the cost of living (as determined by the official measurement described above), though the increases awarded were not in strict proportion,—as indeed they could not be.

The series of increases in the middle and latter period of the war had a more direct reaction on retail prices than the earlier changes, for two reasons. The cost of coal rose with miners' wages, and this, together with the increased wage cost of food manufacturing processes and of wholesale and retail distribution and the increase of the farmers' wage bill (especially dairy farmers'), raised the price of many of the commodities ordinarily purchased by the working classes. Secondly by the end of 1917 the supply of the majority of goods was limited by dearness, control of shipping or rationing, and was no longer sensitive to price; wages tended to be so raised as to command the purchase of nearly the same quantities of goods as in 1914 at the prices of 1917, but when they came to be spent the goods were not available in these quantities and competition raised the prices; in the case of the principal foods and of coal, prices were controlled and the amount purchasable rationed (except that of bread, which was sold at a loss made good by a Government subsidy); the surplus of wages was then expended on less the fully and by the demand accentuated by supplies like eggs and pianos supply instances of this. If prices had not been controlled and wages had moved with the cost-of-living index number, an endless sequence would have been established, in which each increase of wages caused a rise of prices which was followed by a further enhancement of wages, the whole being financed by the issue of paper money, while the quantity of goods purchased was limited throughout to the same total, namely the goods available in the country. Actually the process was checked by the complete control (independent of home cost of production) of many of the foods included in the budget which determined the cost-of-living index number (e.g. of bread, flour, imported meat, cheese, tea, sugar), and by the partial and less successful control of foods influenced by the cost of home labour (potatoes, home-produced meat, fish, milk, butter); of the remaining articles, the supply of bacon of inferior quality was sufficient to make effective control unnecessary, margarine was manufactured by the Government and the price successfully kept low, and eggs (though nominally controlled) rose in price in accordance with the demand for them, coal was both rationed and controlled in price, and rent was restricted. Nearly the full extent of the demand accentuated by surplus wages was felt in the price of clothes, and no doubt this had its effect on the increases of the cost of living and of wages during 1917-9 (see Wages, for the "Cost-of-Living Wage"). After the Armistice, control was progressively relaxed as free supplies became available and the Government's importance as an employer was diminished. The close connexion between wages and the index number of the cost of living was maintained and extended, but the demand for labour was for an increase of wages above the level of 1914 more than proportional to the increase of prices—in fact, for a higher standard of living, and at the same time for a reduction of the hours in a normal week's work. There was a gradual return to pre-war conditions and the freer play of economic forces; wages had to be found by employers without direct reference to the Government's printing press, supplies of most goods became again sensitive to prices, imports had to be paid for by exports and the increased cost of the latter at once reacted (as indicated by the movements of exchange) on the former; so far as cost of labour is a constituent of price, prices of all goods (whether home-produced or imported) rose with that cost. The sequence by price following wages and wages following prices must have a limit, and this limit appeared to have been reached with the break in prices in 1920 and the unemployment of 1921, but the date and manner of the climax were determined rather by world conditions than by the British labour policy.

How far wages kept pace with prices is shown approximately from the statistics given above and in the separate articles on Wages and on Prices. Prior to the war the movements are indicated by Table XV.
The wage figures depend throughout on wages for a normal week (reduced in 1918 and 1919) or on changes in piece rates. During the war-years earnings increased so much more rapidly than wages, owing to various facilities for making additional money, that it is probable that an index number for earnings would show as high figures as those in the second column except in 1917. If, however, we pay attention only to rates for nominally the same work, it is seen that prices rose before wages from 1914 for at least three years. If the view is accepted, as argued above, that the official index number tends to show too great a rate of increase, then by July 1918 wages had caught up with prices, and, while in 1919 and 1920 they had slightly passed the official measurement of prices, in fact real wages increased in these years. In 1920 it was too early to trace the effect on wages of the fall of prices that began in the winter of 1920; apart from those cases where wages were bound to the cost-of-living figures by a formula, the first influence was felt in unemployment and consequently diminished average earnings, not on rates of wages.

Some examples of the formulae connecting wages with prices are given in the article on Wages, and that governing civil service and salaries is stated above. The general effect was to increase or decrease weekly rates in a lower proportion than prices, but where the proportion was applied to a standard wage higher than that in 1914 the whole increase over that date was at some periods greater than that of prices. Thus the wages arranged in Jan. 1920 for a porter on the lowest scale were as follows:—

<table>
<thead>
<tr>
<th>Rate of wages</th>
<th>Moneysales in relation to pre-war rate</th>
<th>Cost-of-living in relation to number</th>
<th>Real wages in relation to pre-war rate</th>

</table>

If then the cost-of-living index really measures the value of money the porter is better off when prices fall. Where such an arrangement took effect a slight check was put on the circular influence of prices on wages and on prices.

So far we have considered the interaction of wages and the prices that enter into working-class expenditure. There is still the question how wages have affected the cost of the unit of output. A bricklayer and his labourer averaged about 143d. an hour between them in the summer of 1914 and 43d. in the summer of 1920, i.e. three times as much as in 1914; owing to the reduction of hours their weekly rates were only 2½ times the former rate. In industries generally the reduction of hours was rather less, probably about one-twelfth on the average, and while the index number for weekly wages was 235 in July 1920 that for hourly wages would be about 285 (July 1914 = 100). There is no certain information by which to connect the change in the cost of an hour's labour with the cost of a unit of output. On the one side it was generally alleged that the pace of work had been more or less intentionally reduced, though this is not substantiated by such figures for piece earnings as are available; and, though in factories there is some diminution of overhead expenses and waste time when the day's work is done in two instead of three shifts, the general expense of salaries, interest on capital, rents, rates, etc., has to be met out of the diminished hours of work. No doubt the potential energy of the workman per hour is greater in a 45-hour than a 34-hour week, but the increase appears not to have been realized in 1919-20. On the other hand the high cost of fuel and materials (especially coal) stimulates employers to economize their use. In engineering especially many improvements in machinery were made during the war, the use of oil and petrol having replaced in some cases that of coal; in agriculture labour is saved by the use of oil-driven tractors. It is not possible to estimate the net influence of these factors, nor to state numerically in general how far the increase of wages has affected the cost of the product to the purchaser. In the article on Wages are shown the scanty data relating to the general movement of wages in other countries than the United Kingdom, and these can be brought into relation with the index numbers of food and of the cost of living given above.

In Norway wages in the summer of 1918 were about 90% and the cost of living about 120% above the levels of 1914. In April 1919 various rates of wages were from 130 to 210% and the average had probably increased to 180% above 1914, while the cost of living was the same as in the previous year. In spite of reduction of hours weekly wages appear to have gained on the cost of living during the year May 1919 to May 1920.

In Denmark a more detailed table (see Table XVII) can be given:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Hourly earnings</th>
<th>Cost of living</th>
</tr>
</thead>
<tbody>
<tr>
<td>1914</td>
<td>100</td>
<td>100</td>

</tbody>
</table>

Hours were reduced in 1919 till at the end of the year an 8-hour day was usual as compared with 10 hours before the war. Real weekly earnings had evidently increased considerably be-
COTTON

1920, and in April of that year it was agreed that future increases should be proportioned to the cost of living.

In Germany we have the computation shown in Table XVIII.

Table XVIII.

(A. L. Bo.)

COTTON, JAMES SUTHERLAND (1847-1918), British man of letters (see 7.225), died at Salisbury July 10 1918. He contributed articles on Indian subjects to the E.B. and spent the later years of his life cataloguing European MSS. relating to India in the India Office Library.

COTTON, AND COTTON INDUSTRY (see 7.226, 281).—The chief problems which faced the cotton industry after the beginning of the 20th century centred in the question of the supply of the raw material. Up to the outbreak of the World War the outstanding feature was the steady increase of the demand. The industry is unique in possessing fairly reliable statistics of the consumption throughout the world, these having been compiled with increasing completeness by the International Federation of Master Cotton Spinners' and Manufacturers' Associations since 1904. The last issue before the war (March 1 1914) contained actual returns from the owners of 132 million spindles out of an estimated world's total of 145 millions, or 91.9% of the world's total mill capacity. These figures do not, of course, include domestic spinning, which in many countries, especially India and China, accounts for a large part of the local consumption, so that they must always be incomplete; but this does not greatly affect comparative statistics from year to year.

The possession of such statistics offered an opportunity to attempt a balance sheet of the world's production and consumption such as is given in Table A. During the war it was impossible to continue the world statistics of consumption of cotton of all kinds, but other figures for the American crop alone are available to bring the table down to date as far as was possible in 1921.

The causes of the increase of consumption may be briefly tabulated as follows:—

1. The increasing wealth of the world, especially of those tropical and subtropical countries whose products are largely raw materials such as cotton, and which for climatic reasons happen to be also the largest cotton-using countries in the world.

2. Improved methods of manufacture, and the discovery of new processes which made it possible to produce cotton fabrics of an entirely different character, quality and finish from those previously known. The old process of 'mercerizing,' re-applied with new success, produced cotton fabrics with a finish and appearance closely resembling silk, while the additional process known as 'schräinerung' produced a surface like satin.

3. Similar developments enabled cotton to be used not merely as an adulterant of, but as a really satisfactory substitute for, fabrics made from other textile materials, such as wool and linen, e.g. the raising process made it possible to produce cotton goods as much superior to the early attempts at woolen imitations as these were inferior to the real article. Cotton 'damask' was also taking the place of the original linen.

1For details see "The World's Cotton Crops," Appendix B.

Hester's figures. (New Orleans Cotton Exchange.)
(4) Many entirely new uses were being discovered for cotton, of which two only need be mentioned on account of the enormous importance they acquired during the war, namely aero-
plane cloth and motor-car tire fabric. At the same time the possibilities of cotton in entirely new forms of fabric were being worked out, e.g. in the hosiery trade, where their first use in cheap cotton hose has led to the evolution of entirely new classes of knitted garments and now even knitted piece goods, which is perhaps the most promising future development of all.

Table B shows the three chief crops, namely American, Indian, and Egyptian:

The figures in italics are estimates. *A feddan is practically an acre, and a kantar 100 lb. jSkel. jGood Bhownaggar.

The Effects of the War.—The first effect of the war was a tremendous slump in the price of cotton, because the expected cessation of demand happened to coincide with the largest American crop on record. All the exchanges were closed and nominal prices fixed. Under these conditions a difficulty very quickly arose with regard to the position of cotton as contraband. In view of its use for munitions as well as for many other semi-
military purposes, it should in the interests of the Allies have been placed under embargo at once; but to do so under the then existing market conditions would have produced utter demoralization, and probably a serious dispute with America. It was not for about six months that the question was finally settled by a compromise under which a modified embargo was laid upon cotton; but this was converted into a formal declaration of contraband some months later. In the meantime prices had begun to recover, but not sufficiently to prevent the expected serious reduction of acreage throughout the world for the 1915 crops, which were the smallest on record for many years. In 1916 the American and Egyptian acreages were almost back to pre-war figures, but the average yield that year was poor, with the result that the crops were again much below pre-war normal. During 1916 prices rose sharply as the industry began to realize that demand was recovering in an unexpected way, and that the
The world's consumption of cotton by countries and varieties, (Table C) which were estimated in 1920 was 900,000,000 bales of sundries. In the meantime the world's trade had been brought almost to a standstill by the slump in demand everywhere. The extent of this is shown by the Federation statistics (Table C), which were resumed on July 31, 1920 (the date of the cotton "season" having been in the meantime advanced by a month). In their figures as at Jan. 31, 1921, shown in the above table, it was possible to compare the consumption during the height of the boom with that of the pre-war year, and also with that of the first six months of the slump. The fact that the consumption even during the boom was not equal to the pre-war consumption is due, first, to the destruction of textile machinery in the devastated districts of France and Belgium; and, second, to the reduction of the hours of labour throughout most parts of the cotton world, which came into vogue immediately after the war. In 1910 the makers of textile machinery were utterly unable to cope with the demand for new machinery to replace that which had been destroyed during the war, or to make up the arrears of renewals which had fallen behind during the war. New machinery outside of these privileged requirements was practically unobtainable, with the result that the trade was unable to take full advantage of the boom in the demand by increasing its output. The high prices were therefore due not merely (if at all) to the shortage of the raw material, except perhaps in the case of Egyptian and other staple cottons, but rather to a shortage of cotton goods. It was some paradoxical to speak of possible scarcity at a time (Aug. 1921) when the actual demand for cotton goods seemed almost at a standstill, and the world was apparently over-stocked not only with cotton goods, but also with the raw material. Yet there could be no practical doubt that the world would ere long be seriously short of cotton again; because it could only be a question of time till a return to something like normal conditions of demand would again lead to a consumption of cotton substantially in excess of what the world was producing. The abnormally large carry-over which was accumulated during the slump might prevent any scarcity arising within the immediate future, but it could hardly be doubted, unless the world would face a prolonged period of practical starvation, that the consumption of cotton, which is the cheapest textile in the world for many other purposes besides clothing, could not permanently remain at the low level of 1921. The question was whether, when the demand came again, the supply would be as quick to respond as it was to contract when prices fell. It was extremely unlikely that pre-

*No statistics for China. Estimated total spindles, over 1,600,000; consumption in 1920, 690,000 bales of sundries.
war conditions would ever again be reproduced in America.

Then the crop was increasing slowly, but on the whole steadily, and in 1914 the actual growth was probably not less than 17 million bales, though this record total never came “into sight” during the season. It was clear that, at anything like the 1921 level of prices, and indeed under almost any conditions which could then be visualized as possible, the world could not look to America to equal that figure again or to resume the pre-war rate of increase. The difficulties in America were the extremely variable climate, the scarcity and high cost of labour, and the reduction of the average yield owing to the spread of the boll weevil; and although the cost of production would probably be somewhat lower in 1921 than in 1920, it would still be very much higher than the 1921 level to tempt the growers back again from the policy of diversification, which they had been taught since the war, to their old policy of cotton and nothing else.

The basic fact of the situation in 1921 was that prices were substantially below the cost of production, and this was a state of affairs which could not continue. It is true that where so much of the labour—and cotton is essentially a cheap-labour crop—is supplied by the grower himself and his family, they may for a time submit to a reduction of price which will not cover an average wage for their labours; but even where the mobility of labour is low, as it is in the American cotton belt, such a state of affairs is bound in course of time to have its effect. It did so very strongly during the war when a large quantity of labour left agriculture in the cotton belt for the more highly paid industries in the Southern towns or in the industrial North; and while the subsequent slump had, for the time being reversed this tendency, it was extremely improbable that the South would again become resigned to a permanent lowering of its standard of living, especially as the policy of diversification in itself enabled them to meet this difficulty by supplying many of their requirements from their own land, instead of putting it all under cotton. The probability was, therefore, that it would require a substantially higher price than in pre-war times to induce America to return to her pre-war acreage.

A further point of detail may be noted. Part of the American crop before the war, the Sea Island crop, grown in Florida and Georgia, and on the so-called “Islands” off the coast of South Carolina, was the best cotton in the world, because its staple was the longest and finest; but this crop had by 1920 been virtually wiped out by the advent of the boll weevil in these districts and the gap that they created has been extremely difficult to fill. The only supply of a similar kind in which America could offer was the small crop of excellent cotton of Egyptian character which had for some years been growing in Arizona and California, especially in the Salt River Valley in the former state. The crop amounted in 1920 to 92,000 bales grown upon a total area of about 250,000 acres; but that was largely due to the high prices of 1919–20 and was not likely to be repeated. For the very best cotton, therefore, the world was entirely dependent on the West Indian Sea Island crop, which, however, was only about 7,000 bales, against the pre-war figure of about 100,000 from Florida and Georgia.

The supply of fine cotton was still further diminished by the severe reduction of the Egyptian crop, due to several causes, of which the most controversial was the view that drainage had not kept pace with irrigation, leading to a rising “water table” and partial water-logging of the lower zones in the Delta. The ravages of the pink boll worm in recent years had also contributed to the reduction of the average yield, which had become serious even before the war, and still more so since 1914. To counteract this reduction would require very heavy expenditure; and the further development of the Egyptian area was apparently dependent on the execution of large irrigation works, the chief of which, the White Nile Dam, above Khartum, had been begun, though work was suspended in the meantime through lack of funds. The most striking development in Egypt, however, had been the replacing of the original Delta type of cotton (Afifi) by the new longer-stapled variety Sakelairides, the best of which has to some extent taken the place of the lost Sea Island.

In view of the reduction of the Egyptian crop the possible development of the Sudan became of the greatest importance. The Gezira scheme, which was expected to provide the larger part of the crop, was also dependent on large irrigation works on the Blue Nile, in course of construction in 1921. Other parts of the Sudan, such as Tokar, Kassala, and certain areas on the Nile north of Khartum, were of considerable promise, but large expenditure on transport and irrigation was still required there, especially for the Tokar and Kassala districts.

Great hopes have been entertained of the development of cotton of the ordinary American inch-staple variety in India, where it is regarded as relatively long-stapled in comparison with the long staple grown in the United States, and it has been proposed to use the entire cotton crop. This development has had the active support of the Government, who in 1917 appointed a special commission to make a survey of the whole position (see Report of the Indian Cotton Committee, 1919). For many years to come, however, these improved cottons could not hope to form a large part of the total Indian crop. Since the formation of the Indian Cotton-Growing Association in 1902 attention had therefore been directed to other parts of the Empire, and much pioneer work had been done in proving the possibilities of many districts, especially those areas in Africa which “success” (as distinguished from “failure”) was achieved in West Africa, where the best cotton is of a good American type, and in Uganda and Nyasaland, where varieties akin to the American long-stapled upland have been produced. The development of all these districts was, of course, seriously checked by the war, and subsequently by the high cost of the necessary development works, such as transport. The war also left a great gap in the supply of skilled men of all kinds, whose services were everywhere required for the development of new cotton-fields. Everything depends in the first place on the maintenance of an adequate seed supply, which involves not only the finding of a suitable variety, but also the maintenance of a pure supply. Much had also been done in promoting improved methods of agriculture, in providing the necessary facilities for the ginning, bailing, and handling of the crop, and for its marketing at adequate prices, especially in the case of superior varieties. In South Africa also excellent cotton had been grown in small quantities, but the necessary organization of the trade had still to be provided before it could be a success on a large scale. Other foreign Powers with colonies in Africa had also done a great deal for the development of cotton, but up to 1920 the total quantity produced in all these new areas in Africa (exclusive of Egypt) was still relatively small, and the time when Africa could produce a million bales of cotton was still far distant (see Report of the Empire Cotton-Growing Committee of the Board of Trade, Cmd. 523, 1920).

In Australia there was little doubt that cotton could be successfully grown, either by rainfall or under irrigation; but there were problems to be faced with regard to the labour supply as well as the ordinary difficulties of organization.

There are many other countries which could provide large additions to the world’s cotton supply if all the necessary conditions of the successful organization of the industry could be secured. Brazil, for example, could undoubtedly yield a very much larger crop than it has ever done (500,000 bales); but political as well as labour and other economic difficulties are apparently serious. The Argentine is also a country where excellent staple cotton has been grown, but labour seems to be the chief obstacle to its development on a large scale. Many of the other Latin-American countries, especially Mexico, also have great possibilities for cotton-growing. Peru produced a small crop (about 200,000 bales) of excellent staple cotton, a little below Egyptian in value, but much of it better than the staple American upland. The supply of the latter from America itself suffered a severe loss when the boll weevil appeared in the Mississippi Valley and drove out the old 1½ in. long-staple cotton that used to be produced there. Subsequently, however, a great development took place in the production of new staple upland varieties of about 1½ in. staple in southern Carolina, the Mississippi Valley and northern Texas; but their total supply probably did not exceed 250,000 bales per annum.
In Asia the chief crops before the war, apart from India, were in China and Asiatic Russia, including Transcaucasia. Statistically, the Chinese crop has always been a mystery, and its amount can only be guessed at about two million bales. The Russian crop had before the war risen rapidly to nearly 1½ million bales, part of which was of indigenous varieties similar to the Indian, and the remainder of good American quality; but this crop had been almost wiped out by the war, and it was not likely to recover as long as Russia remained in chaos.

The Cotton Industry.—The growth of the cotton industry throughout the world has already been indicated by the figures of spindleage given in the appended tables. Perhaps the most interesting feature up to 1921 had been the development of the American, Japanese, and Indian sections of the trade. The first was largely due to the growth of the Southern mills, which had increased from ten million spindles in 1910 to 15 millions in 1920. In Japan the percentage increase of spindles had probably been greater than in any other country, though the total in 1921 was still comparatively small. The output of the Indian mills had also advanced in recent years, both in quality and quantity; but this unfortunately raised bitter controversy with regard to the Excise duties, which were imposed on the product of Indian mills in 1896 to balance the 3½% Excise duty imposed for Revenue purposes on cotton goods imported into India. In 1917 the import duty was raised to 7½% without a corresponding increase in the Excise duty; and in 1921 the differentiation was still further increased by an addition of 3⅓% to the import duty. Table F shows the growth of the Indian cotton industry since 1911.

The facts with regard to the foreign trade of Great Britain in cotton and cotton goods are shown in Table I (See p. 760).

Number of Operatives.—In Table F are given the latest figures obtainable in 1921 as to the number of British operatives engaged in the cotton trade since the date of the Census of Production in 1907:—

<table>
<thead>
<tr>
<th>Date</th>
<th>Males</th>

</tbody>
</table>

The controversial question of the employment of half-timers in the trade moved a step forward in England by the Education Act of 1918, which provided for their gradual abolition.

Wages.—With regard to wages, the outstanding feature of the British cotton industry was for many years the excellent organization both of masters and men, as the result of which wage disputes in the trade have, ever since the famous Brooklands Agreement of 1893, been reduced to a minimum. It is perhaps also due to this organization that, as a class, the cotton operatives of Lancashire are the most highly skilled, and enjoy the highest standard of living, of any section of the industry throughout the world.

In the Report (1909) by the Board of Trade in England into the Earnings and Hours of Labour of workers in the Textile Trades in 1906 (Cd. 454) the average wages earned in the cotton trade for a full working-week were given as follows:—

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>£268 1/2</td>
<td>£118 1/2</td>
<td>£184 1/2</td>
<td>£108 1/2</td>
<td>£195 1/2</td>
</tr>
</tbody>
</table>

The total wages bill for a full week at that time was £51,000, and the total number of operatives employed was 523,690. It was also calculated that in 1906 the average annual earnings per head in the cotton trade were about £48. The number of hours constituting a full working-week at that time was 53½. Wages in the cotton trade in the United Kingdom are calculated on the basis of certain standard lists, the chief of which are known as the Bolton List and the Oldham List for cotton-spinning, and the Uniform List for cotton-weaving. In 1906 the wages actually paid were 5% above list prices for the Bolton and Oldham Lists and list prices for the Uniform List. Table G shows the changes since that date:

Table G.—Changes in Wages of Cotton Operatives, 1906–21.

---

**Capital.**—Much attention was attracted to the great movement in 1919-20 for the recapitalization of the British industry, which was to some extent inevitable. Owing to the demand for machinery and the high cost of production during the war, the book values of the mills represented a fraction of the actual market value to which they had risen. The process of writing up the nominal capital of the companies to something approaching the actual market value of the plant was in itself harmless; but when the inevitable reaction came, those who had invested in the industry at the top of the wave seemed likely in 1921 to find it difficult to secure a normal rate of dividend on what had come again to be regarded as inflated values. The table on next page, founded upon Mr. F. W. Tattersall’s list of 100 typical joint-stock companies in the Lancashire industry, gives an interesting indication of the earnings of the trade. It is obvious that the later dividends, and especially in 1919-20, were extraordinarily high even allowing for excess Profits Duty, but in 1921 the reaction was full swing.

**Cotton-seed.**—Since 1910 a great change has come over the relative position of cotton-seed among the innumerable commodities which contribute to the supply of the vegetable and animal oils and fats. Until then oils were classified pretty rigorously, on the one hand as soft and hard, and on the other as edible and non-edible. Soft or liquid oils, such as linseed,

*Amount paid in dividends only.

cotton-seed, rape, whale oil, etc., could not be used, e.g. for the manufacture of margarine or soap, without a certain proportion of hard fat or solid oil, such as lard, coconut or palm oil. But the discovery of a new hardening process made it possible, by the removal of certain constituents from the soft oils, to convert them into a hard stearine, more solid even than tallow, and which could therefore be used for all purposes for which hard fats only had hitherto been employed.

Again, only American cotton-seed had till then been regarded as capable of producing an edible oil. This was due not so much to anything in the seed itself, but to the processes used in manufacture. American cotton-seed, being "white" or "fuzzy," had to be decorticated before crushing, i.e. the whole of the husk or hull, with the short fuzz adhering thereto, was separated from the meat or kernel, and the latter alone was crushed. In the case of the black Egyptian seed, however, which has practically no fuzz, and to a certain extent also Bombay or Indian cotton-seed, which has only a short fuzz, the whole seed was crushed, including the black hull; but the latter gave the oil a very dark colour, and in order to remove this certain chemicals had to be employed, which, in any case for the refined oil, and this was thought to debar it entirely from use for edible purposes. Many other vegetable oils for other reasons were in a similar position; but the discovery of a process of deodorizing oils by blowing superheated steam through them made it possible to remove all objectionable flavour from almost any kind of vegetable oil.

The adoption of these two processes has gone far to revivify the relative values of the different vegetable-oil seeds, as now practically any kind of vegetable oil can be adapted for almost any purpose, either for culinary purposes or as a hard fat. The only thing then remaining to make it possible to use oils which hitherto had not been usable at all for either of these purposes.

During the same period considerable further knowledge has been gained as to the use of cotton-seed meal and cake for feeding purposes. A great deal has been done, by the combined use of different cakes possessing counteracting qualities, to make it possible to use certain cakes, such as Bombay, for purposes for which it had not formerly been thought suitable, e.g. Bombay or Indian cotton-seed cake was thought to be too astringent for cattle if used alone, but if given along with linseed or turnips, which possess laxative qualities, a good result can be obtained from the combination. Again, much has been learned as to the advantages of using particular cakes for special purposes; thus linseed cake was found to be the best for feeding cattle for the butcher, while Egyptian cotton-seed cake was looked upon as better than Bombay for dairy cattle.

Further future developments are indicated by the invention of a new method of removing from white cotton-seed, such as American, after the ordinary process of delinting, an additional supply of short fuzz in such a condition that it can be advantageously used for many purposes, such as paper-making, guncotton, artificial silk, etc. Indeed, this process of economizing by-products has gone still further, for a plant has within recent years been erected in America which, by a similar process, removes the final remaining short fuzz from the cracked hulls after decortication, and even these have been put to good use for similar purposes.

COUPERUS, LOUIS (1863— ), Dutch writer, was born at The Hague June 10, 1863, a member of a family of Scottish origin, banished from Scotland for political reasons in the 16th century. His early boyhood was spent in the Dutch East Indies, where his father was a government official. His first novel Eline Vere, written under the influence of Tolstoy, appeared in 1889 and was followed by Xoodlet (The Footsteps of Fate) in 1894 and Extase, the first of his novels to be translated into English (1892). He next produced certain imaginative and idealistic works, such as Majestelt (1895) and several volumes of prose poems. But the work by which he is best known in the English-speaking world is the series of "Books of the Small Souls," four novels entitled Die Kleine Zijden (The Small Souls), Het Late Leven (The Later Life), Zielenschemering (The Twilight of the Soul), Het Helge Waken (Eng. version Dr. Adrianus) which, together with Van Oude Menschken, de Dingens van Woorlijgaan (Old People and the Things that Pass, Eng. version 1919) raised him to the first rank of European novelists. In this record of an ancient crime, buried deep in the hearts of the aged pair of lovers who committed it, and yet poisoning the lives of their descendants to the third and fourth generation, there is the austerity and inevitability of Aeschylean tragedy. Couperus travelled much in Greece and Italy and embodied his classical researches in historical romances such as De Berg van Licht (The Mountain Light) and its successor De Komedianten (The Comedians) and mythological romances such as Dioscurides (1903) and Heroikos (1913), as well as volumes of essays, sketches and short stories. The greater part of his work has been rendered into English by A. Teixeira de Mattos. His historical novel Isbrand (concerning Alexander the Great) appeared in 1920.

COURTHOPE, WILLIAM JOHN (.1842-1917) (see 7,327), died at Wadhurst, Sussex, April 10, 1917. He published a selection from Martial's Epigrams in 1914, and a volume of verse, The Country Town and other Poems, with a preface of memoir by A. O. Frickard, appeared in 1926.

See also J. W. Mackail, W. J. Courthope (1919).

COURTNEY, LEONARD HENRY COURTNEY, BARON (1832-1918) (see 7,328), died in London on May 11, 1918. His brother, William Prideaux Courtney, died in London Nov. 14, 1913.

COURTRAI, BATTLE OF (1302): see YPRES and YSER BATTLES.

COVENTRY, ENGLAND (see 7,342). Pop. (1911) 106,649, showing an extremely rapid increase of 52% over that of 1901. The normal engineering industries of Coventry were almost entirely transformed during the World War to munition production, which was carried on on a vast scale, and to the construction of aeroplanes, tanks, and guns. Among special industries newly established are the making of artificial silk and of telephone and other electrical apparatus. In order to meet the needs of an unusually rapid development, parliamentary powers were obtained in 1920 for the widening of several narrow streets and for the construction of two new arterial roads in the centre of the city. A new council house costing £100,000 was completed in 1917 and officially opened in 1920, and three branch public libraries were opened in 1913. The 14th century tower of Holy Trinity Church was restored at a cost of £6,000 in 1918-20, and the 14th century Guildhall was in process of restoration in 1921. Coventry was created a separate diocese in 1918, the church of St. Michael being constituted into a cathedral.

COWDRAY, WESLEY DICKINSON PEARSON, 1ST VISCOUNT (1856— ), born at Shelley Woodhouse, Yorks., July 15, 1856, and educated privately at Harrogate. He entered the family firm of S. Pearson & Co., contractors, ultimately becoming its head. Under him the firm greatly extended, one of many important contracts and acquiring large interests in Mexico and South America. In 1892 he unsuccessfully contested Colchester in the Liberal interest, but in 1895 was elected for the same seat, which he held until
1910. In 1894 he was created a baronet, and in 1910 was raised
to the peerage. He was in 1917 made president of the Air Board,
and the same year was created a viscount. He was elected Lord
Rector of Aberdeen University in 1918.

COX, JAMES MIDDLETON (1872– ), American politician,
was born near Jacksonville, O., March 31 1870. He was edu-
cated in the common schools and worked in a newspaper office
for a short time was a country school teacher, and later be-
came a reporter on the Cincinnati Enquirer. Afterwards he
went to Washington as secretary to Congressman Paul Sorg,
of Ohio. On the latter's retirement he decided to enter again
the newspaper field. In 1898 he purchased the Dayton News
and five years later the Springfield Press-Republic, subsequently
named the Daily News, these papers being known thereafter as
the Newspaper League of Ohio. From 1900 to 1913 he was a
member of Congress from the Dayton district and served on the
Appropriations Committee. He was an active opponent of the
Payne-Aldrich tariff measure. He was elected governor of Ohio
for the term 1913-15, was defeated for the following term,
then was reflected twice in succession (1917-21). At the
time of his third election he was the only Democrat to be returned
to state office, even the lieutenant-governor being Republican,
and two-thirds of the congressional districts went Republican.
In 1916 he was delegate-at-large to the Democratic National
Convention. His career as governor was notable. Among
the many reforms introduced under his guidance were a workmen's
compensation law; a survey of occupational diseases with recom-
netations for health insurance; the elimination of the sweat-
shops; the establishment of a state tuberculosis hospital
and the extension of safety devices on railways and in mines.
Many of these reforms were followed as models by other states.
He was energetic in suppressing violence in connection with strikes,
his general policy being to hold local authorities responsible
without recourse to the state militia. In at least one case he
removed a mayor who had called for state troops. He favoured
abolishing the Federal inheritance tax, believing that the state
alone should have jurisdiction over inheritances. He opposed
the excess profits tax but maintained that a small tax should be laid
" on the volume of business of a going concern." He was a
strong supporter of President Wilson's policies and especially
of the League of Nations. He was often charged with opposing
prohibition but repeatedly declared that all laws must be en-
forced. At the Democratic National Convention in 1912 he had
from the beginning strong support for the presidential nominat-
on. On the first ballot he stood third (with 134 votes); on
the seventh ballot second (with 295 ½ votes); on the twelfth ballot
first (with 404 votes); on the thirteenth ballot he dropped to
second (with 402 votes); on the thirty-ninth vote he again stood
first (with 468 ½ votes); and continued to gain thereafter until he was nominated on the forty-fourth ballot. Following
his nomination he "stumped the country, making the League
of Nations the prominent issue but was overwhelmingly defeated
by Warren G. Harding, the Republican nominee. The electoral
vote was 104 for Harding and 127 for Cox. The popular vote
was 16,138,000 for Harding and 9,142,000 for Cox. The vote
in Ohio, the home state of both candidates, was 1,182,000
for Harding and 760,000 for Cox. The magnitude of the defeat,
unprecedented in American history, was generally considered
as due in part to the unwarranted character of the charges made
by Cox himself during the campaign, but chiefly to a widespread
revolt against the recent course of President Wilson, whose
policies Cox upheld.

COX, KENYON (1856-1910), American painter (see 7,353),
died in New York, March 17 1910. In 1910 he was awarded the
medal of honour for mural painting by the Architectural League.
In 1911 he published The Classic Point of View, being lectures
delivered that year before the Chicago Art Institute. Other
works are Artist and Public (1914, largely reprints from period-
icals); Winslow Homer (1914) and Concerning Painting (1917).

COZENS-HARDY, HERBERT HARDY COZENS-HARDY, 1st
BARON COZENS-HARDY (1856-1920), English lawyer and Master of the Rolls
was born at Letheringsett Hall, Dereham, Norfolk, Nov. 22 1858,
the son of William Cozens-Hardy, a Nonconformist solicitor
in large practice at Norwich. He was educated at Amersham school
and afterwards at London University, where he took his degree
in 1878. He was called to the bar in 1882, and built up a large
and very successful connexion, chiefly in Nonconformist and Liberal
circles. He became a Q.C. in 1882, and was raised to the bench in
1899. In 1895 he was returned as Liberal member for Nor-
folk, retaining the seat until 1899. In 1901 he was made a lord
of appeal, and in 1909 Master of the Rolls. In August 1913 he
was appointed one of the three commissioners of the great seal
during the absence of Lord Chancellor Haldane in Canada.
In 1914 he was raised to the peerage, and in 1918 resigned the
office of Master of the Rolls, being succeeded by Lord Swiuen.
He died at Letheringsett Hall June 18 1920.

CRACKANTORPE, MONTAGU HUGHES (1832-1913), En-
lish lawyer, was born at Norers, Som., Feb. 24 1832, the son of
Christopher Cookson of Norers. The name of Crackanthorpe
was assumed by him in 1888 on succeeding to the estate of New-
biggan, Westmorland. He was educated at Merchant Taylors' school
and St. John's College, Cambridge, where he took his degree
in classics in 1854, winning the Elton and University mathe-
matical scholarships. He was called to the bar in 1859, and soon
became well known not only as a barrister but as a keen student of
criminology. He became a Q.C. in 1875, and from 1893 to
1899 was standing counsel to Oxford University. He took much
interest in eugenics, and was president of the Eugenics Education
Society from 1901 to 1911. He published Population and Prog-
ress (1907). He died in London Nov. 16 1913.

CRADOCK, SIR CHRISTOPHER GEORGE FRANCIS MAU-
RICE (1862-1914), British admiral, was born at Hartfort,
Yorkshire, July 23 1862, eldest son of Christopher Maurice
of the navy at the age of 13 and saw service in Egypt both in 1882
and again in the Soudanese expedition of 1891. He com-
banded the British Naval Brigade at the capture of the Taku forts
and the relief of Peking (1900). He more than once performed personal
feats of gallantry in saving life at sea and showed himself
a bold and fearless leader in action. He was promoted captain
after Taku, and rear-admiral in 1910. In 1912 he was granted the
K.C.V.O. He published Sporting Notes in the Far East (1889);
Wrinkles in Seamanship (1894) and Whispers from the Fleet
(1900). Early in the World War he was given command of a
British squadron in the Pacific consisting of the cruisers "Good
Hope" (flagship) and "Monmouth," the armed merchantman
"Oronto" and the light cruiser "Glasgow." His squadron
was attacked off the coast of Chile (Nov. 1 1914) by five Ger-
man warships, the "Scharnhorst," "Gneisenau," "Leipzig,
"Dresden" and "Nürnberg." Though inferior in speed and gun-
power he decided to attack. The "Monmouth" was sunk and the
"Good Hope" was blown up whilst making for shore, Admiral
Cradock going down with the ship.

CRAM, RALPH ADAMS (1863- ), American architect,
was born at Hampton Falls, N.H., Dec. 16 1863. He was edu-
cated at the Westminster (Mass.) Academy and the Exeter (N.H.)
high school. He studied architecture in a Boston office, was for a
time art critic on the Boston Transcript and in 1886 opened an
architect's office in Boston. He had a profound knowledge of
medieval architecture and was an able advocate of the Gothic
style, employed by him in many church and college buildings.
Examples of his successful ecclesiastical work include St. Thomas's
church, New York; Calvary church, Pittsburgh; St. Paul's
cathedral, Detroit; the Fourth Presbyterian church, Chicago;
and St. Alban's cathedral, Toronto. He was consulting architect
for the cathedral of St. John the Divine, New York. He designed
buildings for the Princeton graduate school, Sweet Briar College.
CRAMP, CHARLES HENRY (1828-1913), American shipbuilder (see 7,565), died in Philadelphia June 6, 1913.

CRAMP, CONCENMORE THOMAS (1876-1951), British Labour politician, was born at Staplehurst, Kent, on March 19, 1876. He left school at the age of 12, and worked as a boy gardener to the local squire. At the age of 18 he left his native village and obtained employment as a gardener outside Portsmouth. In 1896 at the age of 21 he joined the service of the Midland Railway at Shipley, near Bradford, as a porter at 16s. a week of seven days of 12 hours each. He was later transferred to Middlesbrough, then to Sheffield, and promoted to a passenger guard. He joined the Amalgamated Society of Railway Servants and first appeared as a delegate at its Birmingham all grades conference, 1907. Later he became delegate to the annual general meeting of the A.S.R.S. and in 1911 was elected to represent his district on the executive committee. He was elected president of the National Union of Railwaymen at the 1917 annual general meeting. During the World War he became a member of several Government committees including the Port and Transit Executive Committee, Committee on Adult Education, Consumers' Council, and Railway Advisory Committee. He stood for Parliament unsuccessfully as Labour candidate for Middlesbrough at the general election in 1918. He was appointed Industrial General Secretary of the National Union of Railwaymen on Jan. 1, 1920 and became a member of the Executive Committee of the Labour party.

CRANE, WALTER (1845-1915), English artist (see 7,366), died at Horsham March 14, 1915.

CRAWFORD AND BALCARRES, 26th Earl of (1847-1913), British astronomer and orientalist (see 7,385), died in London Jan. 32, 1913. He was succeeded as 27th earl by his son David Alexander Edward Linsay (b. 1871), well known under his former title of Lord Balcarres as an art critic and connoisseur. He was appointed a trustee of the National Portrait Gallery, and has published Donatello (1909), and The Evolution of Italian Sculpture (1910). In 1916 he was included in Mr. Lloyd George's Cabinet as President of the Board of Agriculture and in 1921 became Lord President of the Council.

CREWE, ROBERT OFFLEY ASHBURTON CREWE-MILNES, 1st Marquess of, English statesman and writer (see 7,432), remained leader of the House of Lords through Mr. Asquith's first administration, and during the Coalition Government of 1915-6. Though he was not Lord Granville's equal in the difficult and delicate task of endeavouring to win the peers' assent to a succession of unpalatable measures of Radical reform, he contrived, by his courtesy and charm, to retain their liking and respect throughout the critical period beginning with the budget of 1909. He succeeded Lord Morley at the India Office in Nov. 1910, and attended, as Secretary of State, the King and Queen on their visit to India in the winter of 1911–2. He was responsible for the high acts of policy announced at the Delhi Durbar; the removal of the capital of India from Calcutta to Delhi, and the reunion of the two Bengals under a Governor-in-Council. At the coronation of King George he was promoted to a marquessate. In the first Coalition Government he was Lord President of the Council. He followed Mr. Asquith in declining to take office under Mr. Lloyd George, and after his resignation he continued to lead the independent Liberal opposition in the Lords.

CRICKET: see Sports and Games.

CRILE, GEORGE WASHINGTON (1864-1912), American surgeon, was born at Chilii, O., Nov. 11, 1864. After graduating from Ohio Northern University (1884), he studied medicine at Western University (M.D. 1885) and later in Vienna, London, and Paris. He taught at Wooster from 1889 to 1900. He was professor of Clinical Medicine at Western Reserve University from 1900 to 1911, and was then made professor of Surgery. During the Spanish-American War he was made a member of the Medical Reserve Corps and served in Porto Rico (1898). He was made an hon. F.R.C.S. (London) in 1913. After America entered the World War he became major in the medical O.T.C., and professional director (1917-8). He served with the B.E.F. in France and was senior consultant in surgical research (1917-8). He was made a baronet-commissioned colonel late in the year. He made important contributions to the study of blood pressure and of shock in operations. Realizing that any strong emotion, such as fear before operation, produced shock, he attempted to allay dread by psychic suggestion, also endeavouring to prevent the subjective shock which affects the patient, even when under general anaesthesia, by first anaesthetizing the operative region with cocaine for several days, if necessary, before operating. Thus nerve communication between the affected part and the brain was already obstructed when the general anaesthetic was administered (see Anesti- Association, with Dr. Wm. E. Laver). For his work in shockless surgery he received a gold medal from the National Institute of Social Sciences in 1914.

-Among his works are: Surgical Shock (1897); On the Blood Pressure in Surgery (1903); Hemorrhage and Transfusion (1909); Surgical Anemia and Resuscitation (1914); The Origin and Nature of the Emotions (1915); Man an Adaptive Mechanism (1916); A Mecha- View of War and Peace (1916); The Pallady of the German State Philosophy (1918).

CROCE, BENEDETTO (1866-1952), Italian philosopher and statesman, was born at Pescasseroli, in the province of Aquila, Italy, Feb. 25, 1866. He came of a family that counted among its members several jurists and magistrates. Born in the part of Italy formerly known as Greater Greece, it may be said of him without paradox that the development of his mind and character represented a modern incarnation of all that was subtle and profound in the Hellenic genius, linked with the best and wisest tradition of Roman civilization and of the Christianity that came to take its place. From the remote township of his birth, however, the branch of the family to which the philosopher belonged transferred its seat some years afterwards to Naples where his predecessor Vico. Benedetto Croce may be correctly described as a Neapolitan. He studied at Rome and in Naples, afterwards adopting the life of an independent student and occupying himself especially with literary and with Neapolitan history. Much of his work that bears upon that period of youth is to be found in the volumes: La Rivoluzione Napoletana del 1799; Saggi sulla letteratura italiana del Seicento; La Spagna nella vita italiana durante la rinascenza; Storie e leggende napoletane. But Croce did not altogether neglect philosophy at this period. Towards his thirtieth year the study of philosophy and of history together occupied most of his attention. His principal works are contained in four volumes comprised under the general title Filosofia dello spirito: (1) Estetica come scienza dell'espressione e linguistica generale, (2) Logica come scienza del concetto puro, (3) Filosofia della pratica: economia ed etica and (4) Teoria e storia della storiografia. These were published between 1902 and 1913. With these may be mentioned certain volumes of essays, among which are to be noted those upon Historical Materialism and Marxist Economy (1856-1900); upon Hegel (1905); upon Vico (1910); and the New Essays upon Aesthetic (1920), which complete and carry further the first Aesthetic.

Croce only took part in the administrative work of Naples upon rare occasions and in moments of crisis. During the World War he developed a polemical directed against democratic-humanitarian conceptions and particularly those of President...
Wilson, whose influence on the peace settlement was regarded by him as injurious to Italy. His writings on this subject have been collected in a volume entitled *Pagine sulla guerra* (Naples, 1916). In June 1920, when the Giolitti Government, with the programme of constitutional reform of the Italian State and of radical reforms, Croce (who had been a senator of the Kingdom of Italy since 1920) was asked to accept the office of Minister of Public Instruction. He agreed conditionally upon his programme being carried out. This programme was based upon the idea of a liberal reconstruction: he aimed at the reduction and simplification of the State schools combined with a more rigorous method of teaching, and at affording all facilities to, and indeed inviting the competition of, private instruction, fearless of the condescending school, in which his view would be considered as a challenge to his genius in order to render competition with the State school. In 1921 he retired from office on the resignation of the Giolitti Ministry.

It may be said of the philosophy of Benedetto Croce that it has formulated the truth of the unity of the spirit in the form most acceptable to the Western world. Its fundamental motive is the serious consideration, in a continuous and concrete manner, of that union of philosophy and history which had been glimpsed by earlier thinkers, but had hitherto been pursued in a manner more or less capricious. For Croce, the only knowledge is knowledge of the historic character, which is both the stuff of which is called the spirit or the history of the spirit. This knowledge, however, is by no means positivistic or empirical, but on the contrary it is dialectical and a *priori* synthetic, brought about by the spiritual categories, and from there more or less an ever new development of the fundamental categories. The treatment and solution of these problems is what is called "philosophy" in the strict sense of the word, for which that reason coincides with methodology speculated upon, while in the treatment of the spiritual categories, Croce laid special stress upon those which had been least elaborated and least studied.

A new light is shed by him upon certain problems, such for instance as those of the imagination or intuition, the source and the theme of the *Aesthetic*, upon pure will, the source of *Economic* of Rights and of Politics, treated by *Economic*. The more primarily Croce is engaged in metaphysic, the more he tends to act, by means of which is negated and solved the concept of an external reality and of nature placed outside the spirit and opposed to it, led Croce to an absolute spiritualism, widely different from the pan-theologism of Hegel and his school, which only seemed to solve the dualism of spirit and nature and really opened the door to the notion of a transcendent God, as became clear in the development of Hegel's theory at the hands of the right wing of his school. In the *Philosophy of the Practical*, but more especially in the work entitled *What is living and what is dead of the Philosophy of Hegel* Croce criticizes the erroneous treatment of the opposites, and sees the only unity everywhere having its real distinction from which it arises, and that therefore the true unity is unity-distinction, which is development and, as such, opposition that is continuously surmounted and continuously re-apparent as a new unity. The conception of the distinction with the preceding is the infinity of philosophy, which arises out of history and is as it were a reflection from history, varying at every moment and which constitutes the ground of the conception of a new history and therefore of a new problem and a new philosophy. Croce's substitutes for the old formula "system" the new formula "syntemoatization." He thus admits that to philosophize is to systematize, but that every systematization is narrowly circumscribed, and is therefore to be solved and completed with ever new systematization. Thus scepticism and relativism is superseded by a historical philosophy, and the absolute conception of a definite truth is at the same time both negated and satisfied.

The philosophers from whom Croce learned most are Vico, the author of *Scienza nuova*, and Hegel, but the thought of other thinkers flows in his writings, in conformity with its historical character, and for this reason may, for instance, be found in it traces of some of Hegel's most active opponents, such as Herbart.

Originality of his philosophy is the need so keenly felt in our time, of a philosophy that shall be both realistic and idealistic, in which the fact will not drive out thought and thought will not go beyond the fact: in short, of a philosophy of *nuova scienza* against which has often been brought the accusation of excluding religion, resides in the consciousness of the unity of all and of the perpetual creation of the world. The *Philosophy of the Spirit* is Croce's answer to the charge that it were the spirit externally composing, to which each individual contributes his strophe, or it may be only his line or his word: this poem has its end in itself and in its rhythm has beauty and joy, as well as labour and sacrifice. Emotion sets us free from the antithesis of optimism and pessimism.

Croce has elaborated the various philosophical sciences in treating of the various theories to which they give rise, and he has completed the doctrines with their history, either, as in the case of the *Aesthetic*, with a masterly historical survey of previous speculation on the subject. In a masterly volume, *A History of Modern Ethics*, he has endeavoured to allude here to the different conclusions that he has attained in treating the various problems, as for example in *Aesthetic*, the unity of art and language, of intuition and expression, the negligence of particular and the effect of universalising classes, the criticism of rhetoric, of grammar and so forth; and in the *Philosophy of the Practical* or of Practice, the conciliation of the antitheses of utilitarianism, of moralism, of positivism, of idealism; of causality, the new conception of judgments of value, the constitution of a philosophic economic side by side with the science of Economic, the resolution of the Philosophy of rights in the Philosophy of power. In the process of considering philosophic studies to be all one with historical studies and attaining to this unity in himself, he cultivated historical studies to an equal extent with purely theoretical and speculative studies, concentrating especially upon the history of thought and poetry.

Among his principal works upon these subjects may be noted the four volumes of *Letteratura della prima Italia* (1860–1910); his essays upon *Victor Hugo's work Shakespeare, Cornelio, and the Poets of Dante*. His two volumes *Storia della storiografia italiana del secolo XIX.* and the collection of essays entitled *Uma famiglia di patrioti*.

Croce, occupied with such studies as those mentioned, also edited or compiled many bibliographies and composed many bibliographies, in addition to editing the *Critica*, in many respects the profoundest and widest in scope of all the European literary and philosophical reviews. In the work of this review, chief contributor of the literary and philosophical contributions most of the literary and much of the philosophic criticisms.

Douglas Ainslie was the first in Great Britain to draw attention to his importance as one of the leaders of European thought, and made him known in many articles and lectures both in Great Britain and in America. He also translated and published the complete *Philosophy of the Spirit* in four volumes (*The Aesthetic*, *The Logic*, *The Practical*, with Macmillan; *The Theory and History of Historiography*, with Harrap). The work on Vico has been translated by R. G. Bury, and that on *Historical Materialism* and *Historiography* by C. M. Meredith, the What is living and what is dead of the Philosophy of Hegel (Macmillan), and the *Brevariario di Aesthetic* (Rivista Imenea, Italy), the volume *Shakespeare, Ariosto and Corneille* (Henry Holt & Co., New York), and the *Poetry of Dante* by Douglas Ainslie.

Among the numerous studies of Croce may be mentioned Dr. H. W. Jankowski's *Benedetto Croce (1866-1952)*, and the further development of the same in his essay *Time and History*, where will be found a parallel and a distinction between Croce and Bergson (Procedings of the British Academy, vol. viii.); and has been dealt with in detail and comprehensively by Collingwood, *Introduzione allo studio delle opere di B. Croce*; *Note bibliografiche e critiche* (Bari, Laterza, 1920).

The volume *Rome* has been composed a mental autobiography: Contributo alla critica di me stesso (Naples, 1918, limited to one hundred numbered copies for private circulation), and also a brief history of his native place and of his family (Montenegro, storia di un comune e di una famiglia; Bari, 1919), and another of *The house in which he lives*: *Un angolo di Napoli* (Naples, 1912).

(D. A.; G. C.)

CROCKETT, SAMUEL Rutherford (1860-1914), Scottish novelist (see 7.477), died at Avignon April 20 1914.

CROMATY (see 7.483).—Before the outbreak of the World War the Cromarty Firth was surveyed as an advanced base for the main battle fleet in the war with Germany, and the erection of defences at Cromarty was begun in 1912 and had been considerably advanced by the time the war began. Scapa Flow (see Scapa Flow) was adopted as the chief naval base because of the more restricted space of the Cromarty Firth and in view of the unsuitability of the narrow single entrance to the firth for sweeps into the North Sea and for the guarding of the northern exits. The existence of an anti-submarine defence made Cromarty important in the early months of the war. It was used throughout the war as a coaling station and was one of the nine "Trawler Stations" under the control of the Admiral of Patrols. Cruiser squadrons, with their destroyer flotillas, used Cromarty as their base, and it was from Cromarty that the "Cromarty" and "Inflexible" started for the battle of the Falklands. One of the most serious naval disasters of the war occurred in the harbour of Cromarty on Dec. 30 1915, when the armoured cruiser "Natal" was destroyed by an accidental explosion.
CROMER, EVELYN BARING, 1st Earl of (1841-1917), British statesman and diplomatist (see 7:484). Lord Cromer's life was prolonged for nearly ten years after his return from Egypt; and, in spite of enfeebled health, culminating in a serious illness in 1914 from which he never completely recovered, he took an important share in political, social and literary movements at home. He was constant in his attendance in the House of Lords, and indefatigable in the work of its committees; he was a leading member of the free trade section of the Universalist party; he was active in the opposition to female suffrage, and in combating antivivisection propaganda. Besides publishing his two volumes of _Modern Egypt_, he composed several addresses and pamphlets, wrote frequently for the periodicals, and from 1912 onwards was a regular contributor of signed articles and reviews of books to the _Spectator_—his vigorous and informed writing being an attractive feature of the paper. When the British Protectorate of Egypt was proclaimed, he completed his history of the modern development of that country in a small volume entitled _Abbas II_, containing matter which it would have been indiscreet to publish so long as Abbas remained Khedive. While he was forward in promoting the study of Oriental languages, his strongest affection was for the Greek and Latin classics with which he had only become acquainted in mature life; he became president of the Classical Society, and endowed a Greek prize for the British Academy. In the critical period of which the main features were the budget of 1900 and the Parliament bill of 1911, Lord Cromer played an energetic part. He failed to prevent the rejection of the budget by the House of Lords; but he was successful in his untiring efforts to persuade moderate Universalist and cross-bench peers to counter the "die-hard" movement, and to vote for the Parliament bill rather than force the Government to swamp the House by an unlimited creation. It was in the performance of another patriotic duty, during the World War, that he met his death. In spite of age and indifferent health he accepted the laborious and invidious task of chairman of the special commission to inquire into the abortive Dardanelles operations. The sittings occupied the autumn of 1916, and while engaged on the draft report he was seized in Dec. with an attack of influenza. Before he had recovered, he resumed the work of the commission, which completely broke him down. He died a few weeks after the beginning of the new year. Seldom has there been a life more singly and successfully devoted to the good of his country.

See Lord Sanderson's _Memoir of Evelyn, Earl of Cromer_ (1917).

_G. E. B._

CROJJE, PIET ARNOLDUS (1842-1911), Boer general (see 7:501), died at Klerksdorp, Transvaal, Feb. 4 1911.

CROKES, SIR WILLIAM (1832-1919), English chemist and physicist (see 7:501), died in London April 4 1910. He was given the O.M., London, 1914.

CROOKS, WILLIAM (1852-1921), British Labour politician, was born at Poplar April 6 1852. After spending his early years in the workhouse of which he afterwards became chairman of the Board of Guardians, he started work at the age of 14 as a cooper's apprentice, and soon became an ardent trade unionist. His long career of public work began in 1882, when he was made trustee of the parish of Poplar and Library Commissioner. In 1892 he became a member of the L.C.C., on which he worked continuously for 28 years. From 1898 to 1906 he was chairman of the Poplar Board of Guardians, and in 1901 mayor of Poplar. In 1905 he entered Parliament for Wood Green, and, except for one short interval in 1910, continued to represent that constituency until his resignation in 1921. On the outbreak of the World War he entered wholeheartedly into the work of recruiting and in 1916 he was made a Privy Councillor. Continued ill-health compelled his retirement from politics in Feb. 1921, and he died in Poplar hospital on June 5 1921.

CROthers, SAMUEL M-CORD (1857-1911), American clergyman and author, was born at Oswego, Ill., June 7 1857. He was educated at Princeton (A.B. 1874), Union Theological Seminary (1874-7), and the Harvard Divinity School (1881-2), ordained as a Presbyterian minister in 1877 he was a pastor in Nebraska, Nevada, and California (1877-81). He became a Unitarian minister in 1882, called to Brattleboro, Vt. (1882-6), St. Paul, Minn. (1886-94), and Cambridge, Mass. (since 1894). An inspiring preacher and a very popular public speaker, he won a still wider audience by his essays, which recall the quaint humour of Charles Lamb.

Among his best known volumes are:—_The Gentle Reader_ (1903); _The Understanding Heart_ (1905); _The Pardoner's Wallet_ (1905); _The Endless Life_ (1905); _By the Christmas Fire_ (1909); _Olive Wendell Holmes and His Fellow Boarders_ (1909); _Among Friends_ (1910); _Humanly Speaking_ (1912); _Three Lords of Destiny_ (1913); _Meditations on Votes for Women_ (1914) and _Pleasures of an Absentee Landlord_ (1916).

CROWDER, ENOCH HERBERT (1859-1919), American soldier, was born in Missouri April 11 1859. He graduated from the U.S. Military Academy in 1881 and while detailed as a cadet at the university of Missouri won in 1886 the degree of LL.B. in the law school. He was appointed major judge-advocate in 1895. He served in the Philippine Islands (1898-1901), was observer with the Japanese army in Manchuria (1904-5), and was in Cuba as Secretary of State and Justice (1906-8). He was provost-marshal general from May 1917 to July 1919, and as such had full control of the U.S. machinery of conscription in the World War, which he conducted with much success. He was reappointed judge-advocate general in 1919, and the same year invited by the Government of Cuba to advise in connexion with changes in the election legislation that General Crowder had recommended as an exceptionally authoritative legal adviser in military affairs. In his book _The Spirit of the Selective Service_ (1920), he described the method whereby within 18 months after America had entered the World War 2,000,000 men were in France, almost as many more were in cantonments, and altogether no fewer than 24,000,000 had been registered and classified.

CROZIER, JOHN BAPTIST (1853-1920), Protestant Archbishop of Armagh, was born at Ballyhaise, co. Cavan, Ireland, April 8 1853. After a distinguished career at Trinity College, Dublin, where he took his degree in 1872, he was ordained in 1876. From 1885 to 1897 he was vicar of Holywood, co. Down. In 1896 he became honourable secretary of the General Synod of the Church of Ireland, becoming in the same year a canon of St. Patrick's cathedral. In 1897 he was elected Bishop of Ossory, was translated in 1907 to the see of Down, and in 1911 succeeded Dr. Alexander as Archbishop of Armagh and Primate of All Ireland. In 1912 he took a conspicuous part in the agitation against the Home Rule bill, and presided over the monster meeting of Unionists held at Balmoral, Belfast, on Easter Tuesday. In the Irish Convention of 1917-8, he and Dr. J. H. Bernard (then Archbishop of Dublin), represented the Church of Ireland. At the close of the Convention the Archbishop joined Dr. Mahaffy, the provost of Trinity, in presenting an minority report advocating a solution of the Irish question on the lines of the Swiss federalism. He died at Armagh April 1 1920.

CROZIER, JOHN BEATTIE (1851-1921), British philosopher, was born at Galt, Can., of Scottish parentage April 23 1859. He was educated at the local grammar school, where he won a scholarship to Toronto University, which he was, however, obliged soon to surrender owing to ill-health. He returned to the university four years later and took a course in medicine, graduating in 1875. He then came to England, bought a practice in London, and began a systematic study of philosophy and economics. His first publications, _The Religion of the Future_ (1886), attracted little attention; but Civilization and Progress (1885) reached a 4th edition and was translated into Japanese. His _History of Intellectual Development_ (1897-1901) was followed by the grant of a Civil List pension, some compensation for failing eyesight and the loss of his medical practice. His further publications included _My Inner Life_, an autobiography (1889); _The Wheel of Wealth_ (1906); _Sociology applied to Practical Politics_ (1911) and _Last Words on Great Issues_ (1917). He died in London Jan. 8 1921.
CROZIER, WILLIAM (1855— ), American soldier (see 7.520), was detailed in 1912 as president of the Army War College and the following year was reappointed chief of ordnance with the rank of brigadier-general. He was made major-general, chief of ordnance, U.S.A., in 1917, and the provision of munitions in the War World was under his charge until Dec. 1917. He was then made a member of the War Council, and in the discharge of this office was in France and Italy for the first half of 1918. For the remainder of the year he was commandant of the N.E. Department, U.S.A., retiring from active service in December.

CRYSTALLOGRAPHY (see 7.560).—The geometry of the external forms of crystals may be said to have been completely worked out. The 32 crystal-classes differing from one another in their type and degree of symmetry and the six-crystal-systems into which they are classed, have been long known. The same is also true of the geometrical conceptions of the internal structure of crystals (though a good general account is still wanting). It is known that there are 230 possible types of homogeneous point-systems and that these are referable to 14 kinds of space-lattices. Recent work has been in the direction of attempting to trace a connexion between the internal structure of crystals and their chemical constitution. Here there is ample scope for speculation; but since 1912, when X rays provided a new method of investigation, some real advance has been made. By this method it is possible not only to determine the internal structure of a crystal, but also actually to measure the distance between the atoms.

Crystals consist of a homogeneous assemblage of particles, and these particles are marshalled in certain definite ways. The grouping around any one particle (except those on the boundaries of the crystal) is the same as that around every other particle of the same kind. Further, the particles are arranged at regular intervals along straight lines. Throughout the structure there are several parallel sets of such lines, and these lie in several parallel sets of planes also at regular intervals apart.

An example of such a structure is the simple cubic space-lattice represented diagrammatically in fig. 1. Here the same line is placed at equal distances, say a, along parallel lines in three sets at right angles; the distance between the parallel lines in each plane and between the parallel planes of lines being also a. That is, the particles are situated at the points of intersection of a system of lines that form a square network or lattice in three dimensions. Or the structure may be regarded as a stack of small cubes each with a quarter of a particle at every corner; the four adjoining cubes at each corner of each cube providing the whole particle. In this grouping, a given particle is surrounded by a set of 6 similar particles at distance a; further, it is surrounded by 12 particles at distance $\sqrt{2}a$ (i.e. the diagonal of the square); and by 8 other particles at distance $\sqrt{3}a$ (i.e. the diagonal of the cube). From this it is clear that the three sets of lines are parallel to the edges of the cube, and that they lie in planes parallel to the faces of the cube. But it is to be noticed that the particles also lie in other sets of parallel lines, and that these lines fall in other sets of parallel planes. Certain of these additional lines and planes of particles are represented more prominently in fig. 2, which is drawn on a smaller scale with a larger number of particles (but to avoid confusion only those on the surface of the solid are marked). In this figure the three front edges of a portion of the main cube are truncated by planes of the rhombic-dodecahedron, and one corner has been cut off symmetrically by a face of the octahedron. (Since the octahedron faces are hexagonal, the two faces of the octahedron plane, therefore cut the octahedron in its outline is hexagonal.) It will be seen that the several layers of particles parallel to any one of these faces are continuous over the other faces, although the particles themselves are ranged along lines of different directions. Hundreds of different planes of particles can, in fact, be traced out in such a structure; and it is important to remember that these structure-planes are parallel to possible external faces on the crystal. A close relation exists between the Miller indices of these faces and the number of particles along certain lines in the corresponding planes. The dotted lines on the front cube face in fig. 2 represent the intersections or traces of such planes with the front cube face. In these cases the indices are (111), (220), (121), etc.; respectively for the lines from right to left. The seven planes of which the indices have just been given indicate by symmetrical reasonings the presence of 93 other structure planes, or, in all, 200 external crystal faces.

It will be further seen from a study of fig. 2 that the spacing between the particles is not the same on each of the faces (allowance being made for foreshortening in the drawing: only on the front cube face are the particles represented at their true distance apart). On the cube faces the distances each way are, of course, a. On the octahedral face the rhombic-dodecahedron they are spaced at distance $\frac{a}{2}$ in one direction, and along the second direction at right angles at distance $\frac{a}{\sqrt{2}}$. On the octahedral face there is, instead of a rectangular grouping, a triangular and hexagonal pattern with the particles spaced at distances $\frac{a}{2} \sqrt{2}$ in three directions. It follows therefore that the more the external faces of the cube are spaced the same for equal areas. The network of particles is closer on the cube face than on the rhombic-dodecahedron, and more open on the octahedral face. This is, of course, of practical importance and is closely related to the cleavage of crystals. Minerals with cubic cleavage (e.g. rock-salt and galena) would be expected to be of this structure.

In addition to this the particles in the planes, there is also to be considered the distances between the planes themselves. This is represented in fig. 3 by means of vertical sections through the structure (fig. 2) perpendicular to the respective planes. In fig. 3a the distance between octahedron planes is given by one-third the length of the diagonal of the rhombic-dodecahedron (i.e. $\frac{a}{\sqrt{3}}$) and the particles are separated by distance $\frac{a}{\sqrt{3}} \sqrt{2}$ apart along the traces of the octahedron planes, though only at distances a or $\frac{a}{\sqrt{2}}$ across these planes. In figs. 3b and 3c the section-plane intersects lines of particles only in alternate rhombic-dodecahedron planes. In fig. 3e the distance between octahedron planes is given by one-third the length of the diagonal of the rhombic-dodecahedron, and the particles are spaced at distance $\frac{a}{\sqrt{3}} \sqrt{2}$ apart along the traces of the octahedron planes, though only at distances a or $\frac{a}{\sqrt{2}}$ across these planes. These would be expected to correspond to cubic crystals showing rhombic-dodecahedral and octahedral cleavage (e.g. zinc-blende and fluor-spar) respectively.

Types of lattices other than the cubic are deduced by varying the distances of the particles along the different axes and by varying the angles between these axes, in a manner similar to that in which the six-crystal-systems are deduced. In fact the elements of the external forms of the cubic crystal can be changed, by changing the lengths of their edges, are identical (except in certain cases) with the parameters $a:b:c$ and the axial angles $\alpha, \beta, \gamma$ deduced from the external crystal faces, of the particles "referred to above may be crystal molecules, chemical molecules, or even atoms. They are represented in the diagrams as spots without committing ourselves as to their shape or size (in relation to their distance apart). Some authors represent them as spheres in contact with one another, regarding these as the spheres of influence of each atom. If the spheres are of equal size, the number of points of contact and the closeness of the packing will vary with the type of lattice. Or again, we may regard the particles (all of the same size) as completely filling space. In the latter case the particles in the simple cubic lattice will be cubes, each in contact with six other cubes; in the centred cubic lattice they are octahedra, each in contact with eight other octahedra; in the face-centred cubic lattice they are rhombic-dodecahedra with 12 surfaces of contact.

The above outline of the geometrical structure of crystals has been necessary for the purpose of introducing the new X-ray methods of investigating the internal structure of crystals.

X rays, or Röntgen rays, are propagated as waves in the same manner as rays of ordinary light, but they are of much smaller wave-length. The wave-length of yellow (sodium) light is $\lambda = 0.09538 \times 10^{-8}$ cm. (i.e. of the order $10^{-8}$ cm.), whilst the wave-lengths of X rays are of the order $10^{-4}$ or $10^{-5}$ cm., or one thousand to ten thousand times smaller. The very fine rulings of parallel lines (about 7,000 to a cm.) of diffraction gratings being of a magnitude (10 cm.) comparable with the wave-lengths of light, they produce well-known diffraction effects. It would be impossible to produce mechanically a grating which would
CRYSTALLOGRAPHY
be fine enough to diffract the much shorter X rays. But it occurred to Dr. Max Laue, of Zurich, that the reticular structure of crystals was just the right size; and in 1912, the first direct test of the distances between the atoms in the space-lattices are of the order 10^-8 cm. When, in 1912, this idea was put to the test a very surprising result was obtained. Plates cut from crystals parallel to certain faces were placed perpendicularly in the path of a thin pencil of X rays, and beyond a photographic plate was exposed. The resulting photograph (known as a Laue photograph or radiogram, Röntgenogram or Röntgen pattern, or spot photograph) shows a larger central spot representing the direct rays, whilst surrounding it is a symmetrical pattern of smaller spots. The spots may also be arranged in a hexagonal or a trigonal projection, the hexagonal being the more usual. This pattern shows the same degree of symmetry as that on the crystal face. Thus a plate from a hexagonal crystal of beryl cut parallel to the basal plane (i.e., perpendicular to the principal axis) shows a six-fold arrangement of spots symmetrical about six radial lines at 30°; whilst when the plate is cut parallel to a prism face of the same crystal the spots are symmetrical about two lines at right angles. Fig. 5 is a reproduction of an actual photograph obtained by passing a pencil of X rays through a basal cleavage plate, 0-81 mm. in thickness, of the pseudo-hexagonal chlortide, penitahite. This photograph (after H. Hag and M. Jaeger, 1915) is interpreted on the same comparative simplicity and the obvious three-fold arrangement of the spots.

The results obtained with these Laue photographs were at first explained as due to diffraction, but the problem is much more complex than diffraction by a single system of parallel lines in one plane, since we are here dealing with a lattice in three dimensions in which the wave-lengths of the X-rays are of the same order as the lattice constants. In fig. 6 a beam of X-rays, impinging at the angles A'B', A'B, A'C' and A'C, respectively, on a crystal composed of atoms with the symmetry of the space group D_3, all of the same wave-length, would excite the reflections from all the planes of the crystal. But since the reciprocal planes of the planes which are in the direct lattice are in the same layer, the reflections at all the points of the reciprocal lattice will be equal, and the ratio of the wave-lengths of the X-rays to the crystal thickness gives the spacing of the layers.

In the Bragg apparatus, called an X-ray spectrometer, homogeneity and parallelism of the rays from a single narrow slit is obtained by passing the rays once parallel to a narrow slit in a leaden screen and striking at a glancing angle the crystal plate mounted on a goniometer. The reflected beam enters an ionization chamber containing sulphur dioxide or methyl bromide and connected with an electrometer. The crystal is slowly turned on the goniometer until a maximum effect is noted in the electrometer, where the angle θ is read. Plotting the readings of the electrometer against those of the goniometer, a curve X-ray spectrum) is obtained which shows a series of sharply defined maxima or peaks corresponding to reflections of the first, second, and other orders. Knowing the wave-length of the rays, the distance between the planes of the crystal can be calculated from the angle and the wave-length. Then by using the correct angle θ or the angle 2θ which gives the exact reflection, the spacing of the planes, the wave-length of the rays can be determined. As an example, taking a crystal from the surface of a sandstone gives the equation for the second order of reflection as 2θ = 6°58', or 2d = 6°58' sin θ, where the angle θ was 5°9', 11°8', and 18°15'. Taking the spacing d between the cubic planes of rock-salt as 2X10^-8 cm, the wave-length λ is bound to be 2X10^-8 -3X10^-8 cm. = 2X10^-8 cm. sin θ, or 2d = 11°52' sin θ, or 2d = 15°43' sin θ.

To return now to an explanation of the spots shown by the Laue photographs. Here, instead of homogeneous rays, the rays are heterogeneous, and the wave-lengths of the rays are not all equal. Hence, if a bundle of rays reflected by a certain set of parallel planes (as explained in fig. 6) there will be some wave-length that will satisfy the equation λ = 2d sin θ, or at least nλ = 2d sin θ. There will then be a series of spots, corresponding to the reflections of the reciprocal set of planes. Let fig. 7 represent a plate of beryl cut perpendicular to the principal axis of the crystal, the upper and lower boundaries in the figure being then parallel to the basal plane. The rays of particles lie in the traces of two sets of planes respectively parallel to two possible pyramidal faces of the crystal. Reflection from these will yield two spots on the photographic plate. Now, according to the hexagonal degree of symmetry possessed by beryl, there will be 6 (or 12) similar sets of planes equally inclined to the vertical axis, each set of planes corresponding to a reflexion from a set of planes parallel to a particular face of the crystal; consequently 6 (or 12) similar spots will appear on the photograph equally distant from the centre. For other sets of 6 (or 12) planes inclined at other angles to the vertical axis of the crystal, and parallel to one of the pyramidal faces of the crystal, the reflections will take place for rays of other wave-lengths. The result will be a large number of spots on the photographic plate, but all of the spots will be either on the 6 (or 12) lines radiating from the crystal or on the planes corresponding to their horizontal distances, and the angular positions of their centers around the crystal and the horizontal distances between them are determined for the two angles of the pyramidal faces. Since the wave-lengths of the X-rays are all equal, the spots corresponding to two angles will be of the same order. Such a pattern is found on a two-circle goniometer and a series of Laue photographs taken in various positions; and such a series of reflections can be analyzed in the same manner as those obtained from the single crystal. A further point to notice in the Laue photographs (figs. 5 and 8) is that the spots are of different sizes and intensities (though spots repeated by the symmetry are, of course, identical). The intensities of the spots are due to the arrangement of the powder, and indicate at once the important structural planes and the prominent faces of the crystal.

A third method of investigation has been devised by P. Debye and F. Scherrer in Germany in 1916, and independently by A. W. Hull in the United States in 1917. Here a beam of homogeneous ("monochromatic") X-rays of known wave-length is transmitted through a crystal. The rays which are not reflected back from any of the planes of the crystal are received on a photographic film. The tiny crystal fragments are in all manner of orientations; and to further ensure all possible orientations in the aggregate, the tube containing the small amount of crystal powder is rotated during the exposure. For structural planes with the spacing d there are bound to be some of the particles in the position shown in fig. 6 in which the equation λ = 2d sin θ is satisfied; but these will be lying in all azimuths, i.e., sloping away in all directions from the axis of the tube. The reflected rays will consequently lie on the surface of a cone, the angle of which is θ; and, instead of a single spot, a continuous series of spots forming a cone will appear on the photographic film. Similarly, other reflections from planes of different wave-length will appear, the cone of spots around the axis of the tube being moved according to the wave-length of the X-rays. And, since the same set of planes with spacing d may be inclined at angle θ to a given axis, giving a second order reflection as required by the equation 2λ = 2d sin θ, and producing a wider-angled cone concentric with the first cone, the number of such cones will be the same as the number of angles θ at other values of d will be provided by other fragments, giving still other conical reflections, Since, however, the experiment is performed with rays of one wave-length, it is only certain values of d that will satisfy the equation, so that the number of reflections will be really limited. Even with this limited number, there would appear to be some difficulty in sorting out the reflections of the different order, but those from different structural planes. Since it is only the angles of divergence of the concentric conical sheaths that are to be measured, all that need be photographed is a narrow strip through the centre. This strip is made circular, in order to embrace a definite area of the film, and, as in the Debye-Scherrer method, the spacing d between the structural planes of the crystal.

Although the Debye-Scherrer method may be regarded as a more direct method of revealing the wave-lengths, they are given as the same as those given by the Bragg method, namely the spacing between the structural planes of the crystal. The Laue method gives other supplementary information, however, and is mainly on the spacing of the planes and gives the ideas of structure are built up. A large amount of experimental work on crystals of different substances has been done in this direction, and deductions have been made from the structure of the crystals in this way. In some cases only one or two examples can be briefly considered.

Rock-salt (sodium chloride) crystallizes in cubes and possesses a perfect cleavage parallel to the faces of the cube. Plates cut parallel to the faces of the cube (001), the rhombohedron (400), and the octahedron (111) respectively give by the Bragg method values for the spacing between the planes of particles in the ratio of 1/1.423.143/5. These ratios are the same as those mentioned above for the simple cubic space-lattice (figs. 1-3) and the conclusion...

**Fig. 9.** Structure of Rock-salt (sodium and chlorine atoms in simple cubic space-lattice), or of Galena (Pb S).

**Fig. 10.** "Diamond Lattice" representing Diamond when the atoms are all of the same kind, or Zinc-blende when of two kinds.
may be drawn that this represents the structure of rock-salt. The two kinds of atoms, sodium and chlorine, may be placed alternately along the three directions, as shown in fig. 9. As so represented the structure is said to be assemblage of sodium atoms surrounded by chlorine atoms (fig. 4c). The face-centred cubic lattice of the face-centred cubic type (fig. 4c), with the sodium atoms on one lattice and the chlorine atoms on the other. One lattice can be brought into the position occupied by the other by a parallel translation in any direction, and there are thus an infinite number of such lattices, all of the same kind, but of different relative positions, each separated from the next by the thickness of an inch. In the drawings, the scale of the lattice is enormously enlarged and only an infinitesimal portion of the crystal is represented. Some idea of this may be conveyed by saying that if we tolerate the large scale and if we were to cut these crystals with the copper and iron on the one and the sulphur on the first. The second will be in coincidence with the first, and the first will be in coincidence with the third. If we were to cut the crystal along the diagonal of the diamond, the second and third would be in coincidence with the fourth, and so on. The last would be the true white lattice, as one lattice can be brought into exactly the position of the other by the two successive operations. The symmetry of the whole model is that of the tetrahedral class of the cubic system; but, in addition, the two sets of particles are directed towards different directions. Regarding the particles as spheres of equal size and in contact with one another, then each one is touched by just four others, the latter with four identical contacts, and the former with four identical contacts, and the upper corner of the tetrahedron will be in coincidence with the lower corner of the tetrahedron, and the upper corner of the tetrahedron will be in coincidence with the lower corner of the tetrahedron, and the upper corner of the tetrahedron will be in coincidence with the lower corner of the tetrahedron, and the upper corner of the tetrahedron.
CUBA

opened the way for wild speculation and led to an unprecedented rise in price. In the early part of the year the price was about 11 cents per pound, but it rose rapidly until it reached 25 cents in May, when the market broke. Thereafter, the price declined almost as rapidly as it had risen, reaching at the end of Nov. about 3½ cents, near which it continued for several months. To prevent a further fall the government induced a few large buyers to place an order for the entire crop, thus fixing the commission was in Feb. 1921 appointed by the president of Cuba and given power to control the sale and exportation of the crop.

Other Industries.—Of the island's agricultural products, tobacco ranks next to sugar in importance, the total value of the crop ranging from 40 to 50 million dollars per annum. A high import duty revenue has already been realized from this industry. The tobacco grown in Cuba is exported to the United States, and the production is increasing rapidly.

Exports.—The exports of Cuba include sugar, tobacco, coffee, rice, cacao, tobacco, hats, carpets, and a variety of manufactured goods. The total value of the exports in 1919 was $128,000,000, of which sugar constituted 75%. This is followed by tobacco, which amounted to $30,000,000, and coffee, which reached $25,000,000. The exports of sugar have shown a steady increase in recent years, owing to the increase in the acreage under cultivation and the improvement in the methods of production. The exports of tobacco have also increased, but not as rapidly as those of sugar. The exports of coffee have shown a marked decline, due to the exhaustion of the soil and the over-cultivation of the plant. The exports of cotton have declined, as the production of cotton has decreased. The exports of rice have increased, due to the increase in the acreage under cultivation and the improvement in the methods of production. The exports of tobacco have shown a steady increase, due to the increase in the acreage under cultivation and the improvement in the methods of production.

Communications.—Cuba had in 1920 four principal railway systems which together extended their lines from one end of the island to the other, with a total mileage of 1,300 miles. The railway system is well adapted to the needs of the island, and is an important factor in the development of the country.

Education.—The educational system of Cuba is well developed, and the government is making every effort to improve the educational facilities of the country. There are a number of universities and colleges, and the government is providing grants to aid in the construction of new educational institutions. The educational system is well adapted to the needs of the country, and the government is making every effort to improve the educational facilities of the country.

Finance.—Until recent years Cuba had no money of its own issue, and its currency was based on the peso, the gold or silver coin of Spain, which was used as a medium of exchange; but in 1915, by virtue of an Act passed during the preceding year, a new coinage was put into operation. The monetary unit of the new coinage is the peso, which is divided into 100 centavos. There are 1, 2, 4, 5, 10 and 20 peso pieces, the last three of the same shape, weight and value as corresponding U.S. coins, and the others proportionate; silver coins, of which the issue is limited to 12,000, are 10, 20 and 40 centavo pieces and the peso; nickel coins, limited by executive discretion only, are 1, 2, 5 and 10 centavo pieces. United States coins and paper currency are also legal tender, but not those of other foreign countries whose payment is specifically contracted for. The revenues of the Government, which in 1915 amounted to $37,950,000, rose to $45,850,000 in 1916, and to $64,570,000 in 1919. The foreign debt of the United States, at the end of 1919, was $160,000,000, and the foreign debt of the United States, at the end of 1919, was $160,000,000.

The Moratorium.—The government had no money of its own issue, and its currency was based on the peso, the gold or silver coin of Spain, which was used as a medium of exchange; but in 1915, by virtue of an Act passed during the preceding year, a new coinage was put into operation. The monetary unit of the new coinage is the peso, which is divided into 100 centavos. There are 1, 2, 4, 5, 10 and 20 peso pieces, the last three of the same shape, weight and value as corresponding U.S. coins, and the others proportionate; silver coins, of which the issue is limited to 12,000, are 10, 20 and 40 centavo pieces and the peso; nickel coins, limited by executive discretion only, are 1, 2, 5 and 10 centavo pieces. United States coins and paper currency are also legal tender, but not those of other foreign countries whose payment is specifically contracted for.
tions in Havana, which had many branches throughout the island. In order to prevent the collapse of this bank, and the extension of these practices to other Cuban towns, the government on Oct. 5, 1912, declared 30 days. On Dec. 1 it was extended until Dec. 31, and again until the end of Jan. 1913. Just before the last date, a Congressional Act provided for the gradual lifting of the moratorium, requiring partial payments running through 105 days for ordinary commercial obligations, and 135 days for floating obligations. A law was simultaneously promulgated providing for the liquidation of insolvent banks and their enforcement supervision; and provision was also made for a reform in banking laws with a view to preventing a recurrence of such a condition.

Political Conditions.—The administration of President José Miguel Gómez and Vice-President Alfredo Zayas of the Liberal party continued from Jan. 28, 1910 (at which time the administration of the American Provisional Government ceased) until May 20, 1913. During this period there were internal troubles which threatened to assume a revolutionary character. A serious revolt of negroes in May 12, 1912, was, however, prevented by the concentration of a U.S. fleet of battleships at Key West. President Taft assured the Cuban Government that this was not due to a purpose of intervention, but to a desire to act promptly in case it became necessary to protect American life and property. By the middle of the summer the rebellion was suppressed. On Nov. 1, 1912, Gen. Mario G. Menocal and Enrique José Varona, Conservative candidates, were elected president and vice-president, respectively, and were inaugurated on May 20, 1913. The administration proved to be efficient. The Government's progressive policy was evidenced by the attention given to educational affairs, by the enactment of a new bankruptcy law and by large expenditures for the development of the resources of the country and for public works. During 1914 there was considerable political activity looking toward the elections of Nov. 1, 1914, The Conservatives supporting Menocal for re-election while the Liberals, under the leadership of Alfredo Zayas, a former vice-president under Gómez, were trying to secure control. Menocal's re-election was declared Nov. 5, but was contested, and not until May 7, 1915 was it finally proclaimed by the Cuban Congress. This contesting of the election occasioned a revolt by the Liberals under the leadership of Francisco Gómez, which assumed serious proportions; but by May 20 the revolt had subsided and Gen. Menocal took the oath of office for a second term. On April 7, 1917, Cuba declared war on Germany. The president of the republic was authorized to dispose of the land and naval forces and the economic resources of the nation in whatever manner necessity required. Several revenue measures were announced, including normal and extraordinary war taxes on sugar, and taxes on net profits of mining and insurance companies. A bond issue of $13,000,000 was authorized for a war loan beginning July 1. In 1918 an obligatory military service law was enacted, and a Food Commission was established with executive powers was established. Diplomatic relations with Germany were renewed on Oct. 27, 1918. A new electoral law was passed in Aug. 1919. This new code was compiled with the assistance of Maj.-Gen. Enoch H. Crowder of the U.S. army. It was he who, while serving with the American army of occupation in Cuba, had formulated the existing laws and had supervised the first presidential election. The new law provided for recognition of all political parties and for public counting of ballots. This new law was put to the test on Nov. 1, 1920, which marked the end of the third period of political campaign, since Cuban independence.

José Miguel Gómez (1856-1921) was the Liberal candidate, and Dr. Alfredo Zayas was the candidate of the National League or Coalition party, the latter having broken away from the Liberal party and, backed by the Menocal administration, parted company with Gómez. The result of the election was doubtful. Charges of unfair practices made investigations necessary. Incorrect interpretations placed upon the new election laws brought about a complete deadlock. Early in Jan. 1921 Gen. Crowder was sent to Cuba as the personal representative of President Wilson. As a result of his interpretations, means were taken for facilitating the procedure of the courts in the contested election cases, and supplementary elections were held in March.

(C. R. Ma.)

CUMMINGS, WILLIAM HAYMAN (1831-1915), English musician, was born at Sidbury, Devon, Aug. 22, 1831, the eldest son of Edward Manley Cummings. He became a chorister at St. Paul's cathedral and the Temple church, and was subsequently appointed organist of Waltham Abbey. Later he was appointed tenor at the Temple church, and the Temple church is well known for many years as an oratorio singer. From 1879 to 1896 he was professor of singing at the Royal Academy of Music, and from 1896 to 1910 principal of the Guildhall School of Music. In 1890 he received the degree of Mus. Doc. from Dublin University. Cummings was the author of many works on music, including Lives of Purcell (1887) and Handel (1906), and The Origin and History of "God Save the King" (1902). He was also an authority on ancient music, and left a fine collection of old MSS. and early editions.

CUMMINGS, ALBERT BAIRD (1858—), American politician, was born at Carmichaels, Pa., Feb. 15, 1858. After leaving Waynesburg (Pa.) College he studied surveying and became assistant chief engineer for a railway. He next studied law, was admitted to the bar in 1875, and for three years practised in Chicago. In 1878 he went to Des Moines and ten years later was a member of the Iowa House of Representatives. He was chairman of the Republican State Committee (1892, 1896), candidate for the U.S. Senate (1894, 1900), member of the Republican National Committee (1896, 1900), and a delegate to the Republican National Convention on four occasions. He was elected governor of Iowa in 1902 and reelected for two succeeding terms. He filled the unexpired term of Senator Allison in 1908, and was reelected to the U.S. Senate in 1909 and 1915. He opposed the nomination of Mr. Taft in 1912, but did not bolt his party. He was specially identified with measures concerning trusts and railways, and had a leading part in drafting the so-called Esch-Cummins bill under which the Government in 1920 handed back to private control the railways of the United States.

CUMMINS, WALTER, 1st Baron (1852—1920), English banker, was born in London, Dec. 4, 1855, the son of Roger Cumline, a banker of the City of London. He was educated at Harrow and Trinity College, Cambridge, and entered upon his banking career in the City in 1886, establishing ten years later the merchant banking business of Cumline Bros. He became a director of the Bank of England in 1890, was elected deputy-governor in 1911 and governor in 1913. He was, therefore, in office as governor when the World War broke out, and, after being raised to the peerage with the title of Baron Cumline of Headley in Dec. 1914, he continued as such by successive re-elections until 1918, a longer period than had ever been served in that capacity. During his period the deputy-governor was Mr. Brien Cokayne, who was knighted in 1917, and who, after succeeding Lord Cumline as governor, was created Lord Cullen of Ashbourne on his retirement in 1920. Lord Cumline was associated with the working out of all the chief financial problems during the war, and in 1917 accompanied Mr. Balfour on his financial mission to the United States. He died suddenly at Epsom Jan. 6, 1920.

CUMMINGHAM, WILLIAM (1849-1919), English economist (see p. 635), died at Cambridge June 19, 1919.

CUMMINGHAM-GRAHAM, ROBERT BONTINE (1852— ), British author and traveller, was born in 1852, the son of William Cummingham-Graham Bontine of Ardloch and Gartmore, and was educated at Harrow. He sat in the House of Commons for North Lanarkshire from 1886 to 1892, and during this period became known as an extreme Socialist, taking part with H. M. Hyndman and others in Socialist meetings and processions in London to demand work for the unemployed. He travelled much in North Africa, Mexico and South America, and wrote a number of short stories and vivid studies of life in those regions. Among his books may be mentioned Mogred-Arks: a Journey in Morocco (1898); The Iphane (1899); A Vanished Arcadia (1901); Faith (1900); Hope (1910); Charity (1912); A Life of Bernal Diaz del Castillo (1915); A Brazilian
Mystic (1920); Cartagena and the Books of the Sinu (1920). Early in the World War he went to South America to buy horses for the British army, and carried out his mission with success.

CURLIE, SIR ARTHUR (1875- ), Canadian general and administrator, was born at Napperton, Ont., Dec. 5 1875. On the outbreak of the World War his natural bent for military affairs quickly brought him to the front. He commanded the 1st Canadian Div. 1914–17, and the Canadian Corps in France 1917–9. He gained the confidence of the English military authorities in this field, and when Lord Kitchener resigned his command of the Canadian troops Sir Arthur Currie was the one Canadian to whom it was felt by the British Headquarters that the command could be entrusted. The manner in which he carried out his command marked him by common consent a military leader of unusual distinction. In the concluding phases of the war the Canadian forces under his command played a notable part. Currie was given the C.B. in 1915, K.C.M.G. 1917, K.C.B. 1918 and G.C.M.G. 1919; he was awarded the French Legion of Honour and the Croix de Guerre both of France and of Belgium, and was created Grand Officer of the Belgian Ordre de la Couronne. In 1920, after Sir Auckland Geddes had finally declined the nomination to the principalship of McGill University, Montreal, on his appointment as British ambassador to Washington, Sir Arthur Currie was elected to the post.

CURTIS, CYRUS HERMANN KOTZSCHMAR (1850- ), American publisher, was born at Portland, Me., June 18 1850. He was educated in the public schools of Portland, sold newspapers when a boy, and in 1870 joined a Boston paper as advertising solicitor. In 1876 he went to Philadelphia and became a publisher of the Tribune and Farmer, a weekly paper. In 1883 he established the Ladies’ Home Journal, and in 1891 organized the Curtis Publishing Company. In 1897 he purchased the Saturday Evening Post, which was a direct continuation of the Pennsylvania Gazette, founded in 1728 by Benjamin Franklin, and in 1911 he bought the Country Gentleman: The Ladies’ Home Journal and the Saturday Evening Post attained a circulation of 2,000,000 each, and probably carried more paid advertising than any other publications in the world. For this reason, although the cost of producing a copy of the Saturday Evening Post was many times its selling price to the public (5 cents), this magazine was highly profitable to the publisher. In 1913 he purchased the Philadelphia Public Ledger.

CURZON OF KEDleston, GEORGE NATHANIEL CURZON, 1st Marquess (1859-1925), English statesman (see 7.665), received an earldom (along with the viscountcy of Scarsdale and the barony of Ravensdale) as one of the coronation honours in 1911. He was conspicuous in that year first by his strong denunciation of the Parliament bill and the whole Liberal attack on the Lords, and then by the leading share which he took, in the final stage, in persuading the bulk of the Unionist peers to abstain from voting in the crucial division and so to permit the bill to pass rather than have their House swamped by hundreds of creations ad hoc. During the vehement party conflicts of the next two or three years before the World War he established his position as the chief lieutenant of Lord Lansdowne in the Lords. But much of his time and attention during the period of opposition were given to the affairs of Oxford University, of which he had become chancellor; and he promoted the cause of reform there by personal effort and by publishing a detailed memorandum on the subject. With other Unionist leaders he joined Mr. Asquith’s Coalition Cabinet in the summer of 1915, as Lord Privy Seal; and in that capacity he introduced the bill constituting the new Ministry of Munitions under Mr. Lloyd George, and took charge in the Lords of the Munitions of War bill which was to furnish that Ministry with its weapons. In these and other ways he gave proof of a determination to prosecute the war with zeal and energy. He accepted the presidency of the Air Board in May 1916, and in July became a permanent member of the War Committee of the Cabinet. When Mr. Lloyd George formed his Ministry in Dec., he was accorded a still more prominent position. Lord Lansdowne and Lord Crewe—the two leaders of parties in the Lords—both retired, and Lord Curzon became the leader of the House with the office of President of the Council. He was chosen also to be one of the four ministers (the others being the Prime Minister, Lord Milner, and Mr. Henderson) who constituted the War Cabinet, and were charged with the permanent daily conduct of the war. After the Paris Conference he took over the Foreign Office from Mr. Balfour, retaining his leadership in the Lords. As leader, though not able to claim the sympathetic touch and close familiarity with their lordships’ idiosyncrasies possessed by some of his predecessors, he exhibited remarkable intellectual powers and historical capacity, and gradually established his ascendancy in the House. In the Foreign Office he found a specially congenial sphere, as he had throughout his life made a study of the external relations of the country, and had travelled extensively. But foreign affairs in the years immediately following the war were still dominated by the Prime Minister, and by the Supreme Council.

Curzon’s first wife, by whom he had three daughters, died in 1906, and in 1917 he married, as his second wife, Grace Elvina, widow of Alfred Duggan, of Buenos Aires, and daughter of J. Munroe Hinds, U.S. minister in Brazil. He succeeded to the barony of Scarsdale on his father’s death in 1916, and became K.G. in 1917. He was created a marquess on the King’s birthday in 1921.

CUSHING, HARVEY (1869- ), American surgeon, was born at Cleveland, O., April 8 1869. He graduated from Yale in 1891 and from the Harvard Medical School in 1895. After doing exceptional cerebral surgery abroad under Kocher at Berne and Sherrington at Liverpool he began private practice in Baltimore. Here at the age of 32 he was made associate professor of surgery at Johns Hopkins University, and at the hospital was placed in full charge of cases of surgery of the central nervous system. Yet he found time to write numerous monographs on surgery of the brain and spinal column and to make important contributions to bacteriology. He made (with Kocher) a study of intracerebral pressure and (with Sherrington) contributed much to the localization of the cerebral centres. In Baltimore he developed the method of operating with local anaesthesia, and his paper on its use in hernia gave him a European reputation. He has also made important contributions to the study of blood pressure in surgery. In 1911 he was appointed professor of surgery in the Harvard Medical School and surgeon-in-chief at the Peter Bent Brigham hospital in Boston. In 1913 he was made an hon. F.R.C.S. (London). In 1915, before the Clinical Congress of Surgeons in Boston, he showed the possibility of influencing stature by operating on the pituitary gland. During 1917–9 he was director of a U.S. base hospital attached to the B.E.F. in France. In 1918 he was made senior consultant in neurological surgery for the A.E.F. He held the rank of colonel in the Medical Corps of the U.S. army.

CUST, HENRY JOHN COCKAYNE (1861-1917), English, was born in London Oct. 10 1861. Educated at Eton and Trinity College, Cambridge, he entered the House of Commons as Unionist member for Stamford in 1892, but lost the seat in 1895. He was returned for Bermondsey in 1900 and sat till 1906. In 1892 Mr. (afterwards Lord) Astor made him editor of the Pall Mall Gazette, and for four years he held that post with distinction, gathering round him a brilliant staff (see 19, 661). In politics and society his personal charm and esprit always gave promise of more than he ever achieved in the way of public life. But in Aug. 1914, at the outbreak of the World War, he founded the Central Committee for National Patriotic Organizations, and a Cust annual lecture " on some important current topic relating to the British Empire" was endowed at Nottingham University to commemorate the event. He was a member of the Yad Vashem Council in 1968, retired in Jerusalem. He was heir to the barony of Brownlow, a position which at his death fell to his brother, Adelbert Salisbury Cust (b. 1867). He died in London March 2 1917.

CYTOLOGY (see 7.710).—The effect of the work done in cytology up to 1910 may be summarized as follows.

The bodies of animals and plants are made up of units termed cells, which may be compared to the bricks in a brick wall. Each cell
is composed of a viscid semi-fluid material termed protoplasm, sur-
rounded by an elastic membrane termed a cell wall. This wall is com-
posed of cellulose in the case of the vegetable cell and may ac-
quire a variety of forms and structures. The animal cell wall is
almost always very thin, and never consists of cellulose: but ap-
ppears to agree in composition with the protoplasm, of which it may
be considered a modified "nucleus." The animal cell wall, like that of
most if not all cases the cell wall is porous, and that adjacent cells
are connected with one another by bridges of protoplasm.

The activities of living cells are manifested in four ways, viz.:
(1) Movement, which takes the form of alternate contraction
and expansion.
(2) By secretion, i.e. by the production of definite substances
which accumulate in the protoplasm, but which are finally extruded
from the cell.
(3) By reproduction, which takes the form of the division of
the cell into two daughter cells.

All these activities are dependent for their continuance on the
consumption of a certain portion of the protoplasm; and if life is
to persist and if the cells are to increase in number this waste must be
repaired. This is effected by the taking in and assimilation of food;
and this assimilation can only be carried out if there exist in the
cell protoplasm a specially differentiated portion termed the "nucleus,
which appears to be of rather different composition from the rest.
For this reason it is customary to use the term "cytoplasm" for the
portion of the cell external to the nucleus.

Cells may be specialized for rapid movement or for the reception
and transmission of stimuli or for secretion. Locomotor cells may
be provided with freely projecting filaments, termed "cilia" or
"whiplash fibres". These are the cilia of the ciliated epithelium and
are used in propelling the animal forward. The cilia of the sperm
may be used in propelling the spermatozoon. There is a series of
processes known as "ciliary motion". The motion may be caused by
the action of a series of delicate fibres, the "neuro fibrillae". The
axons end in a brush of root-like processes called "terminal dendrites";
these dendrites are in contact with the neurones and with the outer
neurone to which they hand the stimulus, or with a muscle cell
in which they cause contraction, or with a secretory cell in which
they initiate secretion.

The reproductive cells or "germ cells" are, as their name implies,
cells which have the capacity of giving rise to a mass of cells out of
which the body of a new individual is built up. They occur in many
forms and are found in the lowest grades of animals, i.e. the Protozoa,
but amongst the higher animals, or Metazoa, they are remarkably con-
stant in general characters, exhibiting practically the same forms
throughout the whole series of invertebrates and of vertebrates of the
highest and lowest grades of the human race. They appear under two types, viz.:-(1) a small
motile male cell, which consists mainly of a head which is a con-
densed nucleus, to which is added a vibratile flagellum termed the
tail, and(2) a motile female cell or egg, of the cyto-
plasm of which there are deposits of food material known as yolk.

Normally a male cell must unite with a female cell before develop-
ment can take place, but the eggs of many animals can develop
without this union and are then termed "parthenogenetic." In
other cases where union with a male cell normally takes place eggs
can be stimulated to develop without previous union with a male cell.

Turning now to the consideration of the nucleus, we find that this
is frequently invisible in the living cell, but when it can be made out
it appears either as a clear vesicle (as in many lower plants) or as a
nucleus, termed the "nuclear membrane." When making its way
through the protoplasm (as in Amoeba). When, however, it is fixed and stained it exhibits a characteristic structure. It then appears as a vesicle containing a fluid termed the "nuclear
sapp," and bounded by a membrane termed the "nuclear wall." The
sapp is traversed by a network of threads known as "linin fibres,
and adhering to these are a number of granules termed "chromatin" be-
cause they attract and retain the colouring matter of the staining
fluid so strongly. In addition there are usually one or two rounded
masses, termed "nucleoli," which are apparently not composed of exactly the same
chemical substances as the chromatin granules—and it is possible by
the use of certain stains to colour them differently from the tint assumed by the chromatin.

We have already seen that assimilation or the building-up of
fresh protoplasm is impossible in the absence of a nucleus. This is
probably the reason why, amongst certain lower animals, providing
that the non-nucleic piece, though capable of movement, cannot
digest or assimilate food and, after a short period of activity, dies.
The division of the nucleus always precedes the division of the cell
and the process is termed "cytokinesis," not because the cell is being
constricted into two, or much more frequently indirectly by the
process termed "karyokinesis" or "mitosis." In this method the
chromatin grains were believed to be aggregated into a continuous
spirocheloid thread termed the "spireme," which then became
segmented into a definite number of segments called "chromosomes."
The chromosomes always appear in the same number in the same
species at every division of the nucleus. Meanwhile the nucleus
or nuclei disappear, apparently dissolved in the cell-sapp; and the
nuclear membrane becomes dissolved so that the cell sap is mingled
with the cytoplasm; and then a small body termed the "centro-
osome" is ruptured, liberating the nucleus. The chromosomes may
be seen as an aggregate of alternate discs of singly and doubly
refracting material; cells provided with these threads are termed "muscle"
cells.

When subjected to the reception and transmission of stimuli are
known as "nerve cells" or "neurones." Those which are situated
at the free surface of the animal, and which are provided with stiff
processes of various kinds which are easily affected by stimuli, are
known as "sensory neurones." These neurones are present in place of the stiff processes, one or more root-like branching pro-
cesses known as "receptive dendrites." Stimuli when received are
conducted by these dendrites to the "neuromes" or "muscular fibres," which are capable of thickening and contracting, and to the cell-sapp. In many cases these neurones are composed of alternate discs of singly and doubly
refracting material; cells provided with these threads are termed "muscle"
cells.

Development of the fertilized egg, and the merest cells are termed the "spermatozoon;" and the nuclear membranes are termed the "proplasmic fibres" or "cytoplasmic fibres" become attached to the halves of the sapp; one
from each centrosome going to a corresponding half of the

When the chromosomes have reached positions at opposite
poles of the centrosome the female fibre, proceeding from the
have constituted the mitotic sapp; certain other fibres appear
running directly from one centrosome to another in the axis of the
spireme, which are termed "spirem fibres," whilst the sapp chromosomes are termed the "equatorial plate."

The movement of the female fibre the two halves of each chromosome are dragged apart from
one another, and eventually one set of half-chromosomes becomes
massed together in the vicinity of each pole of the spindle, that is, within each daughter centrosome. Each of such sets of chromosomes constitutes a daughter nucleus. The chromosomes become longer and thinner and more entangled with one another until the initial stage of a linear network with adhering chromatin granules is produced.
The stages leading to the segmentation of the spireme and the
solution of the nuclear membranes are termed the "prophases of the nucleus" and are termed the "karyokinesis." The stage in which
the daughter chromosomes are seen to separate and are termed the "metaphase." The stage involving the separation of
the halves of the chromosomes is termed the "anaphase," whilst the
steps leading to the reconstitution of the daughter nuclei are termed the "telophase."

In the fertilization of the egg it is penetrated by the head of
the spermatogon which carries with it a segment of the tail termed
the middle-piece. The middle-piece is distinguished by its diameter
being much more distal part of the tail and it includes a centrosome
which has been derived from the centrosome active at the
last division of the sperm mother cell. Sometimes the distal part
of the tail is left behind at the surface of the egg—sometimes it
penetrates with the rest of the spermatogon. In the latter case it remains
passive in one cell of the embryo and is absorbed and is
without influence on the hereditary properties of the embryo, since
the other cell of the embryo is the only one capable of taking
influence must be carried by the head, which is a condensed mass
of chromatin: hence is derived the strong belief that not only is the nucleus the bearer of hereditary powers but that the chromatin is the element of the nucleus in which they are concentrated.

The spermatogon head, once immersed in the egg, swells up and
assumes the characteristic structure of a nucleus; it acquires nu-
mer; and a nuclear membrane is formed, enclosing into the same number of chromosomes as are present in the egg
nucleus. It is then known as the "male pro-nucleus," whilst the egg
nucleus is termed the "female pro-nucleus." The centrosome derived from the middle-piece is termed the "proplasmic centrosome"
or rays which is termed the "spirem-auster;" the two nuclei approach each other, and the sperm-auster then becomes changed into a spindle, the "protokaryogon" or "sometimes" on the equatorial plate of this spindle: so that when the compound or
"zygote" nucleus divides equal portions of maternal and paternal
chromatin are distributed to the first two cells of the embryo—and
the same thing follows at every subsequent division of the growing embryo, so that paternal and maternal chromatin is distributed in equal amounts to every cell of the body.

The ripe germ cell consequently possesses only one-half the number of chromosomes with the same quality as the cell originally produced and therefore at some time in its history a reduction of chromosomes must take place. The older view was that this occurred at one of the ripening divisions in consequence of the spireme becoming segmented into separate chromatin threads. It is of interest to point out that all of these pieces exhibited a transverse split which was regarded as an indication of the belated appearance of the full number: at the first maturation division these threads were divided, however, to different cells, so that each daughter cell received only half the original number of chromosomes—a division was known as the "reduction division," or "meiotic division.

Embryos are usually capable during the resting stage of the nucleus the question has been raised whether they retained their individuality throughout the whole growth cycle. Various considerations lead to the conclusion that their individuality is maintained and that, where the number is very small as in the cells of the nematode worm Ascaris, the chromosomes or at least their ends can be detected in the resting nucleus; moreover the chromosomes are not all alike, but differ in size and shape from one another, and to each paternal one there is a corresponding maternal one of similar size and shape, and it seems unlikely that, if they vanished in the resting stage, they would reappear in exactly the same form at the subsequent mitosis. It has been surmised that this individuality in form and size was an indication of a difference in function in distributing the hereditary qualities—and Boveri's discovery that, when an echinoderm egg was enucleated by a needle, one-quarter of the female nucleus was used by the other act as a new nucleus, so that at the first division the egg was divided into cells lead to the conclusion. For Boveri showed that under certain circumstances new chromosomes are formed connecting all four daughter nuclei, and on this spindle the chromosomes were irregularly distributed; and that if the four resulting cells were separated and allowed to develop separately they themselves subdivided again. Whereas Driesch proved that it was possible to rear any of the first four cells into which a normally fertilized egg divides into a perfect larva of diminished size. Since an unferilized egg has also been induced by appropriate stimuli (see embryology) to develop into a perfect larva, the conclusion is inevitable that one complete set of chromosomes (maternal or paternal) is essential to the normal development, and that cells regarded as being "normal" have these contained grow into normal embryos; hence every kind of chromosome has its appropriate function to grow in development.

Progress since 1910: The Cytoplasm.—If we now turn to the great advances in our knowledge of the cell which were made in the 15 or 20 years ending in 1912, we may direct our attention first of all to the cytoplasm.

About 1890 Hardy published his first paper 1 in which he showed that the effect of the usual preservatives used in killing cells was to produce fibrillar nervous systems which had no counterpart in the living protoplasm, for exactly the same effect could be produced by the use of these same fluids on dead protoplasm; that in fact all colloidal solutions, which he termed "sols," could be easily induced to pass into a semi-solid or "gel" phase in which the molecules were arranged in strings. From such networks the intervening fluid could be easily forced out, but by gently heating colloidal solutions a different form of "gel" was produced, from which a pressure of several atmospheres failed to force the fluid out. In the first case the fluid contents were called the continuous phase and the fibre the disperse phase but in the second case the fluid is locked up in tiny droplets inside the semi-solid gelatine and then the fluid was the disperse phase and the gelatine the continuous phase.

This discovery led to great scepticism as to the existence in life of the various structures seen in stained protoplasm. Fresh attention was given to the study of protoplasm in the living stage and a most ingenious instrument designed by Kite 2 was used with effect by Chambers 3 for this purpose. This was an

1 Th. Boveri, "Die Entwicklung disperser Seegelzellen," Zeln- studien, No. 6 (Jena, 1907).

excessively fine needle point of hard glass, bent at right angles to the glass tube from which it was drawn, fixed so that the point projected into a glass cell from the roof of which a hanging drop was suspended the living cell or cells it was desired to explore. The needle could be manipulated by screws and the glass cell was mounted on the stage of a microscope. It was discovered that, generally speaking, the cytoplasm of a cell was a sol which was sometimes very thick and viscous and sometimes more fluid, but that the outer layer next the cell wall was a gel, of which indeed the cell wall might be regarded as an intensification. The various inclusions contained in the central cytoplasm, such as coloured granules, oil drops, etc,—could be freely observed about by the needle. When, however, the nucleus of the cell approached mitosis, a change took place, and the astral rays were found to be strings of semi-solid material, as were also the mantle fibres of the mitotic spindle: the astral rays became connected with the peripheral gel surrounding the cell. On the other hand no centrosome could be detected in the living cytoplasm, but the sphere surrounding the centrosome was found to consist of fluid material which Chambers supposed to be squeezed out from the cytoplasm during the process of gelatinization of the astral rays, and from it proceeded fluid rays visible as clear streaks in the living cell which alter the actinoid condition of the astral rays. When the spindle divided, the mantle fibres passed again in the centre into the sol state, and this change propagated itself towards the poles as the two daughter cells separated from one another.

Examined in the same way, the cross-striped myonemes characteristic of the muscle cells of arthropods and vertebrates turned out to be composed of alternate discs of gels of different consistencies; but no trace could be made out of neuro fibrilae in the living nerve fibre and the cell nerve, i.e. the body of the neuron containing the nucleus when examined in the living condition exhibited Brownian movement,—i.e. the granules pulsed under the impact of freely rolling molecules—a circumstance which proves it to be in the sol condition. On the other hand it should be recorded that Chambers 8 found that the cytoplasm of the ganglion cells from the central nerve-cord of the lobster was a very viscous substance which could be pulled out into long threads without undergoing essential change. When pulled away from the nucleus a clear empty space appeared on the side of the nucleus in the direction of the pull, which was only slowly filled by inflow of the plasma from the two sides.

It will be observed that in living protoplasm the change from the sol to the gel condition is reversible and very frequently takes place, and may be exhibited by living cells will find their explanation in this circumstance. Dr. Gates, professor of botany in King's College, London, has described to the present writer a beautiful demonstration once shown him by Chambers. It consisted of living spermatozoids (immaure male germ cells) from the testis of an insect; these when stimulated by the needle could be induced to undergo mitotic division; the chromosomes could be seen like bunches of grapes of a slightly more granular consistency than the rest of the cytoplasm moving along the mantle fibres.

The Brownian movement of the nucleus is the criterion of whether protoplasm is in the sol state of a sol or a gel, although not an absolute one, for Chambers has shown that a sol may be so thick as to prevent this movement and yet it may be possible to move particles in it freely by means of the glass needle. Bayliss 7 has shown that the actively moving pseudopodia of amoeba show a vigorous Brownian movement, but that when
they are caused to retract by electric shocks the movement ends, showing the conversion of the material into a gel.

Side by side with these observations on living protoplasm have gone renewed observations on its structure by means of more refined fixatives and stains. It has been shown that many of the older preserving fluids which were used to differentiate the nucleus and especially the chromatin of the nucleus from the cytoplasm, had a destructive effect in dissolving out many of the constituents of the cytoplasm.

A more refined technique has demonstrated the existence of bodies of disc-like structure, which were found to be the form of fibres or, less frequently, of small oval granules. What their function in the life of the cell is has not been determined. Meves supposed them to be bearers of heredity like the chromosomes and designated them as mitocondria. Later, in the division of the halves being distributed to the two daughter cells. Later researches by Gatenby have failed to confirm this. He finds that the mitochondria are irregularly shaped, but are regularly arranged at all times and in all parts of the cell.

In young cells this apparatus takes the form of a wreath surrounding the centrosphere or area of clear cytoplasm which envelopes the centrosome in the young cell—i.e. in the cell just after it has originated by division of the mother cell. During the growth of the cell this wreath disintegrates into smaller elements which become scattered throughout the cytoplasm. These disc-like bodies in their typical form consist of disc-like bodies made up of a substance which stains faintly, edged for half their circumference by a rim of intensely black with the reagents used. The latter is the characteristic disc-like appearance of these bodies. The fact that the Golgi apparatus reacts strongly with osmic acid has been held to prove that it must be partially made up of a substance allied to lecithin, which contains a fat group, the lecithin.

The most interesting fact about both mitochondria and the Golgi apparatus is that the elements of both increase in number by transverse division and, hence they cannot be regarded as indivisible deposits or temporary deposits of excreta, but are in some sense elements of the living cytoplasm. What relation they have to the general metabolism of the cell is not yet clear. Efforts have been made to show that in certain cells they are the centres of fat formation, and in pancreatic cells of the characteristic pancreatic secretion—but these endeavours have not yet carried conviction to the minds of cytophysists. Much further work on these lines is needed before certainty can be obtained.

In the formation of the spermatozoa of insects and mollusca the mitochondria and the Golgi apparatus play a very definite part which has been elucidated by Gatenby. The spermatid, which is the stage in the spermatogenesis in which the nuclear portion is contained, is formed by a transformation of the spermatogonium, a large cell, in which the mitochondria are scattered, and the Golgi apparatus is a large disc-like body, which forms the middle-piece of the spermatid, in which it is contained. The spermatid then passes into a small round cell, which is termed the spermatagonium, which contains only a few mitochondria, and the Golgi apparatus is a large disc-like body, which forms the middle-piece of the spermatid, in which it is contained. The spermatid then passes into a small round cell, which is termed the spermatagonium, which contains only a few mitochondria, and the Golgi apparatus is a large disc-like body, which forms the middle-piece of the spermatid, in which it is contained.

An egg which is fertilized by a spermatozoon becomes a fertilized egg, which is a fertilized egg, and this fertilized egg is called an egg. The fertilized egg is formed by the union of the sperm and the egg, and is termed the zygote.

Wilson showed further that sometimes the odd chromosome has a mate with which it pairs but which is much smaller than any of the chromosomes of the other sex. The fertilized egg of the female is formed by the union of two nuclei, and the fertilized egg of the male is formed by the union of two nuclei. The fertilized egg of the male is formed by the union of two nuclei, and the fertilized egg of the female is formed by the union of two nuclei. The fertilized egg of the male is formed by the union of two nuclei, and the fertilized egg of the female is formed by the union of two nuclei. The fertilized egg of the male is formed by the union of two nuclei, and the fertilized egg of the female is formed by the union of two nuclei.

The earlier conception of the preparation for the mitotic division of the nucleus has been that the chromosomes become arranged in a continuous thread termed the chromosome, which then becomes transformed into a ring of chromosomes, and these chromosomes are termed chromosomes. This conception has gradually been superseded by a much simpler one, viz. that the chromosomes persist as long looped threads during the resting stage of the nucleus and that these long looped filaments become shorter and thicker as mitosis approaches. To this change of view many workers have contributed, amongst whom we may specially mention Agar and Hogen. The free ends of these threads are attached to the centrosome, which is immediately outside which is the centrosome. In the preparation for the reduction division of the germ cells, when the chromosomes first become distinguishable they are said to be in the "leptotene" stage. In the leptotene stage the threads pass out of the centrosome, and these threads are termed "zygotene" threads. Each pair fuses to form a single thicker thread known as a "pachytene," and in this way the number of chromosomes becomes reduced to one half. Though formerly the end-fusion of corresponding chromosomes was strongly believed, in this day to-day unequivocal evidence that such an end-to-end union (known as "metasyndesis") ever takes place. On the contrary, it is now known that the end-fusion of corresponding chromosomes is a side-by-side union ("parasyndesis") has been demonstrated. Lately Hogen has shown that parasyndesis takes place in the cockroach, an insect which has formerly been regarded as presenting the typical case of end-to-end union.
The pachytene stage is characterized by a great contraction of the chromosomes, which leads to their being gathered up in a characteristic "bouquet" at one side of the nucleus—of course that side adjacent to the centrosome. Then the nuclear wall is dissolved and the nucleus dissolves as if resolved from one another. This process is known as "diakinesis." During this process the line dividing the sister chromosomes which paired may reappear, and also cytokinesis. Where this reappears it is indicated by a"needle."

In most cases, however, this complete separation does not take place, but only a partial separation, which leads to the chromosomes assuming an elongated form. Each half of the ring corresponds to one of the two original chromosomes, and these halves are dragged apart in the ensuing mitotic division. Most frequently each half forms a constrictio in the nuclear wall, and these constrictions are often united to form the characteristic "loneons" of the longitudinal division of the chromosome which is consummated in the second maturation division. For this reason the term "loneons" has been best reserved for the shortening and partially split chromosome. 

Modern theories of heredity assume that a chromosome consists of a linear series of rudiments, each of which has its particular part to play in the up-building of the embryo. A side-by-side pairing enables us to see how corresponding rudiments belonging to maternal and paternal chromosomes are brought together: an end-to-end pairing would of course render such a process impossible.

The contraction of homologous chromosomes does not always take place in a straight line. In the germ cells of the new BatracophisJansens has shown that one filament becomes spirally wrapped round the other. He believes that he has demonstrated that when the two chromosomes separate the now isolated chromosomes are no longer the same as those which became united with one another but each has appropriated one strand of the other. Jansens has also found a similar process in other crustaceans; but he certainly has demonstrated cross connections between the pairing chromosomes, and if the chromosomes are the actual bearers of heredity it is reasonable to suppose that the fact that they alone constitute the head of the spermatozoon, then there are a good many facts (see GENETICS) which seem to require for their explanation an interchange of substance between the two parent nuclei. In fact, it is a general characteristic of all living cells of higher plants or animals that they are quite impervious to a breaking or losing of their integuments.

In the ripening of the egg very peculiar phenomena occur which have only recently received an explanation. The unripe female germ cells or oogonia show nothing peculiar in their mitosis, but during the prophase of the first ripening division an enormous increase in size of the egg cell takes place. The leptotene threads are at first clearly visible and can be seen to pass into the pachytene stage, but then they fade away. The nucleus becomes very large and gorged with nuclear sap, from which circumstance is derived the name, "germinal vesicle," which the older authors bestowed upon it. The nucleus becomes large and conspicuous. At the close of the first maturation division the nucleus has still not returned to its normal size. Now the nuclear wall is thinned out, and the nuclear sap mingles with the cytoplasm; then the chromosomes can again be detected as minute tetrad within the cytoplasm of the egg cell. It is only in this way that the egg is furnished with the essential cell structures. The nuclear wall disappears and the nuclear sap mingles with the cytoplasm; then the chromosomes can again be detected as minute tetrad which begin to arrange themselves on the mitotic spindle of the egg cell. Now the egg is brought to the state of maturity. In the most favourable cases it has been shown that what happens during this period of growth is that the chromosomes swell up, become pressed against the nuclear wall, and almost suddenly vanish by intensified staining. It seems to be clear that a chromosome consists of at least two substances—a framework which does not stain and an embedded material which stains intensely, and to which alone the name chromatin is properly applied, applicable, and that during the growth of the egg cell the framework swells up enormously. De Baehr has shown that in the male germ cells of the anadid Saccocirrus, a similar growth period exists, though it is of very much shorter duration than the corresponding period in the life of the female germ cell, but, short though it is, it is long enough to cause the chromosomes to swell up and temporarily fade from view.

The nuclei of the germinal-spaces of the older authors is that so conspicuous a feature in the unripe egg, has formed the subject of some most interesting researches. Hogben has shown that in the cockroach Periplanetae the nucleus becomes vesculated and that practically the whole of the substance is removed and the remaining peculiar staining properties, scattered in the nuclear sap and even in the act of passing through the nuclear membrane. They can also be detected in the cytoplasm outside the nucleus. There seems to be little doubt as to the loss of the material of chromosomes. When the number of chromosomes per cell is doubled, the corresponding number of fragments of chromosomes is also doubled. This is seen in the case of the frog's egg may take the form of a prick with a needle. Under these circumstances the development of astral fibres takes place, centring on a particle lying in the centre of the egg.  

Hagelry and Hogben have shown that in certain cases these emitted fragments may assume the appearance of nucleoli, since they seem to secrete round themselves both nuclear sap and a nuclear wall. Ultimately they all disappear. Though it has not been possible to observe them in the frog's egg, the appearance of such nucleoli is supposed to be due to the association of the chromosomes during the ripening of the egg-cell. If this be the case, it is reasonable to surmise that the formation of nucleoli is in some way connected with the multiplication of chromosomes; and indeed it is a reasonable hypothesis that the absorption of these pieces of nucleolus in the cytoplasm leads directly to the synthesis of yolk. It has recently been asserted by Carleton that the chromosomes, the function of which was to form a centre for the synthesis of a mass of chromatin which constitutes the nucleolus and is destined to be emitted into the cytoplasm, where it no doubt plays a part in the subsequent growth of the cytoplasmic structures.

The parthenogenesis. We have seen that the normal history of the egg cell is to undergo two ripening divisions, at the first of which the chromosomes are reduced in number by one half. When the egg is fertilized by the spermatozoon only is the full number of chromosomes restored by the addition of those brought in by the spermatozoon. This is exactly what happens in the frog's egg and in the corresponding operation in Agar et al. de Baehr. But for the subject the plant-louse Apis palmares, the eggs of which develop without the aid of the male throughout the same division and the corresponding division. When the egg is in the female, the number of chromosomes is increased by the spermatozoon. When the egg is fertilized by the spermatozoon only is the full number of chromosomes restored by the addition of those brought in by the spermatozoon. If the egg is the female, the number of chromosomes is increased by the spermatozoon. No phenomenon more natural in the history of the species. If we take the case of naturally parthenogenetic eggs first, we find that a great many organisms can be divided into species, each of which is bounded by the inhibition of the female. In these cases the eggs the preparations for the reduction division occur. Out of the apparently irregular chromosomes network leptotene threads differentiate themselves. These pair of forms thicker pachytene threads—then at diakinesis these become divided into two and the central nucleus is formed from the two. The number of chromosomes and the number of chromosomes are established. Then the period of growth supervenes the last and the chromosomes become indistinct, but when they reappear in the metaphase they are in the full number and only one maturation division takes place at which all the chromosomes are longitudinally clef. From these facts de Baehr draws the conclusion that the reduction division is suppressed and only the second maturation division takes place. A somewhat different case is presented by the egg of the bee. The egg of the bee is a female but if unfertilized grows into a male. In the latter case of course the resulting animal has in all its properties of the male. If the egg be fertilized it continues to produce germ cells, the reduction division is suppressed. The nucleus of the spermatocyte enters on the prophase of the mitosis and the cell divides, but one of the daughter cells is devoid of a nucleus which is called the "spermatozoon." In the case of the egg, this is termed a "fertilized egg." The nucleus becomes divided longitudinally, and the spermatozoon, which contains the nucleus, is now capable of undergoing a further division; and then like the egg in Apis, it enters on a single maturation division in which the chromosomes are divided longitudinally, and the spermatozoon divides. In the case of the male it is the nucleus which is possessed by the nucleus of the tissue cells of the male, which is the reduced nucleus and not the new nucleus of the fertilized female.

In still other cases, as in the eggs of the small crustacean Artemia, the two ripening divisions may occur, but the first one can give rise to a nucleus which is not extruded as a polar body but remains in the egg and, remaining with its sister nucleus, restores the full number of chromosomes. Finally, the egg of the frog's cell is brought to the stage of ripening, and the development of astral fibres takes place, centring on a particle lying in the egg.

8 For a full account of recent work see A. Brachet, "L'Œuf et les Facteurs de l'Ontogenèse," Encyclop. Scientifique (Paris 1916).
adjacent to the egg nucleus, apparently a centrosome formed from this spermatozoon, which quickly proliferates by division of the centriole to that of the gel condition. It baffles our imagination, however, to conceive how a solution can be the seat of internal structure and how in particular a nerve cell, with all its inherited and acquired aptitudes or "engrams," can be in life nothing more than a thick syrup.

CZECHOSLOVAKIA (Československo, Československá Republika).—The republic of Czechoslovakia is a new creation in recent years, for it is the fusion of two old nations. Although it is an independent entity, it begins with the dramatic collapse of the Austro-Hungarian Monarchy at the close of the World War, and the definitive proclamation of Czechoslovak independence on Oct. 28, 1918. Some of its constituent territories, however, notably Bohemia and the lands of the Bohemian crown (Moravia, Silesia, Lužatia) enjoyed, up to the year 1620, many centuries of independent existence and played an important, sometimes a dominating, part in the political and religious history of central Europe.

The republic has a pop., according to the census of 1921, of 13,785,875 and an area of about 55,000 sq. m. (approximately the size of England and Wales). It comprises three great natural regions: (1) Bohemia, (2) Moravia and Silesia, (3) Slovakia and Ruthenia (Sub-Carpathian Russia = Podkarpacka Rus). Bohemia, with an area of some 20,400 sq. m., has a pop. of 6,664,932; Moravia, with 8,600 sq. m., 2,600,737 inhabitants; Silesia, 1,800 sq. m., and 670,937 inhabitants; Slovakia, 20,000 sq. m., and 2,993,479 inhabitants; Ruthenia, 5,000 sq. m., and 655,731 inhabitants. The whole is about 600 m. long and has a maximum breadth of 185 miles. In respect of population it occupies the tenth place among European countries; in respect of size the fourteenth place; in density of population the seventh.

The frontiers were fixed by the Peace Treaties of St. Germain, Versaillies and Trianon, while a portion of the ancient principalities of Tečin (Teschen) was adjudicated to it by the Paris Conference (July 1920). On the W. and N., where it borders upon Bavaria, Saxony, Prussia and Poland, it is enclosed by mountains, some of them of very considerable height, which form on those sides a natural and strategic frontier. In Bohemia the highest peak Sněžka (Schneekoppe) has an altitude of 5,116 ft., in Slovakia the summits of the Carpathians and the Tatra range rise to a height of between 5,000 and 6,000 ft. South of these ranges lie fertile and well-watered plains and lowlands extending to the borders of Austria, Hungary and Rumania. Some 60% of the entire area of the republic is included in the basin of the Danube, the rest being traversed by the Laba (Elbe) and the Vltava (Moldau), the former passing in particular through regions remarkable for their rich fertility. Some one-third of the entire surface of the country is covered by forests. The climate of the republic is a medium between a maritime and continental one.

Prague, the capital (200,000 inhabitants), is picturesquely situated on the Vltava and justly famous for its architectural beauty. Bratislava (Pressburg), the capital of Slovakia, with its great Danubian harbour, is the gateway of central European trade to the East and the Balkans. Other towns of importance in the republic are Brno (Brünn), with 200,000 inhabitants, the capital of Moravia, and the centre of an old established and flourishing textile industry; Plzeň (Plzen) with 100,000 inhabitants, famous for its beer and as the seat of the Skoda iron works; Košice (Kaschau), the commercial centre of eastern Slovakia; and Užhorod (Ungvár), the capital of Ruthenia. Of German towns in Czechoslovakia (most of them with a considerable Czechoslovak minority), Liberec (Reichenberg), and Jablonec (Gablonz), are important industrial centres. Carlsbad (Karlowy Vary), and Marienbad (Mariánská Lázně), are famous spas. Czechoslovakia indeed is one of the richest states of Europe in mineral and health-giving waters, and possesses more than 200 watering places and health resorts. Besides Carlsbad and
Czechoslovakia is a mixed character. The prevailing element is that of the Czechs (7 millions) form one people; indeed as long ago as the 9th century the kingdom of Great Moravia, with frontiers roughly identical with the present boundaries of the Czechoslovak Republic, was the creation of the Slav people, who occupied in common a territory stretching from W. Bohemia to the Carpathians.

The Czechs and the Slovaks, or, to give them their united name, the Czechoslovaks, are a branch of the great Slav family of which the Russians are the most numerous and the most important member and to which the Serbo-Croats with the Slovenes, the Poles, the Bulgarians and the Wends of Germany also belong. Even after the conquest of Bohemia by the Huns and the Huns under the Habsburgs, the language spoken in the country is Czech. The difference between the Czech language and the language spoken in the Huns is essentially a dialectical and the struggle for independence culminating in the declaration of the Czechoslovak State, has emphasized and developed the sentiment of Czechoslovak unity. It is not without interest to note that the three principal leaders of the movement for independence were a Moravian of Slovak descent (Masaryk), a Slovak (of the Stepanie), and a Czech (Dr. Beneš).

Of the non-Czechoslovak races in the republic the Germans are the most numerous, numbering some 3½ millions, chiefly dispersed along the W. and N. frontiers of Bohemia and in Moravia and Silesia. Their presence is largely the result of a colonization which was favoured by the Bohemian kings and princes of the 12th and 13th centuries, and secondly of a policy of Germanization pursued by the Habsburg rulers from the date of the battle of the White Mountain in 1620 (when the Czechs lost their independence) up till the very close of the World War.

On the day following the attainment of Czechoslovak independence, Oct. 29, 1918, the Germans of Bohemia and Moravia—the so-called Sudetenland Germans—declared the districts where they predominated a province of the new Austrian State, which had been constituted some eight days previously. It was not until the Treaty of London was concluded on Sept. 10, 1919 and the Treaty of Saint-Germain was signed in September 1919 by the Government that the Germans of Bohemia and Moravia that the Western Frontiers of the Czechoslovak State it would indeed have been difficult, with justice, to deduce a right of self-determination, in this case, of counting all the fruits of misused power. In Slovakia the Slovaks were subjected to a similar system of Magyarization. The Hungarian census of 1910 purported to show that in Slovakia there were 1,697,552 Slovaks and 901,793 Hungarians. The correct figures, however, were shown by the census of 1919 to be Slovaks 2,141,000, Hungarians 665,000.

Other nationalities occupying portions of the Czechoslovak Republic are Ruthenians (600,000 and Poles (500,000). On the other hand there are some 500,000 Czechoslovaks in Austria, 450,000 in Hungary, more than 200,000 in Yugoslavia and Romania, and over 800,000 in America.

Special provision is made in the Constitutional Charter of the republic (in accordance with the terms of the Treaty of St. Germain) for the protection of national, religious and racial minorities. Difference in religious belief, confession or language, constitute no obstacle to any citizen in regard to entry into the public services or offices, to the attainment to any promotion or dignity, or to the exercise of any trade or calling. In towns and districts in which there lives a considerable section (20% or more) of citizens speaking a language other than Czechoslovak, schools are to be provided, the instruction to be imparted in the language of that minority. Such a minority has also a right to a proportionate amount of the funds set aside by the State or by the local authorities for purposes of education, religion or philanthropy. The courts of justice and the public offices are also required to pay regard in respect of language to the desires of a minority which numbers at least 20% of the inhabitants of the locality. Every act tending to force a citizen to abandon his nationality—in other words oppression of a citizen on account of his race—is expressly prohibited.

Creation of the Republic.—When in July 1914 Austria commenced hostilities against Serbia, thus bringing about the world war, this act of aggression took place against the will of the Czechs and Slovaks, at that time subject to Austrian and Hungarian rule respectively. Open protest or organized revolt, however, was impossible owing to the proximity and indeed the presence in overwhelming numbers of German and Hungarian troops, who were expressly garrisoned among the Czech population in order to stifle any possible outburst of national and pro-Ally sentiment. Direct political action was equally impossible, as the Austrian Parliament was suspended. Whenever opinions did happen to be expressed which could be construed as criticism of Austria or Germany the offenders were speedily punished, and it was not long before the political leaders of the Czechs and Slovaks found themselves in confinement, some of them under sentence of death. While the Czech and Slovak press was subjected to a rigorous censorship and many of its organs prohibited from appearing. Some of the political leaders escaped over the frontier—among them Prof. Thomas Garrigue Masaryk and Dr. Eduard Beneš, who were subsequently to lead a success-
ful campaign abroad for the destruction of the Austrian Monarchy and the attainment of Czechoslovak independence.

The persecutions, sometimes revolving in their cruelty, to which (on account of their pro-Ally sympathies) the Czechs were subjected during the first two years of the war, had the effect of uniting all the different political parties into one single national block; and when the Austrian Parliament was at length convoked in May 1917 the Czech parties made a unanimous declaration that it was their aim to work for the union of Czechs and Slovaks as one people in an independent state.

As the war proceeded, further declarations of national and anti-Austrian sentiment were made, the most notable being the “Twenty-Fifth Manifesto” issued on May 17, in which all the Czech deputies of the Austrian Reichsrat and of the Diet of Bohemia, Moravia and Silesia unanimously demanded full independence and representation at the future conference which should conclude peace in Europe.

Meanwhile the Czechs, who were as Austrian subjects obliged to serve in the Austrian army, lost no opportunity of passing over to the Allies. Of 70,000 prisoners taken by Serbia early in the war 35,000 were Czechs. Of these 3,000 perished during the Serbian retreat or died of fever or cholera. The remnant, 33,000, was finally formed into a force which, called the Czechoslovak legions already fighting on the French front. Of a total of 600,000 Czech troops in the Austrian army over one-half surrendered to the Allies. In Russia a Czechoslovak legion was formed at the outset of the war, and later this grew into a regular army which by 1918 numbered 100,000 men.

The activities of Prof. Masaryk in Russia, England and America, enthusiastically supported by his compatriots living abroad, and especially by the Czechs and Slovaks who had emigrated to the United States, the self-sacrificing valour of the Czechoslovak legions on the French, Italian and Russian fronts, and the work of the Czechoslovak Council with its headquarters at Paris, moved the Allies to acknowledge the last-named body as the de facto Provisional Government of the Czechoslovak State.

On July 13 1918 a Czechoslovak National Council, representing all parties, was formed at Prague as a complement to the National Council already existing at Prague. This was the first direct step taken at home towards the establishment of the new State.

On Aug. 9 1918 the British Government issued the following declaration:

"Since the beginning of the war the Czechoslovak nation has resisted the common enemy by every means in its power. The Czechoslovaks have constituted a considerable army, fighting on three different battle-fields and attempting, in Russia and Serbia, to arrest the progress of the Russian armies. In all of their efforts to achieve independence, Great Britain regards the Czechoslovak people as an Allied nation and recognizes the unity of the three Czechoslovak armies as an Allied and belligerent army waging a regular warfare against Austria-Hungary and Germany. . . ."

This declaration materially helped to seal the fate of Austria, and implicitly recognized Czechoslovak independence as an accomplished fact. France and Italy, by accepting the assistance of Czechoslovak legions on the French and Italian fronts, had already practically acknowledged Czechoslovakia's claims (Briend, 1918). In the first week of Sept. 1918 the United States of America and Japan issued declarations practically endorsing the British declaration.

On Oct. 14 1918 the Czechoslovak National Council was constituted as a Provisional Government with all the attributes of sovereign and independent power. On Oct. 17 the Austrian Emperor Charles issued a manifesto offering the various nationalities of his empire a measure of autonomy on the basis of an Austrian federation. The offer was too partial and came too late. Austria's hour had struck. The Czechs at home declined even discussion with the Vienna Government, and declared that the question of the Czechoslovakian State must be left to the Peace Conference. In the 18th the Provisional Government at Paris issued a declaration of independence, signed by Prof. Masaryk, Dr. Beneš and Gen. Střécník. On Oct. 27 the Austro-Hungarian Government recognized the rights of the Czechoslovaks, and cabled to President Wilson at Washington a request for an armistice and peace negotiations.

Thus, on Oct. 28 1918 the Czechs regained the independence which they had lost almost 500 years before, at the ill-fated battle of the White Mountain on Nov. 8 1620. The National Council at Prague issued a proclamation of independence and took over the reins of government. In spite of the presence of Austrian and Hungarian garrisons in Prague and other towns, there was no bloodshed. Every consideration was shown to the Imperial troops and the Imperial civil authorities, who were allowed to vacate their posts without being subjected to force, and the universal rejoicings of a liberated people were happily marred by no scenes of violence.

On Oct. 16 the First representative body of the Czechoslovak people—the National Assembly as it was called—met at Prague. Its members, 336 in number, were selected from all the different political parties in proportion to their strength as shown by the last parliamentary election previous to the war. The Assembly proceeded to decide upon the form of government to be adopted. The unanimous decision of the Assembly was in favour of a republic, and Prof. Masaryk, at that time still absent abroad, was unanimously chosen as first president. A Cabinet was formed, with Dr. Kramář, who during the war had been sentenced to death for treason and afterwards reprieved, as premier, and Dr. Beneš as foreign minister.

Two days after the declaration of the independence of the Czechoslovak State, which had been signed also by the representatives of Slovakia, the Slovak National Council issued a "Declaration of the Slovak nation," wherein it was solemnly set forth that the Slovaks in blood, language and civilization form part of the Czechoslovak nation. A considerable time, however, elapsed before the Slovaks were allowed without hindrance to unite fully with the Czechs. The Hungarians (Magyars) declined to surrender the territories inhabited by Slovaks, and it was necessary to call in the military help of the Czechs before the last Hungarian troops, who had initiated a reign of terror in Slovakia, could be driven out of the land.

In the extreme eastern corner of the Czechoslovak Republic, there is situated a little autonomous region of Russinia (or Sub-Carpathian Russia), which, together with Slovakia, was part and parcel of the Hungarian Kingdom till the Treaty of St. Germain permitted its incorporation with Czechoslovakia. The National Central Council of the Ruthenians, which met on May 8 1919 at Užhorod, their capital, unanimously adopted a resolution approving of incorporation with Czechoslovakia, on the principle of autonomy. Thus by the express will of their own people, the various lands represented in the Czechoslovak Republic, viz. Bohemia, Moravia, Silesia, Slovakia and Russinia, united to form one State with a single central Government having its seat at Prague. The tasks, almost infinite in number, confronting the new State were of great gravity. The country had been brought by the Austro-Hungarian war policy to the very brink of economic and financial ruin. A starved and decimated population stood face to face with difficulties, not only on every frontier but indeed to some extent within the borders of the State itself. The spirit of courage and endurance which had helped the Czechoslovaks to achieve their independence was now to inspire a further work of great significance—the consolidation of a free, democratic and enlightened republic in the heart of Europe, the most westerly outpost of the great Slavonic world stretching from the banks of the Elbe and the Danube to the Pacific Ocean, and at the same time a nation bound by ties of gratitude and common interest to the Anglo-Saxon and Latin races. "At home we feel sufficiently contented," said Dr. Kramář, the premier, at the first session of the National Assembly, "of being able to rely upon our own powers alone, and that without injustice to others. We shall count upon the devotion of all towards the State and we shall show that not only have we been able to achieve our liberty but that we know how to preserve it and to be really free—worthy of our great past, of our traditions and of our sufferings."

The National Assembly confirmed all the emergency measures which had been passed by the National Council between Oct. 28 and the date of the first session of the Assembly, such for
instance, as enactments declaring the Austro-Hungarian code of laws (with some few express exceptions) as still in force and measures securing continuity in the executive and administrative offices of State. There was thus no appreciable break in political, legal or local administration. The framing of a constitution for the new State was early proceeded with. On Feb. 29, 1920, after a parliamentary committee had been at work on its provisions for almost a year, a constitution of the republic was adopted by the National Assembly.

**Constitution.** The framers of the constitution were largely influenced by the American and French constitutions, and the American principle of the division and balance of the legislative, executive and judicial powers was followed.

The actual terms of the constitution are introduced by a preamble, which runs:

"We, the Czechoslovak nation, desiring to consolidate the perfect unity of our people, to establish the reign of justice in the Republic, to assure the peaceful development of our native Czechoslovak land, to contribute to the common welfare of all citizens of this State and to secure the blessings of freedom to coming generations, have in our National Assembly this 29th day of February 1920 adopted the following constitution, the Republic of Czechoslovakia; and in so doing we declare that it will be our endeavour to see that this Constitution together with all the laws of our land be carried out in the spirit of our history as well as in the spirit of those modern principles and ideals that should form the basis of human civilization, for we desire to take our place in the Family of Nations as a member at once cultured, peace-loving, democratic and progressive."

Legislative authority is exercised by two popularly elected bodies, a Chamber of Deputies of 300 and a Senate of 120 members. Of these, the Chamber of Deputies, as the more fully representative of the popular will, possesses greater powers, being enabled in certain cases to carry its legislation in face of the opposition of the Senate. The Senate was intended to play the part of an organ of supervision, so as to act as a preventive of too hasty or too loosely drawn-up legislation. It has in more than one instance already exercised its powers as a check and restraining authority with good effects—its amendments even on substantial points having been several times accepted by the Lower Chamber.

Suffrage is universal, both men and women who have attained the age of 21 years being able to vote in elections to the House of Deputies. To vote in elections to the Senate the vote must have reached the age of twenty-six.

The president of the republic is elected in a joint session of the two Chambers. His period of office is fixed at seven years, and he may be re-elected at the end of his first term for a second period of seven years. For a third term, however, he cannot be elected until after the expiration of seven years from the conclusion of his second term of office. This restriction does not apply to the first president—President Masaryk.

The president of the republic is not answerable at law, for his official acts. He may be impeached in one case only—namely, for high treason, on the motion of the Chamber of Deputies; and his only punishment, if found guilty, is the loss of his office and disability ever to hold it again. For each and all of his State acts one minister at least is responsible.

Among other outstanding terms of the constitution are the following:—The Czechoslovak State is declared to be a democratic republic with an elected president at its head. To make any alteration in its fundamental constitution a law is required—a law which, as opposed to an ordinary law, has to be passed by a three-fifths majority of Parliament. Russia (Sub-Carpathan Russia) is granted the widest possible autonomy compatible with the integrity of the Czechoslovak Republic. The Chamber of Deputies is elected for six years, the Senate for eight. Deputies must be at least 26, senators 45 years of age. They possess immunity, but may be handed over to the ordinary courts by resolution of the House to which they belong. Parliament must sit twice a year. Declarations of war and amendments to the constitution require a vote in their favour of three-fifths of all members of both Houses. Cabinet ministers may participate in the meetings of either House and on the request of either House must attend its session.

Finance and army bills must be introduced first in the Lower House, the Chamber of Deputies. A measure passed by the Chamber of Deputies becomes law in spite of its rejection by the Senate, if the Chamber of Deputies by a vote of the majority of its entire membership repasses the measure.

During the period when Parliament is not sitting, a permanent commission of 24 members (16 from the deputies and 8 from the senators) sits to enact urgent measures which have temporarily the force of law. These acts are valid only during six months by which time Parliament which subsequently meets.

Cabinet ministers are appointed by the president; they need not be members of either House.

In respect of civic rights and privileges of sex, birth or vocation are recognized. Titles may be conferred only when they refer to office or occupation. The liberty of the press, the right of free expression of public opinion, as well as the liberty of conscience and religious profession are guaranteed. All religious confessions are equal before the law.

All citizens of the republic are fully equal before the law and enjoy equal civil and political rights; their residence, language or religion; the special provisions for the protection of national and other minorities have already been referred to. The constitutional charter thus represents an honest effort to set up a truly democratic republic which shall be able to meet the demands of the varied races and religions within its borders.

**Administration and Justice.**—The executive Government is placed in charge of 15 ministries concerned with the following matters:—foreign affairs, interior, finance, commerce, labour, food supplies, railways, health, social welfare, justice, agriculture, public instruction, national defence, posts and telegraphs, and the unification of laws. The collective responsibility of this Cabinet of ministers is expressly laid down in the charter of the constitution. The president of the republic enjoys such executive functions as are expressly assigned to him by the constitution, and he has his own council of state—presided over by a permanent official, to conduct such matters as fall within his competence and to facilitate communication with the rest of the executive.

For purposes of political administration the republic has been divided into administrative subdistricts, the heads of which are appointed by and directly responsible to the central Government. Local civil government is carried on by popularly elected parish, district, urban and municipal councils.

The tribunals of the republic are the Supreme Court of Justice, which sits at Brno and is the court of final appeal both in civil and criminal cases, two courts of appeal sitting at Prague and, respectively, 33 provincial courts and 410 district courts, all of which possess jurisdiction in both civil and criminal causes. Commercial cases are dealt with by the ordinary courts, except at Prague where a special commercial court sits. Litigation in mining matters is conducted before special benches attached to the district courts in mining districts. In large industrial centres there are also industrial courts to deal with disputes between employers and workpeople. At Prague there sits also an electoral court which decides upon the validity of disputed elections or forfeiture of seats and other questions relating to parliamentary or elected bodies. A constitutional court decides whether the acts of Parliament are in harmony with the charter of the constitution.

Previous to 1918 the territories now comprising the Czechoslovak Republic were of course under the Austrian or Hungarian code of laws respectively. On the collapse of the Austro-Hungarian Monarchy the Austrian code was adopted for the lands of the Bohemian crown and the Hungarian code for Slovakia. A special Ministry—that for "the unification of legislation and administrative organization"—has been entrusted with the unification of the laws for the whole republic; and two commissions of legal experts under the control of the Ministry of Justice were in 1921 at work on a careful revision of the old codes, which when completed would be issued as a uniform code for the entire republic.

**Foreign Policy.**—"Our policy," said Dr. Beneš in 1921, "is a policy of peace: in domestic affairs our programme is the logical sequel to our foreign policy, namely, social and racial order and justice, and unremitting effort on behalf of social and political democracy. The Great War must have taught us all that a calm and sensible discussion of all our differences is possible." The Czechoslovak Republic was first and foremost concerned, while avoiding all that may smack of chauvinism or imperialism, to maintain its integrity within the frontiers assigned to it by the Peace Conference. To that end it insisted upon the strict observance of the Treaties of Versailles, of St. Germain and of Trianon. It favoured an Anglo-French entente or alliance, seeing therein a substantial guarantee for the due carrying out of those pacts. An intimate collaboration with England and France was a constilutor sine qua non for Czechoslovakia. The creation of the so-called "Little Entente," aiming at the prese-
viation of the status quo in central Europe, was the primary outcome of Czechoslovak foreign policy. Czechoslovakia, Yugoslavia and Rumania became bound together in the Little Entente by a treaty of alliance (Convention with Yugoslavia dated Aug. 13, 1920, with Rumania April 23, 1921), positive in so far as it aimed at the establishment and maintenance of peace, security and normal economic conditions in central Europe, and defensive in so far as it was directed against all attempts at reaction menacing the existence of the new states. The efficacy of the Little Entente as a counter-reactionary alliance was manifested in April 1921, and again in October 1921, when its concerted action helped to frustrate the two attempts of Charles of Habsburg-Lorraine to recapture the throne of Hungary.

In respect of Austria Czechoslovakia was animated by the desire to assist in relieving the economic situation of the country, while opposed both to the incorporation of Austria with Germany and to the foundation of a Danubian confederation. It was in favour of aiding Austria on a broad basis of financial and economic help, to be rendered generally to the states of central Europe by international agreement. It was in favour of creating in central Europe a new political and economic system by which permanent peace would be secured—a definite understanding between all the "Succession States" of the former Austro-Hungarian monarchy in the matter of communications, post, telegraphs, navigation, finance and banking, exchange of goods and commercial treaties generally, opening up the way to a system of unfettered economics and freer trade—but at the same time proceeding to harmonise the economic and political sovereignty of the Czechoslovak Republic.

In respect of Hungary Czechoslovakia was at one with Yugoslavia and Rumania in holding that a Habsburg restoration would be a casus belli. These countries adopted the view laid down by the Paris Conference on Feb. 2, 1920, which declared that "it is not within the intention nor can it be regarded as the duty of the principal Allied Powers to intervene in the internal affairs of Hungary or to dictate to the Hungarian people what form of Government or of Constitution they shall adopt: nevertheless the Powers cannot allow the restoration of the Habsburg dynasty to be regarded as a question concerning the internal policy of the Hungarian nation alone. They declare therefore that a restoration of this nature would be in conflict with the very basis of the peace settlement and would be neither recognized nor tolerated."

On the other hand Czechoslovakia was desirous of renewing economic and political relations with Hungary, the more so as agricultural Hungary might be regarded as the complement of central Czechoslovakia, supplying her with natural products and providing a market for Czechoslovak manufactures.

With Poland the relations of the Czechoslovak Republic were for a considerable time seriously troubled by the question of Teschen, both countries laying claim to that territory. The Paris Conference in July 1920 decided for the partition of the disputed area; and the decision, though it signified no small sacrifice for the Czechs, and caused deep disappointment throughout the country, was accepted loyally in the hope that by this sacrifice the friendship of the Poles would be secured. In the words of Dr. Beneš, "the Czechoslovak Government regards the conflict with the Poles as definitively ended and is desirous of systematically pursuing a policy of rapprochement." It was in this sense that the whole policy of Czechoslovakia towards Poland was directed, and the Czechs were hopeful that Poland would ultimately join with the Little Entente.

Towards Russia the policy of Czechoslovakia was logically consistent. It had always been opposed to intervention in Russia, and insisted upon Russia desisting from any act that might be construed as intermeddling in the affairs of Czechoslovakia, in particular the pursuit of Bolshevist propaganda on Czechoslovak territory. The Czechs were animated with intense sympathy for the real Russian people, and looked forward to the day when they would be able to cooperate as kinsmen in the reconstruction of a peaceful and well-ordered Russia.

In pursuance of its practical policy of rapprochement and economic cooperation in the restoration of central Europe in particular and of Europe in general, Czechoslovakia concluded a series of commercial treaties with her various neighbours and with the Allied Powers.

Political Parties.—Not only was there in 1918-21 a sharp contrast in policy between the Czechoslovaks and the minority races living within the republic—the Germans and the Magyars—but each nationality was split up into a multiplicity of factions. The Czechoslovaks had 199 representatives in the House of Deputies and 103 in the Senate, and this total of 302 members was divided among no less than nine parties. The Germans and the Magyars were also proportionately split up. The strongest party in the republic was that of the Czechoslovak Social Democrats, which up to Sept. 1920 was represented by 74 deputies and 41 senators. The left wing of the party, 22 deputies and 5 senators—after a somewhat violent quarrel, then broke away and formed an independent organization owing allegiance to the Third (Moscow) International. This Communist party established its own organ, the "Rudé Právo." (The Red Rights), in opposition to the "Právo Lida." (The Rights of the People), the organ of the Social Democratic party. The Social Democrats were well organized among the industrial workers and agricultural labourers. They pursued a Marxist programme aiming at the socialization of the State, the means of production and consumption: they were opposed to a dictatorship of the proletariat, and were for evolutionary as opposed to revolutionary methods. They supported the peace policy of the Czechoslovak Government in foreign affairs, and were strongly opposed to intervention in Russia. They were also in favour of a closer cooperation with the German democratic element in the State.

The Communists aimed at a dictatorship of the proletariat, the creation of workmen's and military councils and a close hand-in-hand cooperation with Soviet Russia.

The Popular party, composed of Catholics and recruited largely from Slovakia and the country districts of Moravia, was represented by 33 deputies and 18 senators. Its organization was chiefly in the hands of the priests. It championed the rights of private ownership against Socialism, and combated the anti-Rome movement which was taking place throughout the republic. In foreign affairs it supported the Government.

The Agrarian party numbered 42 members, and published an important daily, the "Venkov." (Country). It was drawn from the peasant and small-farmer class, was in favour of land reform, private property rights and increased production all round. It was opposed to Socialism.

The National Socialists numbered thirty-four. They pursued a national as opposed to an international social policy, being thus opponents of the Social Democrats and in particular antagonistic to Communism. They were opposed to the Soviets, but were favourable to intervention in Russia. They were also in favour of intervention in that country.

The National Democrats (Liberals), whose organ was the "Narodí Listy," numbered twenty-nine. They were led by Dr. Kramář, and, being mostly recruited from the educated, professional and official classes, were more influential than the numbers suggest. They were strongly represented in Prague and other cities. They were, of course, opposed to Marxism and Communism. In domestic politics they were strongly Nationalist and suspicious of the Germans. They were the champions of State authority, order and public morals.

Of the German parties the strongest was again the Social Democratic party, originally numbering 31 deputies and 16 senators, but having subsequently lost three deputies who formed a German Communist party acting more or less in concert with the Czechoslovak Communists.

In 1921 the total number of Socialists of every complexion in the House of Deputies was 141, as opposed to 137 Bourgeois members (Czechoslovaks 109, Germans 72, Magyars 7). In the Senate the Socialists numbered 68, as against 73 Bourgeois members (Czechoslovaks 103, Germans 37, Magyars 3).

The composition of the Chambers sufficiently explained the fact that up to Sept. 1921 the Government of the republic had
remained in the hands of a Coalition Cabinet, or (as at the latter date) of a Cabinet composed of permanent officials supported by a coalition of parties.

Social Legislation.—The democratic sentiment of the Czechoslovak nation, and its maturity in social matters, resulted in the adoption of a social policy which, while proceeding without undue haste, was characterized by a comparatively rapid course of reform. Social legislation, in order to accommodate the first and third principles of justice and sickness and old age, favoring the insured, in respect of the former an increase of 30% in the payments to the insured as compared with July 1 1917 was made, while at the same time it was agreed, in agreement with the Social and trade unions, that sickness insurance was made to include maternity insurance. Old-age and invalidity pensions were not universal; they were made to apply, outside civil servants, to clerks and private officials only. Sickness was also secured to insured women. A universal scheme of old-age and invalidity insurance was before Parliament in 1921. Pensions for war invalids had been granted by special enactments. Insurance against unemployment was originally introduced as an emergency measure, but the economic conditions following the war necessitated the maintenance and extension of this form of insurance, which for normal times has been given legislative sanction and a State contribution to the payments made by the trade unions.

The most notable accomplishment of the young republic in the field of political reform has been the enactment of Dec. 19 1918 establishing a State and regional administration system. Thus, the considerable portion of the land which had been feudal estates since 1848, were divided. The Agricultural law of 1920 provided for the purchase of estates at the fixed price of 55 crowns.

Wages have also been the subject of legislation; special commissions have been empowered to regulate the wages in the so-called "hazardous industries" (mining, building, etc.). They have been appointed to fix the salaries of clerks in the metal industry, thus minimizing the danger of conflicts in respect of wages having to be settled by means of strikes.

By the 1917 law for the far-reaching goal of solving the housing problem an attempt has been made towards the appointment of a State and regional administration system. Thus, the considerable portion of the land which had been feudal estates since 1848, were divided. The Agricultural law of 1920 provided for the purchase of estates at the fixed price of 55 crowns.

A vast measure of freedom, compared with their position under the Austrian régime, has been granted to women both politically and socially. Politically women are now the equals of men, and there is not only a law to prevent a woman occupying any position in the various professions or in the administration of the State. In the two Houses of Parliament they were represented in 1921 by 16 members. Women have also been admitted to the schools of engineering and to the medical schools. In 1921, the greatest interesting event was the admission of women to the State insurance funds for the first time in the history of the country. However, in 1921, the great interest in the formation of the new State, there was a great demand for women to enter the fields of commerce and industry. Women were also admitted to the universities, and in 1921, the first university for women was opened. In the same year, the first women's college was opened.

Another enactment assures to miners a 10% share of the net profit of the mines, this share was employed for educational, philanthropic, or other purposes of utility. The basis of this enactment was the fact that the miners were the only ones who had not been affected by the war, they were the only ones who had been able to continue their work during the war. This enactment was intended to give the miners some share in the profits of the mines, and to ensure that the miners would not be left without work when the war was over.

On the principle of the mining councils, factory or industrial councils were projected for all industries. These councils were organized to represent the interests of the workers and to negotiate with the employers on matters of wages, hours of work, and conditions of employment. The councils were also intended to promote the welfare of the workers and to protect the rights of the workers. However, these councils were not very successful, and they were eventually abolished.

Land Reform.—Long before the political revolution of 1918 the Czechoslovak people knew of the need for land reform. The old system was one of land ownership by the State, and the peasants were tenants of the State. The peasants were not owners of the land, and they had no say in the management of the land. The land reform was intended to give the peasants a say in the management of the land, and to give them the right to own the land. The land reform was also intended to give the peasants the right to vote in the election of the representatives of the peasant community. The land reform was a great success, and it is still in force today.
Economics and Finance.—The economic and financial position of Czechoslovakia showed signs in 1921 of steady recovery from the chaos which succeeded the close of the war. Rich in natural resources and peopled by an intelligent, experienced and frugal population, the country had every reason to look forward to a prosperous industrial development in the future. Without Slovakia the republic would be mainly an industrial State: with it there is a slight preponderance in favour of agriculture, 41.5% of the entire population being occupied on or in connexion with the land and 38% in industry and commerce.

In special branches of industry Czechoslovakia is prominent among European countries, as for instance in the production of sugar and glass. In the manufacture of alcoholic liquors it occupies third place among European countries. It is less favourably placed in respect of the iron and textile industries, having to rely to a large extent on imported material. 235,000 tons and 1 million square yards of clothing are annually imported. Mines of the country are capable of producing some 15 million tons of black coal and 24 million of brown coal ( lignite). The yield of iron ore is almost one million tons annually, while gold, silver, tin, graphite, kaolin, felspar, kaolin, clay, felspar, graphite, kaolin, and felspar are also found in the country. The production of glass is considerable. The sale of glass is 900,000 tons annually, and 1,700,000 tons of pig-iron are annually produced. The output of coal girders is 150,000 tons and sheet-iron 34,000 tons. Czechoslovak manufactures and exports agricultural machinery, plant for sugar refineries and distilleries, locomotives, railway carriages and trucks and other rolling-stock, motor-cars, tractors. Aeroplanes are made at Prague and Pilsen (Pilsen). In its output of graphite Czechoslovakia takes second place among European countries. Graphite is particularly used in Russia and other countries nearer the source of supply.

The economic importance of Czechoslovakia is strikingly shown by a comparison with the rest of the former Austro-Hungarian Monarchy. Previous to the war the present Czechoslovak territories were an important country in the production of sugar. In 1899 the sugar output was 850,000 tons, or 46% of the spirits, beer 57%, malt 57%, foodstuffs 50%, chemicals 75%, metals 60%, porcelain 100%, glass 90%, cotton goods 75%, woolen goods 75%, soap 60%. The war, of course, cut off the supply of raw materials for the textile trade, which in 1921 was still suffering from shortage, particularly of raw cotton.

The important industry which can export sugar: is the second largest beet-sugar producer in the world, having some 500,000 ac. of beet under cultivation. In 1920-1 some 715,000 tons of sugar were produced, 189 factories and refineries being engaged in the industry, and 300,000 tons were available for export. Of beer 13 million hectolitres are brewed annually, of which one million is produced in the city of Pilsen. In the district of Zatec (Sazav) district of Bohemia, and of these no less than 40% are exported. The republic has 676 breweries and 140 malt-houses.

With an area of over 140,000 sq. m., of which 39% is forested, it is evident that Czechoslovakia exports not merely large quantities of timber but also furniture, bent-wood furniture, toys, musical instruments, etc. Of the bent-wood furniture 90% is exported and finds a ready market in England, France, Belgium, and in many other countries. There is also produced annually some 250,000 tons of porcelin. Of porcelain 30,000 tons is produced annually in 68 factories, Karlovy Vary (Carlsbad) being the chief centre of the pottery industry.

Czechoslovakia glass dates from the 15th century. Bohemian glass enjoys a world-wide reputation, which is well deserved: the crystal ware of Bor (Haida), the imitation jewelry and glass figures of Sedlec (Galerie); the glass factories of Prague, Turnov, are exported to every part of the world. Over 60,000 workpeople are employed in the glass industry.

Leather is among the more important manufactures of Czechoslovakia. Raw materials are employed on 50,000 workmen, glove manufacturing the same number. Some three-fourths of the entire output in both these wares are exported, largely to England and to Germany.

Czechoslovakia, as already indicated, is not only an industrial State: it possesses at the same time a highly developed agriculture in which over 40% of the entire population is engaged, that is to say, some 5,700,000 persons are working in some way or other connected with the land. 1,300,000 farms are in existence. This land is arable land and of this a little over a third, grown up to an altitude of 1,100 ft. and 1,300 ft. above sea-level. Only 4\% of all arable land in the country is unproductive (in Great Britain 15\%). The chief agricultural products are potatoes (1,200,000 tons, 1919-20), wheat (1,650,000 tons, 1919-20), barley (1,300,000 tons, 1919-20). The agriculture of the republic supplies the material for several important industries, including the production of sugar, beer and spirits, starch (120 factories), syrup, sugar, chicle, etc. The production of cement, which in 1919 was 2,600,000 tons, is also considerable. Good quality limestone is found in Bohemia and the Slovakian wines being the best known.

Agriculture is encouraged by a suitable system of education. Since it came into being the republic had by 1921 founded 13 new universities, 400 technical colleges and 120 agricultural schools, 500 agricultural schools, a number of normal homes, and 200 agricultural schools, besides the 170 higher technical schools and secondary grammar schools. The republic has 7,500,000 acres of arable land, and 1,700,000 acres of meadow, pasture and woodland. The effects of the war were severe upon the agricultural industry. The value of output fell 33\% but the production of crops rose to 690 and 290 million tons respectively. In 1919 Czechoslovakia exports to Great Britain (exclusive of colonies) amounted to a value of 238 million pounds, imports to 328 million pounds. Sugar, malt, hops, baskets, musical instruments and toys are the principal articles of export to Great Britain.

While suffering from the symptoms affecting central Europe generally, Czechoslovakia is, nevertheless, in a better financial situation than any of its neighbours. The budgets of 1919 and 1920 disclosed deficits of 5 billion and 3 billion kronen respectively, but in that for 1921 the revenue slightly exceeded the expenditure. Czechoslovakia was thus the only country in central Europe in a well-balanced budget. The national debt amounted to some 40 billion kronen, against which the state itself possessed assets in the shape of forests, coal mines, the former domains of the Habsburgs, including iron, lead, and other sources of natural wealth, besides the State-owned railways.

Communications.—As a wholly inland nation, Czechoslovakia has to depend for its means of transport upon its railways and its waterways, notably the Elbe, which connects the republic with Hamburg and the North Sea, and the Danube, which unites it with the east of Europe and the Balkans. Under the peace treaties Czechoslovakia acquired 240 miles of railway, besides 1,300 miles which were owned by Austria-Hungary. Before the war the Czechoslovak traffic on the Elbe totalled some 4 million tons annually. On the Danube the amount was 2 millions, but this total bids fair, under normal conditions, to be easily passed, and the recent construction of docks, warehouses and shipbuilding yards, was already proceeding energetically. It was also proposed to link up the Elbe and the Danube by a railway specially fitted for the purpose. The construction of docks, warehouses and shipbuilding yards, was already proceeding energetically. It was also proposed to link up the Elbe and the Danube by a railway specially fitted for the purpose.

The total length of railway track in Czechoslovakia was in 1921 3,700 miles, of which 1,000 m. was of standard gauge, 1,000 m. of narrow gauge, 1,000 m. of normal gauge, and 700 m. of special gauge. In the course of a few years this mileage was to be
Largely increased, Parliament having voted some 6,500 million crowns for further construction and improvements. Some 4,700 m. of track are State-owned; some 2,000 m. in the hands of private companies, but will probably be taken over by the State. Czechoslovakia has 5,000 post-offices, some 10,000 m. of tele- 
graphs, and close upon 8,000 m. of telephone communication. Aerial telegraphy is well established, and there are stations at Prague, Budapest, in addition to which there exist also cross-country serv- 
ices. The republic possesses seven radio-telegraph stations.
of anti-Austrian sentiment in Rumania, whose attitude after the outbreak of the World War proved the correctness of his judgment. He now sought even at a cost to win over Rumania to fight on the side of the Central Powers. But his efforts proved fruitless, because the leading Hungarian statesmen would not agree to Rumanian demands involving the cession of Hungarian territory. For a long time Czernin succeeded in persuading Rumania to remain neutral. When, at the end of 1916, she finally passed over into the Entente camp Czernin returned to Vienna. The foresight which he had shown as minister at Bucharest, the skill and zeal displayed in his intercourse with the Rumanian court and Government, and his good personal relations with influential circles at Bucharest, decided the Emperor Charles to entrust him with the direction of Austro-Hungarian foreign policy in succession to Count Burian.

Czernin was, and remained, a decided advocate of the view that the Central Powers could not obtain so crushing a victory over the enemy in the field as to be able to dictate the conditions of peace. Therefore, from the day of his taking office down to his resignation he consistently maintained that, even at some sacrifice, they ought to seek the conclusion of a peace which should preserve to them their position as great Powers. Czernin did not indeed contemplate the conclusion of a separate peace with the enemy, but as against German statesmen he insisted that Germany also, especially in the questions of Belgium and Alsace-Lorraine, would have to reconcile herself to concessions. By gloomily painted pictures of the military, political and economic situation of Austria-Hungary he sought to influence the German Emperor and the German higher command, and succeeded in awakening sympathy with his peace ideas among the members of the German Reichstag. Czernin was not only cognizant of the peace negotiations which the Emperor Charles opened with England and France through his brother-in-law, Prince Sixtus of Parma, but he approved of them. He knew nothing, however, of the contents of the letter of March 24, 1917, in which the Emperor Charles spoke of his willingness to support the "just demand" of France for the return of Alsace-Lorraine by any means and by the use of his whole personal influence with his ally. But he himself was simultaneously engaged in trying to influence German statesmen in the same sense, promising in the event of their making sacrifices in the west to compensate them in the east, chiefly by the acquisition of Polish territory. But his efforts, then and later, broke down on the determination of the German army leaders to obtain a military decision. These men saw in Czernin a danger to the political and military interests of the Alliance, and attacked him violently. During the negotiations at Brest-Litovsk from Dec. 1917 to March 1918, the opposition between the views of the Austro-Hungarian delegation led by Czernin and the German delegation became strikingly manifest. In the negotiations leading up to the convention between Russia and the Quadruple Alliance, signed on March 4, 1918, Czernin took a conspicuous part. A few weeks earlier peace had been concluded at Brest-Litovsk with the newly founded republic of the Ukraine. The fact that Czernin, in order to secure this "bread peace," had ceded to Ukraine the district of Chelm, to which the Poles laid claim, aroused the most violent resentment among the Poles, and led to unsparing attacks upon him by the Austrian Poles. In the beginning of April 1918 his position was no longer tenable. The immediate cause of his resignation on April 14, 1918 was the conflict between him and the Emperor Charles over the "Sixtus letter." Czernin was one of the few active statesmen among the Austrian nobility who sought to continue their political activity under the Austrian Republic. At the end of 1920 he became the representative of the Liberal bourgeois party of central Vienna in the National Parliament.

For Czernin's activity in Bucharest and in the World War see his Im Weltkriege (1919). His despatches from Bucharest are printed in the Austro-Hungarian Red Book, Diplomatische Aktenstücke betreffend die Beziehungen Oesterreich-Ungarns zu Rumanien, 22 Juli 1914 bis 27 August 1916. A favourable view of Czernin's attitude in the "Sixtus Affair" is taken by Count August Demblin in Czernin und die Sixtusaffaire (1920); the standpoint of Prince Sixtus is represented in Prince Sixt de Bourbon. L'offre de la paix séparée de l'Autriche (1921).
DABERNON, EDGAR VINCENT, 1st Baron (1857 - ), English politician, was born at Slinfold, Sussex, Aug. 18, 1857, the youngest son of Sir Frederick Vincent, 11th Bart., of Stoke d'Abernon, Surrey. He was educated at Eton College, and entered for the Indian Civil Service, being in 1877 head of the examination list for the appointment of student draeorman at Constantinople. The same year, however, he entered the army, but in 1880 was appointed private secretary to Lord Edmond Fitzmaurice, at that time commissioner for Eastern Rumelia. The following year he became a member of the commission for the evacuation of territory ceded to Greece by Turkey, and in 1882 was sent to Constantinople as the representative of Great Britain, Holland and Belgium on the council of the Ottoman public debt, of which in 1883 he became president. In 1883 he was sent to Cairo as financial adviser to the Egyptian Government, remaining there until 1888, when he returned to Constantinople as governor of the Imperial Ottoman Bank, a post which he resigned in 1897. In 1887 he received the K.C.M.G. Sir Edgar Vincent entered Parliament in 1899 as Conservative member for Exeter, but lost this seat in 1906. He unsuccessfully contested Colchester in 1910. In 1914 he was raised to the peerage as Baron D'Abernon, and became very prominent during the World War as chairman of the Central Liquor Control Board. In 1920 he was appointed ambassador to Germany. Lord D'Abernon published in 1919 "Dreams of Modern Greece," which was adopted for use by the university of Athens. He married in 1890 Lady Helen Venetia Duncombe, daughter of the 1st Earl of Feversham.

DAHN, JULIUS SOPHUS FELIX (1834-1912), German historian, jurist and poet (see 7.734), published his complete works of fiction, both in prose and verse, in 1903. The final volume of Die Könige der Gemalten appeared in 1911. He died at Breslau Jan. 3, 1912.

DAHOMEY (see 7.734).—An estimate made in 1918 put the population at slightly over 900,000, of whom 65% lived in the coast and adjacent regions. Upper Dahomey, two-thirds in area of the whole colony, has no more than 12 inhabitants per sq. m., compared with 50 per sq. m. in Lower Dahomey. Porto Novo (seat of Government and chief business centre) had about 25,000 inhabitants, including some 400 Europeans. Whydah and Abomey each had a population of 12,000 odd. In all there were over 700 Europeans in Dahomey. There are large numbers of mulattoes in the coast towns, chiefly employed as clerks.

Trade and Communications.—The French devoted much attention to the development of the natural resources of the country and to opening communications. The mains of railway are the railway (the ocean port of Porto Novo) which runs parallel to the Niger frontier reached Săvic, 162 m. inland, in 1912. Thence a metalled road (nearly 300 m. long), with substantial bridges was built to the Niger at Madaakali, just W. of the British (Nigerian) border. This Route de l'Est a motor wagon service for passengers, mails and goods was opened in 1912. From Pahu, 16 m. from Kotonou, a branch line (20 m. long) runs W. to Whydah and Seghorou. The line from Porto Novo to Sakedo, near the Niger border, was in 1914 extended to Podé (total length 47 m.). On the Togolende side there is a good metalled road connecting with the middle Niger region. In the coast region a mail steamer service was opened in 1912 along the lagoons between Porto Novo and Lagos.

Cocoa plantations were largely developed from 1912, and the coconut palm—for the copra trade—introduced in the lagoon districts, where in central Dahomey cotton plantations met with success. Maize is largely grown for export, and there are considerable herds of cattle in the north. But palm oil remains the chief source of wealth of the country; oil palms cover about 600,000 acres. The value of the exported palm oil in 1912 was 80,000,000 francs. The trade for 1916 was valued at 14,500,000 francs; in 1918 at 23,300,000 francs (evenly distributed between imports and exports). The increase in 1918 is largely due to higher prices. Palm kernels and palm oil are the chief exports; maize, cotton, dried fish, copra, shea nuts and shea butter rank next in value. Cotton goods, gin and trade spirits are the chief imports.

During the war the cotton trade had collapsed, and since the war the kernels have gone mainly to Liverpool. In 1913 Germany had 49.2% of the total trade, France 26.5%, the United Kingdom 23.7%: the elimination of Germany told mostly in favor of the United Kingdom. The colony is self-supporting; in 1919 the budget balanced at 2,370,000. Nearly half the revenue is derived from a poll tax on the natives.

History.—In 1911 the French disposed the chief, a member of the old royal family, whom they had installed at Abomey. He had been intriguing against French rule. His territory was divided among a number of petty chiefs placed under the direct control of the resident at Abomey, and the whole country became the colony of Dahomey and its dependencies. From that time little trouble was experienced in the native administration. In Sept., 1912 it was reported that the French Government approved the abolition of slave trade, formerly conducted in the southern coast of Dahomey. Dahomey was devoted to the cultivation of palm oil, and the increase of this export was due to the use of mechanical processes instead of the former primitive method of pressing the kernels. The net exports of cocoa and palm oil were increased during 1911, the former largely due to an improved method of preparation. The trade was, however, not much affected by the war, in which Dahomey was neutral. The war caused much loss to the French colonial trade, but the country was not seriously affected, and the trade was soon restored to something approaching its former level. The country is directly governed by a governor, assisted by a council of ministers, and includes three provinces; the territory is divided into 22 districts, each governed by a chief or his delegates. The native courts of law are retained, but the French system of administration is rapidly being introduced. The registered population at present is 2,000,000. See Dasehomy (1920), a useful handbook issued by the British Foreign Office; A. Le Herisse, L'Anecroye de l'Abomey (1916); P. Sprigade, Die französische Kolonie Dazomey in Mitt. deutschen Schultschilden (1918); L'Afrique Francaise (Paris, monthly).

DAIL EUREANN: see IRELAND, SECTION POLITICAL HISTORY.

DAMROSCH, WALTER JOHANNES (1862— ), American musician and conductor, was born at Breslau, Germany, Jan. 30, 1862. He came to America in 1871 and ten years later began his career as a conductor in Newark, N.J. In 1894 he founded the Damrosch Opera Co. for producing Wagner. In 1896 he produced, as director of the Oratorio Symphony Societies, Wagner's Paravol in concert form for the first time in the United States. Since 1903 he has been director of the New York Symphony Orchestra. He is the composer of The Scarlet Letter (1891); Cyra (1913); and music for Eupides' Medea, Iphigenia in Tauris (Berkley, 1913) and Sophocles' Elektra (New York, 1917). At the request of Gen. Pershing he reorganized the bands of the A.E.F. in 1918.

His brother, FRANK HEINZ DAMROSCH, was born at Breslau June 22, 1890. He was conductor in Denver, Newark, Bridgeport, and New York (the Oratorio Society 1868-1912). From 1905 he was director of the Institute of Musical Art.

DANCING (see 7.704).—The years 1910-20 saw a remarkable revival of the love of all kinds of dancing in England and America. On the one hand the organization popularly known as the Russian Ballet has put new life into stage dancing, while on the other the Americans are responsible for a reawakening of the love of dancing in the ballroom. At the end of the 19th century the Ballet in England had become a spectacular show of very little artistic significance; the standard of dancing technique was of the lowest and, except in the case of one or two dancers such as Adeline Genèe, it is doubtful whether stage dancing could be called an art at all. In the ballroom, dancing had become a rather perfunctory social function, practised without any particular skill or regard for steps.

Classical Dancing.—The revolution in stage dancing was started in England by Sergei Diaghiloff's company of Russian dancers, but no account of modern stage dancing would be complete without some reference to the so-called "Classical Dancing" which came into vogue at the beginning of the 20th century and had such an influence on all the stage dancing of a later date. Classical dancing was a revolt against the form and style of the stage ballet as it then existed. It was an attempt to rescue the art from the artificiality of the older ballet, and bring beauty of line and movement into prominence, instead of the technical skill of the steps alone. In addition to this, classical
DANCING 795

dancers laid stress upon the musical side; they sought to interpret the great composers in dancing; values of Chopin, Mendelssohn's "Spring Song," some of the smaller works of Schubert—all these were "interpreted" in different ways. The dancers sought to catch the mood of each piece of music by an appropriate series of poses and movements, which were intended to be not only expressive of the music but beautiful in themselves. The costume worn was a simple dress in the Greek style, with the feet bare; the strangeness of this costume at the time and the similarity of many of the poses to Greek paintings and friezes led to the use of the word "classical" for this dancing.

The first and greatest exponent of this particular school was Isadora Duncan. Her own point of view with regard to stage dancing is worthy of mention:

"In my art I have by no means copied, as has been supposed, the figures of Greek vases, friezes, and paintings. From them I have learned to regard nature, and when certain of my movements recall gestures that are seen in works of art it is only because, like them, they are drawn from the grand natural source.

This description epitomizes the whole of the theory of classical dancing, and Isadora Duncan's numerous successors improved very little either on her own theory or practice. Her technique was of her own invention and, although the result looked simple and easy to the eye of an onlooker, it was in reality the result of great ingenuity. Perfect balance, perfect transition from one pose to another however slowly, perfect control of breathing and movement, all these, she found, required as much practice and study as the older style of ballet dancing. There was nothing impromptu, nothing amateurish in her work. The result was entirely novel and at first was received with ridicule both in Europe and America; it was only much later that she achieved the success and received the praise which were her due. She danced on the stage by herself without scenery and with only a single background of curtains which showed off the movements to their best advantage and kept the concentration of the audience on the dancer only.

It was left to one of Isadora Duncan's successors, Maud Allan (b. 1879), to popularize classical dancing in England. Her strongest quality was the very interesting way in which she interpreted musical phrases and moods. The early musical training she had in Berlin accounted for no doubt for this fascinating quality.

The influence of classical dancing on the stage dancing of a later date is very considerable. The ballet which was designed to the music of "L'Après-midi d'un Faune" of Debussy, and which was danced by him with picked members of Diaghileff's corps de ballet, would never have been possible without Isadora Duncan, and her dancing undoubtedly had a great influence in bringing stage dancing back into relation with real life and away from the absurd artificiality of the 19th century stage ballet.

The "Russian Ballet."—England hardly had time to recover from the revolutionary methods of Isadora Duncan and Maud Allan when there appeared a new organization which was acclaimed with rapturous applause and enthusiasm, first of all by the artistic world of London and very shortly afterwards, at their bidding, by the general public. Sergei Diaghileff was responsible for the introduction of this company and was the moving spirit in collecting together the various people who contributed to this highly artistic and successful enterprise. He was the founder of the ballet company, and the leading dancers, Larionova, Anna Pavlova, Lydia Lopokova, Vaslav Nijinsky, Adolph Bolm, Léon Massine and Enrico Cecchetti.

The success of this company not only in London but all over the world—they visited all the principal towns of Europe and America—was all the more unexpected because very few people in England were aware that anything so perfect could come out of Russia. The existence of the Imperial Court ballet at St. Petersburg was dimly known, and it was thought at first, quite wrongly, that Diaghileff's company had some connexion with it.

So far from this being the case it can truthfully be said that the composers of dancing in St. Petersburg had no great opinion of Diaghileff's productions and achievements. The "Russian Ballet" was instituted in 1735 and continued up to the revolution and the Tsar's deposition in 1917. The high standard of technique of the Imperial Ballet was very largely due to Diakiev, a ballet master of the early 19th century at St. Petersburg, but Diaghileff's troupe was a very revolutionary body, and had very little in common in idea with the Imperial Ballet. True, the corps de ballet and dancers of the "Russian Ballet" were trained in the Imperial schools, and Sokolov was the assistant ballet master at the St. Petersburg opera, and Bakst and Massine had trained with the Imperial Ballet. The classical ballets performed by the Imperial Ballet at St. Petersburg year after year did not as a rule form part of Diaghileff's repertoire. His outlook on stage dancing differed much from the official ideas in Russia as those of Isadora Duncan from John Tiller. His aim, like Miss Duncan's, was to bring the ballet into relation with real life and the contemporary arts which go to make up the "production."

The ballets themselves can be divided broadly into two classes: those which are the direct descendants of earlier ballets, and those which are essentially experiments in new directions. Into the first category fall such ballets as "Lac des Cygnes," "Pavillon d'Armaille," "Cléopâtre," "Thamar," "Oiseau de Feu," "Petrouchka," the dances from "Prince Igor" and "Sylphides." With regard to the last-named an interesting point was the use of Chopin's music, orchestrated by well-known Russian composers. This orchestration of what was hitherto considered as essentially piano-music created quite a sensation, and was one of the most successful efforts of the Diaghileff company. The vivid colour schemes of the scenery and dresses, and the modernity of some of the music (as in "Petrouchka," were as much responsible for the effect of vitality and realism as the standard of the choreography and dancing, which were in themselves higher than any hitherto seen in England. Apart from the setting however, the characterization of the various personages in these ballets was presented in such a way as to make the stage people seem alive and convincing to the audience, every device of stage-craft and orches-
DANIELS—D'ANNUNZIO

for the first time. The woman's part in these dances is absolute passivity; she has to follow the man's lead and be responsive to his lightest touch. Every good dancer is now an adept at this, and the variety of steps in common use is surprising.

The evolution of the valve from mid-Victorian days is worthy of note. At the beginning of the 20th century, for some reason which is quite obscure, the tendency of dance bands was to play the valve faster every year than the last. The result of this was that the valve was the first to go out of use instead of being slow in time, became a series of fast revolutions. Dancers refused, in consequence, to continue to perform what one may call the one-two-three circular rhythm of the valve at the accelerated pace; they found the solution of the problem was to dance the same steps at a slower rate in cross rhythm against the music. Various other steps were added to enable these couples to manoeuvre successfully among the old-fashioned dancers. These new steps became crystallized, others were added, and the result was finally taught as the "Boston.

The popularity of the "Boston" was short-lived owing to the difficulty of the performance in cross rhythm, and the congestion of traffic in the ballroom on account of the different speeds of the revolving couples. As soon as the new American dances obtained a hold in England the latitude in steps so essential to the new dances was extended to the old valve. The tempo of the music slowed down to its original speed and the "Boston" disappeared. Valses were played more slowly and the latitude of steps was the same as in the other dances. The old one-two-three step has very largely gone, and the difference between a valve and a fox-trot is mostly one of rhythm. The modern valve was called the "Hesitation" as opposed to the earlier "Boston." The "Tango" was the result of an attempt on the part of dancing teachers to introduce a new dance into the ballroom about the year 1913. It came originally from America and is said to be founded on a dance used in the cafés of South America, which would account for its somewhat "Spanish" style; the rhythm of the music is akin to that of the "Habañera." The most remarkable feature of all the dances described above as opposed to the dances of earlier generations is that the personality of the dancers is clearly reflected by the steps they use.

The music of the modern ballroom is almost entirely supplied by the United States. The music used in the American dances is no longer a string band and piano, but consists of various combinations, the most common of which perhaps is—piano, violin, alto or tenor saxophone, banjo and jazz-drum. This last-named needs some explanation. The word "jazz" signifies noise in America and is in no way a dance. The drummer uses a side drum, a big drum and cymbals played with the feet, and various other instruments on which he beats a tattoo with his drum-sticks in alternation with the side drum. He is in fact a sort of one-man band in himself and adds considerably to the rhythm of the ensemble. There is much variety in the method of playing dance music to-day as in the dances themselves. Dance bands therefore vary considerably in style and organization from what might be expected, and the best known command very high salaries. The skill of a modern dance band lies in two essentials: first, a good rhythm; and secondly, cleverness in exterminating variations on the tune by the different executives.

The effect of the American dances has not yet permeated the social scale, and the masses among whom dancing has always been a popular pastime, and they continue to prefer the dances of the 19th century.

DANIELS, JOSEPHUS (1862— ). U.S. politician, was born at Washington, N.C., May 18, 1862. He studied at the Wil- son College, and at the age of 18 became editor of the Wilson Advance. He was admitted to the bar in 1885, but preferred newspaper work, becoming editor of the Raleigh State Chronicle. He was printer for the state of North Carolina from 1887 to 1893, and then for two years, under President Cleveland's administration, was chief clerk of the Department of the Interior. From 1904 he was editor of the Raleigh News and Observer, with which his former paper was consolidated. He was twice a delegate to the National Democratic Convention, and from 1896 to 1916 was a member of the Democratic National Executive Committee. He early became a supporter of Woodrow Wilson for the presidency and was publicity manager for his campaign in 1912. In 1913 he was appointed Secretary of the Navy by President Wilson. In 1914 he issued an order prohibiting the use of intoxicants on ship-board and within the limits of navy yards and stations. His personal interest in the enlisted men was shown by his provision of opportunities for training in various camps. In 1916 he wrote a critical history of the growth of the navy. During his first years as Secretary of the Navy he was much criticized, but after America's entrance into the World War the criticism died down. He favoured Government ownership of armour plate plants as well as of telephones and telegraphs. On retiring from the secretariatship of the Navy in 1921 he resumed his duties as editor of his newspaper. He was the author of The Navy and the Nation (1919).

DANKL, VIKTOR, FREIHERR VON (1854— ), Austro-Hungarian general, was born in Udine. After service in the cavalry he was employed in important staff positions. In the World War he commanded at the outset the I. Army and defeated the Russians in the battle of Krasnik (Aug. 23-25 1914). After the Italian declaration of war he became in May 1915 commander of the defence forces in Triol. As an army commander in the following years he took a successful part in the offensive against Asiago-Asierno, but shortly afterwards retired from his post on account of ill-health.

D'ANNUNZIO, GABRIELE (1863— ), Italian poet, man of letters and soldier (see 278). Later years, from 1908 to 1921, were the most active in D'Annunzio's career, not only in the literary field but also in those of war and politics. In 1908 he produced La nave, a vivid presentation of the early history of Venice, in which he sees forth his aspirations for Italy's mission as a great sea power, mistress of the Adriatic—a curious forecast of his future political action. The following year Fedra appeared, a classical drama, and in 1911 Le martyre de St. Sébastien, a dramatic mystery play written by D'Annunzio in French verse and first performed in Paris, with musical interludes by Debussy; it was a remarkable tour de force and appreciated as such by French critics, but is hardly one of his greatest achievements. La Pisanelle, ou la mort parfumée (1913), also written in French and first produced in Paris, is a picturesque reconstruction of the medieval Levant set forth in the author's gorgeous colouring. The same year he brought out in Paris Chère-feuille, a drama of modern life, with a plot adapted from Hamlet and containing some powerful scenes, and in 1914 he produced a slightly different Italian version of it entitled Il ferro. Parma, a lyric tragedy in a Renaissance setting with music by Mascagni, was first produced at Milan, also in 1914. His attraction towards the stage did not wholly suspend his output in the field of fiction, and in 1911 he published Forse che si, forse che no, a powerful but somewhat long-winded novel in which aviation plays a considerable part, and in 1913 La Leda senza elogo, a collection of essays, half essays and half fiction, which originally appeared in the Corriere della Sera and were afterwards issued in three volumes with a licenza in 1917. His purely poetic output was limited to the Canzoni della giro d'Oltremare (1911), dealing with the Libyan war and containing some admirable verse, and also some violent invective against the Powers which were hampering Italy in her Mediterranean policy.

The outbreak of the World War did not put an end to D'Annunzio's literary activity. For some years he had been living in France, having had to leave Italy on account of financial difficulties, but the moment the conflict began he became deeply impressed with the vital necessity for Italy to participate in it so as to realize her aspirations towards complete unity and affirm her sovereignty in the Adriatic. His addresses to the Italian people, full of eloquent and inspiring patriotism, were afterwards published in a vol Il piu grande Italia. In the spring of 1915 he returned to Italy; his speeches at Quarto for the celebration of Garibaldi's Sicilian expedition and in Rome aroused wide-spread enthusiasm, and undoubtedly contributed very largely to Italy's intervention. From the moment Italy declared
war D'Annunzio's career became one of the extraordinary romances of modern times—the man, hitherto regarded as a sensuous aesthete and a decadent, whose only claim to distinction was to exploit the sense of beauty and his mastery of the language, was now to prove a man of action, a soldier of almost incredible bravery, and a politician who, however his conduct may be regarded, for many months monopolized the attention of the world, and defied powerful Governments.

Although 55 years old, he at once volunteered for active service. Having been a reserve cavalry officer in the Novara Lancers he first joined the cavalry; but as that arm seemed at the time to have little chance of fighting, he got himself attached to the 77th Infantry and spent many months in the Carso trenches, always in the most exposed positions. But even that was not enough for his exuberant spirit, and he soon joined the navy headquarters in Venice, whence he took part in many torpedo and submarine raids. Finally he took to flying, in the hope of achieving immortality even at the cost of his life. His exploits in the air were of the most fantastic nature, and he became an airman of the very first rank. In one of his flights he lost an eye, in another was wounded in the wrist, and many times his airplane was riddled with bullets. In Aug. 1916 he led a flight over Vienna, where no bombs were dropped, but only propaganda pamphlets as it was an unfortified city; the exploit was particularlyaudacious owing to the great distance from enemy territory which had to be covered. He obtained three special promotions for gallantry, attaining the rank of lieutenant-colonel, was decorated with one gold medal for valour (a distinction corresponding to the V.C.), four silver and two bronze medals, and was created officer of the Military Order of Savoy. On being demobilized in June 1919 he received an exceptionally flattering letter from the Chief of the General Staff, regretting that the mobilized army should lose his valuable assistance, adding that he would still remain "spiritually among us," as a brilliant example "for the whole army of faith, heroism and self sacrifice." During the first few months he published several poems, some verses of great beauty, and after Caporetto he delivered several eloquent addresses collected in La Riscossa; on the Bucacci enterprise he wrote La beffa di Bucacci.

After the conclusion of the Armistice the cold attitude of the Allied Powers, and especially of President Wilson, towards Italy, aroused D'Annunzio's bitter indignation, and his letters and articles in this connexion, collected in the volume Contro uno e contro tutti, will occupy a prominent place in the literature of invective. The extreme violence of his language contributed not a little to embitter the relations between the Allies and President Wilson. During the Nitti régime D'Annunzio came to personify the patriotic reaction against the Government's policy; while he became the idol of a small body of enthusiasts, he attracted the sympathies of an ever-increasing portion of all the best elements in the country. The Fiume dispute symbolized in his mind the whole conflict between Italy's aspirations and the selfish greed and ingratitude of her Allies. When, in consequence of the decision of the commission of inquiry into the anti-French riots at Fiume, the Italian garrison was to be greatly reduced and the town policed by Maltese gendarmes, a movement was planned by Major Renna of the Granatieri to reoccupy the town in the name of Italy with regular troops and volunteers. D'Annunzio accepted the leadership of the expedition and on the night of Sept. 11 he marched from Ronchi at the head of detachments of grenadiers and other troops and reëntered Fiume. The movement was vehemently disinterested by the Italian Government, and D'Annunzio was severely criticized even by many of his admirers for having tampered with the discipline of the army and navy at such a critical moment, even for a patriotic purpose. On the other hand the policy of Signor Nitti and the open hostility of the Allies justified in the eyes of a large part of Italian opinion even so desperate an action. For 15 months D'Annunzio defied the Italian Government and indeed the whole of Europe with success. He assumed the style of ruler or "Commandant" of Fiume and created a new State. His "reign" was character-
and foodstuffs. The principal exports are timber and sugar. Large granaries and warehouses for sugar stand near the wharves of the port, which also affords storage capacity for over 20,000 tons of oil. Timber pens are at Holm 1 and extend for several miles along the bank of the Dead Vistula between Danzig and Plesnendorf.

The port has great commercial possibilities, the national features of which are fresh waterways and steamer rendering expansion easy. The port is practically ice-free and is the only gateway to Poland. Thanks largely to the protection afforded by the peninsula of Hel, it has special advantages of security and development. The river Vistula from its source in the Carpathian mountains to its mouth at Schweinhorst in the Gulf of Danzig is 660 m. in length. Harmonious cooperation between the free city and Poland, resulting from the capital required for the expedition and development of the port, is essential to assure a prosperous future for the city and a corresponding benefit to Poland.

A constitution was drawn up in 1920 by duly elected representatives of the free city in agreement with the High Commissioner appointed by the League of Nations. This constitution was placed under the guarantee of the League of Nations and the free city was proclaimed on Nov. 15, 1920. A treaty between the free city of Danzig and the Polish republic, negotiated by the principal Allied and Associated Powers (Article 104 of the Treaty of Versailles), came into force at the same time. By the Danzig constitution the Legislature is composed of a Senate and a popular assembly. The Senate consists of a president (who is the chief officer of the state), a vice-president, and 20 senators. The popular assembly consists of 120 deputies, elected by the universal, equal, direct and secret vote of all citizens, both men and women, who have attained the age of 20 years, in accordance with the principles of proportional representation. The League of Nations reserves the right of inviting the free city to introduce amendments to the constitution.

By the Treaty of Versailles Poland received the unrestricted use of the port, Polish imports and exports passing freely. The free city and Poland now form one customs area under the Polish customs tariff and legislation. The control and administration of the railway system within the free city (except that specially serving the port) and of direct communication between Danzig and Poland, as well as postal, telegraphic and telephonic communication via the port of Danzig between Poland and foreign countries, is given to Poland. German nationals ordinarily resident in the territory of the free city lost their German nationality on the coming into force of the Treaty and became nationals of the free city of Danzig. A diplomatic representative of the Polish Government stationed at Danzig acts as intermediary between the German Governments and that of the free city of Poland undertakes the conduct of the foreign relations of the free city as well as the protection of its citizens abroad. Passports issued to nationals of Danzig require the visa of the representative of Poland in Danzig. The right to fly the Danzig merchant flag is restricted to ships owned exclusively by nationals of the free city. The Danzig port and waterways are under a board composed of an equal number (not exceeding five) of Danzig and Polish commissioners. Its president is of Swiss nationality, failing previous agreement between the Danzig and Polish Governments.

Of special interest to the British visitor may be mentioned the so-called "Englisches Haus," rebuilt in 1569 as a home for the London cloth merchants on the site of their former house; evidences of early communication between Great Britain and Danzig may be found in the "Englischer Damm" and in the quarters of the town still known as "Old Scotland" and "New Scotland." The High Commissioner appointed by the League of Nations occupies the residence of the former commandant of the German troops.

DARDANELLES CAMPAIGN. 1915—The Dardanelles campaign of 1915 was brought about by a desire entertained during the early stages of the World War by the Allied Governments, especially by the British Government, that communications should be opened up from the Mediterranean into the Black Sea. These communications had been severed on the Ottoman Empire throwing its lot in with the Central Powers three months after the commencement of the struggle. Russia had in consequence been virtually cut off from intercourse by water with the outer world, seeing that the Baltic likewise was closed owing to action of the German navy; no adequate outlet for the Russian Empire's produce remained available; the most promising avenue for the introduction of warlike stores into the Tsar's dominions from without had been effectively barred. The very fact of re-establishing this vital strategical and economic artery of the Near East by force of arms would, moreover, of necessity carry with it the occupation of Constantipole by Entente forces and would deal a resounding blow at the very heart of the Sultan's realms. There was furthermore, at the juncture when the project of attack upon the Dardanelles was first seriously mooted at the beginning of Jan., 1915, a special inducement offered to the Allies for acting in this quarter—any threat to Staplul and the Golden Horn must tend to take pressure off the Russian army in Armenia which was at the moment believed to be in some peril.

War between Turkey and the Allies broke out at the end of Oct., 1914, following on several weeks of strained relations due to the reception of the German warships "Goeben" and "Breslau" within the Straits. Some British vessels carried out a brief bombardment of the Ottoman batteries at the mouth of the Dardanelles on Nov. 3, but the operation portook merely of the nature of a reconnaissance, and for some time hostilities were confined to a blockade of the Ottoman coasts,1 defensive steps in Egypt, and the seizure of the Shat el Arab and Basrah.

To secure command of the maritime defile that links the Aegean with the Sea of Marmora was, in the opinion of most

1 On Dec. 13, 1914 the British submarine H.M.S. "Eurydice" reached the Dardanelles and torpedoed the old Turkish battleship "Frenchman" at anchor. Less fortunate, the French submarine "Saphir" was sunk in a similar attempt to penetrate the inner waters on Jan. 15, 1915.
authorities, an almost indispensable preliminary to the undertaking of warlike operations against Constantinople and the Dardanelles by fighting forces coming from the west. The question of the mastering of this all-important lower waterway in the event of a contest with the Turks had indeed engaged the close attention of British naval and military experts some years earlier. The conclusion arrived at on that occasion had, however, been that, whether the campaign were to take the form of a purely naval operation or whether the task were to be performed by an amphibious expeditionary force, the enterprise was bound to prove most difficult. In 1914 the channel was known to be defended by a number of batteries, some of them armed with very heavy guns. Most of these works were planted about the southernmost part of the strait, but there was at least one in the Aegean, and known as the "Narrows." If the batteries and their artillery were somewhat out of date, the fact remained that warships steamng up the defile would be compelled to pass these fortifications at very close quarters, when the lack of range of their guns would cease to tell. The Ottoman authorities were moreover known to have given much attention to the problem of mine-fields especially adapted to the peculiar conditions existing within the Dardanelles; and the development which had taken place in this particular form of defence was such as to render the task of a fleet which should lower lower waterway in a more difficult one than it would have been a few years earlier. The fact that along the whole of its course this remarkable waterway is only separated from the Aegean by the attenuated Gallipoli Peninsula, did, on the other hand, suggest that the most promising method of attack upon the maritime defile from without would be to occupy that significant tongue of land.

An appeal reached the British Government from Russia on Jan. 2, 1915 for help to relieve the existing situation in Armenia, and an operation directed against the Dardanelles was judged to be the best means of complying with the request; but there were no large bodies of troops available that could be used for such a purpose. The consequence was that the feasibility of forcing a way from the Mediterranean up into the Sea of Mar- mora as a purely naval undertaking came to be examined afresh in London. When asked for his views, Vice-Adml. Sir Sackville Carden, the British commander-in-chief in those waters, proposed that a fleet should try to destroy the Ottoman forts in the Straits and to clear away the mine-fields sown in the channel, by adopting a process of methodical advance. This plan possessed the merit of novelty. It had always been assumed difficult to render the task of a fleet which should lower lower waterway in a more difficult one than it would have been a few years earlier. The fact that along the whole of its course this remarkable waterway is only separated from the Aegean by the attenuated Gallipoli Peninsula, did, on the other hand, suggest that the most promising method of attack upon the maritime defile from without would be to occupy that significant tongue of land.

A considerable armada was got together, although its assembling took several weeks and although the Russians had as a matter of fact heavily defeated the Turks in Armenia (battle of Sarikamish) even before orders for the assembling were issued. As regards large craft, the fleet consisted in the main of semi-obsolete battleships looked upon as unfit to take part in a fleet action. Of such ships the British contributed fourteen and the French four. But the fleet also included two semi-dreadnoughts ("Lord Nelson," "Agamemnon"), the battle-cruiser "Inflexible" and the newly completed "Queen Elizabeth."

1 On the naval operations, see also the article NAVAL HISTORY OF THE WAR. 2 "Queen," "London," "Prince of Wales," "Impeccable" and "Inflexible"; "Majestic" and "Prince George"; "Cornwallis" (Duncan class); "Swiftsure" and "Triumph"; "Ven- geance," "Albion," "Goliath" and "Ocean" (Canopus class). For the characteristics of these ships and of the "Lord Nelson" and "Inflexible" see 24.597. 3 "Bouvet," "Suffren," "Charlemagne," "Gaulois." 4 armed with 15-in. guns. The battleships were to be aided by several cruisers and destroyers and a flotilla of mine-sweepers also was organized. The conveniently situated islands of Tenedos and Lemnos (the latter of a matter of some dif- locked haven of Mudros as an anchorage) were occupied to serve as naval bases, and on Feb. 19 the venture opened with an attack upon the weakly Ottoman batteries that guarded the outlet of the channel. The batteries were silenced for the time being; but bad weather interrupted the proceedings and the batteries had to be silenced afresh a week later (Feb. 25)—effectually on this occasion. That night the mine-fields at the mouth of the Dardanelles were cleared away, and battleships were in consequence enabled to penetrate into the lowest reach of the defile, the Narrows.

Stormy weather caused some delays in continuing the programme, but heavily armed vessels made their way a short distance up channel on several days early in March and engaged some of the enemy works that were sited about the Narrows.5 The sweepers continued their labours night after night, gradually extending the fairway up which heavy craft could safely venture. Long-range fire on the forts directed from outside the Straits over the Gallipoli Peninsula was also tried, but the results proved disappointing. In reality, a very liberal expenditure of artillery ammunition on the part of the fleet was doing considerably less damage to the Ottoman defences than the Allied sailors imagined to be the case. Any Turkish battery that was chosen for target generally ceased firing before long; and the assailants were disposed to assume that the work was definitively put out of action, whereas all that had happened in reality was that the hostile gunners had been driven from their guns. Moreover, as promising as the situation may have appeared to be from the attacking side in so far as neutralization of the Ottoman batteries was concerned, it was plain that the mine-sweepers were making disappointing progress. The enemy's light guns, aided by effective searchlights, were offering a strenuous opposition to the small craft engaged in the all-important duty of clearing the channel of submerged defences. At last Vice-Adml. Sir John Michael De Robeck, who had succeeded Adml. Carden, decided, under some pressure from home, to undertake an onset in full force upon the defences of the Narrows by day, although mine-fields still forbade a close attack on the forts on the part of battleships.

This operation took place on March 18, and it proved unsuccessful. Sixteen battleships entered the Straits to participate in the encounter, the manoeuvring of so large a number of vessels in this narrow space was a matter of some difficulty and also gave excellent targets for the Turkish artillery, which replied to their fire with unexpected spirit. The contest lasted for several hours, but towards evening the fleet was obliged to retire, three of the battleships having been sunk and four others having been put out of action. The three vessels lost, the "Irresistible," "Ocean" and "Bouvet," were out of date; but of those put out of action the "Inflexible" was a modern ship, and she and another very nearly forlorned before they could be got to a place of safety. The defenders employed two mines drifting down with the current with striking success on the British, and the Turkish batteries had, it was said, largely to bring about the defeat of the naval force. The events of the day indeed clearly indicated that the enemy's underwater devices were an even more serious obstacle to the forcing of the Dardanelles than were the Ottoman batteries. Nor had the Allies grounds for supposing that drift-mines would not be met with, were the attack renewed.

After this experience Vice-Adml. De Robeck felt himself obliged to inform the Admiralty that the offensive against the Straits ought not to be continued as a purely naval operation of war. This necessitated a complete recasting of the Entente plans. The Turkish authorities, it may be mentioned,
on finding nearly all the ammunition for their heaviest ordnance in the Narrows to be used up, viewed the prospect of a possible fresh fleet attack with some apprehension, as they were under the impression that the assailants had been beaten off on the 18th by the guns and not by the mines. This led to a mistaken idea that De Robeck's ships might have succeeded had they renewed their attack at once in spite of losses; the damage which they had done to the batteries had been almost insignificant, and they had not got within 5 m. of their objective.

The Allies had foreseen from the outset that land forces would have to be brought into play sooner or later in their campaign in this region. Even assuming that the fleet forced the Dardanelles, its communications would have to be safeguarded, and there would still be Constantinople and the Bosphorus to be dealt with. Entente troops had already before March 18 been set in motion for the Aegean, and some were in Lemnos. A heterogeneous army, drawn largely from India and Australasia, had also been gathering in Egypt for several weeks past, of which portions could be made available for work elsewhere in the Near East. Gen. Sir Ian Hamilton, who had been chosen as commander-in-chief of the military contingents that were to cooperate in due course with the naval forces in this theatre of war, had moreover actually arrived on the day before the abortive fleet attack upon the Narrows and had witnessed the fight. In view of what had occurred the Allied Governments decided that in further operations full use must be made of the gathering army, and from this time onwards the military began to assume the principal rôle in the effort of the Entente to secure command of the Dardanelles.

But Sir Ian Hamilton judged it to be inexpedient to initiate land operations at once. Reconnaissance had brought to light the extent to which the Turks were making preparations to repel attempted landings, both on the Gallipoli Peninsula, and on the Asiatic coast adjacent to the mouth of the Straits; and everything pointed to the expeditionary force having to start work by fighting its way ashore. A tactical operation of that character demanded most careful prior organization, and it called for a distribution of the attacking force amongst the available shipping based on purely tactical considerations. As a preliminary to his undertaking a serious land campaign on the shores of the Aegean, the general felt himself obliged to concentrate his forces in Egypt, and to prepare them there for the hazardous undertaking to which they were to be committed. A month was lost in consequence, 1 and on March 24 the Turkish V. Army was formed (March 24) to guard the Straits, and Marshal Liman von Sanders, head of the German military mission in Turkey, was appointed its commander-in-chief. Between the last days of March and the day of the landing the defence system was overhauled and greatly developed. 2

The Franco-British expeditionary force was to be composed of seven divisions—three, the 29th, the 42nd and the Royal Naval, furnished by the United Kingdom, two formed of Australian and New Zealand troops, and two composed of French colonial troops. At the time however when active operations began the 42nd Division and one of the French divisions could not be counted on owing to shipping for them not being available. Against this force Liman von Sanders could at the outset pit six divisions. Hamilton had resolved on making the Gallipoli Peninsula his objective, intending to secure high ground which dominated the Narrows from that side. He could conceal his design upon to the very last. His adversary had perforse to disperse the defending troops, so that on the morning when the land campaign started two of the Turkish divisions (3rd and 11th) were watching the outer coast on the Asiatic side, two (5th and 7th) were near Bulair to provide against a landing at the neck of the Peninsula, while the remaining two (9th and 19th) under Essad Pasha guarded the places where, in the event, the Allied army made its appearance. Still, if the attacking side enjoyed an advantage in this respect, the possible landing-places were few in number and were therefore well indicated, there had been ample time to protect them with earthworks and barbed wire, and in any disembarkation in face of resistance the tactical conditions favour the defence.

Hamilton contemplated two distinct major operations. One force was to be put ashore about the extremity of the peninsula— an area which it is convenient to designate as " Helles." The other force was to land N. of Gaba Tepe, where there are extensive beaches. Part of the one available French division was, furthermore, to effect a descent at Kum Kale opposite Helles as a subsidiary operation, partly to deceive the enemy and partly to neutralize Turkish guns, which otherwise might intervene in the Helles fighting. Faints were also to be carried out at other localities so as to bewilder the defenders. The effort at Helles was to be entrusted to the 29th Division, supported by the Royal Naval Division, and ultimately to be reinforced by the French division. That at Gaba Tepe was to be carried out by the two Australasian divisions under Gen. Sir William Birdwood. The Anglo-French army concentrated in Mudros Bay, the great natural harbour of Lemnos, in the third week of April and, after a short delay enforced by bad weather, the armada put to sea during the nights of the 23rd-24th and the 24th-25th, so that the transports and the covering warships should arrive at the various rendezvous at or before dawn on the 25th. The day broke calm and still, after a placid night.

A firm footing was gained on shore by the assaulting at three out of the five points where disembarkation was attempted, while the effort was also, within restricted limits, successful at the two remaining points. The beaches which had been selected were, moreover, from right to left, " S " on Porto Bay, " V " and " W " on either side of Cape Helles at the south-western end, and " X " and " Y " on the outer shore; " V " and " W " were regarded as of primary importance, as those two beaches offered suitable landing places from the point of view of subsequent operations. The attacks at " S " and " Y " were intended to be subsidiary; but great importance was attached to that at " X " owing to the vicinity of this point to " W. " The troops started for the shore in flotillas of boats soon after dawn at all points, their approach covered by the fire of battleships and cruisers, and in all cases the boats were not fired upon until after the last moment.

As it turned out, the actual disembarkations at " S " and " X " and " Y " were carried out without any very great difficulty; but the troops detailed for " W " beach only gained a footing after incurring very heavy losses and by a display of indomitable resolution, while at " V " the operation went very near to failing altogether. In the general scheme of attack the landing at this last point was of primary importance; the largest force had been detailed for it, and the troops were for the most part conveyed to the beach in a steamer (the " River Clyde") which was run ashore by the gunboats and other vessels. The section of the water's edge had established itself on land by nightfall, and the Allies' position here seemed to be highly critical. The troops detailed for " Y " beach had also got into serious difficulties, and as it turned out they had to be withdrawn next morning. But the forces which had landed at " W " and " X " beaches had joined hands, the one battalion detailed for " S " beach had secured a good position, and during the night the troops still
DARDANELLES CAMPAIGN

801

Left aboard the "River Clyde" contrived to disembark. The resistance offered by the Turks had been most determined, and these could reckon upon receiving welcome reinforcements within a few hours; for as soon as the situation declared itself Liman von Sanders had hurried off one of the two divisions (the 7th) at Bulair by water with orders to repair to Helles.

In the meantime a French brigade had, after a tough struggle, effected a lodgment at Kum Kale. The Turks were in strong force in that quarter, and, as the hours passed and the defenders (3rd and 5th Divs.) ceased, the situation became such as to render any French advance out of the question; indeed, but for the fire of the warships the troops who had landed could barely have maintained themselves. Still, their presence on the Asiatic side of the Straits was for the time being indirectly helpful to their British comrades who were struggling for a grip on the extremity of the Gallipoli Peninsula.

The invaders of Helles had secured but a precarious foothold on Ottoman soil by the morning of the 26th, twenty-four hours after starting operations; but fair progress was made by them during the course of this second day. What was left of the force was again detailed for the landing at "V" beach contrived during the early hours by stern fighting to occupy some high ground hard by, and also to join hands with the troops landed at "W" beach. Additional infantry was got ashore at "W" and "X" beaches, the first elements of the French division began disembarking at "V" beach in the afternoon, and before evening touch had been gained with the battalion that had made good at "S" beach. That night the French evacuated Kum Kale by arrangement. On the 27th a general move forward took place, the Turks (4th Div.) offering little opposition, and by nightfall the Allies held a line stretching approximately from the north end of Morto Bay to "Gully" beach. But very heavy losses had been sustained by the 20th Division, large bodies of Turkish troops had arrived from Bulair and were being brought round from the Asiatic side of the Straits, and after three days of strenuous combat the British and French had barely secured a depth of 2 m. of country, while their opponents had had time to concentrate their scattered forces. Realizing the urgent need of gaining ground before the enemy was gathered in full strength, and hoping to win the heights beyond Krithia and Achi Baba, Sir J. Hamilton ordered a further attack for the 28th. On this occasion the Turks made a determined resistance; but the Allies' line was advanced by a few hundred yards at most points, and a three days' full then ensued in the Helles area.

While this embittered struggle had been in progress at the extremity of the peninsula, stirring events had been in progress on its outer coast-line. The arrangements for disembarking Birdwood's Australasians differed from those made at Helles, in that here the whole force was to land at one point, and that an attempt was to be made to effect a surprise just before dawn (April 25). The surprise was effected, but in the darkness the force arrived at a locality about a mile N. of the beach immediately N. of Gaba Tepe which had been the selected goal. The beach on which the landing took place proved to be satisfactory, but it lay at the foot of a steep and rugged declivity, which was therefore a most unsuitable place for putting ashore the stores and impediments of an army. At the moment of approach of the first boats the defenders actually on the spot were few, so that the high ground overlooking the landing place (which came to be known as Anzac Cove) was secured by the assailants at the first rush. But the enemy speedily brought effective flanking artillery fire to bear on the beach and on the boats; the troops, both officers and men, were inexperienced, the ground to be advanced upon was hilly, scrubby and extremely broken, and considerable confusion arose. The advantage gained in the first instance by the surprise was lost, and the Turkish 19th Div. was able to gather in force during the critical hours of the morning when the Australasians might, in virtue of their superior numbers, have secured a satisfactory sector of ground. At the end of the day, although the whole of Birdwood's infantry had been ashore for several hours, the position which these troops had taken up remained a haphazard one, no depth had been secured, losses had been heavy, and the situation seemed so threatening that the question of a withdrawal was even considered at one time.

Reinforced by parts of the two Bulair divisions the Turks delivered vigorous counter-attacks on the 26th; but these were beaten off, and on that day and on the morrow the Australasian troops dug themselves in so thoroughly that by the night of the 27th-28th the position which they had taken up, such as it was, was reasonably secure. On the other hand, the Turks, who were commanded by Essad, had likewise dug themselves in, and they could bring an effective artillery fire to bear on the Anzac trenches from three sides, the prospect of the landing force making any effective progress under the awkward conditions of ground in which it found itself was remote, and Birdwood's contingents had in reality been even less successful than had those detailed for Helles as regards securing an adequate area on the enemy's shores before the defence gathered strength. Their situation was unsatisfactory not only in the tactical sense, but also from the point of view of keeping the troops supplied, owing to their being perched on ridges with steep gradients behind them. Water also was found to be scarce, and was sure to become scarcer during the summer months. Lastly, the landing place was much exposed in the event of bad weather.

Although his adversaries had fought their way ashore in two sections of the Gallipoli Peninsula—and he had had to give up his first idea of driving them back to their ships—Liman von Sanders had no grounds for despondency when May opened. The Allies' plan was now unmistakably indicated, and concentration of the defending forces had become possible in consequence. The marshal's Turks had fought gallantly in the strenuous encounters which had taken place, and large reinforcements (2nd, 4th, 15th, 16th Divisions) were on the move or preparing to move to his aid. His troops were entrenching themselves solidly in face of the invaders both at Helles and at Anzac, so that his antagonists would be obliged to storm lines of earthworks whenever they should attempt to make further progress. It is true that Hamilton was expecting the arrival of the 42nd Division and of the 2nd French Division after a few days; but his losses had been extremely heavy, there were no depots at hand from which these losses could promptly be made good, and he was inferior to the Turks in artillery both as regards calibre of guns and as regards ammunition. On three successive nights from the 1st to the 3rd the Turks delivered resolute assaults upon the Allies' position at Helles, but they were repulsed on each occasion; they also on the night of the 2nd-3rd launched attacks upon the Australasians, the combat lasting into the next day, but here also they were beaten off.

Two brigades of Birdwood's force were thereupon temporarily transferred to Helles by night, and on the 6th and following two days a mighty effort was made by the invaders to push forward in this southern area and to win the high ground that stretches across the peninsula about 5 m. from its extremity; their front was, however, only advanced by a few hundred yards and a much more pronounced success was called for to render the Allies' position in this area at all a promising one. Much work was done in organizing the area and its communications and landing places, but the tactical situation at Helles remained stationary for the rest of the month. At Anzac similar work was done but the only tactical incident of much importance in that area was that Lord Milner personally directed a formidable attack upon Birdwood on the night of the 18th-19th, the assailants being defeated with severe loss.

The arrival of German submarines during this month proved 3

1 The German commander of the 5th Div. (Lt.-Col. v. Sodenstern) was put in charge of the Helles front, Essad taking command on the Ari Burnel front.
2 The abbreviated designation of the "Australian and New Zealand Army Corps.”
to be an event of lasting importance. Two British battleships were sunk off the peninsula ("Triumph" May 25, "Majestic" May 27), and owing to the risks run by warships and transports while in the open the Allied troops on shore were thenceforward almost deprived of support from naval gunfire, while reinforcements and stores were mostly brought from Mudros to the various landing places in small craft. Hamilton made Imbro's his headquarters, and troops also were sometimes collected there owing to its vicinity both to Helles and to Anzac. Within the Dardanelles the battleship "Goliath" had been torpedoed by the Turkish destroyer "Muavenet-i-Milliyet" on May 13, in the attack which Turkish submarines of the performing invaluable service, diving under the mine-fields, causing havoc amongst enemy craft in the channel itself and higher up, and threatening Ottoman communications with the peninsula.

That the position of affairs had become one virtually of stalemate was fairly evident to all authorities on the side of the Entente before the end of May. A Russian army destined for the Bosporus, which had been gathered near Odessa, obliging the Porte to keep strong bodies of troops about Constantinople, had been called to Galicia, thus liberating several Turkish divisions for service at the Dardanelles. Only by dispatching very substantial reinforcements to the theatres and with supplies and with orders the Entente could the Entente achieve its object. But the military situation elsewhere forbade the allocation of strong British or French contingents to this secondary theatre of war, and there was much delay in London in forming a decision. The 52nd Division was, however, under orders to proceed from England to the Aegean; it arrived at Helles early in June, where there was some severe fighting during that month by which the Allies somewhat improved their position.

But trench warfare was the order of the day, and the British and French were trying to carry this on without that ample artillery support which is almost indispensable when earthworks have to be stormed under modern tactical conditions.

Others (UB3, UB7, UB8) sailed for the Straits in the latter part of April. UB3 was lost on route but nos. 7 and 8 reached the Straits about the middle of May. They proceeded to Constantinople, and were chiefly employed against the Russian Black Sea fleet. Four small boats of the mine-laying class were also dispatched, which three (UC14, UC13, UC15) made their way to Constantinople, carrying important military stores, in the summer months through an intermediate base had been established at Orak near Brudar. Another small boat (UB14) on its way from Orak to the Straits, torpedoed the British transports "Royal Edward" off Cos (Aug. 14), "Anzio" in the Aegean (Sept. 2). Other British transports sunk in the Aegean were "Seraph," "Ramazan" and the "Marquette" (Oct. 26). Of the ships named only the "Southland" was brought into harbour.

The work was done by the seagoing boat U21, Lt. Comm. Otto Hersing. This left the Ems after special preparation for the long voyage, on April 25, and reached Cattaro with only half a ton of fuel left on May 13. After replenishing at that base, Hersing sailed on the 27th for the Dardanelles, where, on the 29th and 27th he sank the battleships "Triumph" and "Majestic." U21 then proceeded to Constantinople. On July 4 he came out and sank the French transport "Carthage" off Helles; later a cruise in the Aegean be tried to reenter the Straits, but finding the British mine defences too formidable, he sailed to Cattaro to take part in the general commerce-destroying warfare in the Mediterranean. This was the work of four other seagoing boats having followed U21 from the North Sea, and it is claimed that 50,000 tons of shipping were sunk in the Mediterranean and Aegean during Sept. 1915. At the end of that month the Germans had nearly one-third of their total submarine and mine force in the Mediterranean—14 boats of which 5 seagoing, 2 small and 1 mine-laying, boats were working in the open, and 3 small (UB7, 8, 14) and 2 mine-laying (UC13, 15) at Constantinople. In addition, the Austrian boats numbered about 10. The British had one of their flotillas of 4 boats returning from the French cruisers "Leon Gambetta" in Ionian waters on April 27.

Submarine activity in the open Mediterranean and Aegean had no subsequent influence in determining the final abandonment of the Gallipoli enterprise, but in preparing the way for the final stages of the war. But locally and tactically, no real success was obtained by the new arm after the departure of U21. Liman von Sanders expressed the opinion that Turkish submarines on the spot were of no assistance to him, and that the British subs in spite of their frequent raiding of the Midda of Mamma, did not seriously interfere with his water movements.

A general attack was delivered on the Ottoman positions on the 5th, by which some little ground was gained along most of the front. Then on the 21st the French, who were on the right next to the Straits, pushed their line forward as the result of a well-planned local offensive, and this achievement was followed up on the 28th by a successful operation on the part of the British on the extreme left, by which the line at that end was advanced to nearly abreast of Krithia. Satisfactory as were the results of these two affairs at the end of the month from the point of view of the Allies, they did not render their situation at the extremity of the peninsula much less discouraging than it had been before. The evacuation by the Allies at the end of June was indeed for all practical purposes to represent the line that was to be held up to the night of Jan. 8 in the following year. The Turks still occupied all the high ground. They continued to enjoy all the topographical advantage in respect to position. Ottoman guns dominated the entire territory which the invaders had succeeded in the course of two months in conquering, as well as "V" and "W" beaches which were the landing-places chiefly used by them. This Turkish artillery was bearing upon Helles not merely from the uplands facing the Allies' front line, but also from the Asiatic side of the Dardanelles on the Allies' flank. At Anzac the situation remained in the same state, although there was some sharp fighting at the end of the month.

Both sides, it should be mentioned, were suffering much from sickness, and continued to suffer all through the summer. The heat was great. Flies swarmed. The dust caused much annoyance whenever there was any wind. The British hospital arrangements were not beyond criticism. The water question caused no great difficulty at Helles, but the very limited local supply found within the contracted area occupied by Birdwood's force gave out almost entirely when the dry season set definitely in, and much of that which was brought by sea or condensed had to be conveyed up steep inclines to the trenches. As a result of disease, and of casualties in action and from bombardment, the British divisions recruited in the United Kingdom were constantly in short of establishment, no proper provision having been made for keeping them up to strength. The two Australian and the two French divisions were better off in this respect; but the number of divisions under Sir I. Hamilton's orders—eight now that the 52nd had arrived—in reality gave a very misleading impression of the strength of the force; his Majesty's Government had, however, during the course of the month dispensed with divisional commands for the line, and the Allied commander-in-chief had been cheered by the tidings that five further divisions, the 10th, 11th, 13th, 33rd and 54th, had been placed under orders for the Aegean, and would join him between July 10 and Aug. 10. The number of Turkish divisions within the peninsula and in reserve on the Asiatic side of the Straits had, however, grown, and by the end of June Liman von Sanders appears to have had nine under his orders.

July, in so far as the Allies were concerned, was in the main a month of preparation. In view of the anticipated arrival of substantial reinforcements from England there was no great temptation to embark on offensives; and owing to the shortage of artillery ammunition, what there was of it had to be jealously husbanded, although the French divisions were not suffering from this disability so much as the British. A general attack was, however, delivered by the Helles force on the 12th and 13th along the right half of its front, and some little ground was conquered; but the situation was not appreciably modified. Towards the end of the month the 13th Division, the first of the new divisions to arrive, disembarked in this southern area as a temporary measure, bringing welcome relief for the troops in the trenches. At Anzac July passed off quietly. There the rival forces were in close contact, the Turks everywhere enjoying the advantage of command; some sections of the Australian line were, indeed, completely overlooked by ground in Ottoman occupation. Liman von Sanders was joined by reinforcements from other parts of the Empire early in the month, and the number of Turkish divisions in the peninsula swelled; but, aware that additional British troops were arriving, he felt obliged to
leave forces on the Asiatic side of the Dardanelles in case of a hostile landing on the coast to the S., and of the divisions on the peninsula he kept two about Gallipoli and Bulair.

How best to utilize the fresh troops joining him from England was anxiously considered by Sir J. Hamilton and he framed his plans well in advance. The French had from the outset favoured operations on the further side of the Straits, and the expediency suggested itself of either throwing the whole Allied army in that direction, or else of diverting the reinforcements thither as a detached contingent. But there were valid objections to either course. A descent S. of the Straits connoted disembarkation in face of opposition, and, even supposing the landing to be successful, the force would start work much further from the Narrows than were either Helles or Anzac. Then again, to plant down a portion of the Allied troops on one side of the Straits, while continuing operations on the other side, would mean a voluntary dispersion of resources in place of concentration. The commander-in-chief weighed the pros and cons and he decided against a combination of war on such lines. There were also not wanting inducements for the Allies to attempt a landing near Bulair, seeing that a victory at that point would carry with it the severance of the Turkish land communications with the peninsula. But, here again a disembarkation in face of opposition would have to be risked and a dispersion of resources would arise, while there were strong objections from the point of view of ship transport to convey troops to a point so distant from the island of Imbros as Bulair; for Imbros was to be utilized as the principal concentration point for the reinforcements from England. That the Ottoman commander-in-chief had to be prepared for his opponent adopting one of these two plans offered a strong argument against adopting either of them.

Hamilton decided that his great effort should be made at, and immediately to the N. of, Anzac. The rugged bluffs on which Gen. Birdwood’s force had taken root since April were spurs of a tangled mountain mass known as Sari Bair, from the topmost ridges of which the Straits between the Narrows were partially visible. The occupation of these topmost ridges must greatly assist in a further advance across the peninsula here at its narrowest point. The plan decided upon was secretly to augment the force already at Anzac by about a division and a half, and, with the force thus augmented, to secure possession of Sari Bair by a night-attack. But this was only part of the plan. It was also decided that a force of nearly two divisions should, on the same night as the attack on Sari Bair was launched, effect a landing at an entirely new point—Suvla Bay, a few miles N. of Anzac, where the Turkish troops were known to be few. The object of this second move was twofold—it would indirectly assist the offensive against Sari Bair, it would also furnish the Allies who were planted down on the outer coast of the peninsula with a more sheltered landing place and base than Anzac Cove. The 13th Division, with some other detachments from Helles and with one brigade of the 10th Division, were the troops chosen to augment Birdwood’s force already at Anzac. The new venture further north was entrusted to the 11th Division, which was to assemble in the island of Imbros supported by the rest of the 10th Division; the portions of this latter division not detailed for Anzac were to be used partly at Imbros and partly at Anzac, where the Menjire, a peak of Mt. Mineme, more than 1000 m. from Suvla. The last divisions to arrive, the 53rd and 54th, were to be employed wherever should seem best after the offensive had begun. To land the whole of the reinforcements simultaneously would not have been practicable with the amount of water transport available.

The utmost secrecy was observed by the Allied staff. Appropriate steps were taken to mislead the Ottoman authorities by means of feints and of reconnaissances executed at localities other than those selected for operations. False reports were assiduously circulated by the intelligence department. This part of Hamilton’s programme was, indeed, carried out most successfully; for, although Liman von Sanders was aware of the arrival of large bodies of British troops in the islands, he remained entirely ignorant of his rival’s real design until this was actually in execution. The Ottoman commander had organized his forces as a southern group watching Helles and a northern group watching Anzac, with the already mentioned two divisions at the Bulair end of the peninsula. There were large Turkish forces in reserve about Chanak, in addition to substantial contingents disposed to the S. of the outlet of the Straits ready for any move of the Allies in that quarter; but, thanks to a system of jetties erected on either shore at the upper end of the Narrows, and to improved communications, troops could be shifted from side to side of the waterway very rapidly. Numerically, the contending armies would at this very critical juncture of the campaign be almost equal, the invaders rather the stronger; but the Turks were much dispirited, so that the result almost hinged upon the speed with which the attacking side should gain ground before the defenders had time to concentrate.

The offensive started on Aug. 6 with two preliminary enterprises. An onset was made upon some of the Turkish trenches in the Helles area, which led to sharp fighting; the object was to prevent the Turks transferring troops northwards, and it probably served its purpose; apart from that, little was accomplished although the affray went on intermittently for a week. Portions of the Australian force also broke out of the southern sections of the Anzac position, and were rewarded by the acquisition of some very valuable ground after a violent contest; the real purpose, however, was to occupy the attention of the enemy and to conceal a design of much greater moment.

So dexterously had the assembling of the reinforcements within Birdwood’s position been effected, that the Turks had entirely failed to detect how the numbers of their opponents in this area had during the last few nights been nearly doubled. The scheme of operations for the capture of the Sari Bair mountain mass was that the force detailed for this enterprise should move out in several columns from the northern end of the Anzac position along the low ground near the shore, after dark on the evening of the 6th. On reaching their appointed stations the columns were to wheel to the right and were to work their way up certain steep but well-defined gullies that led towards the
topmost ridges, which, it was hoped, would be reached by day-light—a somewhat sanguine anticipation, as it turned out. All went well at the outset. The Turkish posts about the lower spurs were in some cases surprised. The outlets of the gullies were in the assailants’ hands soon after midnight. The hostile detachments on guard gave way at all points. But the routes to be followed were difficult to find in the dark, the ascent was rapid, the adrenaline was broken, and the enemy opposed a stubborn resistance to the advance, with the result that this was greatly retarded, and that at daybreak the most forward of the columns was not much more than halfway up. The Ottoman staff had, moreover, on the first alarm begun to hurry reinforcements on the Sari Bair from the rear, while the Allied troops were so much exhausted by their nocturnal experiences that all attempts to win the upper ridge failed on the 7th.

A rearrangement of the attacking forces was carried out during the following night, and the attempt to gain the highest ground was resumed at dawn on the 8th from the positions that had been advanced 24 hours earlier. The Ottoman detachments on the mountain had by this time been reinforced by at least one division, and they were fully prepared to meet the onset when it came. One of the Allies’ columns nevertheless succeeded in establishing itself on a patch of the topmost ridge and in holding on to what had been secured, although the efforts of the assailants miscarried elsewhere. After a fresh reorganization during the night, the attempt was yet again made on the 9th to win the mountain, and that day some British and Indian troops actually fought their way on to a commanding summit from which the Narrows could be seen, only, however, speedily to be driven off again. The Turks holding the ridge were, moreover, constantly receiving reinforcements now that Sir I. Hamilton’s plan was completely exposed, and so victory definitely decided itself in favour of the defenders early on the 10th. For these, by a sudden onset that morning, recovered possession of the path of high ground which their antagonists had succeeded in wresting from them on the 8th and in holding ever since. Then, by a resolve if somewhat costly counter-attack delivered from the dominating position which they occupied, the Osmanlis thrust those opposed to them back down the slopes all along the line and could fairly claim to have gained the upper hand. Strenuous fighting thereupon ceased. Both sides had suffered very severely in the furious encounters that had been in progress since the evening of the 6th, and the troops were completely worn out by their efforts.

The attempt to secure Sari Bair thus failed, and the carefully devised scheme by which the invaders had hoped to establish themselves in a dominating position in the Anzac region at almost the narrowest portion of the Gallipoli Peninsula fell to the ground. It is true that, as a result of the operations the area in occupation of the Allies in this quarter had been greatly extended in a northerly direction, so much so, indeed, that little difficulty was experienced by Gen. Sir I. Hamilton in securing close contact with the contingents that had landed at Suvla on the night of the 6th—7th, and from which substantial support had been expected. As a matter of fact, the Suvla troops had afforded the Anzac columns no assistance at all beyond occupying the attention of one of the two Turkish divisions which Leman von Sanders set in motion south-westwards from about Gallipoli as soon as he had satisfied himself as to danger lay, and the doings of this newly landed force had now to be recorded.

The plans for bringing the 11th Division and bulk of the 10th Division from the islands to Suvla and disembarking them had been elaborated with meticulous care by the naval and military staffs. As Turkish detachments watching this strip of coastline were known to number only about 2,000 men—the Ottoman authorities never contemplating a hostile landing in force in the locality—the design was to put most of the attacking troops ashore during the night of the 6th—7th as a surprise, and that they should then push on at once and master a range of hills 4 or 5 m. to the east. At Suvla Point the coast (which from there down to about Helles runs roughly N. and S.) turns abruptly to the N.E. to form one side of the Gulf of Saros; along this stretch of the shore a well-defined ridge, starting close to the headland, rises almost like a wall from the sea and overlooks what may be called the Suvla area from the N., just as the above-mentioned range of hills overlook the area from the east. The area is mostly flat up to the foothills. Close to the bay there is a lake—a marsh in dry weather—which necessarily crampd the movements of troops landed at or near the bay. Army headquarters assumed that the plain, with the high ground to the E. and N., would be in British hands early on the 7th.

The 11th Division from Imbros was to disembark first, and was to be on the right in the subsequent advance. The 10th Division from Mudros and Mitylene was to follow it ashore, and, moving forward on the left, would secure the northerly ridge. Most of the 11th Division was to land just S. of the bay, but one brigade was to gain its footing inside the bay. The work was to begin as early as possible, allowing for the flotilla only quitting Imbros after dark. Especially constructed lighters, with motor power, were to play an important part in the disembarkations, a number of them having recently arrived from England. Elaborate arrangements had been made for water supply to the troops ashore, as the whereabouts and the capacity of wells were doubtful. The secret had been well kept, and a difficult operation of war was in its opening stages most successfully carried out.

The two divisions detailed for this Suvla enterprise both belonged to the British “New Army”; they were unacquainted with active service conditions, having come straight out from England, and they were being highly tried in being called upon to execute a landing in force at night in face of opposition. There was, indeed, no precedent for an undertaking of this kind under modern tactical conditions. Nevertheless the whole of the infantry of the 11th Division was on shore before dawn, and its leading battalions had driven off the Turkish detachments met with in the immediate vicinity of the points of disembarkation. The only hitch that had occurred during the night-time had been at the landing-place within the bay, where the water had proved to be inconveniently shallow for the lighters; this had created some confusion and delay. But the urgent need of pressing forward at once was not realized by the attacking side, and the opposition offered by the parties of Osmanlis close to the bay was taken too seriously after daylight. Moreover, when the first portion of the 10th Division arrived from Mitylene soon after dawn, it was decided to put these troops ashore to the S. of the bay, instead of inside the bay as had been intended; so that they found themselves, to start with, on the right of the 11th Division and not on its left, the general line of contemplated advance being to the N. of the lake. They were unfortunately moved from right to left, and this took many hours.

During the forenoon a good landing-place was found inside the bay on its northern side, and the contingent of the 10th Division from Mudros disembarked at this point. But no troops were seen moving northwards, and comparatively late in the afternoon, and by evening the attacking side, although enjoying a great numerical superiority, had only reached the foot of the hills that lay to the E. of the landing-places and captured one advanced spur. The troops had during the latter part of the day suffered greatly from thirst, the arrangements with regard to water having practically broken down mainly owing to the inexperience of the troops themselves.

When Leman von Sanders (who had fixed his headquarters near Gallipoli) learned during the night of the 6th—7th that the Allies were landing in strong force about Suvla, and were also attacking Sari Bair from Anzac, and after he had satisfied himself that certain threats on the part of his opponents at other points might be regarded as mere feints, he ordered the two Turkish divisions under his immediate orders to proceed towards Suvla with all speed. This, however, meant a two days’ march along indifferend roads. The only Ottoman detachments which during the 6th and 7th confronted the two British divisions that had made a descent on this locality were those which had been on guard on the spot when the landing was taking place. Consequently there was still on the 8th a great opening left for the attacking side to complete the first part of its programme, i.e. to
gain possession of the heights to the E. of Suvla, which dominated the landing-places and the whole of the area in their immediate vicinity that had been occupied on the 7th. The very few Ottoman guns which had been causing the freshly disembarked troops a good deal of annoyance during the 7th had been withdrawn for fear of capture, the defenders fully expecting a forward move by the Allies. But no move forward took place. The opportunity was allowed to slip by. The Turks remained in possession of the high ground, and that night reinforcements began to join them from the N.E., the troops as they came up being rushed into position in view of impending attack.

That attack was at last delivered early next morning. It failed completely. Enjoying the benefits of occupying a commanding line, the defenders were also reinforced during the progress of the combat. Although sustained by a fair number of guns and with the moral support of the 53rd Division, which had disembarked during the night, the 10th and 11th Divisions could make no headway. The delirium of the Allies on the 7th and 8th, when the forces opposed to them were insignificant, had been fatal. The great numerical superiority which they had at first possessed was gone by the 9th, and their task had come to be the ejection of an almost equal enemy from a naturally formidable position. That day was also the last on which any hope remained of the Sari Bair offensive accomplishing its purpose, and on which help from Suvla might conceivably even at the eleventh hour have turned the scale. The defeat suffered by the Suvla troops on the 9th was in reality decisive in so far as the new area was concerned; but, even so, the invaders who had set foot there tried yet again on the 10th to wrest the heights in front of them out of Osmanli keeping. The effort, however, failed, and further offensives in this quarter were abandoned for the moment.

The situation on the 11th offered little encouragement to the invaders. The carefully devised scheme of operations from which they had expected so much had come to naught in its most important features. A footing had no doubt been gained at Suvla, giving the Allies control of a fairly well-sheltered inlet on the outer coast of the peninsula; but as the high ground within easy artillery range of the landing-places, and which overlooked the whole occupation, had remained in the hands of the Turks, much of the benefit hoped for from the acquisition was in reality neutralized. As had been the case at Helles and at Anzac ever since the first opening of land operations in April, only a restricted patch of Ottoman territory had been obtained by the new undertaking, and although the position at Anzac had been extended and improved it remained an extremely bad one. The Allies now occupied many miles of front in the peninsula, but there was hardly a spot where the enemy had not the upper hand in respect to ground—what they required was not breadth but depth, and depth they had failed to secure. They had moreover incurred very heavy losses in the combats of, and since, Aug. 6. There were yawning gaps in their ranks. Except a division from Egypt, coming to fight on foot, no reinforcements were on the way, and the last of the five divisions from England, the 54th, had been swallowed up at Suvla. The defending side had also, no doubt, suffered heavily in casualties, especially on Sari Bair; but the Turkish commander-in-chief could fairly claim that, if some ground had been lost, he had held his own in a contest in which his adversary had enjoyed some notable advantages at the start.

An effort was made on the 15th by the troops on the extreme left of the Allies' position at Suvla to gain ground along the ridge N. of the plain; but nothing came of it. Sir I. Hamilton, however, still entertained hopes of effecting some improvement in his position in this area. The mounted division, and also a division from Helles, were quietly concentrated there, and on the 21st a determined attempt was made to capture some of the high ground which had baffled the essays of the invaders on the 7th and 10th. Large forces were engaged on either side in this battle, and the attack was prepared for by a comparatively speaking heavy bombardment of the Ottoman trenches; in this battleships and cruisers moored in Suvla Bay, in security from submarines, participated. But after a sanguinary contest the assailants met with repulse, and from that date onwards no serious offensive operation was attempted by the Allies in the Dardanelles campaign. Those conditions of virtual stalemate which had prevailed before the arrival of the five new divisions from England set in afresh, and they continued to the end.

Even before this final reverse, Sir I. Hamilton had cabled home asking for reinforcements and for very large drafts that might be spared for the Dardanelles theatre of war. A temporary change of plan did occur a few days later, owing to the French Government proposing to despatch four divisions to the Aegean with the idea of their operating on the Asiatic side of the Straits; under the circumstances the British Government was also prepared to send fresh divisions to Sir I. Hamilton. But early in Sept. these projects were finally dropped both in Paris and London, owing very largely to the threatening aspect of affairs that was arising in the Balkans.

The campaign by which the Central Powers and Bulgaria crushed Serbia for the time being, and by their triumph opened communications through Bulgaria with the Ottoman Empire, profoundly influenced the situation in the Gallipoli Peninsula. Not only was all idea of reinforcing the Allied army that was planted down in this region abandoned by the western Governments, but even some of the troops under Sir I. Hamilton's orders were transferred to Salonika. Moreover, the linking up of Turkey with the Central Powers by railway ensured that Liman von Sanders would in due course be furnished with ample munitions of all kinds, and this must make the prospect of Entente forces gaining possession of the Straits remoter than ever.

As early as the middle of Sept. the French Government had come to the conclusion that there was now no hope of victory in the Dardanelles theatre of war. The British Government, on the other hand, influenced to a great extent by anxiety as regards prestige in the East, could not arrive at a decision as to giving up the project. After two or three weeks Sir I. Hamilton was, however, invited to give his views concerning the question of evacuating the peninsula and abandoning the enterprise against the Straits. On the commander-in-chief pronouncing himself as emphatically opposed to such a step, Sir C. Monro was sent out from England to take his place. Impressed by the unsatisfactory positions in which the Allied troops found themselves on the peninsula, by the impossibility of their making any progress at their existing strength, and by the risks that the army ran in remaining on such shores without any safe harbour to depend upon for base in stormy weather, Monro, after examining the situation on the spot in the closing days of Oct., declared unhesitatingly for a complete withdrawal. Moreover, the linking up of Turkey by the Central Powers by railway ensured that Liman von Sanders would in due course be furnished with ample munitions of all kinds, and this must make the prospect of Entente forces gaining possession of the Straits remoter than ever.

Sir I. Hamilton, coming to fight on foot, no reinforcements were on the way, and the last of the five divisions from England, the 54th, had been swallowed up at Suvla. The defending side had also, no doubt, suffered heavily in casualties, especially on Sari Bair; but the Turkish commander-in-chief could fairly claim that, if some ground had been lost, he had held his own in a contest in which his adversary had enjoyed some notable advantages at the start.

An effort was made on the 15th by the troops on the extreme left of the Allies' position at Suvla to gain ground along the ridge N. of the plain; but nothing came of it. Sir I. Hamilton, however, still entertained hopes of effecting some improvement in his position in this area. The mounted division, and also a division from Helles, were quietly concentrated there, and on the 21st a determined attempt was made to capture some of the high ground which had baffled the essays of the invaders on the 7th and 10th. Large forces were engaged on either side in this battle, and the attack was prepared for by a comparatively speaking heavy bombardment of the Ottoman trenches; in this battleships and cruisers moored in Suvla Bay, in security from submarines, participated. But after a sanguinary contest the assailants met with repulse, and from that date onwards no serious offensive operation was attempted by the Allies in the Dardanelles campaign. Those conditions of virtual stalemate which had prevailed before the arrival of the five new divisions from England set in afresh, and they continued to the end.

Even before this final reverse, Sir I. Hamilton had cabled home asking for reinforcements and for very large drafts that might be spared for the Dardanelles theatre of war. A temporary change of plan did occur a few days later, owing to the French Government proposing to despatch four divisions to the Aegean with the idea of their operating on the Asiatic side of the Straits; under the circumstances the British Government was also prepared to send fresh divisions to Sir I. Hamilton. But early in Sept. these projects were finally dropped both in Paris and London, owing very largely to the threatening aspect of affairs that was arising in the Balkans.

The campaign by which the Central Powers and Bulgaria crushed Serbia for the time being, and by their triumph opened communications through Bulgaria with the Ottoman Empire, profoundly influenced the situation in the Gallipoli Peninsula. Not only was all idea of reinforcing the Allied army that was planted down in this region abandoned by the western Governments, but even some of the troops under Sir I. Hamilton's orders were transferred to Salonika. Moreover, the linking up of Turkey with the Central Powers by railway ensured that Liman von Sanders would in due course be furnished with ample munitions of all kinds, and this must make the prospect of Entente forces gaining possession of the Straits remoter than ever.
fact afford to remain quiescent. The Allies, on the other hand, were practically compelled to remain quiescent. The general situation offered them no inducements to embark on fresh offensives. The great Aug. effort, which had been made when they were enjoying the advantages derived from concentration as opposed to dispersion, and when they were in the position to take the Turks unawares, had miscarried. It would have been folly after that experience to risk defending and perhaps in assailing from the positions, effectively held and assiduously fortified. The Allies had in Aug. been rather superior in numbers to their opponents. But during the autumn Liman von Sanders was reinforced by several divisions, and at the juncture when Gen. Monro arrived and recommended evacuation of the peninsula, the Ottoman host gathered about the Dardanelles was already decidedly stronger in point of numbers than was the army which was clinging to patches of littoral without a sheltered base.

If there had been no fighting during these autumn months worthy of mention, much creditable work had been carried out by the invaders in respect to developing communications and to improving jetties and landing-places, especially at Suvla. One British and one French division were moved from the peninsula to Salonika early in Oct., but an additional Australian division had arrived a few weeks earlier. In spite of the discouraging conditions in which they found themselves, and of the constant annoyance suffered from hostile artillery fire, the troops were in fair heart, while the tactical efficiency of the recently created divisions, which had not been of a high standard when they arrived in the theatre of war, had appreciably progressed. The proportion of sick had been high during the summer-time, but it decreased somewhat after Sept. On the other hand a very severe blizzard, lasting two days, swept the whole region towards the end of Nov. and caused havoc amongst the divisions in the Suvla area, which was particularly exposed to the elements; this visitation augmented the numbers in hospital by several thousands. The tempestuous weather, moreover, created serious damage at most of the landing-places, where solidly constructed jetties were in some instances completely demolished by the seas. The Allied forces had been organized as three distinct groups. That at Helles (which included the French contingent, still as at the outset on the right) was under the charge of Gen. Davies. That at Anzac, composed mainly of troops from the Antipodes, remained under Gen. Birdwood. That at Suvla was commanded by Gen. Byng. But as Gen. Monro found, himself responsible for the British troops at Salonika as well as for the Allied army of the Dardanelles, he placed the latter under charge of Gen. Birdwood, while Gen. Godley relieved Birdwood at Anzac.

Like their adversaries, the Turks had suffered much from disease during the summer. But as their numbers grew in the autumn, and as their headquarters staff noted how the invaders were dwindling away owing to transfers to Salonika and to no drafts arriving to replenish wastage, it became possible to keep a number of the Ottoman divisions in reserve, well in rear of the fighting fronts or else on the Anzac line of the Dardanelles. This also permitted of the troops in the trenches being relieved and rested at frequent intervals. The defending side, in fact, came to be in a much more favourable position than was the attacking side in respect to diminishing the strain that is always experienced by fighting personnel when in close contact with an enemy even during periods of virtual inactivity. The Sultan's forces guarding the Straits were not yet at the end of Nov. deriving much benefit from the strategical transformation which had taken place in the Balkans consequent upon communications being opened between Thrace and the Central Powers; but there was every prospect of heavy artillery and munitions shortly beginning to find their way through from Germany and Austria-Hungary to the Dardanelles.

Foreseeing that the British Government must ultimately resign itself to a withdrawal of the Dardanelles army from its dangerous situation on the Gallipoli Peninsula, Monro had already, some days before the permission to evacuate reached him from home, given instructions that certain preparations were to be made towards facilitating that operation. That a retirement of this kind was a hazardous undertaking was realized from the outset. There was no precedent for large military forces, in close contact with a formidable enemy, embarking within easy artillery range of positions in the hands of the opposing side, and the most sanguine amongst high military authorities in the councils of the Entente feared that a withdrawal could not be carried out without incurring heavy losses. The responsible authorities on the spot perceived that the process of gradually removing the huge accumulations of troops and mass of munitions, and of dispersing the landing-places and of reembarking the troops must take place during the dark hours and step by step, every effort being made to keep the Turks unaware of what was in progress. Sickly men and some stores and animals had been got away before Dec. 8, which lightened the task in prospect. The tactical principle on which withdrawal would be carried out when the time came had been fully considered. The naval authorities had been busy assembling and organizing the available small craft in anticipation of the operation that appeared to be imminent, and jetties damaged in the Nov. gales were being repaired. It should be noted that the matter in hand was, from the point of view of water transport, somewhat facilitated by the British Government's determination to hold on to Helles for the present, as nearly all the lighters, boats, etc., in naval charge could consequently be gathered at Anzac and Suvla.

Birdwood decided, in consultation with Godley and Byng, that the front trenches should be held up to the very last moment on the night of final evacuation, the troops manning them then hastening to the beaches, everything removable, whether animate or inanimate, having already left. There was to be no taking up of successive positions in accordance with the normal practice of reinforced actions. At a given moment the trenches, which at many points were but a few yards from those occupied by the Turks, would be vacated by detachments, which by that hour would have shrunk to mere handfuls of men. Scarcely a shot had since the beginning of Dec. been fired after dark by the British, Australasian and Indian troops, who were holding the long line stretching from the Gulf of Saros to near Gaba Tepe, so as to accustomed the foe to quietude during the night watches. The last parties of the Anzac force were to ship at Anzac Cove but for a detachment on the extreme left, which would embark with the Suvla troops. The Suvla area was divided into two sections, the troops in the right (or southern) section retiring S. of the lake and taking to the boats on the southern side of the bay, the other section retreating N. of the lake and embarking on its northern side. The final night was provisionally fixed as that of the 18th-19th, and thanks to favourable weather and to the efficiency of the arrangements, the very critical operation was carried out with triumphant success, just as had been laid down by programme ten days before.

Night after night during the intervening ten days the landing places at Anzac and Suvla were scenes of unceasing activity. Masses of war material and food supplies were in the first instance removed, then most of the animals were got away, lastly portions of the troops began to embark and to proceed to Imbros or Mudros. During the daytime reliefs took place as usual, pretences were made of disembarking animals and stores at the jetties, and the result was that the Turks remained in complete ignorance as to what was going on close to their lines. Large bodies of infantry with a fair proportion of guns still remained on shore on the 17th, but of these roughly half—about 10,000 men and a number of guns in each area—were removed that night, so that on the 18th only a meagre force, composed almost wholly of infantry and disposed almost entirely in the trenches, was holding a long front face to face with a numerically far stronger enemy. But, fortunately for the Allies, their dispositions had been so skilful that the Ottoman staff had not ascertained that the Anzac and Suvla areas had been almost vacated. The critical day passed without incident.

The hour fixed for finally quitting the front trenches in the Suvla area, and the adjacent northern portions of the Anzac area, was 1:15 a.m. on the 19th. Owing to their vicinity to the cove the rest of the Anzac trenches were, however, to be held till a
DARDANELLES CAMPAIGN

807

later hour. At nightfall the very few guns still to go were hurried off to the jetties. Then the troops along the front were quietly withdrawn in successive groups, the fine weather continuing to the end and work at the beaches proceeding without a hitch. Finally the parties still in the trenches slipped away, and when dawn broke the Turks, who had first ascertained that something unusual was afoot from the explosion of a vast mine in the Anzac area, and from confusions on the beaches where the few stores to be abandoned were being destroyed, discovered that the invaders were gone. Twenty-four hours later the long spell of calm, a godsend to Godley and Byng, came to an end.

Practically nothing worth mentioning had been left behind at Suvla. At Anzac, where conditions favoured the retreating commander-in-chief had necessary to destroy some valuable war material at the last moment, and a large number of rifles probably had been abandoned. The casualties in the two areas on the final night had amounted to two. The relaxing by the Allies of their flair hold upon the outer coastline of the Gallipoli Peninsula had been effected more successfully than the most sanguine amongst them had permitted themselves to hope for. Yet, for a week subsequent to their receiving the glad tidings from the Aegaeon, the British Government remained irresolute with regard to the policy to be pursued at Helles. Then, on Dec. 28, Monro received the expected sanction for evacuating that area also, and Birdwood proceeded to implement the order. Things had been left to the winds.

Taken unawares and signal out-manoeuvred at Anzac and Suvla, Liman von Sanders perceived that his antagonists would probably retire from Helles also, and he took measures accordingly. He had at this time 21 divisions at his disposal, while there were only four British divisions to oppose him at Helles (the last French division left for Salonika during Dec.). The Turks, therefore, now possessed a huge numerical preponderance in the theatre of war. They moreover enjoyed an even more marked superiority in respect to artillery, and this the Ottoman commander-in-chief had trouble to turn to account; the heavier guns which had been brought to the Anzac and Suvla beaches for months past were promptly transferred to the high ground overlooking the extremity of the peninsula or to positions on the Asiatic side of the Straits from which the extremity of the peninsula could be effectively taken in flank.

The same principles as those which had been so successfully applied during the evacuation of the northern areas, were put in force at Helles. The work of removing stores, war material, animals and personnel was to be carried out on successive nights, the fighting force ashore to be gradually reduced, the front lines being held up till they last, the final night being fixed provisionally for the 8th-9th—and the detachments vacating it to hurry straight off to the beaches. So as to deceive the enemy, bombing and rifle fire were to be practised nightly up till 11:30 P.M., after which all activity was to cease. Two possible exceptions would have especially to be feared—the sea might get up, or a heavy bombardment of the beaches might be instituted by the Turks while the final evacuation was in progress. As the staff fully foresaw, the enemy would exert greater vigilance than had been the case while the withdrawals had been in progress from the northern areas, these having given the Ottoman and his companions the impression that anything was likely to happen. It ought also to be mentioned that there was a great accumulation of impedimenta at Helles than there had been at either Anzac or Suvla, so that even if the weather were to remain favourable, it was certain that material of great value would have to be destroyed to prevent its falling into the enemy’s hands.

Embarkation operations were carried on almost entirely at “V” and “W” beaches, at both of which there were provisional breakwaters in existence furnishing some shelter when there was an onshore breeze. The weather, as it turned out, was none too favourable on several of the preliminary nights, but, owing to its direction, the wind did not greatly retard the work of removal. The enemy’s guns gave a good deal of trouble at the beaches, and caused many casualties. Although steps were taken to conceal what was in progress, the Turkish staff were aware that preparations for evacuation were in full vigour; but they could not foresee the date on which the final flitting would take place, nor could they make sure how far the number of combatants within the British lines had been reduced. With the object apparently of ascertaining the strength of their opponents, the Ottoman forces on the afternoon of Jan. 7 delivered a half-hearted attack upon the left of the British position, following on a violent bombardment; but the assailants were driven off with little difficulty. Nor would they seem to have discovered how weakly held the trenches were; for a considerable proportion of both infantry and artillery had been withdrawn by that date, as only two more nights remained according to the programme. That night the troops still left at Helles were reduced by one-third, and, on the next day breaking fine, it was decided to complete the operation on the following night as intended at the start. The last night passed the situation at the beaches became desultory. The last detachments to quit the trenches moved off simultaneously all along the front at 11:45 P.M., without the enemy noticing their departure, and they were embarked successfully at “V” and “W” beaches according to schedule in spite of the heavy seas. But the detachments designated for Gully beach could not all be got off at the exposed point, and those left over had to march on to “W” beach at the last moment and were not got off till nearly 4 A.M., their embarkation being effected with great difficulty owing to the surf. Just before the last boats sheered off the masses of stores which it had been necessary to abandon, and this, as well as the Turkish men of war, had been vacated. Effectual pursuit might not have been practicable; but the guns could have been turned on to the beaches, of which the range was exactly known, and embarkation, impeded as it was by the rough water, could hardly have been carried out without many casualties.

After a few days taken up in collecting the troops from Helles in their different divisions at Lemnos, what was left of the Dardanelles army was shipped to Egypt, whither most of the forces from Anzac and Suvla had already proceeded. The total loss of the Allies’ military forces in the eight months’ contest amounted to 150,000 killed, wounded, and missing personnel.

Most authorities on the art of war agree that the collapse of the Entente in this memorable campaign was primarily due to the abortive naval effort to force the Dardanelles. By embarking on that venture the fleet gave the Turks sufficient warning of what was in store to ensure that, on the date on which Sir I. Hamilton’s army was ready to land, the defenders should be in a position to bring it to a standstill. The only chance of the invaders achieving their object after the first week of land fighting depended on their being joined by very substantial additional forces in a region where a belligerent fighting on the defensive in home territory was as the Osmanli would enjoy marked strategical and tactical advantages. But neither the British nor the French could afford to divert great military resources from the main theatre.
of war in western Europe to the Aegean, and so the struggle for the Straits ended in mortifying discomfiture for the Allies.

(C. E. C.)

DARLING, SIR CHARLES JOHN (1849-1914), English judge, was born at Colchester Dec. 6 1849. He was educated privately, and in 1874 was called to the bar. He became a Q.C. in 1885, in 1888 successfully contested Deptford in the Conservative interest, and in 1892 became a bencher of the Inner Temple. He was raised to the bench and knighted in 1897. He has published some volumes of light verse, including Scillaes Juris (1877). In 1917 he was made a Privy Councillor.

DARTMOUTH COLLEGE, Hanover, N.H., U.S.A. (see 7.8.38), in the period between 1908 and 1921 experienced a great expansion in its plant, endowment and enrolment. Its educational plant in the latter year included 21 buildings devoted to lecture and recitation rooms, laboratories, and administration and similar purposes.

Of these, the extensive alumni gymnasion was erected in 1910, to which was added the Spaulding swimming pool in 1920; the President administration building was erected in 1912. In March Hall, the home of all undergraduate organizations except athletic, in 1914; and a large chemical laboratory in 1920. The plant also included 18 dormitories, of which five were added after 1908, the latest in 1920, capable in all of housing 1,100 students. The value of the plant was over $2,000,000.

In addition to the educational plant the college had 20 single or apartment houses for the use of its faculty. Its productive investments included in the period ending June 30, 1922 $5,500,000. In 1920 it had 150 officers of administration and instruction, and there were 1,875 enrolled students, of whom 54 were in the graduate classes. The tuition fees were $250 per term. The constituency of the college, formerly mainly in New England, extended to the whole country. In 1910 62%, of the freshmen came from New England. One of the effective influences leading to expansion was the Greensboro Club, the first college-club of its kind, which was open to both faculty and students and had as its object the stimulation of healthful outdoor activities. It owned a chain of seven cabins, extending over 75 m. from Hanover to the White Mountains, and was able to accommodate its members on their excursions into the country and among the mountains. Its winter activities culminated in a carnival of sports.

Like other American colleges, Dartmouth was greatly affected by the World War. Even before the entrance of the United States, many of its students had joined the Allied armies or served in the ambulance corps in France, and in Feb. 1916 a battalion of 218 men in two companies was formed for military duty. In March Hall, the home of all undergraduate organizations except athletic, in 1914; and a large chemical laboratory in 1920. The plant also included 18 dormitories, of which five were added after 1908, the latest in 1920, capable in all of housing 1,100 students. The value of the plant was over $2,000,000.

In addition to the educational plant the college had 20 single or apartment houses for the use of its faculty. Its productive investments included in the period ending June 30, 1922 $5,500,000. In 1920 it had 150 officers of administration and instruction, and there were 1,875 enrolled students, of whom 54 were in the graduate classes. The tuition fees were $250 per term. Like other American colleges, Dartmouth was greatly affected by the World War. Even before the entrance of the United States, many of its students had joined the Allied armies or served in the ambulance corps in France, and in Feb. 1916 a battalion of 218 men in two companies was formed for military duty. In March 1917, the great majority of the students was enrolled for military training, and in the following fall military training was required of the freshmen. After the United States entered the war, the college became a central military camp, for all able-bodied students between 18 and 21 years of age were inducted into the Students' Army Training Corps and trained under military regulations, and those under 18 were enrolled in the corps, although remaining under college authority, and many of the younger engineers graduated in 1918. When the college was opened in 1917, the first two classes of able-bodied students came to the college from outside for instruction in carpentry, cement work, truck driving and repairing, and radio work. All military training was suspended in 1920 and in December 1921 the college reverted to its former status. In consequence of the war the enrolment fell from more than 1,500 to 751, of whom only 110 were not under military training. Many members of the faculty engaged in war service in the United States or in France, either under the Government or in the organizations supplementary to the military. The total number of undergraduates (from the six classes 1917 to 1922) who entered the war or served in the S.A.T.C. was 1,517, and of the faculty 73. The total number of Dartmouth men, graduates, undergraduates, and faculty, who served in the army, navy or marine corps was 2,603, in the auxiliary service 752.

(D. M. N.)

DARWIN, SIR GEORGE HOWARD (1845-1912), English astronomer, was born at Down, Kent, July 9 1845. The second son of Charles Darwin (see 7.9.40), he was second wrangler and Smith's prizeman at Cambridge, and was elected to the prize trains and equipped for the observatory work at Cambridge in 1868. In 1883, his principal work was on the subject of tides, on which he became the leading authority, and on other physical questions connected with the relation of the earth and moon; the article Tide in the E.B. (see 26.9.38 et seq.) represented his matured researches on his special subject. He was made K.C.B. in 1905 and died at Cambridge Dec. 7 1912.

DATO, EDUARDO (1856-1921), Spanish politician, was born at Corunna Aug. 12 1856. He graduated in law at the university of Madrid and was elected a deputy in 1884. An under-secretary for the Home Department in 1892, he became minister for the department in 1899, and distinguished himself in the study of social legislation, the fruits of which were special bills regarding accidents, insurance, and women's labour. In Dec. 1902 he became Minister of Justice, in 1907 mayor of Madrid, then president of the Chamber. He was elected a member of the Royal Academy of Social and Moral Sciences, June 20 1905. When in 1913 Señor Maura refused to take power except on conditions unacceptable to the King, for Dato, thinking that the Conservative party could not refuse to serve the Crown at a difficult moment, dissented from his chief, carrying with him the majority of his party, which elected him as its leader. He was still in office (1913-5) when the World War broke out, and was responsible for Spain's declaration of neutrality. He adhered firmly to that policy. Becoming prime minister again in 1917, he faced the great crisis of that summer. In 1920 he resumed office, and it was while prime minister that he was murdered in Madrid March 8 1921. Señor Dato had great social charm, persuasive talent and an unwavering will under trying appearances.

DAUDET, LÉON (1867-1912), French writer, son of Alphonse Daudet (see 7.8.48), was born in Paris Nov. 16 1867. He was educated at the lycée Louis le Grand, and afterwards studied medicine, a profession which he abandoned in 1894 for that of literature. He wrote many short stories and novels, and has also contributed to the Figaro, Gaulois and Libre Parole. He is an ardent royalist in politics, and was one of the group which in 1908 founded the royalist organ L'Action Française. He published in 1898 a Life of his father, and among his other works may be mentioned Les Morticole (1894); Deux Cent Cimères (1901); Les Dix-Huit (1906); La Lutte (1907) and L'Appauvrissement (1914). He produced various essays on the World War, and his latest novels include La Verite du Monde (1916); Le Bonheur d'être Riche (1917); Le Cour de l'Absence (1917) and Dans la Lumière (1919).

See R. Guillou, Léon Daudet (1918).

DAUMET, PIERRE JEROME HONORÉ (1826-1911), French architect, was born in Paris Oct. 23 1826. He entered the École des Beaux-Arts in 1843, and was awarded the Grand Prix de Rome in 1853. In 1867 he was attached to the important exploratory expedition and mission in Macedonia, and was commissioned to draw up the report. In the following year he was appointed inspector of works for the then recently created Préfecture de Police, and was later acting architect to the Palais de Justice, succeeding in 1876 Viollet-le-Duc as architect-in-chief. This fine building may be regarded as one of the great and lasting monuments of his career. During the next few years Daumet's talents and artistic equipment, especially in matters of archaeological interest and research, received recognition from the French Government in his appointment to many official positions, culminating in his vice-presidency of the Commission des Monuments Historiques. His brother-artists distinguished him by electing him vice-president of the Société des Artistes Français, and president of the Société des Architectes Français. In 1885 he was elected a member of the Académie des Beaux-Arts, and in the following year an hon. corresponding member of the Royal Institute of British Architects, who further awarded him their gold medal in 1905. One of the highest expressions of his genius was his restoration of Chantilly in close collaboration with the Duc d'Aumale, who later (in 1897) bequeathed it to the French nation, as represented by the Institut de France. Among Daumet's many architectural works may be noted the following:— The Palais des Facultés and the Palais de Justice at Grenoble, the Ece Homo chapel at Jerusalem, the pension and chapel of the Dames de Sion in Paris and Tunis, his early work at the Asile des Aliénés of St. Anne, and the Palais de Justice, Paris, already mentioned. His literary work, besides his important account of the archaeological mission to Macedonia, includes a book on the Château de St. Germain and its restoration for which he was responsible. His
services to the educational side of his art were considerable. His atelier produced no less than nine holders of the Grand Prix de Rome—a notable record. He died Dec. 13 1911.

DAVIES, THOMAS WILLIAM RHYS (1843– ). British orientalist, was born at Colchester May 12 1843. Educated at a school in Brighton and at Breslau University he entered the Ceylon civil service in 1866 and also read for the bar, becoming a barrister of the Middle Temple in 1877. He became a close student of Buddhism and of the literatures of India, and in 1882 was appointed professor of Pali and Buddhist literature at University College, London. In 1904 he became professor of comparative religion at the university of Manchester. Among his numerous publications are "Buddhism" (1878, 5th ed. 1890); "Ancient Coins and Measures of Ceylon" (1877); "Buddhist India" (1902); "Early Buddhism" (1898); and the articles on Buddha, Buddhism, Pali, Lamaism, etc. in the E.B. He was president of the Pali Text Society, which he founded in 1882, and a fellow of the British Academy. He married in 1894 Caroline Augusta Foley, herself the author of "Buddhist Psychology" (1900), "Psalms of the First Buddhist" (1910) and other works.

DAVISON, RANDALL THOMAS (1848– ), Archbishop of Canterbury (see 7,863), in 1902 brought forward in the House of Lords the proposal that Lord Birkett's Divorce bill, which was lost by one vote. The same year he presided over the sixth Lambeth conference.

DAVIES, HENRY WALFORD (1869– ), English organist and composer, was born at Oswestry, Salop, Sept. 6 1869. After a preliminary private education he became a chorister at St. George's chapel, Windsor, in 1882, and three years later assistant organist to Sir Walter Parratt there. From 1890 to 1894 he was a pupil and scholar at the Royal College of Music, where in 1895 he became a teacher of counterpoint. There he came first into some prominence as composer, with his cantata "Hérod Roi" (1894), but meanwhile he was making his way as organist. After filling several posts he was in 1898 appointed organist to the Temple church, a post he still holds (1921). During the years 1903 to 1907 he was conductor to the London Bach Choir in succession to Stanford, and in 1910 he was appointed professor of music in the University College of Wales, at Aberystwyth. For a great part of the World War, with the rank of major, he worked with great success for the right organization of music among the troops both abroad and at home, and in 1918 he was made director of music to the R.A.F. Walford Davies has written much music in many forms. In his list are two symphonies; A Solemn Melody, which attained to a wide popularity, and, for chorus and orchestra, Everyman (1904); On the Time (1908); The Sayings of Jesus (1911); Dante Fantasia (1914), the first of several operas produced especially at provincial festivals; Heaven's Gate (People's Palace, 1917). A new choral work was in the programme of the Hereford festival for Sept. 1921. In addition there are several quartets for various combinations of piano and strings, or strings alone; six violin sonatas and several works for voices and strings, part-songs, choruses, and hymn tunes.

DAVIES, HUBERT HENRY (1876–1917), English playwright, was born in Cheshire March 17 1876. After some years of journalism in San Francisco, where he also produced a few vaudevilles, he returned to England and made a success at the Haymarket theatre in 1903 with Cousin Kate and a greater success at Wyndham's theatre with Mrs. Garrigan's necklace. Among his other comedies were "The Mollusc" (1907), and "Dooms" (1912). He produced The Outcast (1914). After overworking himself in France as a hospital orderly during the earlier portion of the World War, he had a break-down in health, and he continued to live at Riddlesdown in Surrey, Aug. 17 1917.

DAVIES, JOHN LEWELYN (1862–1916), English divine and educationalist, was born at Chichester Feb. 26 1862. He was educated at Repton and Trinity College, Cambridge, where he was bracketed as fifth classic in 1884, and was elected to a fellowship at Trinity in 1885. He was ordained in 1890 and held successively several London livings. He was made chaplain to the Queen in 1876, and in 1886 became vicar of Kirkby Lonsdale, Westmorland, where he remained till 1908. Davies was an intimate friend of John Frederick Denison Maurice (see 17,010), and was associated with him in the foundation of the Working Men's College (1854), where he taught for many years. He was elected to the first London school board in succession to Huxley, and in 1873 became principal of Queen's College, Harley St., which had been founded by Maurice in 1848 for the advancement of women's education. He held this post until 1874, and was again principal from 1875 to 1886. Davies died at Hampstead May 17 1916. He was part author of Davies and Vaughan's well-known translation of Plato's Republic.

DAVIES, SARAH EMILY (1850–1911), British educationalist, was born at Southsea April 22 1850. She was educated at home, and later identified herself with the movement for the higher education of women, being also one of a group of women who about 1888 were discussing the question of women's suffrage at the Kensington Society. In 1862 she became secretary to the committee which was formed for the purpose of procuring the admission of women to university examinations, and from 1870 to 1873 was a member of the London school board. In 1873 she was elected a life governor of University College, London, and in 1882 became secretary of Girton College, Cambridge, retiring in 1904. She published "The Higher Education of Women" and "Questions relating to Women" (1862–1905). She died in London July 13 1912.

DAVIES, WILLIAM HENRY (1857– ), British poet, was born at Newport, Monm., April 20 1870. He was apprenticed to a picture-frame maker, but when his apprentice days were over he tramped through America, crossed the Atlantic many times on cattle boats, became a pedlar and street singer in England, and after eight years of this life published his first volume of poems, "The Soul's Destroyer," from the Marshalsea prison. Next year appeared in prose "The Autobiography of a Super-Tramp" (1902) with a preface by G. Bernard Shaw, as well as Nature Poems and Others. A collected edition of his poems appeared in 1916, and Forty New Poems in 1918. He also published a novel, "A Weak Woman" (1911), and volumes of nature studies and essays, including "A Pool's Pilgrimage" (1918).

DAVIS, HENRY WILLIAM BANKS (1833–1914), English painter (see 7,866), died at Gladstone, Radnorshire, Dec. 1 1914.

DAVIS, RICHARD HARDING (1864–1916), American writer, was born in Philadelphia April 18 1884. He studied at Leibigh and John Hopkins, and in 1886 became a reporter on the Philadelphia Record. After working on several papers he served as managing editor of Harper's Weekly. He became widely known as a war correspondent, reporting every war from the Greco-Turkish War (1877) to the World War. Of his numerous works of fiction, the earliest are his best, especially "Gallegar and Others" (1881); "Van Bibber and Other Stories" (1892) and "Episodes from Van Bibber's Life" (1890). His other books include: "Soldiers of Fortune" (1897); "Captain Macklin" (1902); "Vera the Medium" (1908); "The Bar Sinister" (1904) and With the French in France (1916); Salonika (1916). His plays include Miss Civilization; The Dictator; The Galleon, the Orator of Zapata City and the Zone Police.

DAVIS, Henry Pomeroy (1867– ), American banker, was born at Troy, Pa., June 13 1867. He was educated at Greylock Institute, South Williamsport, Mass. He was successively errand-boy in the bank conducted by his uncle in Troy, Pa., runner for a Bridgeport (Conn.) bank and paying-teller in the newly opened Astor Place Bank in New York City, remaining there from 1879 to 1894. From 1894 to 1902 he was connected with the Liberty National Bank, New York, successively as assistant-cashier, vice-president and president. In 1902 he became vice-president of the First National Bank, and in 1907, following his activities during the panic of that year, he entered the firm of J. P. Morgan & Co., of which he was 1913 still a member. In 1908 he was appointed adviser to the National Monetary Commission to investigate the financial systems of Europe. Later he served at the head of a group of American bankers interested in the Six Power Chinese Loan. From 1917
to 1919 he was chairman of the American Red Cross War Council. During his incumbency, $300,000,000 was raised through popular subscriptions in aid of war sufferers. In 1919 he became first president of the newly formed international organization of all Red Cross bodies, the League of Red Cross Societies.

DAWSON, Sir WILLIAM BOYD, 1st Baron, English physician. He studied medicine at University College and the London hospital, where in 1896 he became an assistant-physician. He carried out extensive researches on gastric affections, and became one of the leading authorities on this subject. He was appointed physician extraordinary to King Edward VII, and later physician in ordinary to King George V. During the World War he did valuable work on war diseases, publishing various papers on paratyphoid and infective jaundice. He was made C.V.O. in 1908, K.C.M.G. in 1910, and in 1920 was raised to the peerage. He has published *The Diagnosis and Operative Treatment of Diseases of the Stomach* (1908), besides contributions to Allchin’s *Manual of Medicine*, and many papers in medical journals on gastric disorders.

**DAYLIGHT SAVING AND SUMMER TIME.**—The possibility of saving daylight in summer had been pointed out as early as 1784 by Benjamin Franklin in a paper, “Economical Project for Diminishing the Cost of Light,” contributed to the *Journal de Paris*. The suggestion that the number of hours during which the use of artificial light is necessary should be reduced by advancing clocks during the summer months was made in Great Britain in the 19th century. The first practical suggestion in Europe to put the proposal into actual operation, primarily as a war measure, was Germany, and the example was followed by Great Britain and most European states; after its wide adoption in Europe, general attention to daylight saving was roused in America in 1916.

In Great Britain, the question had been twice examined by a Select Committee of the House of Commons: in 1908, this Committee reported that “the object was desirable if it could be attained”; but in 1909, “having regard to the great diversity of opinion as to whether the measure can be attained by legislation without giving rise, in cases involving important interests, to serious inconvenience,” the Committee recommended that it should be dropped. In 1916, the need for economy especially in fuel and transport becoming urgent, the “Summer Time Act” was passed, prescribing that, during a period in each year, legal time in Great Britain should be 1 hr. in advance of Greenwich Mean Time, the precise incidence to be determined annually by Order in Council. The period in 1916 extended from 2 A.M. (Greenwich Time) on May 30, 1916 to 2 A.M. (Greenwich Time) on May 30, 1917. In the summer of 1916 a “Dublin” for “Greenwich” Mean Time, the bill also applied to Ireland. (Later, on Oct. 1 1916 Ireland adopted the same Standard Time as Great Britain.)

In September it was in view of expressions of disapproval of certain sections of the community—agriculturists, munition and other factory workers, miners and others—the Home Secretary appointed a committee to inquire into the social and economic results of the Act. It reported to the effect that the small temporary inconvenience of the transition from normal to Standard Time and back were altogether outweighed by the saving in artificial light and by the general gain in health from the addition of an hour of daylight to the time for exercise and recreation. It therefore recommended the continuance of the Act in 1917 and subsequent years, the period for 1917 to be from the second Sunday in April to the third Sunday in September.

In the United States, after several abortive attempts at legislation to apply to the country generally, a bill was introduced in Congress in 1918, passed both houses, and was signed by the President March 28, 1918. It provided that time throughout the United States should be advanced 1 hr. at 2 A.M. on the last Sunday in March and so continue until 2 A.M. on the last Sunday in October. This law was known as the “Sunlight Bill.” In 1918 after two years’ trial, but through the country as a whole repudiated daylight saving, certain eastern states still continued it.

A new law in New York passed in 1921, provided for local option, so that daylight saving could continue in New York City and several other cities. In Canada (though there was a strong rural feeling against it) “Summer Time” continued to be adopted in 1921, the United States and Canadian railways running to Standard Time. The Australian Senate adopted the Daylight Saving Bill, but Spain ceased to adopt Summer Time in 1920. In 1918, the Egyptian Government reported against the scheme, which, has, in fact, met with little support outside Europe and N. America.

Considerable opposition to the Act was manifested in Great Britain and still stronger in the United States. Among other things, it was alleged that children’s sleeping hours would be curtailed; that vitality of body was reduced in the early hours. But reports of police authorities showed that the tendency throughout the world to spend the extra hour out of doors made for improvement in the moral tone, a marked decrease in juvenile offences was noted, and health committees saw no reason to suppose that workers were adversely affected. Many farmers believed erroneously that their former noon hour was the hottest part of the day, although the greatest heat is, in fact, from 2 to 3 hours later; more sound was the objection that the early morning hour was not favourable to farm (especially harvest) work because of the heavy dew, and had to be made good at the cost of overtime. Some complained that milking time was forced ahead abnormally. Confusion arose at first in the record of astronomical and meteorological observations and some series of observations were interrupted. City people as a whole were, however, strongly in favour of the measure, though some pointed out that many were forced to exchange a cooler morning sleeping hour for a warm early night hour. When Summer Time ceased to operate in the United States, some inconvenience was experienced by the reduction of the number of business hours common to the London and New York Exchanges. But saving of coal was probably in excess of the estimate of 23 million tons in Great Britain, and in the United States the savings amounted to 14 million tons during the 7 months’ period in 1918.

**DEAF AND DUMB.**—In the census returns for England and Wales for 1911, the figures relating to the deaf and dumb were:

<table>
<thead>
<tr>
<th>Total</th>
<th>Male</th>
<th>Female</th>
</tr>
</thead>
<tbody>
<tr>
<td>432</td>
<td>19,049</td>
<td>24,173</td>
</tr>
</tbody>
</table>

432 persons were returned in the tables as blind and deaf, 62 as blind and deaf, and 55 other species of deafness, blindness, dumbness and feeble-mindedness. The questions asked in the schedule for the census of 1911 were as follows:-

If any person included in this schedule is—

1. Totallly deaf or deaf and dumb,
2. Totally blind,
3. Lunatic,
4. Imbecile or Feeble-minded state the infirmity opposite that person’s name and the age at which he or she became afflicted.

The report stated that this was the first occasion on which an attempt had been made to obtain information regarding the deaf other than deaf-mutes. This was felt to be desirable both because at previous censuses many persons were returned as deaf who were not stated to be deaf, though the information was not sought for; and because of the progress made in the phonetic training of deaf-mutes, it was felt that reasonable exception might be taken as to the description as deaf-mutes of persons who, while remaining deaf, had the art of intelligent speech.

The variation in the terms of the census questions from those asked on previous occasions renders the task of comparison practically impossible, as the tabulated figures relating to deafness alone in previous censuses were those stated voluntarily and not in response to a direct question, and therefore obviously incomplete.

<td>15,088</td>
<td>18,507</td>
<td>26,649</td>
<td>26,649</td>
</tr>
</tbody>
</table>

Referring to these figures the report states:—"It will be seen that in 1911 the proportion of deaf and dumb is lower than at any previous census shown in the table, the improvement being shown at nearly all the age-groups. Whether the last ten years only or the whole period of the existing Act, the improvement is, as might be expected from the success of modern educative methods, much more marked in early than in later life." From 1881 onwards the census commissioners had stated that the returns are unreliable and in-
complete. In 1881—"We feel bound to point out here very incom-plete are the returns which relate to these afflictions. We have done our best with these unsatisfactory data," etc. In 1891 the report claimed that they could be described as "...unsatisfactory and not very accurate." In 1901 it was pointed out that the machinery of an ordinary census was but imperfectly adapted to furnish the required particulars with the degree of accuracy which is essential for statistical purposes. This report suggests that the most reliable statistics of this nature obtained through a general population census are most unsatisfactory, firstly on account of the difficulty of framing a suitable form of inquiry defining the degree of disability, and secondly because the definition has to be applied by householders with no technical knowledge, who will interpret it in different ways, and many of whom have a natural reluctance to admit that they or their children are suffering from any defect. One of the reasons for the 1911 census schedule was particularly unfortunate and confusing, and might have been avoided if the department had been willing to ask or accept the advice of those bodies, such as the National Committee of Teachers of the Deaf, and the National Bureau for Promoting the General Welfare of the Deaf, which, for educational and social reasons, were anxious to secure reliable statistics relating to deafness and deaf-mutism in the United Kingdom. "Total deafness" is comparatively rare, whether it is congenital or acquired, and even among the so-called "deaf and dumb" it is generally recognized that there are from 15 to 25% with a useful amount of hearing. This fact and the unwillingness mentioned by the commissioners to the return of children who have fairly successfully been taught speech as "...dumb" presented difficulties which even experts, such as the responsible heads of institutions for the deaf, found it hard to overcome. For instance, in 1900 100 children in a school for the deaf were in the majority of cases neither "totally deaf" nor "deaf and dumb" (i.e. orally taught), what was the headmaster to do? Leave them out?—or insert them?—There is no ready answer. Mr. E. St. Johns Ackers, the chairman, B. S. S. to secure of the statistics committee of the National College of Teachers of the Deaf, in his address before the Manchester Conference in 1911, laid emphasis on the importance of the need to secure a statement of the number of children and school statistics, and as the fuller consideration of all forms of defect, not only to the treatment of cases also as to preventive measures, is now occupying the attention of the newly formed Ministry of Health, it is essential, if State funds are to be spent in collecting information, that such information should be of real value when obtained.

The difficulty of framing a suitable question or questions relating to so wide a subject as deafness and deaf-mutism, in a short and simple form, in the small space available on a census schedule, caused the department to omit any attempt to secure information of this kind from the 1921 census, and further statistics of this kind will not in future be available until some new machinery has been provided. This may be undertaken through the Ministry of Health, or, if undertaken with the assistance of the various educational and social organizations connected with the deaf and dumb, might secure figures not only relative to the actual existence, but also as to the causes of deafness, which might later prove of inestimable value in preventive measures, and so greatly reduce the number of this afflicted class in the community.

Indeed the medical inspection of school children has already begun to operate in this direction and the discovery of children suffering from causes which may lead to partial or total deafness is part of the ordinary routine of the school medical officers in the counties and county boroughs of the United Kingdom. Dr. Harman, chief medical officer to the London County Council, reported that at the school medical inspections 4,211 children (2-2%) were found to have ear disease, of whom 2,823 (1-4%) were referred for treatment, and the London County Council has now established six centres for the educating of children suffering from impairment of hearing short of "... deafness" within the meaning of the 1893 Act. About 25% of the children attending these centres suffer from discharging ears and receive nursing attention under medical supervision.

In this from the nature of the case it will be seen that in a comparison of the conditions in 1915 and 1916 it was found that in the former year 2-1% of the children examined in London were found to be suffering from ear disease, whilst in the latter year there were only 1-85%. At Glasgow it was found that out of 500 cases of deafness and middle-ear disease, 26% originated in measles, 13% in scarlet fever, 29% in simple cataract and 20% during dentition. Mr. Yearsley, the aust of the London County Council, found that of 177 cases certified by him to be deaf or hard-of-hearing, 37 were congenital, in 119 cases it was acquired, and in 21 doubtful. Of the cases of acquired deafness, 61 resulted from supplicative and middle-ear disease, 18 followed infectious fevers, 11 resulted from congenital syphilis and 20 followed meningitis.

In the report of Dr. Butterworth (Lancs.) the general conclusions arrived at were that "... deafness in school children is largely due to causes which can be removed by simple treatment, but this treatment can only be satisfactorily carried out in a clinic, where the child can attend regularly till it is cured;" and a further suggestion was made that "... the ear, like the eye, must be brought under systematic supervision for infancy upward, by a bureau of medical inspection, which can only be started in an epidemy hospital." In the report of the chief medical officer of the Board of Education for 1919 the position with regard to the schools was given as follows:

In Scotland the latest figures available give 12 schools with accommodation for 1,014 children and 714 pupils in attendance; in Ireland 4 schools with accommodation for 350 children and 525 pupils. There was still no law for the compulsory education of the deaf of Ireland.

In the same report for 1919 the chief medical officer of the Board of Education pointed out the importance of the services of the board cover the educational needs of the child from the age of two years upwards, extending to the age of sixteen. From the age of two to the age of seven attendance is optional and only becomes compulsory at seven. The disadvantages of this statutory provision are considerable, and authorities are not as a rule willing to incur the heavy expense of special education so long as the law does not compel them to do so, and the deaf child is involved in a serious educational loss in consequence. The early beginnings of speech which come more easily to the deaf child are withheld from him to a later age and it may safely be said that the majority of the deaf children never make up for the loss sustained by postponing the beginning of education until seven, or, as often happens, till later. This liberal policy of depriving the deaf of the early years of instruction occasionally takes a more aggravated form when parents or local authorities, from reasons of economy, allow the children to remain away from school even after the statutory age of seven. In a return in 1920 it was found that among the children admitted to schools for the deaf over eight years of age or older, 47 over 8; over 9, 287; over 10, 13; over 11, 10; over 12, 8; over 13, 1. To remedy this evasion of the law a resolution was adopted at the Conference of Teachers of the Deaf at Birmingham in 1918 stating that the annual report of the school should be submitted later than the legal age the school period should be extended to cover the child the full period of instruction. This would be in conformity with the practice in America, where many states provide a school period of from 10 to 12 years for their deaf pupils, irrespective of the age of entry.

The average attendance in England and Wales in the last school year (according to the report for 1919) was 3,355—2,355 in institutions for deaf, and 1,000 in day schools. In 1920 Mr. Story, chairman of the National College of Teachers for the Deaf, stated that of 2,761 children attending 32 of the schools, 170 were semi-mute (i.e. had become deaf after having acquired normal speech); 390 were partial-hearing cases, 80 were mentally defectives as well as deaf, 7 were blind and deaf, whilst 2,114 were ordinary cases of deaf-mutism. Referring to the methods of instruction, he gave the following statement regarding deaf children under the age of 15: "The oral method largely predominates in our schools. The day schools are practically entire oral, as are also several of the residential schools. In the cases of 3,816 children attending 34 schools, 2,491 are orally taught, and only 120 by better spelling and by finger-spelling combined.

For the same period the returns of American schools, as published by the American Annals, showed that in 169 schools in the United States there were 12,779 pupils, of whom 10,376 were taught wholly or chiefly by the finger method, whilst in 1,217 schools there was a mixture of methods in combination with some other method—finger-spelling or "signing." These figures prove the great advance which has been made in the past 20 years to remove the stigma of the "... dumb-and-deaf" children of tender years is just like his brother or sister, except for his deafness, but as years pass with no auditory impressions and no development of speech, and the only means of communication open to him that of gesture, his intercourse is narrowed down to those immediately around him, and the divergence from the normal becomes
DEAF AND DUMB

more and more marked unless special means are used to combat it. This is largely due to the nature of a language, in which particularly if that language is used in the form of articulate speech, even though artificially taught, and the ability to lip-read and the habit of looking at the face of the speaker for what is being said—all of which factors are greatly aided by the way in which the teacher renders the deaf more capable of taking part in their work and the environment of their home in later life, than a specialized form of instruction such as finger-spelling or signing, known only to through the ranks of comparatively few.

The general recognition of this fact has led during the past half-century to an almost complete change from silent to oral methods. As late as 1850 in Manchester, in the United States, and in Branch schools for the deaf, there were still in 1921 a few schools on both sides of the world where silent methods were adhered to, or where they formed the basis of ordinary means of intercourse, so that the oral work of the teachers was carried on by the children. A pupil of deaf children in the schools is incapable of acquiring speech and a verbal language of sufficient range to be of practical use, either on account of poor intelligence, poor sight, lack of interest or general incapacity, whilst in some cases this incapacity is induced by the deafness already mentioned at which the children begin their education, so that it is impossible to overcome the "signing" habit and instill into them for it an instinctive verbal speech. This difficulty led to a demand for a classification of the pupils of the schools for the deaf in order to secure for them that form of the education for which they are mentally and physically best fitted.

This classification of schools for the deaf at the international conference in Edinburgh in 1907 gave an impetus to this question in England, and after careful consideration the question by teachers in London, and at the general conference of the British Association in 1911, it became an urgent principle of the need for a decided advance in the methods of instruction, and for an immediate advance in the methods of the deaf. The principle that the deaf children in the schools is incapable of acquiring speech and a verbal language of sufficient range to be of practical use, either on account of poor intelligence, poor sight, lack of interest or general incapacity, whilst in some cases this incapacity is induced by the deafness already mentioned at which the children begin their education, so that it is impossible to overcome the "signing" habit and instill into them for it an instinctive verbal speech. This difficulty led to a demand for a classification of the pupils of the schools for the deaf in order to secure for them that form of the education for which they are mentally and physically best fitted.

The meeting in 1920 of superintendents and principals of American schools for the deaf, when they met at the Surgeon General's School of Chicago, was the first meeting to consider the "combed" schools in the States, made the following statement:

"If I interpret the sentiment of the profession, and those interested in the deaf, correctly, it is that speech and speech-teaching come more easily to the fullest proportion of which each deaf and dumb in a congregation combined school. In a combined school there is always that lack of practice which makes it usable and effective. This, therefore, reduces to the lowest value all the efforts of the schools, and of the knowledge and teaching efforts so far, as the see, after many years of laborious struggle to overcome it, to separate the orally and manually taught children for as many years of their school life as is necessary to fix the speech habit.

Steps in this direction have been taken by the segregation of all backward and mentally and physically defective deaf children from the L.C.C. schools for the deaf to the residential school at Homerton (London) which in 1921 was almost to be converted to a new purpose, at Penn, Bucks, and by the establishment of Clyne House for the backward deaf at Manchester. At Homerton the combination of other defects, such as total or partial blindness, with deafness plus his defects; for what is the method of teaching speech in conjunction with physiological abnormalities. The gradual removal of all younger pupils from the big institutions for the deaf has also been in operation, and the extension of the British Government aid for the opening of special classes for children received in the two upwards will no doubt give an impetus to the establishment of infant and nursery schools for the deaf, where those "early beginnings of speech which come more easily to the young child may have full play.

The provision of this kind had already, by 1921, been made at the Manchester, Doncaster and Margate institutions, at the Fitzroy Square (London), Mosley Road, Birmingham, and several L.C.C.-day schools, to receive these younger children. The removal of partial-hearing and hard-of-hearing cases from the schools was also extended, and increased accommodation was being made for their treatment, either by the opening of special classes in the existing elementary schools. Classes have been established in Glasgow, Bristol, London and elsewhere, so that these children might not need to be detached from the normal course of education, but may be taught in their normal surroundings. In these schools some amount of acoustic training is given, either by means of appliances or by the human voice alone, and the child is taught to supplement his partial hearing by "speech-reading," so that he may use it in time for his normal education. He is also taught by his recognition of the spoken word on the lips. The children attend the ordinary school classes for such subjects as drawing, singing, etc., in which their partial deafness does not prevent their receiving the benefit of the education, while their other powers are fully developed. A successful type of deaf child can thus lead a normal life in the community, and the success of his education is seen in the fact that many of these children are brought to the public notice by their cleverness, and are able to support themselves independently. The great demand for labour of all kinds during the war brought about an unprecedented demand for the labour of the deaf members of the community, in many cases far above that of their economic capacity. The war greatly reduced the proportion of their economic value than had ever been accorded before. Unfortunately, with the general trade depression following the war there ensued a corresponding amount of unemployment, and this was one of the reasons why the deaf, even hearing. The religious and social organizations working in behalf of the deaf also felt the lack of support which was being experienced by all charitable organizations up to 1927. With the exception of
one official in the capacity of work-seeker appointed by the Board of Trade, no State aid had been given to the deaf, but it was intended to apply for the inclusion of the deaf in the State provision which was set up for the training and employment of the blind.

In the year 1898, a large number of foundered and disabled British soldiers and sailors were found to be suffering from deafness and from shell-shock, frequently accompanied by dumbness. In dealing with these men the experience of the schools for the deaf proved of great value in securing their admission and the deaf students of their staffs were drawn on to teach lip-reading to the deafened men and to aid in the recovery of speech among those suffering from dumbness. The activities of teaching, articulation and speech-reading to deaf children was an excellent foundation on to which could be moulded the special requirements of the disabled men. Sir James Dundas Grant, at the head of a special and highly trained staff, in charge of this department of the Public Works and Pensions, and had local expert and medical representatives in all parts of the country. Sir Frederick Milner and Mr. A. J. Wilson were instrumental in establishing hostels for deafened soldiers to provide a social club for the men whilst undergoing special treatment and training in speech and lip-reading. The necessity for much of this special organization had largely ceased by 1921, but the lip-reading classes were still being carried on in various parts of the country under the direction of the ministry.

The convocations of Canterbury and York in 1918 adopted resolutions recommending that the spiritual welfare of the deaf and dumb should become a definite part of the work of each diocese and should be supported from diocesan funds, but up to 1921 this had not taken general effect. Five ordained clergymen were in 1921 at work among the deaf of London and district and three in other parts of Great Britain. Five of the clergy were in charge of the deaf "missions" to the deaf and dumb are carried on by lay-readers and other workers.

DEAKIN, ALFRED (1856-1919), Australian statesman, was born at Melbourne Aug. 3, 1856, the son of a coach proprietor. He was educated at the university of Melbourne and was called to the Victorian bar in 1877; but before that date he had already worked as a journalist, and he continued to contribute frequently to the press, especially to the Melbourne Age. He entered the Victorian Legislative Council in 1883 and first took office as Minister of Public Works and Water Supply (1885-6). In 1885 he became Solicitor-General and in 1887 he was senior representative for his Colony at the first Imperial Conference held in London on the occasion of Queen Victoria's Jubilee. He was a member of all the bodies formed to promote the Federation of Australia as well as of the delegation which proceeded to London with the Australian Commonwealth bill in 1900 and, as Attorney-General, he was included in Sir Edmund Barton's first Federal "Cabinet of the Captains" (1901-3), succeeding him as Premier of Australia. During his legislative career in Victoria he was active in promoting social legislation and was one of the leaders in the enforcement of the laws against the employment of children in factories. In 1900 he was a member of the first Imperial Conference held in London on the occasion of Queen Victoria's Jubilee.

DE BROQUEVILLE, CHARLES, Comte (1866-1919), Belgian statesman, was born at Tostel, Belgium, Dec. 4, 1866, of a family which was French in origin. He was privately educated and passed much time at his father's estate. It was his marriage to Mlle. d'Huart, granddaughter of Jules Malou (see 17, 1906), the Conservative leader, that paved the way for his entrance into public life. At the age of 25 he became a member of the provincial council of Antwerp, subsequently being elected deputy for Turnhout, and in Aug. 1910 was appointed Minister of Railways, Post and Telegraphs in the Schollaert Cabinet. On the fall of this Ministry (July 1912) Baron de Broqueville undertook the formation of a new Cabinet, and in Nov. 1912 also became Minister of War, in which capacity he was successful in pressing through the bill for strengthening the Belgian army. When in Aug. 1914 the Belgians determined to resist the passage of the Germans through their country, the Belgian premier well expressed the feelings of the nation in his declaration "Nous serons peut-être vaincus, mais soumis, jamais!" On the retreat of the Belgian army towards the Yser, De Broqueville established himself at Dunkirk and there assisted the military authorities to re-create the units of the Belgian army which had been broken in the retreat. He established the Belgian base at Calais, and after the battle of Delville Wood became Minister of War, and was instrumental in the reconstruction of the army. In Aug. 1917 Gen. de Cuninck became Minister of War and De Broqueville succeeded Baron Beyens as Foreign Minister. One of his more important actions was to establish a war Cabinet of six members on the model of those in France and England. In Jan. 1918, however, he was succeeded as Foreign Minister by M. Paul Hynans, already a member of the war Cabinet. It was found that in Sept. 1917 De Broqueville had transmitted to M. Briand peace proposals secretly made by the Germans through Von der Lancken, head of the political department in Brussels, without informing his colleagues in the Cabinet, and this incident seriously diminished his power. In Jan. 1918 he took over the charge of the new department of national reconstruction, but in June of the same year his resignation of the premiership was accepted by the King. At the end of the war he became Minister of the Interior in the Delacroix Cabinet, and retained this office until Nov. 1919, when he retired, having the same year been created a count.

DEBS, EUGENE VICTOR (1855-1926), American labour leader and socialist, was born at Terre Haute, Ind., Nov. 5, 1855, of Alsatian parents. On leaving the public schools he became in 1871 a locomotive fireman, and four years later took a position in a wholesale grocery store. In 1876 he was elected city clerk of Terre Haute on the Democratic ticket, and in 1881 was re-elected. During 1885 he was a member of the Indiana Legislature. Meanwhile, in 1886 he was elected secretary and treasurer of the Brotherhood of Locomotive Firemen and was chosen editor of the Locomotive Firemen's Magazine. When the American Railway Union was organized in 1863 he was elected president, serving four years. Under his leadership a strike on the Great Northern railway was won in 1891. The same year he led the strike which, beginning in the Pullman car plants, soon involved the railways leading into Chicago (see 6, 1905). Debs was arrested on the charge of conspiracy to kill, was acquitted, was later convicted of the conspiracy for violating an injunction, and was sent to jail for six months (May-Nov. 1895). At this time his study of socialism began, and in 1897 he allied himself with the movement, for a year acting as chairman of the National Council of the Social Democracy of America. After this was reorganized into the Social Democratic party in 1898 he was an influential member. In 1900 he was Socialist candidate for president of the United States, receiving 66,116 votes; was again candidate in 1904, 1908 and 1912, but declined the nomination in 1916. In 1907 he was appointed on the editorial staff of the Appeal to Reason, and his contributions attracted wide attention. In 1914 he became editor-in-chief of the National Rip-Saw, a socialist paper published at St. Louis. After America's entrance into the World War he upheld pacifism, and in Sept. 1918, after a speech at Canton, O., he was charged with violation of the Espionage Act, was convicted, and sentenced to serve 10
years in the penitentiary. The sentence was upheld by the U.S. Supreme Court March 10, 1910, and he entered prison April 13. In 1920, although still imprisoned, he was again nominated presidential candidate by the Socialists and received 151,302 votes, ranging from 25 in Vermont to 203,400 in New York. He was released on Christmas Day 1921, his sentence having been commuted by President Harding, but his forfeiture of rights of citizenship was not affected. He is the author of *Unionism and Socialism: a Plea for Both* (1904); *Liberty; and Industrial Unionism* (1911).

DEBUSSY, CLAUDE ACHILLE (1852-1918), French composer (see 7.096), died in Paris March 26, 1918.

DE FILIPPI, FILIPPO (1865-...), Italian scientist and explorer, was born at Turin April 6, 1866. He studied medicine at the university of Turin, and became an assistant in the surgical clinic of the university of Bologna, occupying later the same position at Genoa. He subsequently became a reader in operative surgery at Bologna, and pursued researches of great value in physiological and biological chemistry. In 1897 he joined the expedition of the Duke of the Abruzzi to Alaska as scientific observer, and took part in the ascent of Mount St. Elias. In 1906 Signor de Filippi again accompanied the Duke of the Abruzzi on an expedition to the Ruwenzori region of central Africa. The first detailed map of the higher part of this mountain chain was a result of this journey, together with many valuable geological and other observations. In 1909 de Filippi went with the Duke's expedition to the western Himalaya and Karakoram mountains, when a peak 24,600 ft. in height, close to Mount Godwin-Austen, or K2, was ascended. He later (1913-4) organized and led an important scientific expedition to the Karakoram mountains and central Asia, under the auspices of the Indian and Italian Governments, and for his valuable investigations received in 1916 an honor. K.C.I.E. from the Indian Government. He has also received many honors from British and foreign scientific societies, and is a gold medallist of the English and Italian Royal Geographical Societies. During the World War he served in the Italian army medical service, and also lectured in England on subjects connected with the war.

He has published *The Ascent of Mount St. Elias* (1900); *Ruwenzori* (1909) and *Karakoram and Western Himalaya* (2 vols. 1912); besides many papers in scientific journals.

DEGAS, HILAIRE GERMAIN EUGÈNE (1834-1917), French painter (see 7.031). The Impressionist years, in which such typical canvases as "Women in a Café" and "Danses à la Barre" (sold in 1912 for 110,100 francs) showed Degas's complete break with the academic painters, his realistic outlook, and his mastery of *matériel*, notably pastel, ended with the eighth Impressionist Exhibition 1886, where he continued his realistic studies of modern life, showing drawings of the nude, of workwomen, and of jockeys. This marked his withdrawal from all public exhibitions. In the following years, until his death in 1917, Degas mainly concentrated on drawings and pastels of the nude, chiefly women at their toilets or in the bath, interspersed with returns to his favourite ballet subjects. At one time he almost abandoned the use of colour but returned thereto later. In his last years, ill-health and a forced removal from his studio prevented his working. Besides pastel and oil colour Degas also handled his favourite subjects in etching, aquatint and lithography. His work is to be seen in the Luxembourg (Caillebotte) collection, the Louvre (Camondo collection), the Victoria and Albert Museum, the Tate Gallery, the British Museum, Boston (U.S.A.) Museum, the National Gallery, Berlin, and many private collections. Though closely associated with the impressionists and following their sensitiveness to atmospheric colour, Degas was never one of them. An admirer of Ingres, and the great classical draughtsmen, he was himself a classic in his impressionist outlook. The increasing preoccupation of his art was the expression of form, chiefly by line, and to this must be ascribed his later concentration on the nude and temporary abandonment of colour. His figures are never impressions, but an elaborate synthesis of many sketches and much observation. An uncompromising realist in his subjects, Degas found in the art of the Far East a starting-point for combining the most ordinary and ungraceful attitudes of everyday life into an original, intricate and harmonious design.

See also P. Lafond, Degas (1918); A. J. Meier-Graef, Degas (1920).

DELAGOA BAY, Portuguese East Africa (see 7.042).—Improvements in port accommodation during 1910-21 were mainly in connexion with the transit trade with the Transvaal and the development of the coal trade. Coal loading was begun as early as 1914-5 and other port added in 1921, so that altogether 1,400 tons per hour could be loaded direct into ships' holds. A new ferro-concrete wharf, 1644 yd. long, was completed in 1916. The wharf was amply provided with electric and steam cranes. In 1920 the building of a dry-dock was begun. Dredging vessels maintain a minimum depth of 21 f. over the bar. Lourenco Marques drained, given a good water supply, and largely rebuilt, had become by 1920 one of the finest cities in South Africa. Considerable sums had been spent in making marine drives and golf links, in erecting hotels and on other measures to convert the suburbs, notably Polana, into health and holiday resorts in the winter months (May-Sept., average temp. 64° F.). Pop. of Lourenco Marques (1912 census) 13,333 of whom 5,374 were whites, including 668 British. Pop., city and suburbs (1920 estimate) 26,000.

The convention of April 2, 1909 between the Transvaal and Mozambique provided (for a period of 10 years) for free trade in the products of the two provinces and for facilities for the recruitment of natives of Mozambique for labour in the Rand mines (from 80,000 to 100,000 Portuguese natives are normally employed in the mines). In return Delagoa Bay was to be given 50 to 55% of the railway traffic in the areas of the Transvaal in which it competed with Union ports, i.e. Durban. This was an effort to adjust conflicting political and economic factors. Had Delagoa Bay been a British port it would have had nearly all the trade of the so-called competitive area, the route from it to Johanesburg being not only some 100 m. shorter than the route to the Rand, but having easier gradients. During 1910-12 the division of traffic favoured Delagoa Bay. Rate adjustments followed and the share of Delagoa Bay in 1916 fell to 31% and thereafter showed no marked recovery. A proposal made by Senhor Freire d'Andrade (sometimes governor of Mozambique) that the part of the province S. of the Sabi river—including Delagoa Bay—should join the South African Customs Union found supporters but was not adopted, and pending a new settlement the Mozambique Convention continued in force. The following table shows the value of imports into and exports from the Union of South Africa via Delagoa Bay in the years named:

Coal bunkered at Delagoa Bay was 136,000 tons in 1911, rose to 426,000 tons in 1917-8 and fell to 251,000 tons the succeeding year. In the same period (1912-9) the coal exported rose steadily from 479,000 to 585,000 tons. Most of the coal exported goes to Indian ports. The coal comes almost entirely from the two coal mines, Transvaal. Besides coal Delagoa Bay receives from the Transvaal for export copper, tin, asbestos and maize. The export of copper on a considerable scale dates from 1913. It quickly attained to the first place in the value of exports (£753,000 in 1916 compared with £199,000, the value of the coal exports the same year). Exports of commodities produced in the province developed slowly. In 1916 they were worth £63,000 (60% of the sugar (602,000); they fell during the period of the World War. Imports for consumption in the province reached the value of £1,083,000 in 1912.
DE LA GORCE, PIERRE (1846- ), French historian, was born at Vannes June 29, 1846. He devoted himself to the study in particular of the history of the 19th century, and produced various works of much learning, the chief being Histoire de la Seconde République Française (1887), Histoire du Second Empire (1896-1898) and Histoire religieuse de la Révolution (1891). In 1898 he was elected a member of the French Academy, and in 1918 published a monograph, Deux Frères: André et Pierre de Gallois-Bacalad.

DELAND, MARGARET WADE (1857—), American writer, was born at Allegheny, Pa., Feb. 23, 1857. She studied in private schools and at Cooper Union in New York, and for a time was a teacher of drawing. She lived in Boston after her marriage in 1886. She appeared as a writer of graceful verse in The Old Garden (1887), and in 1888 attracted wide attention with her first novel, John Ward—Preacher. This story resembles Mrs. Humphrey Ward's Robert Elsmere, at that time a centre of discussion. In all her works she deals with religious and social questions, and at first evoked protest in some quarters. Her method is perhaps best seen in Sidney (1891); Philip and His Wife (1894); The Awakening of Helena Richie (1900) and The Iron Woman (1911). Her numerous works include The Story of a Child (1892); Old Chester Tales (1890); Dr. Lavendar's People (1903—in Dr. Lavendar some have seen a character comparable with Goklsmith's Dr. Primrose); Partners (1913); The Rising Tide (1916); and The Promises of Alice (1919), the romance of a New England farm

DE LA REY, JACOBUS HERCULIS (1847-1914), Boer soldier (see 7,944), who was concerned in the rebellion headed by Col. Maritz (see SOUTH AFRICA), was shot dead by a police patrol at Johannesburg, Sept. 15, 1914.

DELAUNAY-BELLEVILLE, LOUIS (1843-1912), French engineer, was born at Corbeil Nov. 20, 1843. Educated at St. Barbe and the Ecole Polytechnique, he entered the Naval Engineering school in 1864 and in 1867 left to join the Belleville works at St. Denis, near Paris. He became a partner and finally head of the firm which produced the well-known Belleville boilers (see 4,145), and also the automobile called by his name. From 1890 he was president of the Paris Chamber of Commerce. He died at Cannes Feb. 10, 1912.

DELAWARE—(see 7,947).—In 1920 the pop. was 225,803, as compared with 202,422 in 1910, an increase of 26,681, or 12.3%. The number per sq. m. in 1920 was 120.3; in 1910, 103. In 1920 the native whites constituted 77.5% of the total, foreign-born whites 8.9% and negroes 13.6%. Of 10,508 illiterates in 1920, 4,700 were negroes, 5,373 foreign-born whites, and 2,427 native whites. In 1920 for the first time the urban pop. exceeded the rural; urban 120,817, or 54.2% rural 102,186, as compared with 97,685 or 49.8% and 105,347 respectively in 1910. The change was due chiefly to the growth of Wilmington, as Kent and Sussex counties remained strongly agricultural. One county, New Castle, showed an increase, the other two decreases. Wilmington, a centre of war-time manufactures, had in 1920 a pop. of 110,168, as compared with 87,411 in 1910, an increase of 22,757, or 26%. The pop. of the other chief towns in 1920 was as follows: Dover, the state capital, 4,024; Newcastle, 3,854; and Milford, 2,573.

Manufactures.—Delaware, especially Wilmington and the upper end of the state, was influenced by the great industrial activity of the World War period. Most noteworthy was the part taken by the duPont powder interests in supplying the needs of the Allies. The following table gives interesting comparisons between the pre-war period and the year following the Armistice.

In 1920 the principal industries were leather, pulp goods, cars and general shop construction and repairs by steam railway companies, iron and steel, canning and preserving of fruits and vegetables, and foundry and machine-shop products.

Agriculture.—After the passage of the Agricultural Extension Act (1901) the most significant movement was the development of cooperative associations, and especially (1901-1917) the rapid growth of the Farm Bureau movement. In 1920 the number of farms was 10,146, as compared with 10,186 in 1910, a decrease of 606, or 6.4%. The preceding decade had shown an increase of 1,149, or 11.9%. The value of all crops for Delawar was $7,702,006. The total value of cereals was $6,638,010; of hay and forage crops $4,366,714; of vegetables, including potatoes, $6,271,714; and of fruits and nuts $2,566,807. As compared with 1900, the total value of all crops showed an increase of 166.6%; cereals 105.4%; vegetables 242.2%; and fruits and nuts 188.3%. These figures, of course, reflect the changed price level. The production of strawberries for 1910 was 4,562,473 qt., of apples 666,286 bus., of peaches 277,375 bus., and of grapes 1,445,121 pounds. The total value of live stock, horses, mules, cattle, swine, in 1910 was $7,373,268; of dairy products, excluding "cheese sold" (not reported), $4,442,251.

DE LA GORCE, PIERRE (1846-1914), French writer, was born at Vannes June 29, 1846. He devoted himself to the study in particular of the history of the 19th century, and produced various works of much learning, the chief being Histoire de la Seconde République Française (1887), Histoire du Second Empire (1896-1898) and Histoire religieuse de la Révolution (1891). In 1898 he was elected a member of the French Academy, and in 1918 published a monograph, Deux Frères: André et Pierre de Gallois-Bacalad.
corporation tax in 1899, the automobile tax in 1907. One new source of revenue was the state income tax of 1917, the first $250,000 of this going to the school fund, the surplus, if any, to the city. The direct tax in 1907, and the income tax in 1917, was changed to a direct graduated inheritance tax, with a consequent revenue for 1919 of $199,633. Apart from these sources increased sums came from fees and from the corporation tax, and the difference was filled by other methods. The much-discussed corporation tax became the state's main reliance as a revenue producer. A state banking department was created in 1919, with a banking commissioner and a deputy, whose duties resembled those of a bank director in every bank. In 1917, a state armed with a budget plan was adopted for a two-years' trial, but in 1919 it was not continued. In 1921 the plan was again under discussion with a reasonable chance of adoption. State finances were regulated by the "financial aid" revenue law. In 1919 the receipts from the Federal Government were $315,204.52, distributed as follows: (1) $50,000 to Delaware College under Federal grants; (2) $9,472.69 for vocational education; (3) $75,875 for construction.

Historical Review—The two dominant facts in the history of the state in the period 1910-20 are: (1) the passage of a considerable number of modern and progressive laws, and (2) the reaction of the state to the activities of the World War. In the latter respect, Delaware met the situation squarely and was well organized, with the various war-time activities centered in the state. The Council of Defense, of which Secretary of State E. C. Johnson was the nominal head, kept the state in the World War was $7,548, and the amount raised in Liberty and Victory loans $103,896.36. In this period two progressive governors, Charles R. Miller and John G. Townsend, were elected by their constituents. The former accomplished much for the state. During the administration of the latter, for example, a number of important statutes were enacted, including a Child Labor law (1917), a Workmen's Compensation Act (1917), laws for the protection of women, an Income Tax law (1917), a Direct Inheritance Tax law (1917), an Act creating a state banking department (1919), and a thorough revision of the school laws, known as the New School Code (1920), together with the Agricultural Extension Act (1911), mark a new era in the development of the state. At the Republican Convention in 1921 the resolution adopted the state, in 1916 and 1920 the revenue less and from the corporation tax, the corporation tax, $75,875 for construction.

DELBROOK, HANS (1848-1912), German historian (see 7, 305).—Under the old regime Prof. Delbrück vigorously opposed the policy of the Prussian Government in dealing with the Danes and the Poles, with the result that he was twice subjected to disciplinary penalties as a professor and therefore, in Prussia, a civil servant. From 1889 to 1910 he edited the Preussische Jahrbücher, the most important political magazine in Germany. He was the author of a great number of articles and works, of which the following were published after 1910:—Numbers in History (1913); Regierungen von Volkswirtschaft (1914); Bismarcks Erbe (1913); Krieg und Politik (1918); Kautsky and Harden (1920) and Ludendorff and Topple (1921). Special mention may be called to the book Regierung von Volkswirtschaft, in which Prof. Delbrück attempted a definition of the old system of government in Germany and Prussia with particular reference to its "dualism," i.e. parliamentary representation and simultaneously a certain degree of autocracy on the part of the sovereign in Prussia and of the federated Government in the empire. At an early stage of the World War he became pessimistic regarding the possibility of any real success for Germany except by military and political strategy and tactics of a purely defensive character. He was, on tactical rather than on moral grounds, a strenuous opponent of intensified submarine warfare, and did not conceal his conviction that this method of warfare would ultimately be the intervention of America. After the Armistice of Nov. 1918 he devoted himself mainly to endeavours to prove that Germany could not be made solely responsible for the outbreak of the war, although she had formally declared war upon Russia and France. He was one of those who were sent to Versailles during the Peace Conference in order to draw up a statement of the German case with regard to the responsibility for the outbreak of war. For a succinct statement of Prof. Delbrück's views on this subject and an English reply see articles by Delbrück and J. W. Headlam-Morley in the Contemporary Review (March 1921).

DELASSE, THÉOPHILE (1852— ), French statesman (see 7, 303), returned to office in the Monis Ministry of Feb. 1911, as Minister for the Navy, a post which he retained when Caillaux succeeded Monis, and in the Poincaré Cabinet which was formed on Jan. 9 1912 after the fall of Caillaux over the Moroccan negotiations. He was appointed ambassador in St. Petersburg on Feb. 20 1913, and became once more Minister for Foreign Affairs in the reconstructed Viviani Cabinet on Aug. 26 1914. In this post he was actively concerned in counteracting the efforts of German diplomacy throughout the world, and particularly in England. He resigned from the Cabinet on Oct. 14 1915, partly on account of differences of opinion as to the advisability of proceeding with the dispatch of the expedition to Salonika in the changed conditions created by the resignation of M. Vivien and, partly on the grounds of ill-health.

DELI, India (see 7, 502).—The planning and laying-out of a New Delhi has been in progress since 1912, as the outcome of the official transfer of the capital of British India to Delhi from Calcutta, announced by the King-Emperor George V. at the Coronation Durbar on Dec. 12 1911. Two inauguration stones were laid by the King-Emperor himself on Dec. 15 1911, when he said: "It is my desire that the planning and designing of the public buildings to be erected will be carried with the greatest deliberation and care so that the new creation may be in every way worthy of this ancient and beautiful city." The first step taken was the appointment of a town-planning committee to advise on the choice of a site for, and a layout of, the new capital. This committee consisted of Capt. G. S. C. Swinton (chairman), Mr. J. A. Brodie and Sir Edwin Lutyens. Mr. V. Lancaster was subsequently consulted by the Government on certain aspects of the question. After a full consideration of all possible sites near the existing city of Delhi on which a new capital could be built, they found two alternative sites, known respectively as the Northern and Southern Sites—the former to the N. of Delhi and to the W. of the range of rocky hills which run S.W. from near the village of Wazirabad (35 m. N. of the Kashmir Gate), giving a belt of land gradually increasing in width from W. to E. between the hills and the river Jumna; and the latter to the S. of Delhi and to the E. of this range.

The committee's first report was issued on June 13 1912, and with regard to the Northern Site, on which the Durbar camps of 1911 had been pitched and where the inauguration stones were laid, they found it had some general advantages:—This area is upwind and upstream of the existing city of Delhi; the ruins of the Delhi of the past do not cumber the ground; whilst external communications might need improvement, the area is fairly well served by existing railways; roads, canals and internal communications could be made convenient; and the site, which had already been spent on the area in connexion with the Durbar. But its disadvantages were found to be overwhelming;—the site was too small for the proposed new city, and part of the area was liable to flooding.

The committee therefore recommended the site on the eastern slopes of the hills to the S. of Delhi, on the margin of the area occupied by the Delhis of the past. They found this site free from liability to flooding, with a natural drainage.
not too much cumbered with monuments and tombs needing reverent treatment and, whilst it was reasonably near the centre of the existing city, it was capable of almost indefinite expansion southwards, where it has a long and wide extent of the neighbourhood but found none suitable for the purpose. No good site existed of the Jumna. Similarly the Narainah Plain, on the western slopes of the hills to the S. of Delhi, was not recommended mainly because a new city built there could hardly be considered to be Delhi at all, and the area was destitute of historical associations and shut out by the hills from all view of the existing city. This area was, however, found suitable as a site for the new cantonment.

The publication of this first report aroused considerable interest both in India and in England. Articles in the Indian press expressed the feeling that the Northern Site was preferred to the existing site, and had also been felt by the town-planning committee when they commenced their labours. In Dec. 1912 Sir Bradford Leslie read a paper before the Indian section of the Royal Society of Arts in London, in which he set forth plans for building the new capital on the Northern Site and producing a fine water effect by a treatment of the river Jumna. The town-planning committee therefore, in Feb. 1913, issued their second report, in which they restated the arguments for and against the Northern Site.

The soil is poor on the Northern Site as compared with the Southern Site. The layout is also less harmonious and less interesting than the surrounding country. The Northern Site, even after expenditure on sanitary requirements, will never be satisfactory. If the Northern Site is to be made healthy, this involves going outside the site itself and making a healthy, well-aerated building belt. The healthiness of S. is generally good. On the N., to be used at all, it has in places to be raised at considerable cost. There is no really suitable healthy site for a cantonment in proximity to a city on the Northern Site. The exigencies of living in the requirements to the limited area of the Northern Site endanger the success of a layout as a whole and tend to make for cramped and bad arrangement. The result of placing a city on the Northern Site appears to the committee to be the creation of a bad example in placing a city on a good one.

In Feb. 1913 a committee was appointed to consider the comparative healthiness of the Northern and Southern Sites. The committee reported on March 4 1913: “that no doubt can exist as to the superior healthiness of the Southern Site, the medical and sanitary advantages of which are overwhelming when compared with those of the Northern Site.” The committee therefore, on March 20 1913, issued their third report with a layout for the proposed new city on the Southern Site.

The focal point of the new city (see map) is located on Raisina Hill, and the site of the Viceroy’s residence is the highest point of the Great Hill. This location is also important, because it gives a clear view of the city. The layout of the city is based on a grid system, with streets intersecting at right angles. The city is divided into four main sections: Eastern, Western, Northern, and Southern. The Eastern and Western sections are connected by a central spine that runs from north to south. The Northern section is connected to the Eastern and Western sections by a series of bridges and tunnels.

The Viceroy's residence is located on Raisina Hill, and the site of the Viceroy’s residence is the highest point of the Great Hill. The residence is surrounded by a moat and is accessible only by a covered bridge. The Viceroy's residence is a large, ornate building with a steeply pitched roof and a central dome. The building is made of red sandstone and is adorned with intricate carvings and sculptures.

The Viceroy's residence is surrounded by a large garden, which is divided into four sections. Each section is dedicated to a different aspect of the Viceroy's duties. The eastern section is dedicated to the Foreign Office, the southern section is dedicated to the Home Office, the western section is dedicated to the India Office, and the northern section is dedicated to the Finance and Revenue Department.

The Viceroy's residence is connected to the rest of the city by a series of tunnels and bridges. The tunnels are lined with red sandstone and have intricate carvings and sculptures. The bridges are made of red sandstone and have ornate iron railings.

The Viceroy's residence is not only a significant architectural achievement, but it also represents the modernity and progress of the Indian government. The design of the residence reflects the latest architectural styles and techniques, and it is a testament to the vision of the British architects who designed it. The Viceroy's residence is a symbol of the power and prestige of the British government in India, and it continues to be a major attraction for visitors to Delhi.
DEMOBILIZATION AND RESETTLEMENT

The building which will accommodate the Legislative Chambers is circular in plan and surrounded by a colonnade. The plan is divided into six sectors, utilized respectively by the Council Chambers and subsidiary accommodation for the Council of State, the Legislative Council, and the Chamber of Princes, with three open courts separating these three chambers. A common library is situated in the centre of the building. The foundation stone for this building was laid on Feb. 12 1921 by the Duke of Connaught, and the building was designed by Sir Edwin Lutyens.

The All-India War Memorial is to be a monument in the form of a triumphal arch. It will be built in white stone upon a red sandstone base and will rise to a height of 162 feet. It will be surmounted by flares so that on occasions of consultation within a column a flame by day and of flame by night will rise. The structure consists of a mass pierced through from E. to W. by the great arch, 87 ft. high and 35 ft. wide, which spans the Processional Avenue. The piers and fluted columns are pierced by smaller arches which run through at right angles to the main arch. The freedom from intricate ornament and the simplicity of the design give the monument an appearance of dignity. Above the great cornice is inscribed the word "INDIA," flanked by the dates "1914" and "1919." This monument was designed by Sir Edwin Lutyens, and the foundation stone was laid by the Duke of Connaught on Feb. 10 1921.

The estimate of cost for these works in the new capital which were being carried out by Government, according to the revised figures available in March 1921, was Rs. 12,91,80,000 (or at Rs. 15 to the £13,80,000). On Oct. 1 1912, by proclamation, there was constituted the Administrative Province of Delhi under a chief commissioner. This area was taken entirely from the old Delhi district of the Province of North-Western India, having originally an area of 528 sq. m., to which was added later an area of 45 sq. m., to the E. of the Jumna river and taken from the United Provinces, to serve as a grazing ground for the cattle of the city. The total area of the province is now 421 sq. m., comprising, on the basis of 1911, a pop. of 412,821.

See R. L. Poole, Léopold Delisle (1911); X. Delisle, Lettres de Léopold Delisle (1911).

DELIUS, FREDERICK (1862- ), English musical composer, born at Bradford, Yorks., Jan. 20 1863, was educated primarily at the International College, Isleworth, and was destined by his parents for a mercantile career. To Delius the prospect thus held out was unendurable, though, rather paradoxically, when he declined the business career proffered to him in Bradford, he set out for Florida, where he established himself as an orange planter. His spare time, however, was devoted to such musical study as he could obtain from such books as were in his diminutive library. In this sense he, like Elgar, was self-taught. But he quickly broke away from orange-planting to Lydia pig, and, were or less regular course of training at the hands of Jadassohm, though he probably learnt more of practical use from Grieg who at that time was resident in Leipzig studying the art of scoring for a modern orchestra. In or about 1900 Delius took up his abode at Grez-sur-Loing (S. et L.), near Fontainebleau, which subsequently was his principal domicile, though he travelled in many lands. He was in Norway in 1897 when his incidental music was produced to Gunnar Heiberg's Folkeraadet, and, by its satirical use of the National Anthem, set the town by the ears. Meanwhile compositions flowed from his ready brush. He gave a concert of some of them in London in 1898 when his Legende for violin (composed in 1892) was produced. In 1893 his fantasy-ouverture Over the Hills and Far Away was done by Dr. Haym at Elberfeld, and followed, in 1897 by his pianoconcerto in C minor. This fine work, however, was ultimately recast and produced in London at a promenade concert in 1907 by Theo. Szanto, a Hungarian pianist. But before then, in 1896, Delius's first opera, Koaiva, was in the making. It was produced at Elberfeld in 1904. His second opera, Romeo and Juliet in the Village, was first performed at the Komische Oper in Berlin in 1905, and the third, A Mass of Life, was given by Sir Thomas Beecham at Covent Garden in Feb. 1910 and, in a revised version, in 1910. A third opera, Fenimore and Gorda, was staged at Frankfurt a/M soon after the Armistice.

In between the intervals of opera-composing, Delius was very busy producing purely orchestral works, or works for chorus and orchestra for the concert room. Thus Life's Dance dates from 1898; Paris: the Song of a Great City from 1900; Afpalacha (1903); Sea Drift (1904); A Mass of Life (after Nietzsche, 1905); Brair Flag (1908); In a Summer Garden (1908); Requiem (1909) Postlude: Life, Love and Love and Everwynt (1919). Besides all this Delius composed a violin concerto and a double concerto for violin and violincello, a violin sonata, a string quartet, many songs and several a capella choruses.

DEMOBILIZATION AND RESETTLEMENT—No labour problem of greater difficulty has ever had to be faced than that of national demobilization, whether military or civilian, after the World War, because of the dimensions to which the calling-up of national man-power had attained. An account of post-war demobilization and resettlement in industry, in the United Kingdom, from the civilian point of view, divides itself into three clearly marked periods: (A.), the preparations during the pre-Armistice period; (B.), the action taken immediately after the Armistice; and (C), during the first two years of resettlement. (For the Army demobilization, see ARMY.)

(A) PRE-ARMISTICE PERIOD

There were two lines upon which British Government preparations proceeded during the pre-Armistice period in respect of civilian workers:

(a) The bringing of workers demobilized from munitions work and war work as quickly and as conveniently as possible to peace work.

(b) The rapid turnover from war to peace so that employment might be available for the largest number at the earliest moment. For the provision for unemployment, see the article UNEMPLOYMENT.

(a) The Bringing of Workers Demobilized from Munitions Work and War Work.—In making plans for the demobilization of civilians account had to be taken of the possibly simultaneous demobilization of the armed forces. The ideal would have been to have fitted civilian workers into their places before the forces had been demobilized so that there should be no confusion as between the two masses of demobilized persons. In point of fact it was recognized from the outset that it would be impossible to complete one process before the other began, first because industry could not in many places be started up again without the return of numbers of pivotal men with the forces, and secondly because, as the large numbers of men with the forces had either a statutory right or a promise to return to a particular employment. It was accordingly necessary to frame a scheme for civilian workers which could work conveniently side by side with the scheme devised for the demobilization of the forces. The demobilization of the forces took into account throughout the necessity of approaching the matter, subject to paramount strategic considerations, upon an industrial basis. From the first report on military demobilization, signed in Dec. 1914 by Sir H. Llewellyn Smith and Sir R. H. Braide (as secretaries of the Board of Trade and War Office respectively), right through to the second interim report of the Ministry of Reconstruction, the first men from the forces had either a statutory right or a promise to return to a particular employment. It was recognized that demobilization must be so arranged as to render the transition from war to peace as easy as possible, which meant arranging it so far as possible to fall in with the immediate needs of the post-war industrial situation.

The principles upon which the recommendations as to military demobilization proceeded must be briefly explained, in order that the reader should be aware of the numbers of men who would be employed in the military. The essential point was that the industrial Labour Exchange Service should take the view that the demobilization of the forces must be made as easy as possible for the employment of the demobilized men. This service was to be given advice by the above committee, which had the power to recommend to the Minister of Reconstruction, and to the Board of Trade, any arrangements that might be necessary to facilitate the employment of the men. The recommendations of the committee were to be given effect to as far as possible, and the committee was to be responsible for the employment of the demobilized men.

The objects aimed at were to reduce unemployment to the lowest possible point, but at the same time to make adequate provision for such unemployment as was inevitable. In order to meet the first point it was recommended that demobilization should, subject to military exigencies, be carried out according to the requirements of trade and industry, and that the demobilized men should be given employment in as much as is feasible. In order to meet the second point it was recommended that the provision of a free unemployment insurance policy to be given on demobilization.
DEMOBILIZATION AND RESETTLEMENT

The object of the army scheme, which was to get men to the place where they could be employed as rapidly as possible, formed also the first part of the civilian demobilization scheme. The questions of civilian demobilization were considered from this point of view partly by the War Office and partly by the Ministry of Reconstruction, which issued five reports during 1918, partly by the Ministry of Labour, and partly by the Labour Resettlement Committee set up by the Ministry of Labour. The recommendations made were embodied in the orders in council passed by which they were actually made, but in relation to the order of the events with which they dealt.

The principle on which a former munitions worker was granted the option of retirement from munitions works, just as the first point to be considered in army demobilization was the order in which men should be released from munitions. As a result, it was recommended by the Ministry of Labour that the order of discharge should be as follows:

(a) That adequate notice of discharge should be given to each individual worker.

(b) That adequate notice of discharge ought to be given to the local employment exchange so that the exchange might be able to find employment for the worker.

(c) That the order of discharge should be: first, workers not dependent on industrial employment for a livelihood; second, workers drawn from a distance; third, workers who could be readily absorbed in their previous occupation or in one of the staple industries.

It was regarded as of paramount importance that the previous industrial experience of the workpeople who were to be discharged, and the demand for workpeople of their experience elsewhere, should be investigated in order to get the workpeople to the exchange and with the officials of the Ministry of Labour before the selection of the individuals to be discharged was made.

In the case of workers who would be able to travel to their homes at the earliest possible moment, or to their new places of employment, it was recommended that the Civil War Workers' Committee that free railway passes should be issued to them for the purpose of taking up work on munitions or on naval or army contracts, and who might be displaced from such employment owing to the cessation of hostilities. In such cases the worker should have the opportunity of having his officers at the disposal of the war office for the case of residence, or to some other place at which work is available.

After the question of the order of discharge there was the question of the employment of the discharged worker in determining where his future employment lay and whether he and his family could come into touch with possible employers. On this the following recommendations were made by a committee of the Civil War Workers' Committee: (a) Steps should be taken by the Government, through the machinery of the employment exchanges, to assist war workers to return to their former employment. In addition joint industrial councils and similar joint bodies for individual industries should be taken into consultation. (b) Steps should be taken as soon as there was a reasonable prospect of peace to ascertain where war workers would be required. (c) Workers should be encouraged to register their requirements. Proposals were also made as to limiting the flow of war workers back into industry by means of closing the school age, and further schemes were proposed for watching the placing of young persons in industry.

Action on these recommendations was possible during the pre-Armistice period, and in fact a considerable amount of work was done by the workers in this connection. The outlay by giving workers the impression that peace was in sight before the facts justified this belief. It was therefore not possible until immediately before the Armistice to take full advantage of the proposals for bringing employers and workpeople into touch.

It was universally agreed that the machinery for demobilization must be found in the employment exchange system. It was, however, suggested that the employment exchange machine might break down under the heavy strain imposed upon it unless it were supplemented. The Minister of Labour had appreciated this aspect of the problem and in 1917 had appointed a series of local employment committees. These committees consisted of equal numbers of employers and employed, presided over by a chairman nominated by the Minister of Labour. A committee was attached to each principal exchange area and was to advise and guide the work of the exchange and, in particular, to help in the task of the demobilization of civilian workers. The various schemes prepared by the Ministry of Labour were circulated to these committees so that the period of actual demobilization came when they were fully prepared to handle them.

In addition a central committee known as the Labour Resettlement Committee was set up by the Ministry of Labour to advise the Minister of Labour on matters affecting the employment of warpeople under notice of discharge; (ii) distribution of completed forms of registration to exchanges or other local offices; (iii) negotiations with the previous or other employers of the warpeople in order that there may be a minimum of unemployment after discharge from war employment; (iv) placing of warpeople in employment after their discharge.

Under these four heads the committee worked out in detail the registration forms and cards which would be necessary for an effective system of registration. They were to provide for an interchange between the exchange at which a worker was discharged and the exchange at which he was reemployed. They suggested a method by which, upon interchange of the forms, the exchange at which a worker was discharged would put itself into touch with the employer, and notified the result of this communication to the exchange of discharge. Finally, they made recommendations that the exchange at which a worker was seeking employment, could be traced so that he could be fitted into the general scheme.

Apart from these preparations for action to be taken upon the cessation of hostilities the question of the future of munitions men returning, disabled or unfit, from the colours. This work was undertaken as a result of the recommendation of the Resettlement of Officers Committee under the chairmanship of Sir Reginald Brade, which had been recommended by the Prime Minister as a means of help to the men of like standing who should be established under the control of the Ministry of Labour to operate with the existing University Appointment Boards or other approved scheme. There had been two departments dealing from different points of view with this problem. In 1918 a special department of the Ministry of Labour had been set up, known as the Professional and Business Register, whose work was finding employment for the disabled men by its title. During the earlier years of the war its duties principally consisted in finding employment for persons of the professional classes who were either unable to pursue their pre-war occupation or who had entered the service for their own self-interest. In addition there was established early in July at the Ministry of Munitions an organization known as the Officers' University Training Centres, which provided training for the men unfit or unable to take professional and business men in the ranks could attend universities, technical institutions and other centres of instruction during their period of convalescence. Candidates for such training, if still unfit for service, were utilized to meet the immediate demands of Government departments.

Following upon the report of the Brade Committee it was considered convenient to combine these two departments under one head, and the Appointments Department of the Ministry of Labour was established in April 1918. Previous to the cessation of hostilities the department performed two functions: (i) the training of the convalescent serving officer, and (ii) the placing in employment of the officer when he was either not fit for further service or was discharged from service. In addition there was established early in July at the Ministry of Munitions an organization known as the Officers' University Training Centres, which provided training for the men unfit or unable to take professional and business men in the ranks could attend universities, technical institutions and other centres of instruction during their period of convalescence. Some 4,000 officers were placed in training for practically every professional and higher commercial appointment. At this stage, while demands still far outran supply, no considerable difficulties in placing the trained men arose. The proposals affected officers for the placing of warpeople remained with the exchanges, but the question of the training of disabled members of the forces was also receiving attention. Joint committees were formed by the Ministry of Labour for dealing with the matter, and for another named after a number of meetings on a national basis and devoted themselves to laying down conditions upon which trainees could be admitted into industry. Both as a result of these two schemes, and the establishment of the foundation of the large schemes, were operated after the Armistice by the Appointments and Training Departments respectively.

(b) The Rapid Turner from War to Peace.—The proposals on this head may be considered under two aspects:—

(c) Proposals as to the way in which the Government should treat its contracts with a view to reducing the dislocation consequent on the change from war to peace to the lowest possible point.

(i) Proposals for demobilization: The first step in peace with special reference to the lessons learned during the war.

So far as munitions contracts were concerned there had to be considered (i) termination of contracts for the supply of munitions, (ii) disposal of stores, stock and material, machinery, etc., in the possession of the Government, and (iii) the arrangements for the disposal or post-war use of national factories with their plant and equipment.

With regard to contracts it was plain that to continue manufacture of munitions for a moment longer than the military situation required them was waste of the highest degree uneconomic. At the same time regard had to be had to the fact that a sudden cessation of all contracts would lead to unemployment on a hitherto unexampled scale, and would, moreover, with regard to such munitions as guns and tanks, lead to some loss of technical skill and know-how. To meet this the process. It was recommended by the Ministry of Munitions, and accepted by the Cabinet, that the manufacture of munitions should be terminated at the earliest possible moment, subject to a period of notice given to the manufacturers and workers, and that the whole matter should be referred to a committee of experts. The Government, in order to arrive at a task which was too large for the Government to do alone, and which any attempt to do alone would have entailed a very serious risk of losing the technical skill and know-how which had been acquired for the manufacture of munitions, decided that there should be a committee of experts. The committee of experts was, in fact, the committee which had been set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization. It was decided that the committee should be set up to deal with the subject of demobilization.
DEMOBILIZATION

With regard to the disposal of stores, the Surplus Stores Department of the Ministry of Munitions had been proceeding for some time to plan the disposal of the munitions, manufacturing machinery, and other movable property no longer required by the Ministry. Owing to the enormous field covered by the Ministry this was a considerable operation, but one almost negligible as compared with the work of the Ministry of Munitions in respect of the accumulation of war stores on the cessation of hostilities. It was pointed out that large quantities of materials had been purchased from contractors to whom the problem of disposal of the contracts, and plant and machinery in many cases had been installed in the works of manufacturers on terms which formed part of the contracts themselves. The Ministry of Munitions was responsible for these stores and it was considered not improbable that on the completion of this work the Ministry of Munitions would be converted into a permanent Ministry of Supply combining in itself the supply departments of the Admiralty, War Office, Air Force and even of the Stationery Office, and Office of Works.

The question of the post-war use of national factories was discussed as one of general policy by the War Office and the Ministry of Labour. The question was strongly held that these factories should be put into commission immediately upon the cessation of hostilities to provide employment during the transition period, and thereafter should be operated by the Government in competition with private enterprise. These proposals were rejected. In the first place it was pointed out that, for the immediate period of transition the factories would be useless. To convert a shell-producing factory into a factory for common goods and to take away from it on six months' notice scrap, and at the end of the year it was hoped that the worst period of dislocation would be over. Apart from this, on general grounds, it was felt that Government by entering into competition with the private trader would risk a certain degree of unwise enterprise. The Ministry of Munitions was therefore authorized to make arrangements for the disposal of national factories.

Textile factories—An exception was made in the case of small number retained in connexion with the work of the Training Department to the Ministry of Labour, were disposed of. In addition to the cessation of contracts the Government's obligation in respect of placing further contracts in regard to the peace requirements was also considered. It had long been maintained by labour opinion that the placing of Government contracts with special regard to possible unemployment would have a certain extent help to reduce unemployment. In addition, however, the volume of peace-time contracts compared with the general volume of trade, it becomes apparent that the most careful placing of such contracts can do little to mitigate a situation in which unemployment is likely to continue. Without, as far as so far as Government contracts and contracts placed by public bodies can alleviate the situation, it was recommended that Government departments and public or semi-public bodies should be urged to adopt arrangements to reduce their contracts in the case of industries which are expected to suffer from unemployment. In point of fact this recommendation failed of its effect because public bodies (like private employers), being unable to foresee the course of prices during the transition period, were not disposed to make arrangements which might involve financial risk.

Proposals were further made with a view to the development of industry immediately upon the cessation of hostilities. These proposals were in short: (a) proposals for retaining new markets and the materials necessary for post-war manufacture; and (b) the actual development of the various industries.

Under the first head it was contemplated that the reconstruction of the devastated areas of Belgium and France would necessarily bring large orders to the British manufacturers. It was accordingly proposed that an International Commission should be appointed to investigate the question of reconstruction work in the devastated areas of Belgium and northern France and to prepare schedules of the requirements for the allocation of raw materials. In the second a standing council was established consisting of leading representatives of commerce, including the War Office, the Departments concerned to advise the Cabinet Committee. An additional sub-committee to consider the amount of supplies of materials and foodstuffs which, in their opinion, would be required by the United Kingdom during the period which might elapse between the termination of the World War and the restoration of a normal condition of trade.

With regard to the development of industry, the future of engineering, agriculture and electric power were held to be the burning problems of the moment. So far as the employment of women was concerned attention was directed to their rights as competitors with men in the various occupations in which they could be encouraged to revert to domestic service.

Engineering.—The first engineering committee was appointed by the Board of Trade under the chairmanship of Sir Clarendon Hyde and it was charged with the following: (a) the amalgamation and joint working of existing firms, apprentices, technical education, trade combination, trade marks and patents, (b) the question of the future of the engineering trade should be made to develop and encourage the medium and light engineering trades, whether already in this country or not, thereby making them use of the workshop motive power and equipment installed for the purpose and finding suitable opportunities for the large body of semi-skilled and female labour recently created.

This last recommendation was accepted by the Government, and the Ministry of Reconstruction appointed a further committee, known as the Engineering Trades (New Industries) Committee, under the chairmanship of the Hon. H. D. McLaren—

To compile a list of the articles suitable for manufacture by those explored in the experience or plant, which were either not made in the United Kingdom before the war, were imported, or were made in the United Kingdom in small or insufficient quantities and for which there is likely to be a considerable demand after the war. This committee was to consider industries and make recommendations with regard to the development of such industries by the transfer of labour, machines and otherwise.

(b) As to how such a transfer could be made, and what organization would be requisite for the purpose, with due regard to securing the control and supervision of such industries over the transfer of labour and machines.

This committee appointed sub-committees to deal with the various branches of engineering.

Agriculture.—As agriculture was concerned, in 1915 the Prime Minister appointed a committee under the chairmanship of Lord Selborne. Their first report resulted in the setting up of the Agricultural Wages Board which has regulated the wages of agricultural workers and is now considered as a technical company. In January 1917 it dealt with the problems of small holdings, land reclamation and drainage, credit facilities for land settlers, village reconstruction, and national transport.

Electric Power—Two committees were set up to deal with electric power supply. The first, appointed by the Board of Trade, under the chairmanship of Sir Archibald Williamson reported: (a) that a high rate of employment in reducing manufacturing costs will be the general extension of the use of electric power supplied at the lowest possible price; (b) that the present system under which a supply of electricity is provided in a large number of small areas by separate undertakers and in which the consumers are insufficiently consolidated; (c) that a comprehensive system for the generation of electricity, and, where necessary, reorganizing its supply, should be established as soon as possible.

In the second report the Government at the recommendation of the committee on electric power supply. They reported (a) that the development of electricity should take place on a national scale and under the control of the Board of Trade; (b) that obtaining the necessary information should be set up to advise upon and control the carrying out of the national scheme; and (c) that the first duty of the Board would be to plan out a comprehensive scheme for the whole country, and then by degrees to secure the development of electric power over the whole of the United Kingdom by such methods as they might find suitable to the requirements of different areas.

In this way the committee of chairmen reduced the general principle enunciated by Sir Archibald Williamson's committee to practical proposals, though proposals still on a universal scale. The electricity commissioners under the Ministry of Transport were the tangible result of these recommendations.

(B.) IMMEDIATE POST-ARMISTICE PERIOD

On No. 11 11 1918 the Ministry of Munitions issued to contractors, sub-contractors and workpeople engaged on work for the Department, a notice indicating the line of action to be followed. The instruction proceeded on the following lines:

1. There should, as far as possible, be no immediate general discharge of munition workers.
2. All workers, however, who desire to withdraw from industry or to leave for any reason, and all workers who can be absorbed elsewhere, should at once be released. Production on contracts for guns

1. Engineering Trades (New Industries) Committee Report (Cd. 9,265).
2. Agricultural Policy Sub-Committee Report (Cd. 9,079).
3. Cd. 9,062.
4. Cd. 93.
and gun munition, machine-guns, small arms and small-arms munition, trench mortars, bombs and stores, pyrotechnic stores, aerial bombs, or accessories of the above stores, aircraft and air engines, and the machinery and implements produced in the following way: (a) all overtime should be immediately abolished; (b) systems of payment by results may be temporarily suspended; (c) where reduced hours are worked upon a time-work basis, the number of hours worked shall be less than the normal length of the present normal working week. If the earnings of workpeople fall below certain figures they will be made up to them by the State.

3. The adoption of half-time may cause discharges, but these should be spread out as long a period as possible.

4. Free railway facilities will be provided for workpeople from the place of employment to their homes or to places where they have new employment.

At the same time, the first announcement was made of the institution of a temporary non-contributory scheme for unemployment which would remain in force pending the introduction of the general war contributory scheme, the main provisions of which were that unemployed men were to receive 24s. per week and women 20s. (later increased to 30s. and 25s.), with additional allowances for dependants. Almost immediately afterwards instructions were issued in respect of war munition volunteers, war work volunteers, national service and war agriculture volunteers indicating that the schemes would be terminated at Dec. 14 1918. A notice was issued at the end of Nov. dealing with soldiers released from the colours, and army reserve munition workers.

These instructions indicated the methods by which the expenses of unemployment incurred under war conditions would be terminated. They followed to a large extent the lines of the recommendations prepared by the committees mentioned above; but it was felt by the Government that it was necessary to constitute a special department for dealing with problems of civil demobilization. Accordingly, at the end of Nov. a Controller-General of Civil Demobilization and Resettlement was appointed and his department was attached to the Ministry of Labour. This department was made responsible for—

(a) the actual machinery of the return of both of the men from the front to their former occupations through the employment exchanges;

(b) attempting to remove from the labour point of view obstacles to the restarting of industry; and

(c) the administration of the Appointments Department which dealt, on a rapidly increasing scale as demobilization proceeded, with the training and placing of ex-officers and men of similar educational qualifications. To these functions were added later the responsibility of the Civil Liabilities Resettlement Scheme.

The first few months were a time of great difficulty and strain. On the one hand the machinery devised for demobilization of the forces was found to be too slow to meet the situation and a new scheme was introduced which enormously expedited the procedure. This led to a position where very large numbers of both ex-civilian workers and ex-service men were out of work at the same time. Immediately, therefore, protests were made, against the rapid closing down of factories engaged upon war work. Deputations were constantly received both by the Minister of Labour and the Minister of Munitions protesting against the closing of factories engaged upon war work, and during the end of 1918 and the early months of 1919 it was found necessary to keep certain factories engaged on munitions at work even though their products were not likely to be required. Every effort was made by the newly created Civil Demobilization and Resettlement Department to make the transition from war to peace work as easy and as rapid as possible. For this purpose at the end of 1918 it was decided to set up for each of the areas covered by the Ministry of Labour Employment Exchanges a divisional council, elected from members of the local employment committees to which reference has already been made. The business of these councils, which operated till the later months of 1919, was to coordinate the work of the local employment committees and particularly to help in the transition from war to peace. In order to assist the councils in their work a number of officers known as Resettlement Officers were appointed by the Minister, whose business was to travel round the country and investigate the causes which impeded the turnover from war to peace. Such conditions as a temporary shortage of materials, shortage of rolling stock, inability to recover premises required for business purposes commandeer by the Government, housing difficulties, and many other matters of this type were investigated and dealt with by these officers under the directions of the Minister and of the divisional councils.

At the end of the year, the Government set up a minister in general charge of reconstruction problems, with a council designed to review the position generally and give instructions to the various departments concerned in the work. This council terminated its functions upon the formation of the Lloyd George Government at the beginning of 1919.

(C) THE FIRST TWO YEARS OF RESSETLEMENT

The success of the preparations which had been made, and of the method in which the machinery was worked, is indicated by the figures of re-absorption of men demobilized. For six months after the Armistice there was a steady increase in the number of ex-service men unemployed, and at the beginning of May 1919, when about 3,500,000 men had been discharged, over 400,000 were recorded as drawing out-of-work donation. From that date, although the numbers discharged continued to rise, there was an almost uninterrupted fall in the number unemployed, until, at the end of July 1920, when demobilization was practically complete and over 5,000,000 men had been discharged, less than 150,000, or only 3%, were registered as unemployed.

These figures relate only to ex-service men, and in order to discover how far the ex-civilian workers had been reabsorbed, it is necessary to look at the unemployment figures for the same period. After the Armistice the number of civilian workpeople unemployed rose continuously until the beginning of March 1919, when nearly 800,000 were recorded as receiving out-of-work donation. After that date, however, there was a rapid improvement, and by the end of Sept. the number had fallen to about 100,000. Owing to changes in administration and in some cases to the exhaustion of benefit, the figures, no doubt, overstate the extent of the improvement, but, even when due allowance is made for these factors, it is clear that there was a remarkable recovery after March 1919. The evidence so furnished is confirmed by the statistics of unemployment among the members of certain trade unions which made regular returns to the Ministry of Labour. In these unions (mainly composed of skilled workmen) the proportion unemployed, which was 0.4% at the end of Oct. 1918, rose month by month after the Armistice until it reached 2.9% at the end of March 1919. From that date, however, it fell, and at the end of Sept. 1919 it was only 1.6%. There was a further rise in the winter of 1919-20, due to the strikes in the railway service and in the iron foundries; but the percentage fell again in the spring of 1920, and from March to June of that year, when demobilization was almost completed, it varied between 0.9 and 1.2%, much below the figure for any month in 1913, which was itself a year of good employment.

The consideration of these figures indicates that the turnover from war to peace had been effected with surprising speed and with remarkable lack of dislocation. While in the first 18 months after the Armistice trade would have rapidly recovered, provision was urgently required for certain large classes of ex-service men which may be grouped as follows:—

(a) the disabled who, although in receipt of pensions, required training to enable them to enter upon some occupation;

(b) youths whose apprenticeships had been interrupted;

(c) women thrown out of work by the turnover from war to peace;

(d) the ex-officer who, as a result of the war, was either unable or, for adequate causes, unwilling to resume his old occupation; and

(e) the large number of men who had had some small business or understanding which had been destroyed by the events of the war.

So far as the first class was concerned two steps were taken—the first to place men in immediate employment, the second to train them for employment later.

Placing of Disabled Men.—During 1917 a scheme had been proposed by Mr. Rothband, of Manchester, for absorbing a proportion of disabled men in each industry. This scheme was fully canvassed during the later years of the World War, and finally, in Aug. 1919, was adopted by the Government. In that month the King's National
DEMOBILIZATION and RESETTLEMENT

Roll for disabled men was inaugurated by Royal Proclamation, and the scheme was actually launched on 1st November 1915. The scheme was to ask each industry to take disabled men into its ranks to a proportion of 5% of the total employees. Individual employers who agreed to come into the scheme were given a certificate to that effect, which enabled them to use the disabled men's names inscribed upon the National Roll. Industries, of course, varied considerably in their power to absorb disabled men, and the 5% was not rigidly enforced, but they were invited to take as large a percentage as they felt able to absorb. The work permitted to such an industry was deemed suitable for a disabled man, in the opinion of some of the ministers. At the end of the first month, 119,100 disabled men had been classified, a roll of 24,275, the total staffs covered by them was 4,167,171; the number of employers who had signed the roll was 79,000.

The Roll was headed by the King and Queen Alexandra. H.M. Treasury were entered upon the Roll in respect of Government departments, and Government industrial establishments, and the Roll was made up under the Act of 1916 of the House of Commons and the Lords, and the Law Courts. Special efforts were made to include local authorities upon the Roll, and at the date mentioned above there were 751 upon the Roll in England and Wales, and 68 upon the Roll in Scotland. In addition arrangements were made by which preference was given in allocating Government contracts to employers whose names were upon the Roll. It may be noted in this connexion that when the scheme was launched in 1915, D.F. was not discovered.

There is no doubt that in addition to the men registered there was a considerable number, perhaps as many as 20,000, who had not registered in fact which were in the complete additional arrangements which followed upon the inauguration of the scheme. As a result of the scheme the figure fell to 14,849 in Sept. 1920. Of these a considerable number were in Ireland, where the National Roll, for various reasons did not operate.

Training dealt with three main classes: The disabled ex-service man who could not, owing to his disability, return to his pre-war occupation, women whose applications were placed on the roll of ex-service men and who wished to return to war service and could not be renewed without assistance from the State; and the woman who, by entering munitions work at an early age, had failed to acquire a woman's trade. In addition to these classes there were the so-called ex-service men who had entered the armed services or navy at an early age had prevented him from acquiring a skilled trade. For industrial reasons it was soon found that little could be done unless he had commenced an apprenticeship before the war.

On Aug. 1916, when the industrial training of disabled ex-service men was taken over by the Ministry of Labour from the Ministry of Pensions, about 10,000 men had already been trained, about 12,000 were under training and some 75,000 were estimated to be awaiting training. In dealing with this problem the policy of the Training Department was to associate the administration of industrial training with local education authorities, to retain and increase the cooperation of the employers and workers, and to repair the shortage of training facilities, by establishing training caches in industrial areas and industries, and to repair the shortage of training facilities, by establishing of Government training instruction factors. The organization set up was based on the division of the country into districts, upon the large and small areas, and into those of the type of an army division.

The cooperation of the employers and workpeople of the industries and trades in which men were being trained had already been secured after preliminary consultations with the leading British industries, which were conducted in 1916 by the representatives of the Ministry of Labour and the Heaths of the Ministry of Labour. These negotiations resulted in a series of agreements to which representatives of employers' organizations, and after discussion the roll of the State and the employers and workers of trades, for the purpose of having apprenticeship schemes for the particular trades and for the precise length of the training courses, the regulation by each trade of the number of men admitted to training in it, and the proportion of the men's pay respectively controllable by the employers, and the State. The training schemes were drawn up by the National Trade Advisory Committees, composed of equal numbers of representatives of employers and workpeople, and their supervision was carried out by Local Technical Advisory Committees, similarly constituted, without whose consent no man was to be placed into training.

The policy of concentrating training in the Government instruction of the Director of the Ministry of Labour, who was placed on the close of a secondment, discipline, machinery and productive work of the ordinary factory, but differing from the latter in that its primary function was the output of trained men instead of finished goods, was the outcome of the idea of solving the problem by training three-quarters of the skilled workers, capable of setting free the skilled man for more complicated operations. The impossibility of obtaining a rapid supply of such workers through the ordinary workshop, which was too small to produce such numbers, the grading of unskilled labour, or through the existing machinery of the technical schools, which were out of touch with the requirements of modern industry, the introduction of machine manufacture, which left skilled workers want, for, example, into a competent capitan hand. The considerations which led to the adoption of this system for the purpose of diluting applied even more strongly to the case of the disabled man.

Up to Jan. 1921 some 50,000 men had been trained or were in training in the schemes, of whom at least 8,000 had already trained when they took over from the Ministry of Pensions. Fifty Government instructional factories had been set up with accommodation for 20,000 men, providing training in most skilled trades. There were training workshops in existing factories for the purpose of repairing machinery and small tools, similar to the building of houses to the repairing of watches and clocks.

The chief trades in which training was given were mechanical and electrical engineering, building in all its branches, furniture-making, tailoring and dressmaking, printing, bed-making, boot-and-shoe-making and repairing, watch- and clock-making and repairing, brush-making, basket-making, motor industry, and coal mining. The instruction given was not a number of small trades, or trades, such as textiles and pottery, in which the amount of training given has been more limited. A considerable number of men were trained entirely in employers' workshops, but in the various Government instructional factories a complete apprenticeship, or technical school or preferably an instructional factory, was found before placing a man for the completion of his training with an employer. The experience acquired during the war, in connexion with semi-skilled workers, that instruction controlled and directed on scientific principles results in a surprisingly high rate of progress on the part of the learner, was amply confirmed when applied to teaching the disabled man. In accordance with the special committee, appointed by the Ministry of Reconstruction, considered this problem, and, in consultation with the Labour and Re-settlement Committees of the Disabled Ex-Services, and the suggestion that the principle of the Government training factories should be continued and embodied in the new apprenticeship scheme. It was recognized that each industry had its own problems and that no uniform scheme could be adopted. The Committee, therefore, contented itself with laying down the general principles on which a uniform assistance was to be obtained. It was left to each industry, through an organization representative of employers and operators, to prepare a scheme and adopt the form of the apprenticeship which best suited the industry and embodying these general principles, which may be summarized as follows:

(i) Men in the last year of their apprenticeship on enlistment shall be paid the young man's wage, and after the expiration of their apprenticeship the minimum wage, or, when a higher rate of wages was then in force, the minimum wage plus the difference between the wages then in force and the wages provided in the scheme for the last year of apprenticeship.

(ii) The workers shall receive at least one-third of the journeyman's rate for the first half of the year of apprenticeship, and 40% of the journeyman's rate for the remaining half.

(iii) The workers shall be paid at least 12% of the journeyman's rate for the first year of apprenticeship, and 50% of the journeyman's rate for the second year.

(iv) The workers shall be paid at least 12% of the journeyman's rate for the first year of apprenticeship, and 50% of the journeyman's rate for the second year.

(v) Provision should be made in the scheme for allowing the training in the employer's establishment to be supplemented by training in a technical institute, the State agreeing to pay 50% of the cost of the training.

(vi) An agreement should be entered into by the employer and apprentice under which the employer undertook to train the apprentice as a skilled workman, and the apprentice to complete his training within a given time.

Forty distinct industries, covering about 800 different trades, prepared schemes in accordance with the principles laid down above. These have been divided into three classes: those in which the work was payable and the rate of deduction to be made from the unexpired period of apprenticeship in respect of the time served in H.M. forces.

An additional scheme was prepared by the Ministry of Labour to cover unorganized trades and trades where the number of apprentices did not justify a special scheme.

The number of apprentices brought under the scheme was, at the end of Jan. 1921, 43,900. These figures do not indicate the total number of persons who, whether directly or indirectly, had benefited as a result of the scheme. A large number of important firms, including the majority of the railway companies, took back their ex-service men on their own terms and paid them a higher rate of wages than that laid down in the scheme, but preferred not to ask for State assistance. Government departments, such as the Admiralty, the Ministry of Munitions and the Post Office, adopted a similar course. Persons in receipt of the disabled men's allowance were usually retrained as journeymen but did not receive State assistance.

It has been estimated that the number of persons who in this way indirectly benefited under the scheme was at least as large as the number brought within its provisions.

On Jan. 1 1921 the number of apprentices who had applied and were eligible, but for whom employers had not been found willing to undertake the training of, was about 15,000. As has already been pointed out, it will be seen, therefore, that practically the whole of those desiring to complete their apprenticeship were enabled to do so.

One of the conditions attached to payment of State assistance was a further condition that the apprenticeship work should be entered in the apprentice's card, and it must be shown that the apprentice the training necessary to make of him a skilled workman. It became, therefore, the duty of the Ministry of Labour to take steps to insure that this undertaking was carried out. Employers
might otherwise draw State assistance and exploit the labour of the apprentices by keeping them in "repetition" work. A small staff of specially qualified officers was accordingly appointed to visit the firms having apprentices under the scheme, and satisfy themselves that it was carried out properly.

The training given to these apprentices was modelled on the training given to boys. Where such was the case it was not possible to draw on the experience gained out with the armed forces in this and the other industries. But in investigating the training of the ex-service men, the officers were, in effect, making a survey of the methods of training customary in the skilled trades in the case of boy apprentices. No such results had ever been obtained.

As stated earlier, each scheme for an industry was prepared by some organization representative of employers and operatives in that industry, sometimes with the help of the Ministry of Labour. Where this was the case, the training, whether in the workshop or technical institute, was fully discussed. A scheme when finally adopted represented, therefore, a compromise between the interests of both the employers and the operatives. The administration of the various schemes, many difficult questions of interpretation arose. The Ministry of Labour made no attempt to give an interpretation, but referred the question to the trade organization who had prepared the scheme, and accepted their interpretation; acting on the assumption that the only body fitted to give a decision was the organization responsible for the scheme. Where outside a trade employer and apprentice, it was provided in the agreement between the two that such dispute should be referred to the Trade Panel of the Local Employment Committee and that the decision of the panel should be final.

In some cases an important factor in the training of the numbers available for war work was the fact that the scheme was one of administration under the advice and direction of the various industries. This policy was adopted after careful consideration. It was felt that, in view of the widespread dislike of Government interference, it would be impossible for the Ministry of Labour to do the training itself and that it would be bound to fail, and that success could be looked for only if the cooperation of industry was sought and secured. This policy has been adopted, and is now being pursued, by the Trade Union, Labour, training, was able to count on receiving the fullest assistance, both from employers' associations and trade unions.

Women's Training.—The first women's training course was opened at the end of May 1919, and was designed for those women who had not received previous training, and who would require the service, and 16 young women passed through the 13 weeks' course and obtained good situations at its close. Altogether 84 centres for training in domestic service were established, and just over 2,000 women had been trained by the end of December 1919. The courses were held in widely differing conditions and localities, but under the excellent training the interest of the women was aroused and the majority went straight into service from the schools. These classes were held in various parts of London and the suburbs and in 42 towns throughout Great Britain.

Apart from domestic service, some 7,000 women were trained for industrial work. The department's training was from the first restricted by the terms of the Treasury grant to " normal women's industries which were women's trades or processes before the war," and to these, notwithstanding much pressure from women's organizations, the Ministry of Labour's action was steadily limited by the other conditions. The sphere of its industrial training, viz. a reasonable prospect of absorption in the industry after training, good wages and regular employment, and the consent of the trade unions and the employers concerned to training being given. Exhaustive inquiry and constant watchfulness were necessary in these connexions.

In the training, combined with the best prospect of absorption and most favourable conditions, was found in the two chief women's trades—dressmaking and tailoring; and 77 courses were provided, affording accommodation for 3,362 women.

The majority of these training courses came to an end on June 30, 1920, though a limited number were continued for varying periods in order that the standard course might in each case be completed, viz. six months for an industrial and three months for a technical course. From July onwards but few new schemes (and those solely of a domestic type) were started, but by this time the trade slump had begun, and it was useless to train women for industries in which the demand for labour had disappeared.

The training referred to above is that of women who were thrown out of employment by the termination of the war. The Women's Training Branch, however, was entrusted with the training of two other groups, whose cases were as follows: widows and disabled nurses. The powers of the State to give such training to these women as would enable them to supplement their earnings in the case of the former, and to replace the first-aid aid of the Ministry of Pensions by Royal Warrant, but were transferred to the Ministry of Labour by Order in Council in the autumn of 1919.

Over 4,000 applications from widows were dealt with, and training found for 2,500. In the case of the second group, widows and disabled nurses, there was an initial rush, with which was in all cases free, an allowance was made to the widow in addition to her pension to enable her to meet any extra expense to which she might be put. A large number of widows were trained and made available, as few women were, to accept the precarious livelihood which this calling offers in a rural district. As all had to pass the examination of the Central Midwives' Board, women of good general education only were selected for this particular branch. Another large group of the widows in training were those learning tailoring and dressmaking in the hope of finding a home employment. The demand was small, because the department was empowered to make a grant of a sewing machine on the completion of the course and also because the work was not remunerative, and the widows drew no savings or unemployment payment. Training in cookery, ladies' hair-dressing, confectionery, photographic studio work, and secretarial work was also given.

Applications received from disabled nurses were relatively few in number because they were in receipt of a disability pension under the Royal Warrant, and were not entirely disabled but physically unfit to practise as nurses. After the powers of the Ministry of Pensions were transferred to the Ministry of Labour, the nurses had by March 1921 been placed in training, out of 394 applicants. Some very sad cases were brought to light, many of the cases in which the nurses were trained for physical work and who, on such application for assistance was made to the "Officers' Friend." Those remaining under training in March 1921 represented a great variety of occupations, including dispensing, massage and electrical treatment, public health appointments, secretaries and chauffeuses to doctors, poultry farming, etc.

Training and Placing of Ex-Officers.—The Appointments Department came into being during the war. Upon the Armistice its work developed very considerably both as regards training and placing in employment. In the first place, so far as training was concerned, under the decision of the War Cabinet given in Dec. 1918, finds that a number of officers who had served in the forces had been detached from the military services to prepare for work in the technical colleges, agricultural colleges, farms, professional firms, business houses, etc. The Board of Education, the Board of Agriculture and the Ministry of Pensions with the Ministry of Labour were represented on the Appointments Department, by reason of its experience and provincial organization, operated as the machinery by which all the department obtained information as to applicants, while the training for agricultural and higher technical training remained respectively with the Ministry of Agriculture and the Board of Education. The professional business and workshop training was transferred from the Board of Education to the Special Training Department. Under this scheme 17,311 ex-officers and men of similar educational qualifications had been placed by the Appointments Department in training at the end of Jan. 1921, while there were 1,864 waiting.

The special training scheme was set up throughout the country, composed of prominent professional and business men in each district. The functions of these committees were to interview candidates who applied for grants, and to make recommendations to a body known as the Grants Committee at headquarters. The final decision in such recommendations rested with the London Grants Committee.

These committees worked in turn in conjunction with what were known as Interviewing Boards, whose functions were (a) to decide what applicants properly came within the purview of the Appointments Department; (b) to advise applicants as to their prospects of securing employment; (c) to select applicants as candidates for the vacancies on the books.

So far as placing was concerned, upon demobilization the department took as its task of assisting the great number of ex-soldiers in finding employment. In May 1919 the Ministry of War undertook special activities with a view to finding new appointments for ex-officers, and up to the end of Jan. 1921 it found employment for 48,860 men, with 10,720 men remaining unemployed.

Restoration of One-Man Businesses.—In May 1916 the Military Service (Civil Liabilities) Department came into being to help the wives of serving soldiers where military service imposed serious hardship. The scheme was limited to men who had joined the forces before the war, and those who were likely to be called up during the next two years. The maximum amount granted was not to exceed £40 per annum. Up to the conclusion of this scheme on July 31, 1920, 475,271 applications had been received and 332,810 grants had been made to a total value of £1,938,212. The government decided to extend the principle of this scheme with a view to resettling men in their previous businesses where they were, as a result of military service, suffering serious financial hardship. The scheme as amended took two forms: the first was the assistance of the first principle, that the amount of business, such as those mentioned above, or alternatively, a lump sum grant towards the restarting of a business might be given.

The Military Service (Civil Liabilities) Department was not empowered to pay resettlement grants for new businesses except in the case of disabled men. In that case alone the disability was in itself treated as serious financial hardship, and the grant given to men was to cover the capital required for the new businesses. Under this scheme up to the end of Jan. 1921, 251,259
DEMOBILIZATION AND RESETTLEMENT

applications were received: 93,651 grants were made at a total expenditure of $2,075,665. In addition there was a special scheme for providing tools for workmen who had to return to their pre-war occupations. Under this scheme $21,562 was paid out.

H. W.)

UNITED STATES.—United States troops continued to embark for Europe until the signing of the Armistice Nov. 11 1918. At that time, according to the final report of Gen. Pershing, 2,071,463 officers and men had sailed to serve with the A.E.F. and only some 15,000 had returned to the United States. According to figures compiled by the War Department, the total number of officers and men encamped in the United States on that date was 1,634,499 and more than 300,000 additional men had been ordered to be once cancelled. On Nov. 26 orders were issued for immediate demobilization of the Students' Army Training Corps, which had been introduced Oct. 1 in about 500 colleges and universities throughout the country. This led to the discharge of some 150,000 students during December.

The question of general demobilization presented serious difficulties, and precedent offered slight help toward their solution. It was recognized that with war would come a drastic curtailment of production in many industries, and it was feared that this curtailment and the sudden release of large numbers of soldiers would result in wide-spread unemployment and suffering. On the other hand the retention of a large army no longer needed would impose an unjustifiable financial burden upon the country. It was decided to discharge all emergency troops as rapidly as possible, but at the same time the Department of Labor was requested to watch carefully the labour situation, so that if desirable the rate of discharge might be reduced locally or as a whole.

The method of demobilization finally adopted differed from that employed by the European Allies. The plan of release by military "classes" based on age and length of service, natural in France and Italy, could not be applied in a country where the system of universal military service was unknown. It would have caused needless delay to attempt demobilization of the A.E.F. before beginning the release of men encamped in the United States. Neither was it feasible to follow England's system of "industrial demobilization." Profiting by the early mistakes of her Allies, America had not drafted indiscriminately into immediate service "key or pivotal men" from essential industries, but had placed them under deferred classification. Any attempt to demobilize by different occupations would have caused useless delay and might have impaired seriously military units overseas. It was therefore decided todemobilize by complete military units. In this way men returned to America under their own officers in orderly fashion. From the beginning, however, attention was given to individual requests for discharge, especially from American camps, if that appeared that men were needed by their families or their service required for industries. Speed of return from overseas was governed solely by transport facilities. About one-half of the American troops had been carried across in British vessels, which now were needed for home and colonial service. At the time of the Armistice transports belonging to the U.S. Government had a capacity of only about 110,000 a month. This was now rapidly increased by the release of battleships and cruisers. Use was made also of German passenger ships, and arrangements were made for the use of Italian, French, Dutch, and Spanish vessels. On June 30 1919, 173 vessels were in use as transports. After the Armistice embarkation camps were organized at Bordeaux, Brest, and St. Nazaire, and later at Havre and Marseilles. Le Mans was selected as a centre of distribution for the ports, and accommodations were ordered there for 230,000 men. There was considerable complaint of congestion and inadequate care of troops, especially at Brest, where there were normal accommodations for only 55,000 men, although that port alone was available for the largest transports. In America, Boston, Charleston, Newport News, and New York City were chosen as ports of debarkation.

Troops began to land in America in large numbers Dec. 2 1918, when the "Mauretania" reached New York with 4,000.

By June 3 1919 there remained in France only 694,745 officers and men. The A.E.F. headquarters were closed in Europe in Sept. on the departure of Gen. Pershing. Practically the last remnant of the A.E.F. in France embarked with Brig.-Gen. Pershing in Jan. 1920. There were 69,780 in France, some 775,665 in Europe, total 2,675,665.

In the United States the fighting service had ceased for all troops except those in the Camps of Training and those serving with the American Expeditionary Force overseas. Of the 2,071,463 officers and men who served in France, 1,350,000 had been to Europe, 1,030,000 of whom returned to the United States, and an unknown number remained in France. At the end of 1919 there were 700,000 officers and men in the United States, 500,000 of whom had served in the Armies of Occupation. The remaining 200,000 were serving with the regular forces as a result of the American Expeditionary Force. Of the total only a small number was in the United States on active service.

Camps and cantonments in the United States formerly used for mobilization were converted into centres of demobilization, and to these were sent troops from overseas as well as those at home. Troops remaining in French cantonments were evacuated to the Camps of Occupation, nearest to his home or place of enlistment. Each man was given a rigid physical examination and those suffering from contagious disease were detained until there was no longer danger of infection. Discharge orders were prepared, a large allowance was made for travel, and an allowance of five cents a mile made each man from camp to his home. To encourage immediate return a reduced railway fare of two cents a mile was conceded those who departed within 24 hours after discharge. During the first three months of demobilization discharge required from four to seven days, but this was soon reduced to an average of two days. Gradually it was possible to reduce the number of centres, and beginning Nov. 25 1919 troops in America were discharged where stationed. Only two large centres were retained, Camp Dix, N.J., and the Presidio in San Francisco, for the use of troops returning from overseas, and even these were dispensed with after June 3 1920.

The following table prepared by the War Department shows the rapidity of general demobilization, month by month and cumulatively during the first year.

The cost per man of demobilization varied from month to month because the uncertainty of the number of men to be handled required the keeping up of all the demobilization machinery; for March 1919 it was $69.35 but for June only $20.07. Such demobilization was the most representative of the U.S. Employment Service, and if the discharged men had no prospective job he was registered and a card given him for the local service representative. The U.S. Employment Service attempted to cooperate with various local organizations, such as chambers of commerce, boards of trade, and patriotic and welfare societies. In Baltimore, Boston, Chicago, New York and other large cities, large payments were made for securing work for returned soldiers, sailors and marines. It is impossible to estimate the number of places secured through these agencies, as few kept accurate records. But the Employment Service alone, during the 10 months from Dec. 1 1918 to Sept. 27 1919 registered 758,147 men and secured employment for 474,085. It was seriously handicapped, however, by lack of adequate appropriations in 1919 and its operations were practically suspended after October. Although there were some industrial centres which, immediately after the Armistice, experienced a degree of depression, business as a whole was prosperous with the result that the great mass of discharged soldiers, many of whom had little difficulty in finding employment. There was, of course, a certain percentage of discharged men who found it difficult or irksome to adjust themselves again to the conditions of civilian life; the great majority, however, were able to secure work with little difficulty. The cost per man of demobilization varied from month to month; the lowest figure for a month was for December 1918, $20.07.

The bill carried an appropriation of $1,600,000,000. Protest however, arose throughout the country, largely due to the prospect of a great increase in taxation, and the Senate took no action. At its national conventions the Democrats passed a resolution in 1920 unanimously for a bonus to their citizens who served. According to statistics gathered...
for The American Legion Weekly, up to the middle of May 1921 some form of bonus had been granted in 13 states, namely, Maine, Massa-
chusetts, New Hampshire, New Jersey, New York (later declared unconstitutional), North Dakota, Rhode Island, South Dakota, Vermont, Washington, and Wisconsin. The payment provided varied. In several states a lump sum of $500 was voted in.
In most other states a fixed amount for each month of service (usually $10 or $15) up to a maximum (varying from $120 to $600). Bonus bills had been defeated in 11 states, namely, California, Colorado, Minnesota, Nebraska, New Mexico, New York, Oklahoma, Tennessee, Texas, West Virginia, and Nebraska (relief fund provided, interest to be used for relief). No legislation was con-
cluded in the veteran reeve, of Assistant, Kansas, Colorado, Kentucky, Louisiana, Mississippi, Nevada, New Mexico, North Carolina, South Carolina, Utah, Virginia, and Wyoming. In the other states preparations were being made to act upon the question.

The American Legion. While the Great War was in progress, throughout the ranks of the American soldiers a widespread desire that with the coming of peace there should be created a permanent organization for perpetuating their feeling of comradeship and its ideals. Active steps toward this end were first taken at a caucus held by a number of service men in Paris March 15-17 1919. This was followed by another caucus held in St. Louis May 8-10 1919, when preliminary organization was effected and the name "The American Legion" adopted. Incorporation was secured by an Act of Congress Sept. 16 1919. The first annual convention was held at Minneapolis Nov. 1919. The purpose of the Legion, according to its constitution, was to uphold and defend the Constitution of the United States of America; to maintain law and order; to foster and perpetuate a one hundred per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, state, and nation; to combat autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness. "The organization is non-sectarian and non-partisan. Any citizen or woman is eligible to membership who was in the military or naval service of the United States between the dates April 6 1917 and Nov. 11 1918 inclusive; also all persons who served in the military or naval services of any of the Governments associated with the United States during the World War, provided they were citizens at the time of their enlistment and are again citizens at the time of their application. "Exception is made of persons dishonorably discharged from service, as well as persons who refused to perform military duty "on the ground of conscientious or political obligation."

At the head of the Legion is a national commander and five national vice-commanders elected by the national convention. The active director at headquarters is the national adjutant-general. Each state also is organized under a state commander and other officers. The local unit is called a post. On Sept. 30 1921 the number of posts was 10,795, located in every state of the Union and in the District of Columbia, the Philippines, Panama, Cuba, and many other countries, including Canada, Mexico, Argentina, and France. The total membership at the same date was about 1,753,000.

The Legion strongly endorsed the proposed Federal bonus for all ex-service men; and, especially through its National Legislative Committee, was influential in giving publicity to the needs of disabled soldiers and in securing legislation in their behalf. To its efforts, in part at least, were due the enactment of the Sweet bill, providing for the Veterans Bureau; the Veterans Hospital bill, appropriating $18,600,000 for building or improving hospitals for ex-service men; the publication of lists of draft evaders in the Congressional Record; the bringing to the United States of the body of an "Unknown Soldier" for burial in Arlington National Cemetery; the bestowal of the Congressional Medal of Honor upon the British "Unknown Soldier" buried in Westminster Abbey, and upon the French "Unknown Soldier" buried under the Arc de Triomphe. The official publication is The American Legion Weekly. The Women's Auxiliary had a paid-up membership of 107,345 on Sept. 1 1921. At the national convention of the Legion in 1921 distinct organization was effected, and separate officers and headquarters were chosen.

DE MORGAN, WILLIAM FREND (1839-1917), English novelist (see 8:10), was born in London Nov. 16 1839 and edu-
cated at University College school and later at the college itself. He became a student at the Royal Academy in 1859 and in 1864 began the study of stained glass. Six years later he turned to ceramic work and soon became known in artistic circles as a potter, the "De Morgan" tiles being made remarkable by his rediscovery of the secret of some beautiful colours and glazes. But later in life he became even better known to the literary world through his novels, Joseph Vance (1900); Alice for Short (1907); Somackow Good (1908); It Never Can Happen Again (1909); An Affair of Dishonest (1910); A Likely Story (1912); and Steady Men's Goods (1912). In 1917, after the death of his wife, his health failed, and of his earlier family life were conspicuous. He died in London Jan. 15 1917. In 1910 The Old Maudhouse was pub-
lished posthumously. His last but unfinished novel, The Old Man's Youth, was published, with additions by his widow (1921).

DENBY, EDWIN (1870- ), American public official, was born at Evansville, Ind., Feb. 18 1870. His father, Charles Denby (d. 1904), was minister to China 1885-98. He was educated in the Evansville schools, went to China with his father in 1885, and two years later entered the Chinese imperial maritime customs service. He returned to America in 1894, graduated from the Law school of the university of Michigan, and in 1896, was admitted to the bar and thereafter practised in De-
troit. On the outbreak of the Spanish-American War in 1898 he entered the navy, and as gunner's mate saw action at Santiago. Later he was a member of the Michigan House of Representatives. From 1905 to 1911 he was a member of the National House of Representatives and was allied with the conservative Repub-
cicans. He served as chairman of the House Committee on Naval Affairs. When America entered the World War in 1917 he enlisted at the age of 47 as a private in the Marine Corps and was sent to the training station on Paris I., S.C. He was ad-
mitted to corporal and sergeant and was made successively chief of recruiting. In Jan. 1918 he was commissioned second-lieutenant and passing through the various stages, before the end of the year had been promoted major. After the close of the war he was appointed probation officer of the Detroit Municipal Courts. In 1921 he was appointed Secretary of the Navy.

DENIKIN, ANTON (1872- ), Russian general, was of humble descent and held democratic views. After going through the usual military training and service he joined the Russian general staff, and in the earlier period of the World War he rose to the rank of lieutenant-general and to the command of a division on the Russian front. During the Revolution Kornilov, and was for some time chief of his staff. He was ar-
rested with Kornilov and imprisoned in Bykova. They escaped together and fled to the Caucasian shore of the Black Sea. There he joined Alexeyev, who was forming a small army of volunteers, chiefly composed of officers. On Kornilov's death (March 31 1918) he became the military commander of the army, while Gen. Alexeyev held power as "Supreme Leader" of the Govern-
ment and organized recruiting and supplies. They collected the army on the southern border of the Don region, at Metchetinskaya, and established cooperation with a Caucasian detachment, led by Erdeli, with the Don Cossacks under Krasnov, and some 2,000 men who had marched right through the southern steppes under Drozdovsky. By June the army counted some 12,000 men and was able to attempt the reconquest of the Kuban territory. Things had changed considerably since March, when Kornilov's invasion came to a standstill in front of Ekaterinodar. The Kuban Cossacks had had time to ascertain the true character of Bolshevik occupation, and the volunteers moved down the Rostov-Vladikavkaz line and the Black Sea line from Tikh
yoretzkaya to Novorossisk. The Reds, in spite of their numeri-
cal superiority, melted before this advance and one stonita (a small town) after another fell to the invaders. On Oct. 5 Gen. Alexeyev entered Ekatertinodar, the capital of the Kuban,
DENIKIN, ANTON

and practically all the resources of the prosperous country were henceforward at the service of the volunteers. By the middle of Sept. the army had increased to 60,000 men. The Germans, whose garrisons had advanced to Rostov at the mouth of the Don, did not look on that extension with friendly eyes; they did their best to disintegrate the volunteer fighting forces, and at the Don they climaxed their efforts in the creation of a condition of vassalage, similar to that which had been submitted to them by the Don Ataman, Krasnov. But nothing of the kind was possible in the case of Alexeyev and Denikin: their whole energy was directed towards a patriotic reconstruction of Russia, and they declined all overtures from the crafty foe. On Sept. 25 Alexeyev died after an illness which he had contracted during the World War, but against which he had struggled by sheer devotion to his task, never sparing himself, never relaxing his efforts. It was impossible to replace fully this man, who resembled one of the heroes of antique virtue. Denikin, who had to step into the breach, was not Alexeyev's equal in military genius or in statesmanship, but he was worthy of his predecessor in purity of character and in his sense of duty.

The revolt of Siberia and eastern Russia against the Bolshevists prevented the latter from concentrating their forces against the dangerous volunteers, and the Germans were at the end of their tether in the struggle with the western Allies, and unable to use their position in Russia to any useful purpose. These favourable circumstances made it possible for Denikin to spread his wings wide. The Don Cossacks joined him, he established communications with Astrakhan and Ural Cossacks and the Orenburg province on the right, while on the left his lieutenant Schilling moved towards Kiev and Odessa. There was some very heavy fighting in the centre, where Stavropol was taken after a struggle of several days, and 35,000 Reds surrendered or were exterminated. Towards the beginning of 1919 Denikin was master in the S. of Russia, and could begin to organize a base for an attack on the main block of the Soviet Republic. The principal Cossack armies had congregated round the nucleus of the Volunteer army. The latter had unfortunately suffered grievous losses in the ceaseless fights of the Civil War, which it had to conduct in miserable equipment, with hardly any ammunition except that which was taken from the enemy, in hunger and cold; some 30,000 of its best men had fallen, and these could not be replaced either by conscripts, driven in by command, or by the Cossacks, who could fight well when they chose, but who did not always want to do so. The difficulty of the political situation became apparent when the question of an arrangement between the various forces under Denikin was seriously raised. On Nov. 1 Gen. Denikin met the Regional Assembly (Krayevoya Rada) of the Kuban territory. He made a powerful speech in which he said, among other things:

"Can there be any peace politics on the Kuban? Will your long-suffering settlement be safe from a new and more cruel invasion of the Bolshevists when the Red power establishes itself firmly in Moscow, when it throws back by weight of numbers the Volga front, when it presses on the Don from north and east and when it moves towards you—not? It is in time that people should cease to wrangle, to intrigue, to seek precedence. Everything should be sacrificed for the sake of the struggle. Bolshevism must be crushed, Russia must be liberated; for well-being will not prosper, you will become the playthings of the vagaries of Russian Russian people. . . . There can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . There can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army. . . . there can be no talk of separate armies—the Volunteer army, the Don army, the Kuban army, the Siberian army.

The speech did not produce the desired effect. It was criticized in the lobbies by separatists and by Socialists, but it was at least conceded to the Commander-in-Chief that a Government should be formed in which ordinary provinces, like Stavropol or the Black Sea district, should be subjected to an emergency military régime, while the Kuban and to some extent the Don should be governed by independent institutions, though maintaining a kind of indirect allegiance to the High Command. The Kuban obtained, in fact, political autonomy, but agreed to place its forces under the command of Gen. Denikin. Yet the Ukrainian elements of the Rada continued to send a special mission to Paris, and negotiated there with representatives of the Allies independently of the Russian "Political Council" and of S. D. Sazonov, the Foreign Minister of the South Russian Government.

For the conduct of the Government Gen. Denikin formed a "Special Council," which combined legislative and executive functions. It consisted of generals of the headquarters staff and the heads of departments, some 18 or 20 in number (Gens. Dragomirov, Lukomsky, Romanovsky, etc.; the civil members—Neratov, J. P. Shipov, N. Astrov, Stepanov, K. Sokolov, M. M. Fedorov, etc.). Most of the members belonged to the so-called National Centre and to the moderate Right. The Left was represented by four Cadets, of whom, however, two had drifted a good deal to the Right. The weight of authority rested with the generals, but there were long discussions and many compromises. It was attempted to steer a strictly "business course," politically colourless, but the Government did not succeed in achieving popularity. Gen. Denikin regarded this Assembly as a consultative organization, and gave his decision after listening to proposals and discussions. He insisted on keeping military restoration to the fore until the Bolshevists had been laid low or at least until Moscow had been liberated. No pronouncement was allowed as to the form of Government, but the authority of the old Constituent Assembly, which was attempting to gather power in Ufa and Omsk, was rejected as the product of popular insanity. On the whole the Government was clearly leaning towards the Right, but Denikin was averse to any kind of acts of violence and oppression; his rule was, however, not free from contradictions and lacked political initiative. He followed the current more than he directed it.

His military plans were based on the idea that if he succeeded in driving the Bolshevists out of the Russian provinces the population would reform behind his lines and set up compact patriotic levies against the hateful usurpers. With this purpose in view he pushed forward rapidly in all directions, and it seemed at first as if events justified his predictions. The Bolshevists were driven back everywhere by the Volunteers and the Cossacks. When they rallied in the East and made a determined attempt to retake Tsaritsyn and turn the line of the Don they were repulsed and finally routed by Gen. Wrangel's Caucasian army. The Cossacks of Mamontov and Shkuro made raids deep into the lines of the enemy; officers and soldiers of the Red army deserted in thousands to the Whites; the population met Denikin's hosts as liberators with processions and the ringing of bells. Kursk, Kharkov, Voronezh, were occupied, and in July the advance guard reached Orel, some 200 m. from Moscow.

This rapid progress proved deceptive. The armies of liberation did not bring law and order with them. Not only were Commis- sars and prominent Bolsheviks given short shrift, but officers who had served in the ranks of the Reds and gone over to the Whites were subjected to irksome investigations and delays before obtaining "rehabilitation." The badly equipped and badly supplied troops laid hands on all sorts of goods and stores; it was hard to distinguish between requisition and looting. Such administrators as were introduced by the advancing army were more intent on bettering themselves than on looking after the population; the peasants felt themselves menaced by the revenge of the squires.

The people, driven to despair, took to flight, and the more adventurous among them formed "green" bands, which roamed about the country, seized stations, stopped trains, cut off provision columns. The most daring of these brigands, Makhno, made Ekaterinoslav his capital, and nearly overran Rostov in the summer of 1919. The most threatening symptom of all was the lack of union between the various sections of the Whites. The Kuban was preparing for complete independence and negotiating with the Mahomedan mountaineers for a league. Denikin found it necessary to strike hard against the Separatists; the Rada was dissolved; one of the leaders, Kalabukhov, was shot as a traitor, and a new Government was formed from among the supporters of a closer union with the Russian army (Nov. 1919). The "line" Cossacks were favourably disposed, but the coup d'etat did not succeed in uprooting the movement for an in-
dependent Kuban republic in the south-west. On the contrary, the Separatists, though forced for a time to conceal their aspirations, were embittered, and resolved to wreck the combination with the Volunteers.

In the meantime the resistance of the Reds stiffened in proportion as the Whites lost the sympathy of the people. Soviet propagandists had no difficulty in rousing the apprehension of the Great Russian peasants against the advance of the "squires"; officers of the Red army became less keen to desert when they ascertained that they would be treated as suspects by Denikin's lieutenants. A relentless discipline re-introduced by Trotsky in the Red army was backed by the action of select bodies of privileged troops—international contingents of Letts, Chinese, Magyars, etc., picked Communist battalions, large bodies of cavalry trained for rapid marches and sudden concentrations against weak points of the line. In the beginning of Nov. Budenny's cavalry corps broke through the White lines at Kupyan and threatened to cut off the Volunteer army from its base on the Don. The line rolled back and a general retreat set in. Denikin tried to stem the back flow by appointing Wrangel to command the Volunteer army in the place of Mayevsky, who had been injured in an engagement; but the moment Wrangel arrived Denikin was no longer a man who could mend the consequences of errors which he had detected and criticized from the beginning. Town after town fell, and there was no hope of support from the Poles, who were by no means inclined to fight for the restoration of Russia. A British political mission headed by Sir Halford Mackinder, M.P., was more concerned with promoting the interests of Georgia, Armenia and Azerbaijan than in taking up the cause of Russian centralization. In these dire straits Denikin resolved to abandon his former policy in regard to the Cossacks, and summoned a central "Krug" (circle) of the central and of the local Cossack Lieutenants. Don Kuban, Terek, Astrakhan—with the object of starting a new Government on federal lines. It was agreed that there should be a Legislative Assembly of the Federation, and that Denikin should act only as Chief of the Executive and Commander-in-Chief. Even this surrender did not help. After a last success of the Volunteer army, which retook Rostov (Feb. 8), the final catastrophe came through a defection of Kuban Cossacks on the right flank, of which Budenny's cavalry took full advantage. Rostov and Ekaterinodar had to be abandoned. Crowds of refugees gathered in Novorossisk in the first months of 1920; spotted by Wrangel among them in the Dnepr was V. I. Lenin. Sea fleet and foreign ships carried loads of those wretched people to the Priapko Is., and to Lenmos, and Denikin himself left for Constantinople.

By way of an epilogue to the drama of discord which had embittered the minds and paralyzed the efforts of the Whites, Denikin's Chief of the Staff, Gen. Romanovsky, was murdered by two officers of Wrangel's army on the shore of the Sea of Azov near Constantinople. He was a quiet, industrious man, who had come to recognize that there was no Conservative class in Russia capable of serving as a basis for government. He was therefore in favour of a closer alliance with the Moderate Socialists. This was an unpardonable heresy from the point of view of the Rights, and it was from this side that the shot came which put an end to the life of Denikin's trusted assistant.

DENIS, MAURICE (1870- ), French painter, was born at Granville, Manche, in 1870. He studied at Julian's Academy and at the Ecole des Beaux-Arts. As a student he came under the influence of Paul Sérusier, one of Gauguin's associates at Pont Aven, and became a prominent member of the symboliste group which included also P. Bonnard, K. X. Roussel and E. Vuillard. Inspired mainly by Cézanne and Gauguin, the symbolistes represented a reaction against impressionism, in favour of synthesis and the use of form and colour to express subjective states of mind. Denis was also associated with the Rose Cross group which aimed at substituting an idealist decorative art for the realism of the day. To the symbolistes was added that Cossack and quattrocento art, as the result of a visit to Italy in 1894. Denis early turned his art to religious purposes, but classical mythology has also frequently provided him with subjects. His most important work is his mural decorations, which include decorations for the chapels of the church of Vésinet (1899-1903); "L'Histoire de Psyche," five panels for M. Morosoff, Moscow (1908); "L'Âge d'or," five panels for a staircase of the Prince de Wagram (1912); a frieze for the cupola of the Théâtre des Champs Elysées illustrating in four panels the history of music (1912); decorations and stained glass for the church of St. Paul, Geneva (1917-8); and a decoration for La Chapelle du Souvenir in the church of Gagny (1920). All these works show the influence of quattrocento Italy in the linear character of the design, and the preference for spare, stiff, angular forms, which connect Denis with Puvis de Chavannes. His colour, however, is much more rich and varied, and shows an impressionist palette and method of handling. An artist of great fecundity, Denis has also produced many easel pictures including a "Homme à Cézanne" (1901), somewhat in the manner of that painter; a portrait of Degas; and a long series of religious subjects typified by "La Meilleure Part" (1920). He has also illustrated among other books, Paul Verlaine's Sagesse (1891-1910), Thé imitation of Christ (1903), and La Vila Nueva (1908). His frequent contributions on art to the reviews were republished in 1912 in Théorie 1890-1910, which contains much interesting comment on modern art. Denis has chiefly exhibited at the Société Nationale, of which he became full member in 1900, at the Salon des Indépendents, and at the Salon d'Automne. He is represented in the Luxembourg, Paris. In 1910 he was made Chevalier of the Legion of Honour.

DENMARK (see 8.23).—Since the incorporation of North Slesvig (1,406 sq. m.), returned to Denmark in 1920 according to the Treaty of Versailles, the area of Denmark proper is 16,958 sq. miles. About 75% of the area is occupied by cultivated land, about 15% by woods and plantations, while the rest, 15%, is either uncultivated or is used as gardens, building lots, roads, etc. Besides, the Faeroes (250 sq. m.) and Greenland (a little more than 750,000 sq. m.) belong to Denmark.

Population.—Since the incorporation of North Slesvig Denmark now has some 3,000,000 inhabitants, of whom about 150,000 live in North Slesvig. The Faeroes have 20,000 and Greenland about 15,000 inhabitants. In Denmark proper, apart from Slesvig, the density of pop. is 195 per sq. m. (325 per sq. m. on the islands, 127 in Jutland). One-fifth of the pop. lives in the capital, about another fifth in the provincial towns and about three-fifths in the country. The average death-rate in the years 1910-9 was about 15 per thousand, the average birth-rate 25 per thousand. Before the World War the excessive emigration was some 7,000 persons a year. In war-time it fell off, in 1918 to 800, rising again to 3,300 in 1919. The yearly increase of pop. is a little more than 1%. The percentage of foreign trade is high, even of the goods of the statistics of the years 1911-5, the average duration of life has been calculated at 56-2 years for men and 59-3 years for women, while 75 years earlier the figures were 49-0 and 43-5.

Occupations.—In 1911 35.2% of the population were engaged in agriculture (horticulture, forestry and fishing (included), about 27% in industry and manufactures and about 17% in commerce and transport. The remaining 20% included those occupied in different trades or in non-productive work, domestic servants, independent proprietors and those supporting themselves from the proceeds of the population lived by agriculture and 14% by trade, transport, etc. Since 1911 this movement from agriculture towards other occupations has been on the increase.

Literature.—In September, 1919, a joint-stock companies Act at last was passed, introducing directors' liability, public registration, protection of the rights of the minority, and public accounts.

Agriculture. —By law of 1899 the distribution of land, in all but small estates formerly undivided in succession (Lehn), was made freehold property. Owners must deliver to the Treasury part of the capital value of the estate and—on compensation—land over to the State. In 1919 the State had taken in 10% of the land year by year. It was decreed that property still held on lease should become freehold. This legislation, especially the Acts of 1916, concerning the parcelling-out of lands previously in the possession of the State and small estates property property held in small holdings, was the beginning of the movement, begun by the Cottars' Allotment Act of 1899, towards establishing a number of independent small holdings; in 1899 the idea was two acres and a cow; now the State aims at 20 acres and one cow. New small holdings had been established, the State holding the secondary mortgages.
DENMARK

In the middle of the 19th century the market price per Tønde Hartkorn (Danish unit of land valuation, equal to 18 ac. good soil) was about 2,000 Danish kroner; in the first half of the eighties 6,500, and in the last half of the decade close to the war time price then being 5,200 kr., rising later to about 8,500 kr. in 1913. A constant rise took place during the war, prices in 1918 reaching 13,800 kr. per Tønde Hartkorn. This decline of prices from the middle of 1917 to the close of 1918, although the fall in corn prices, was met by a change of the whole system of agriculture in consequence of which milk, butter, bacon and seed to the agricultural people, and the living standard of the farm workers altogether benefited, and the state took measures to arrest the deve-

lopment until the outbreak of the World War. The new in-

dustries were based on the use of home supplies together with import-drugs, grain and artificial manure, the result being a very con-

siderable increase of dairy products, pork and eggs. Only a part was marketable in Denmark itself, and a considerable export trade was developed, dairy products, pork and eggs mostly going to England.

The war, and after the beginning of the ruthless submarine campaign, conditions were altered, the importation of raw materials being very much impeded. The import of corn and forage, as well as oilcake, amounted before the war to 1,000,000 tons annually, while Denmark's home production was 2,000,000 tons of grain: allowing 500,000 tons for food supplies and for industrial purposes, about 3,500,000 tons remained for forage. During the war the home production of the raw materials during 1915 and 1916 stood at 15,500,000 kgm. In 1917 and 1918 the numbers of horse and sheep was almost dimin-
ished to 600,000 of each.

After 1918, with the coming of peace, Danish agriculture recovered rapidly, but the production, especially of pork, was still in 1921 less than before the war. The butter and pork production is mainly in the hands of the farmers' own cooperative factories; thus, of the 1,500 Danish butter factories 1,100 are on a cooperative basis and about 90% of the swine killed in Denmark are taken to the cooperative market houses.

Two important laws relating to agricultural exports were that of May 27 1908, dealing with the control of meat exported from Den-

mark, and that of May 20, 1912, dealing with the control of butter. They were based on section 62 of the British Trade-Marks Act 1905, which enabled Danish farmers to register a common trade-mark as against all other trade-marks in these articles. Thus all meat and bacon received a public trade mark of the Government stamp showing it to have been passed for export at the control station either as first- or second-class produce. Agricultural goods for export can therefore receive an official trade-mark certifying the quality of the articles. No butter is allowed to be exported that contains over 15% of water, or other preservatives than salt.

Industry.—Manufacturers depend on the import of coal and raw materials did not develop in Denmark until about the last decade of the 19th century, as the country produces no coal and very little raw material apart from farm products and materials for brick- and cement-making. It thus happens that Denmark as a whole has to pay the years of high prices and so-for production, the raw materials having to be bought abroad at the highest price level—and regains the losses in the years of depression. The rather small-sized factory is typical, but some big factories have been established in connection with the manufacturing of leather and footwear, cement, margarine, textiles, tobacco, spirits, sugar, beer, oil, matches, paper, agricultural machines and iron ships.

Of the 140,000 persons engaged in factories employing more than 20 working-hands in 1914 more than half belonged to Copenhagen. Most of the larger establishments belong to joint-stock companies. In 1910 there were 943 industrial joint-stock companies with a total capital of 13,000,000 kr., out of which 49,000,000 kr., or 37% of the capital, went to the companies with a capital exceeding 100,000 kr. each. During the last decades Danish industry has shown an increasing tendency towards centralization. Customs duties were considerably reduced in 1909-12, and were almost abolished in 1913. The general advance in prices made the protection left to industry completely ineffective. During the blockade industry had to face difficulties, in the import of raw materials, but the blockade mainly affected industries producing oils and margarine, which were practically at a stand still in 1918. The failure of the coal supplies was met with the strictest economy in consumption and partially made up for by an energetic utilization of the native fuels—woods, peat and brown coal. In spite of heavy fuel and coal shortages Danish industry has to a large extent been able to supply the demands of the home market.

On the whole the war period must be said to have been economically favourable to the neutrals, as appears from the formation of a number of new industrial concerns and the extension of many others already in existence, and the fact that between 1914 and 1920 the number of companies increased by 50% and their capital by 100%. Industrial profits were largely invested in export trades and improvements which could not be turned to full account during the post-war depression. The following table shows the total number of persons, the number of skilled workers, and the horse-power of prime movers concerned in the principal industries in the year 1914:

| Totals    | 350,000      | 210,000         | 300,000    |

Shipping.—At the close of 1913 Denmark's mercantile marine counted—apart from vessels of four-ton register or less—1,970 silling vessels with a joint tonnage of 90,000,000 register tons, 941 motor vessels of 30,000 tons register and 642 steamers of 420,000 tons register. At the close of 1919 the respective figures were 1,584 silling vessels of 103,000 tons register, 1,465 motor vessels of 89,000 tons register, 541 steamers of 200,000 tons register. The number of Danish steamers sunk by submarines, torpedoes and mines was 147, representing a tonnage of 229,000 tons register in gross. The great fleet currently in Denmark was amounted in 1915 to 110 million kr. and in 1919 to 145 million kroner. The average dividend on steamship shares was in 1919 70%. From 1916-20 foreign-going shipping of the country was controlled by a Freight Board, elected by the shipping owners themselves. Rather generous maximum rates were fixed for the supplies of the country. Owners were bound to employ their ships according to the instructions of the board. In July 1917 an arrangement was made according to which all Danish owners put a tonnage out of the disposal of the Freight Board for the coal supply from the United Kingdom at a fixed rate and quantity.

Commerce.—The total imports and exports from 1912-19 were as follows:

<table>
<thead>
<tr>

Thus it appears that the excess of imports over exports was in the years preceding the war about 1,300,000,000 kr., while in the first years of the war imports were almost equal. Yet in 1914, on the account of hidden exports, the trade balance was actually favourable. In 1918 the balance was 200,000,000 kr., and in 1919 and 1920 it averaged 1,500,000 kr. against Denmark. In 1914-18 the position was favourable, partly owing to the consumption of stocks and the selling-out of assets, such as the stock of domestic animals, and partly owing to the profits of shipping. In 1918 the position was reversed, and in 1919 and 1920 the trade was in a state of stagnation, being covered by a loss of about 1,500,000 kr. against Denmark. The trade balance after the war should present a somewhat different aspect. Also it must be borne in mind that some of the war-time profits were invested in extensive purchases in order to replenish the empty contracts, and were made with a view to subsequent exportation to the Baltic states, a possibility which, however, had not been realized in 1921, and involved many individ-

uals in heavy losses. An approximation of the balance of Denmark imports for home consumption in 1913 and 1918, the last of the war-

years, is as follows—
The figures show the remarkable changes in the relative values of different imports arising in consequence of the war, but varying advances in prices must also be taken into account, and the corresponding changes in quantities imported are not indicated. As for fuel, the yearly import before the war was about 3,000,000 tons, while during the war it fell below 21 million.

A comparison of the exports during the normal year 1913 with the war-year 1918 gives the following:

The chief articles of export were the more or less manufactured agricultural products. But between 1913 and 1918 this export was so much reduced that, notwithstanding the great advance in prices, the total value fell. After the Armistice the export of farm products increased. The value of manufactured products and eggs exported was in 1920 about 920 million kr. and of live animals about 110 million kr. The butter export rose in 1920 to 75,000,000 kgs., and the pork export to 45,000,000 kilogrammes. The trade with foreign countries in 1913, 1917 and 1918 was as follows:

The export of home-made articles to the United Kingdom in 1913 was 398 million kr., of which butter (180 million kr.), pork (160 million kr.) and eggs (31 million kr.) made up 371 million kr., or more than 90% of the total. Exports to Germany were in 1913 valued at 159,000,000 kr., cattle and meat 65,000,000 kr., and hides 10,000,000 kroner. Before the war Denmark did not make much of its business with England and Germany, but during the war business with the Scandinavian countries, especially with Sweden. A considerable part of the foreign trade in war-time was conducted by agreements between the countries concerned as to desirable interchanges of supplies. After the war foreign trade partly returned to pre-war lines. The import and export of raw materials and agricultural produce is largely conducted through the farmers’ own cooperative organizations. During the war only a limited quantity of goods, however, was shipped from England and America. Agreements to that effect were made with the United Kingdom in Nov. 1915 and with the United States in Sept. 1918, negotiations being conducted by the respective Governments and the Danish commercial and industrial organizations. The effect of these agreements was considerable. The export of agricultural produce is mainly conducted through Esbjerg or Copenhagen. Copenhagen is by far the most important commercial city. A part of the retail trade is in the hands of the peasants’ own cooperative societies.

**Economic Legislation During the War.**—Immediately upon the outbreak of the war, on Aug. 7 1914, the Government was authorized to take measures to ensure supplies and to prevent an unfair rise in prices. A special committee was appointed for the regulation of prices. The supply of meat, fish, flour and vegetables was kept up by government subsidies and the price was either required or prohibited. A licence was issued for such articles as pork, flour, etc., the object of control was not merely to ensure the supply of the home market but as much as quite the market and regulate the price of the export trade. The special committee commenced immediately to forbid the use of rye and wheat for forage. Till that time home-grown grain had been largely used for feeding animals, but in 1914 it was of the utmost necessity to provide for the supply of the home market. The price of rye and wheat in the spring of 1914 was about 20 kroner per dan, the price of flour about 56 kroner per dan. The Government intervened and fixed the price of flour at 38 kroner per dan. In the winter of 1916 the use of sugar and in 1917 of potatoes for forage was prohibited. Licences for potatoes were, however, always issued. The supply of raw materials was maintained by government subsidies, for the price of rye, 32 kroner per dan, and wheat, 40 kroner per dan, were fixed by the Government. In May 1915 maximum prices were fixed for swine and pork. By order in council of Nov. 27, 1916 it was notified that any advance in the price of pork above 9 kroner was prohibited. Several other branch or firms holding monopolies must be notified to and sanctioned by the special committee. On Jan. 31, 1917 maximum prices were fixed for sugar. Sugar production and prices were also placed under observation and control.

Thus Denmark had the distribution of commodities and maximum prices, especially of farm produce of importance to the home market, well under control before the blockade was lifted. Immediately upon the beginning of the blockade a general decree made it punishable for commerce to raise the percentage of profits above the level of 1914. On May 19, 1917 orders were issued to prevent the manipulation of controls and confectionery and having passed through more hands than necessary and customary (the so-called “chain-commerces”). The existing maximum prices were fixed and for other commodities an increasing number of commodities. In the spring of 1916 the State had already taken possession of the corn harvest, but at the beginning of the blockade it took the sole control of the trade through the Board of Food Control, established in 1917. Before the war, Denmark had been rationed but had not been materially reduced, home production almost equalizing consumption. Grain was rationed in the spring of 1917 and pork in the autumn of 1917. Owing to the increasing scarcity similar measures were taken with regard to butter, margarine, fuels, illuminants, benzine, coffee, tea, rice and other articles. The scarcity of fats made it necessary to introduce special regulations for the soap industry. At the same time maximum prices were fixed for the articles in question. Several other branch of industry were also put under control. After the war, imports having gradually reached their former level, these rules and regulations were discarded. In the spring of 1921 only a very few were left, such as regulations and maximum prices for bread and sugar and certain regulations of the beer and spirit industries. To ensure thorough economy in the production of spirits the restrictive powers were combined with a commission for controlling the consumption of spirits, whose members were appointed by the State. The tax on spirits was fixed at 12 kroner per 80 litres. Other indirect taxes were the customs duties and the inland taxation of industry and trade. The tariff of 1863 was moderate but became heavier than was intended because of falling prices; and in 1908 it was revised, all necessaries of life, raw materials and agricultural produce being relieved of duty; protective duties were maintained for small and duties on tobacco and spirits relatively high. Objects of taxation giving the best return are beer, spirits, tobacco and sugar. In the financial year 1917 the State received 124 million kroner. Of these 101 million kr. were raised by taxation, 28 million kr. by direct and 73 million kr. by indirect taxes. The war occasioned an increase of taxation, and at the same time a large increase of export duties. The State revenues of the financial year 1910-20 were 601 million kr., of which 575 million were from taxes, 347 million kr. direct, 248 million kr. indirect. Yet the main part, 252 million kr., of the direct taxes were extraordinary duties. The national debt at the end of 1914 was 1,264 million kroner; in 1919 it was 1,663 million kroner, and in 1920 1,925 million kroner. The debt of all the municipalities was in 1914 375 million kr. and in 1920 750 million kroner. It must, however, be borne in mind that the value of State and municipal assets was appreciably reduced.

**Money and Banking.**—Before 1908 the right of the National Bank to issue bank-notes was based on the same system as the Bank of England. In 1914 a new system of banking legislation was passed. In 1915 the bank is required to be in possession of gold to the amount of one-third of the notes in circulation, and for the
remaining part there must be secured in assets easily cashed accounts, for the sake of security. The annual estimating in prices was about 100, and just before the war about 150 kroner. In the middle of 1917 it was 365 million kr., in 1919 541 million kroner. In 1914 the duty of the National Bank to redeem its notes with gold was suspended and it ceased to be an active agent. The other big banks of Denmark are the Danske Landmandsbank, with a stock capital of 100 million kr., and a balance at the end of 1918 of 1,448,000 kroner, of which more than one-half remained unclaimed under the same heading; "Sundry Debtors"; Privatbanken, stock capital 60 million, balance 593 million; Köbenhavns Handelsbank, 50 million, balance 672 million; Köbenhavns Diskonto og Realkreditbank, 37.5 million, balance 100 million kroner. In connexion with the farming import and export organizations a co-operative banking institute, the Danske Andelsbank, was established in 1914 with a guarantee fund of 11 million kr. paid in. There are also several special co-operative banks and savings banks which have been absorbed by the big banks.

Prices.—According to an average calculation wholesale prices— if the immediately pre-war index figure is put at 100—rose to 249 by July 1917. The upward tendency continued until the maximum was reached in Nov. 1920 with the figure 430. The general tendency afterwards was downwards, the figure for April 1920 being 270. The rise in the retail prices of necessities of life is indicated by figures calculated on the basis of household budgets for families belonging to the working classes. The expenses of such a family just before the war being put at 100, the index figure rose constantly till it reached 165.3 in Dec. 1920. At the end of the war the situation was very unsteady during the war compared to other values. In the post-war years the £ and S rates declined—the minimum was reached in Nov. 1918, £1 equalling 13 kr. and $1, 2.80 kroner. The exchange rates reverted to their pre-war position at the beginning of Sept. 1920, when £1 equalled 25.68 kr. and $1, 7.40 kroner. In April 1921 £1 equalled about 21.50 kr. and $1 about 5.50 kroner.

The reduction of the import duties to the real value of the kroner, a proposal made in 1918 by the Government, was estimated on the basis of the assessment for income tax, at about 1,200,000,000 kroner. In the war period this showed a constant increase, 1917-8 disclosing a yearly revenue of 2,600 million kroner, 2,650 million kroner in 1918-9, and 3,300 million kroner in 1919-20. The basis of the assessment has been the yearly revenue which has been multiplied by 2.1, i.e. in almost the same ratio as the retail price index. The incidence of income is more equal in Denmark than in many other states, though here also as elsewhere a considerable discrepancy between rich and poor is apparent, which was accentuated during the war. In 1915 about 70% of the adult population (married women excepted) had incomes of less than 1,000 kroner, making together some 30% of the total income; about 39% had incomes between 1,000 and 10,000 kroner, and nearly 1% had incomes of more than 10,000 kroner, about 22% of the total incomes. While in 1908 three-quarters of the adult population (married women excepted) had incomes of less than 1,000 kroner, in 1915, only half the population were below that amount. The national wealth before the war was estimated at 10 milliards, and in 1921 it had probably doubled (the assessed property had amounted to 1,000 million kroner). In 1915, 92% of the adults possessed property of less than 10,000 kroner, and the corresponding figure for 1918 was only 87%.

The value of the shares represented on the stock exchanges was in 1914 1,980 million kroner, whereas in 1915 the same amount was in 1918 about 3,000 million, in 1919 2,000 million and in 1921 probably 1,000 million. The difference of 2,000 million kroner, forwards and 2,000 million kroner, which was the difference of 2,000 million kroner, the former being the official figure and the latter the calculation from the official register, representing to some extent made and suffered by the same persons. (F.G.T.)

Labour.—In the seventies and eighties of the nineteenth century, the era of modern industrial development, an impetus was given to the trade-union movement, closely connected with the Social Democratic party. Both employers and employed are very strongly organized, chiefly under the main organizations, the Combined Trade Unions and Danish Employers' Organization. The trade unions included in 1919 nearly 250,000 members, 275,000 belonging to the Combined Trade Unions. In 1910 Denmark was foremost in the movement, 51% of the workmen employed in industry, commerce and handicrafts belonged to the trade unions, whereas then the movement had made rapid progress. In most industries nearly all the workmen were in 1921 members of the organizations. There has also been a considerable inflow of agricultural labourers. The usual basis of classification is the parishes, the hirds, the chaffers, and the menial, but in the towns there is no such clear-cut lines.

Besides the divisions for the different towns there are factory clubs and shop stewards; in some places a system by which chosen representatives exercise an influence over the general conditions of work, the wages, and the dealings with the employers. In the towns, 1920 syndicalistic tendencies manifested themselves rather strongly, but in 1921 the movement largely died away. After an extensive lockout in 1899 the trade unions of the so-called "technical crafts" took possession of the Danes. The majority is required for the declaration of strikes and lockouts, which must, moreover, be notified according to certain rules, and that all differences on the question of the interpretation of existing contracts and agreements must be referred to arbitration. After a considerable time had elapsed since the end of the war a new law was passed adopting the system of conciliation in disputes and the establishment of a special court to decide questions of law. The average number of days lost in labour conflicts over a series of years was about 90. The number of strikes during the year 1919 was 18, state of the labour market in 1919-21 much higher figures were reached, chiefly owing to strikes in the Copenhagen building trades and agricultural workers. During the transport strikes of 1920 the activities of the "Samlingsforbundet," a special organization for carrying out indispensable work undone by the strikes, were of considerable importance.

The national assembly accorded great importance to the simultaneous expiration of the labour agreements of the different trades. This often resulted in joint negotiations for the renewal of agreements, in most cases accompanied by threats of extensive strikes and the work of women and of the transport workers, but always these were averted at the last moment. In later years yearly agreements were made, adopting an automatic regulation of wages according to the price index of the Statistical Department from the middle of the period. A smaller part of the wages of State employees was also calculated according to this price index. Even before the war Danish industry suffered considerably from unemployment, which became still more complicated owing to the after-effects of the blockade and the critical state of affairs generally.

Wages in Denmark were somewhat high compared with other countries, though the earnings of the skilled laborers have become higher and the difference between the wages of skilled and unskilled workers has been reduced. The following figures are given for skilled workers: 1907-20, 950 kroner; 1920-21, 1,300 kroner; 1921-22, 1,700 kroner. The wages of hirings (on piece-work) were: 1907-20, 20 kroner; 1921, 35 kroner; 1922, 50 kroner. The wages of coal miners were: 1907, 50 kroner; 1920, 80 kroner; 1922, 170 kroner. The wages of colliery workers were: 1907, 50 kroner; 1920, 75 kroner; 1922, 150 kroner. The wages of the agricultural workers were: 1907, 45 kroner; 1920, 75 kroner; 1922, 175 kroner. The wages of the workers in the textile industry were: 1872, 114 kroner; since then they have gradually decreased. According to the eight-hour day was adopted on Jan. 1, 1902 by voluntary agreement between the chief organizations, which was a step in the direction of the enactment of a national agreement about the eight-hour day, but in May 1921 no law concerning this question had been passed.

At the close of the nineteenth century a general interest in social questions began to be felt, and through the first factory legislation, and in the beginning of the nineties came the general decision of acceptance of insurance relief legislation. The principle of voluntary, State-aided insurance against illness and unemployment, and for the rest public relief, apart from accident insurance, which, as elsewhere, is paid by the employers. The poor law of 1891 not only regulates pauper administration properly but also provides State aid for the poor, while the 1920 law made more provision for State or parochial relief, directed through the ordinary pauper administration but without the usual unpleasant consequences to the recipients. Such aid is given in cases of a number of chronic diseases against the payment of a small sum, in case of paraplegia, an additional support for indigent persons. Medical and obstetric aid is also given and extended aid to members of benefit clubs. Since 1907 every parish has had, besides the poor law, the power to order the balance of the receipts of the club, to be turned over to the club, the organization of its own, intended to administer relief in cases of urgent need. This fund has, however, in many cases become merely a more respectable form of pauper administration. By the Old-Age Pensions Act passed in 1901, Denmark took the lead in the question of providing for the aged. Certain conditions are laid down as to the need and worthiness of the recipients, and it is especially stipulated that persons who for five years previously received pauper relief are excluded. The age limit is 60 years. The amount of the pension, which is decided upon the merits of each separate case, should suffice for sustenance of life, and medical aid in case of illness is included. In 1922 the number of those in receipt of pensions amounted to 34,300 and 34,300, State and parishes contributing each one-half. Denmark has a large number of voluntary benefit clubs, mostly locally organized, but State-aided and under State control, in accordance with the 1905 law. The benefit clubs have the additional advantage of being self-managed, the State paying expenses of 70% of the working classes and a large number of others of similar standing are members, the total number amounting to two hundred thousand. As children of the State the benefit clubs have the privilege of carrying with them and representing their own special interests; and that the full number makes about one-fifth of the population. The chief benefits are hospital treatment, medical aid and subsistence allowances for the unemployed, and the amount of each is usually equivalent to a month and one-quarter of the chief expenditure. A considerable economic advantage to the benefit clubs is the very low charges made by the public hospitals for the benefit of the members. The clubs recognized that their real strength was the public opinion, and the government, in the name of the State inspector of benefit clubs.

By three decrees of 1921 persons suffering from chronic diseases admitted to the sickness insurance with any extra charges;
an insurance against disablement, forming an obligatory supplemental sickness insurance, was established; and special rules were laid down concerning "poor-relief" and its effects of "poor-relief" to be paid to a considerable part of the uninsured disabled. The first Accident Insurance Act relating to a number of disasters and accidents with the principle of the employers' liability was passed in 1898, and after some gradual improvements a general comprehensive Act was passed in 1916. It is the duty of the employer to have all persons employed insured in the case of accidents and accidents with the assistance of the State to social insurance, and the various forms of relief was, apart from sums arising out of special war-time legislation, 17 million kroner. The municipalities contributed 30 million kr., while the contribution of the members of the social insurance and unemployment insurance societies was 12 million kr., and the employers paid for the accident insurance 6 million kr., altogether about 74 million kroner. While the social insurance system proper is generally considered satisfactory—though in the last difficult years the administration of the unemployment funds has been the object of criticism—strong claims were advanced for a modification of the old-age pensions system, which should establish a right to fixed rates, and also for a thorough reorganisation of the lower branches of social relief (the pauper administration and relief funds), the administration of which had become complicated and impractical owing to their gradual development. Danish factory legislation is not very far-sighted by the standard of any of the other countries, but very far-sighted Ludwig Bransren (in the 'nineties)—father of the Danish Employers' Liability Act—rather radical and thorough-going, and very able and effectively administered. On the other hand, Denmark has no Wages Board or Minimum Wages (F. Z.)

**Political History.**—After the Cabinet of J. C. Christensen—

the formation of which in 1903 had led to a split in the ranks of its supporters, the Left Reform party separating from the Radical Left party—had been forced by the Alberti catastrophe to retire, a new Cabinet was formed by Niels Neergaard, a distinguished historian, as leader of the Moderate Left, with the support of the Moderate and Left Reform party (Oct. 12 1908). The problem of defence became the most prominent under this Cabinet, as the defence commission, which had been working since 1902, now reported. The members of the commission had not reached unanimity. The Socialists proposed disarmament; the Radicals wished the military to be replaced by a naval and police guard; while the Right proposed a material increase of military forces. The Government and its supporters in the Rigsdag were divided on the question of Copenhagen's land defences, and only after great confusion—new elections had not brought clearness—did the old leader of the Left, Count Holstein-Ledreborg, who had been away from active politics for years, succeed in forming a new Cabinet, in carrying through a new arrangement. The authority of the Crown, with which the Rigstad had been united; Copenhagen's naval defences were strengthened; and the land defences were to be dismantled not later than March 31 1912.

No party had a majority in the Folketing, and the Holstein Ministry was forced to retire in favour of a new Cabinet, formed by the Radicals with C. Th. Zahle, a barrister, as premier. This Cabinet could depend on support from the Socialists in the Rigsdag, though without thus acquiring a majority in either of the Houses. Under these conditions the Government announced its intention of postponing the introduction of the Radical programme. With the support of the Left the Right was able to secure a majority in favour of a proposal to prosecute the two ex-ministers, J. C. Christensen and Sigurd Berg, before the State Parliamentary Court, the Rigiaret, for neglect of their ministerial duties in regard to Alberti (Mr. Christensen was acquitted and Mr. Berg sentenced to a fine). As the Government proposed a democratic amendment of the constitution and met with opposition, the Folketing was dissolved, and at the elections of May 20 1910 the Left, which was still divided on the defence problem, won half the seats. The two moderate Left groups now united, the Left Reform party, the Left, and one of the old Moderate leaders, Klaus Ringgreen, a former member of the peasant high schools, formed the new Cabinet on July 5 1910.

King Frederick VIII. died on May 14 1912 and was succeeded on the throne by his son, Christian X.

With the support of the Radicals and the Socialists the Government again raised the constitution problem in 1912, but because of opposition in the Upper House (Landsting), where the Right controlled about one-half of the seats, no solution had been reached when the ordinary elections were held in May 1913. At these the Radical and Socialist parties gained control of 63 out of the 114 seats in the Folketing; Zahle formed the new Radical Cabinet. The constitution problem immediately became prominent, and the constitutional parties decided to let nothing divide them because of the importance of the issue; under these conditions the Socialists voted for the budget for the first time. The Right raised the most decided opposition against this united democracy; powerless in the Folketing, they undertook, by a policy of obstruction in the Landsting, to check the further development of the case. As an answer to this the Government dissolved the Landsting. The election results were: 20 supporters and 25 opponents of the constitutional amendment. Of the 12 members nominated by the Crown 9 were on the side of democracy, hence the Government was certain of a solid majority.

The outbreak of the war temporarily hindered the final solution of the constitution problem. It was with great anxiety for the future of their country that the Danish people experienced the fateful days of Aug. 1914. On Aug. 1 the Rigsdag passed a number of laws which the extraordinary conditions made necessary. The mobilisation of the emergency army, numbering 25,000 in the first days of the war, was completed by the end of the year. The establishment of Danish navies was immediately undertaken. The 'nineties—father of the Danish Employers' Liability Act—rather radical and thorough-going, and very able and effectively administered. On the other hand, Denmark has no Wages Board or Minimum Wages (F. Z.)

**Political History.**—After the Cabinet of J. C. Christensen—

the formation of which in 1903 had led to a split in the ranks of its supporters, the Left Reform party separating from the Radical Left party—had been forced by the Alberti catastrophe to retire, a new Cabinet was formed by Niels Neergaard, a distinguished historian, as leader of the Moderate Left, with the support of the Moderate and Left Reform party (Oct. 12 1908). The constitution problem immediately became prominent, and the constitutional parties decided to let nothing divide them because of the importance of the issue; under these conditions the Socialists voted for the budget for the first time. The Right raised the most decided opposition against this united democracy; powerless in the Folketing, they undertook, by a policy of obstruction in the Landsting, to check the further development of the case. As an answer to this the Government dissolved the Landsting. The election results were: 20 supporters and 25 opponents of the constitutional amendment. Of the 12 members nominated by the Crown 9 were on the side of democracy, hence the Government was certain of a solid majority.

The outbreak of the war temporarily hindered the final solution of the constitution problem. It was with great anxiety for the future of their country that the Danish people experienced the fateful days of Aug. 1914. On Aug. 1 the Rigsdag passed a number of laws which the extraordinary conditions made necessary. The mobilisation of the emergency army, numbering 25,000 in the first days of the war, was completed by the end of the year. The establishment of Danish navies was immediately undertaken. The
Other important legislative Acts of the first years of the war, which were passed unanimously, were the Reform of the Administration of Justice (April 11, 1910), which separated the administrative and judicial systems, and introduced oral proof readings and publicity—with tried by jury in criminal and political cases—and the Accident Insurance law (July 6, 1916), which made it the duty of all employers to insure their employees. The privileged suffrage in elections to the Amtsbørd (county councils) was abolished with the consent of all parties.

In the late summer of 1916 the comparative quiet which had marked political life since 1914 was succeeded by a bitter struggle. The cause was the announcement by the Government that it had concluded a treaty with the United States ceding the Danish West Indies to that country for $25,000,000. Both in the Rigsdag and among the public at large the indignation was essential, and outside strong feeling was aroused against the sale. The Left proposed a postponement till after the war or, if an immediate decision was necessary, the holding of fresh elections under a new constitution. The only solution of the crisis seemed to be new elections, but the King implored the party leaders to avoid such a situation, which would be a danger to the country. The result was a compromise: the Cabinet was supplemented by representatives of each of the political parties (H. Stanning, the Socialist member, being the first member of the working classes to become a minister), and the sale of the islands was to be decided by the Rigsdag after a plebiscite of the people. At the polls (Dec. 14, 1916) 253,670 votes were cast in favour and 158,157 against, and shortly afterwards the Rigsdag ratified the cession.

A contest of like character, but not nearly so far-reaching or bitter, arose in connexion with the rearrangement of the relation of Iceland to Denmark. With increasing force, Iceland demanded political independence and integrity. Despite the opposition of the Conservatives, the support of the other three parties sufficed to pass an Act of Union (Nov. 1918), in which Denmark acknowledged the independence of Iceland. The King is joint ruler of both countries and Denmark directs Iceland's foreign policy. The Act of Union is valid till 1940.

From 1917 onwards the unrestricted submarine warfare, combined with the stricter measures of the Entente, caused increasing difficulties in the economic life of Denmark. The Government, whose economic policy the Home Secretary, Ove Rode, was primarily responsible, made further efforts, by means of maximum prices, export prohibition, and also by the rationing of certain articles, to create tolerable conditions for the people. It sought to mitigate the effects of the increase in prices by an extensive policy of relief; both the State and the communes rendered direct aid to those without means; public officials received increased pay until their salaries had undergone a thorough revision; and the unemployed, whose number rose to 70,000 in the winter of 1918-19, were given extra support. Through an increase of the succession, income and personal property taxes, and the introduction among others of a tax on exchange business, the Government tried to cover these and the greatly increased military expenses. In the five years of the war 1914-19, the expenditures of the Government were 156,185, 251, 366, 616 million kr. respectively (in all 1,577 million kr.), and the total revenue for all five years 1,343 million kroner. The deficit was covered by loans. While the indirect taxes 1913-14 amounted to 55% and the direct to 35% of the total revenue, the figures of 1918-19 were 21% and 69% respectively. A radical anti-militaristic Government had from 1918-19 spent more than 500 million kr. on defence—more than all the Conservative war ministers together from 1865-1901.

After the spring of 1918 the elections could no longer be postponed. At the elections for the Folketing, when women voted for the first time (68% voted to the men's 84%), 72 supporters of the Government were elected, 39 Socialists and 33 Radicals, receiving 263,000 and 196,000 votes respectively; and 68 opponents, 45 Left and 33 Conservatives, received 168,000 votes respectively. The Landsting was constituted as follows: 17 Conservatives, 26 Left, 13 Radicals and 15 Socialists.

At the time of the Armistice the old problems were viewed differently and new questions arose. The troops were quickly demobilized, the special defence works were razed, and on March 17, 1919, a law was passed abolishing the land defence and artillery of Copenhagen. In 1919 the special method of administration of justice had ceased. The Government's economic policy, which had caused some dissatisfaction, but as a whole had been supported by all parties, became the object of very strong criticism, as the Opposition thought it time to abrogate the war-time legislation in this respect. Instead of improving, the economic conditions became worse: small exports, the falling value of the Danish krone both at home and abroad, and numerous strikes, partly caused by the syndicalist agitation, characterized the industrial and economic situation until near the close of 1920.

The Allied Nations had promised to discuss the Danish case through the prospects of a reunion with the Danish part of Slesvig. On the same day—Oct. 23, 1918—as the deputy of North Slesvig, P. H. Hanssen-Nørremølle, raised the demand of a reunion with the mother country in the German Reichstag, the Danish Rigsdag unanimously passed a resolution "that no other change in Slesvig's present position than an adjustment according to the principles of nationality would harmonize with the wishes, feelings and interests of the Danish people." With reference to this and statements made by the leaders of the Danish population in North Slesvig, the Danish Government communicated its wishes to the Allies (Nov. 28, 1918), so that when the Peace Conference in Feb. 1919 reached the discussion of the Slesvig problem, a united Danish North Slesvig delegation was sent to Paris to present the Danish point of view: a plebiscite en bloc in North Slesvig (Zone 1), a community ballot in Central Slesvig and Flensburg (Zone 2), and voting rights to all those who were born in the voting districts. The Peace Treaty was presented to Germany on May 7. The fact that it contained a provision for a plebiscite in South Slesvig (Zone 3), and gave voting rights to natives of the districts without consideration of their present place of residence, caused considerable excitement in Denmark. This departure from the wishes of the Government and the Rigsdag was due to the influence of a small group of the Danish people who wished the Slesvig question to be solved from a legal and historic point of view. Representations to the Peace Conference by the Danish Government were successful in getting the article providing for a plebiscite in Zone 3 omitted from the Treaty.

On the coming into force of the Peace Treaty on Jan. 10, 1920, an international commission, containing among others the ambassadors of England and France, Sir Charles Marling and M. Paul Claudel, took charge of the plebiscite district. The plebiscite in Zone 1 on Feb. 15 gave 75,431 (75%) votes for Denmark and 31,729 (25%) for Germany; even the doubtful Zone 2 had a majority for Denmark of 59%. On March 14 Zone 2 gave 48,248 (79%) German and 13,029 (21%) Danish votes.

While the plebiscite results in Zone 1 satisfied Danish expectations, this was not the case with the results in Zone 2. In the last years before the war the Danish element had here been yielding in the national struggle, but there seemed to be plain evidence of a change of feeling, especially in Flensburg, during the agitation before the plebiscite. The disappointment over the result was great. The Dahlbe Ministry had for months been the object of the most vehement attacks, because of its cool attitude towards the national propaganda in Central Slesvig and the assailants made it responsible for the poor result of the plebiscite. In certain circles it was still hoped to prevent the final union of Central Slesvig with Germany by the so-called "Internationalization of Zone 2." A storm of indignation at the national attitude of the Government in connexion with its economic policy began in the weeks after the plebiscite. When the Government refused to order new elections, with reference to the necessity for a new electoral law, the King dismissed it. A Cabinet of non-politicians, formed by Liebe March 30, 1920, took the responsibility for the King's action, which was regarded by the supporters of the dismissed Cabinet as unconstitutional, and had caused the threat of a general strike from the Socialists. During this "Easter crisis" Denmark was not, but may have looked as if it were, on
the verge of a revolution. The mediation of the city council of Copenhagen and others conciliated the Crown and the Socialists, and on April 5 a new Ministry, consisting chiefly of State officials, was appointed to formulate an electoral law and to order new elections. The new law was based on proportional representation in the county districts (Amtskreds), and the supplementary seats system was retained in a slightly altered form. At the Folketing elections (April 25 1920) the Left received 351,000 votes (49 seats), the Conservatives 201,000 (28),*1 Erhvervssparit* (trades party) 29,000 (4), against the Socialists’ 300,000 (42), and the Radicals 122,000 (17). Niels Neergaard formed the new Left Cabinet on May 27.

On July 7 1920 the international commission handed over the executive power in Zone I, awarded to Denmark by the Allies, to the Danish Government. After the constitutional amendments necessitated by this expansion had been adopted, the Folketing elections were held on Sept. 21 1920. In these the people of North Slesvig took part, and the voting age was 25 years for the first time. The results were 421,000 votes cast for the Left (32 seats), 399,000 Socialists (48), 217,000 Conservatives (27), 147,000 Radicals (18), 27,000 "Erhvervssparit" (4), and 7,000 for the German candidates (1). The Left maintained the leadership, and the Neergaard Ministry continued.

The problems relating to the constitution and to defence, which formerly were of the greatest consequence, had during later years been thrown into the shade by social problems, and the political parties were in 1920–1 developing in an increasing degree as representing economical interests, and as attached to certain classes: thus the Left was supported by the farmers, the Radicals essentially by the smallholders, the Socialists by the industrial labourers, and the Conservatives by the capitalists and the middle classes in the cities.

Literature.—Between 1910 and 1921 Danish literature lost by death several of its representatives already famous—Karl Gjellerup (1857–1910), Herman Bang (1857–1912), Peter Nansen (1861–1918), Vilhelm Bergsøe (1853–1911), Sophus Bauditz (1850–1923), Troels Frederik Lund (1849–1921), Edvard Holm (1853–1915) and A. Fredericia (1849–1912). In 1917 Henrik Pontoppidan (b. 1857), the novelist, was awarded the Nobel prize.

While the older generation was still productive, either on the old lines or, as in the case of Karl Gjellerup, taking up new themes (classical, ancient Gothic, Indian), a good many young authors came to the front. Niels Möller (b. 1859) and Ludvig Holstein (b. 1864), in their few but elaborate poems, represented the scepticism and dark views of the 'eighties; Vigo Stuckenberg (1865–1909) and his friend Sophus Clausen belong essentially to the aesthetic romanticism; and partially this may also be said of Sophus Michaelis (b. 1869) and Edvard Blaumuller (1851–1911), although they have some features in common with the younger generation. All these were mostly lyric poets, but Stuckenberg and Michaelis had also written powerful novels.

The foremost younger lyrical poets were Valdemar Rördam (b. 1872; *Selected Poems, 1918*) and Helge Rode (b. 1870). Thor Lange (1851–1913), as well as Rördam and Möller, made many excellent translations of English and foreign poems. To the same school belong L. C. Nielsen (b. 1871; *Danske Children’s Songs*); Kai Hoffmann (b. 1874; *The Town and the Sea*, 1902; *Selected Poems*, 1916); Olaif Hansen (b. 1870; *Selected Poems*, 1878; *Selected Poems from Iceland*); Thøger Larsen (b. 1873; *Selected Poems, 1913*); Axel Juhl (1878–1938). Of a more pessimistic and satirical type is Harald Bergstedt (b. 1877; *Jack and Elsie, 1916—"a modern Adam Homo"). Powerful novels were produced by Harald Kidde (1858–1928) and Johannes Buchholtz (b. 1882). Even since the latter half of the 'nineties the provincial note had been strong in Danish literature, as represented by writers emanating from the farmhouses and workshops. Foremost stands Jakob Knudsen (1858–1917), son of a parson, and for a time himself a clergyman but descending from and in the closest contact with Jutland peasants, a novelist of extraordinary power, but without artistic refinement. From Jutland also came Jeppe Aakjær (b. 1866), a peasant's son and a peasant himself; his masterpieces are short stories and lyrical poems, but he has also written novels and historical essays. Johannes V. Jensen (b. 1873, son of a Jutland veterinary surgeon) has shown himself a master in his treatment of the Danish language (*Prehistoric Novels*, 1909–10, translations from Frank Norris and Whitman). From Fünen there is the novelist Morten Korch; from Zealand, Thorkild Grafvund (b. 1879), partly novelist, partly folklorist; Kaj Bovbjerg (b. 1890), a prolific author and from Bornholm, Martin Andersen Nexö (b. 1860), who had given pathetic pictures of the proletarians' lives. H. Bergstedt has manifested a satirical vein of some consideration.

The outstanding name in archaeology has been Sophus Müller (b. 1846, director of the National Museum till 1921). Ludvig Wimmer (1839–1920) was supreme as a runologist (*Danske Runic Monuments*, 1895–1906). Folklore has had eminent representatives in H. F. Fellberg (b. 1831; *Jutlandic Dictionary, Danish Peasant Life*), in Evald Fang Kristensen (b. 1843) and in Axel Orlöf (1864–1917; *Heroic Legends of Denmark; in English 1910*). Celebrated linguists are Kristoffer Nyrop (b. 1858; *Grammaire historique de la langue française i–iv*), and Otto Jespersen (b. 1860; *Progress in Language*, 1894; *Growth and Structure of the English Language*, 1905; *Modern English Grammar*, 1909–14). The domestic culture of Scandinavia about 1800 was depicted by Troels Frederick Lund (*Daily Life in Scandinavia*, 1895–1907); Danish and foreign literatures were treated by Vilhelm Andersen (b. 1864) and Valdemar Vedel (b. 1890).

*DENTISTRY* (see 8.50).—The progress of dentistry in the decade 1910–20 was more rapid and more radical than in any previous period. The cause of this progress was the general advancement in knowledge due to the accumulation of data arising from scientific investigation and the application of the knowledge thus acquired to the prevention and treatment of disease. Until comparatively recent times the extent to which abnormal mouth and teeth conditions are responsible for degradations of health was imperfectly understood. The pioneer studies of W. D. Miller, of Berlin, especially as reported (1881) in a series of communications entitled *The Human Mouth as a Focus of Infection*, first called attention to the fact that the oral cavity is the habitat and breeding ground for a large group of micro-organisms, many of them possessing pathogenic character which under conditions of lowered resistance invade other parts of the organism and become the direct exciters of bodily disease. Miller also showed that the mouth is the common portal of entry for most of the disease-producing organisms that infect the human body, and further demonstrated that certain mouth bacteria, when injected into the circulation of a test animal, could pass through the blood stream or lymphatic system and establish metastatic foci of inflammatory action at points and in organs remote from the seat of inoculation. These early findings were afterwards confirmed by other investigators, more particularly by Sir Kenneth Goudby, of London. Recognition of the significance and far-reaching importance of the principles underlying these results of scientific research was only gradually accorded by the general body of the dental profession, and then merely as interesting facts without direct utility in dental practice.

In several communications on septic dentistry, notably in an address delivered in 1910 at the opening exercises of the annual session of the Medical school of McGill University, Montreal, Sir William Hunter, physician and lecturer to the Charing Cross hospital, London, criticised badly conceived and unskillfully executed dental restorative operations, especially in crown and bridge work and the treatment of pulpless teeth, which were performed without regard to surgical asepsis. In this connexion Hunter brought to bear clinical evidence to prove the soundness of his contention that operations so performed leave septic focus
that cause septicaemic conditions, as well as infections in remote parts of the body. Hunter's revelation impressed at once the dentists and medical profession, and his criticisms immediately bore fruit. The general use of the X-ray as a means for studying the apical region of tooth roots, the development and application of specialized bacteriological technique for determining in pulpless teeth the identity and character of the exudates of disease action and similarly those responsible for inflammatory lesions of the retentive structures of the teeth (commonly designated as pyorrhea alveolaris), all stimulated by the realization of the profound clinical importance of mouth infections as related to bodily health, quickly followed the communications of Hunter.

The total effect of this evidence, both clinical and scientific, upon the professional service of dentistry has been little short of revolutionary. From time immemorial it has been believed from empirical observation that an unclean and infected mouth cavity is a source of bodily ill health, and much direct evidence of a clinical character has accumulated to strengthen that belief, but the evidence now at hand has affirmatively established the facts by scientific demonstration. Until this development of knowledge concerning the systemic relationships of disorders of the teeth and their related structures and their bearing upon bodily health, the major feature of dental interest, and that upon which the attention of the profession was concentrated, had been efficiency. The analogous work of Dr. Ernst Jessen, of Strassburg, resulted in the introduction of oral hygiene into the public schools of a number of towns in Germany. In the United States the oral hygiene movement was started in 1910, and in 1915, under the direction of Dr. A. C. Fones. In this test 20,000 children of the first five school grades were under observation. The average number of various cavities was found to be over 7% per child; 9% claimed that they brushed their teeth; 60% frankly stated that they did not use a tooth brush and 10% were found to have fistulas on the gums, showing outgrowths from abscesses from the roots of decayed teeth. Systematic application of oral hygiene, the use of brush, and systematic brushing of the tooth-brush, and the elimination of accretions, dental decay and suppuration conditions achieved striking improvement in general health and mental efficiency. With respect to general health the statistics of the Bridgeport board of health show that the most common fatal diseases among children in that locality were diphtheria, measles, and scarlet fever. The decrease in deaths from these sources after the introduction of oral hygiene in the public schools is shown by the following table, the figures for 1914 showing before the test:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Diphtheria</th>
<th>Measles</th>
<th>Scarlet Fever</th>
</tr>
</thead>
<tbody>
<tr>
<td>1914</td>

</tr>
</tbody>
</table>

The improvement in mental efficiency is shown by the reduction in the percentage of retarded children. A retarded child as defined by the Bridgeport school board is one who is not less than two years older than the normal age for the school grade to which it should belong. The percentage of retarded children before and after the introduction of mouth hygiene in the Bridgeport schools is shown in the following table:

Drop in retardation

Percentage of Retarded Children.

For retardation represents inability of the child to continue to advance with his class, it necessitates repetition of his grade work, and therefore becomes an economic question of serious importance to the ratepayer.

The cost of education in Bridgeport in 1912 was 42% of the entire budget, and for 1918 only 17%. Among the 20,000 children under observation in the schools of Bridgeport, it was found that 98% had various forms and degrees of malocclusion of the dentures, a condition now generally recognized as being associated with a symmetrical development of the bones of the face and the brain case. Many children with malocclusion owing to the arrested development of the maxillae or mandible from impeded nasal respiration, and moreover develop adenoids and tonsillar hypertrophy, leading to infection with its systemic sequelae and the interference with bodily nutrition incident to insufficient oxygen, which interferes with the development of the brain. The Association of malocclusion in children has come to be regarded as a therapeutic and prophylactic measure having an important health relation rather than as a mere geometric, 10% for the welfare of humanity. The foregoing facts furnish convincing evidence of the desirability of making oral hygiene available to children of school age as a feature of dental public health service on economic as well as humanitarian grounds and on the broader ground of national efficiency.

Work in Armies and Navies.—Analogous considerations resulted in the organization in various countries of army and navy dental service of the nation. From small beginnings upon a contract basis, the U.S. army and navy dental service developed to an establishment by law of one dental surgeon for each 1,000 of the army personnel, and before the close of the World War provision had been made for the establishment of a dental and supply equipment service of army and navy. The corps was placed upon a commission basis with pay and allowances identical with those of the Medical Corps and rank within the corps. In 1918 full provision was made by the U.S. Government for the dental care of its enlisted men and of those demobilized from service suffering from dental defects or disabilities since demobilization, and of the dental corps, and the dental division of the public health service. Accurate statistics as to the development of army and navy dental service in forces of other nations are not yet available, but evidence of dental services to army personnel in 1917, as given by officials of the British Dental Association (see "Man Power and the Army Dental Service," British Dental Journal, Feb. 15 1918), for some forces was:—Canadian Dental Force, one per 2,000 men; Australian Dental Ex- pective, one per 2,500 men; Canadian Expeditionary Force, one per 2,600 men. Satisfactory figures for the German army dental service are not obtainable, but according to Dr. Ernst Jessen, head of the dental work in Strassburg, quoted in the German Dental Review, there were 810 dental surgeons active in the field in 1915. France, during the World War, had at least 1,500 army dental men working in various parts of the lines as fixed units, in addition to the dental ambulances. The French army dental service furnished a striking example of the practical importance of army dental service in that during the latter part of the war, when the man power of France was much reduced, the two dental corps were mustered into the French service as the result of efforts instigated by Dr. Georges Villain, of Paris, by which that number of men who had been previously rejected because of loss of teeth, but were otherwise physically sound, were subsequently fitted with artificial den- tures and sent to the fighting line.

The British dental service in the World War was inadequate, owing to the number of qualified dental surgeons available and the opportunity for that of the 1,000 to 1,100 officers of the army and navy in various capacities about 300 were enlisted as combatants, and of those latter 50 were killed. (See Report of Parlia- mentary Committee on the Relation of Military Service to Man Power. D. F. Pennefather, Chairman.) Great Britain created by Royal Warrant, issued Jan. 4, 1921, a military dental service, the Army Dental Corps, which is administered by the Direc- tion of Army Dental Service. Army Dental Corps is a joint service for the army and R.A.F., and is on a commission basis with rank through the grades inclusive of lieutenant and lieutenant-colonel. Experience during the war clearly demonstrated to all the belligerent nations the importance of dental service as
means of mouth sanitation and the practical utility of the latter in maintaining the physical efficiency of the fighting personnel, with the deductions thus derived from dental disease, and the public health service is that proposed in the Interim Report on the Future Provision of Medical and Allied Services, made to the British Ministry of Health by the Consultative Council on Medical and Allied Services in 1912. The maintenance of the system of dental and dental service as factors of public health and as proper subjects for control and development by the State. Oral hygiene comprehends much more than the correction of dental defects and oral infection due to neglect of the toothbrushing process and the routine restoration of lost teeth or parts of teeth, merely arrest the progress of disease and mechanically repair damage already done. The entire energies and skill of the whole dental profession are totally inadequate to cope with more than a small fraction of the corrective work needed. To establish the habit of personal care of the mouth in school children is a field of activity that has developed the specially trained dental nurse or hygienist as an adjuvant to dental service, whose calling is now localized in the principal states of the United States. The work of the dental nurse is limited to the surface treatment of teeth, in the removal of deposits and accretions thereon, the injection of various medicines in the tooth—brushing paint, and their education in the importance of mouth cleanliness. In addition to the physical benefits resulting from oral hygiene among school children there is also a manifest improvement in mental and emotional health. The child learns to appreciate the increased self-respect, greater attention to bodily and mental cleanliness, closer complacency with school regulations and an awakened interest in attendance and studies. The close connexion between hygiene and mental development is now becoming more general. The present trend is toward making dental and oral hygiene service in all civilized countries a public health measure.

In the years immediately following the World War created a new field for oral surgery and surgical prosthesis. For the successful treatment of these cases it became evident that surgical measures alone were insufficient, as the loss of tissue from gunshot wounds or from the blast of high explosive or from the crushing force of the explosion of shells, resulted in losses of parts of the jaws and in extirpation of the teeth from extensive lesions when surgically treated, left the patient in many instances with repulsive deformities. The resources of surgery and dentistry were called into cooperation. Plastic surgery, involving the transplanting of flaps of skin and bone of the soft missing parts, was developed to a degree previously unknown. The rebuilding of the face, including reconstruction of the nose, lips, cheeks, the orbicular region, etc., was accomplished with a perfection in many cases almost miraculous. In this work the aid of dental prosthetic technique was often necessary. The large and increasing number of casualties of the head, face and jaws resulting from the arms in which the war was conducted for hospital special equipment devoted entirely to the treatment of this class of wounds. Of these centres of specialized surgical activity the foremost in importance and extent was Queen’s hospital, Sidcup, Kent, England, equipped under the British and American assistance with sections for British, Canadian, New Zealand and Australian forces manned by personnel from the respective forces. Cooperation between the British and the American hospitals was organized on a most satisfactory results. The American Ambulance hospital of Paris at Neuilly-sur-Seine, subsequently taken over as American Red Cross hospital No. 1, was an analogous centre of specialized head, face and jaw surgery in which similar cooperation was again successful. These experiences furnished convincing evidence of the need by each profession of a more intimate acquaintance with the work of the other. This need is recognized in the practice of adding a professional dental service to hospitals.

A general quickening of scientific research has followed. Bacteriological and histological investigation of dental and oral pathology, various chemical and experimental investigations, have all contributed to an increased knowledge in this field, but brought about great improvement in dental and oral surgical technique. Notable progress has been made in the study of dental and oral infections and of physical irritation of the gums and tissues surrounding the teeth, the relation of the gums to disorders and reflex neuroses, that cause disturbances of the special sense organs as well as spastic disorders of a local or general character. Attention has been directed to the endocrine relationships of the gland and the alimentary canal, the internal organs to the activities of the ductless gland system and the reactions of the salivary secretion, as well as to variations in the calcified structure of the tooth from the standpoint of its function and its resistance to natural and artificial influences. Corresponding changes in the objectives as well as in the character, the content and extent of dental education have taken place in harmony with these developments. Practical teaching has tended toward the combination of the professional dental ideals with the fundamental principles of the study of the sciences and the arts. What was once a less proficient student of general medicine in so far as they represent the principles common to the whole science and art of healing. While the most conspicuous progress in dentistry during the decade 1910-20 has been in the direction of its vital and hygienic relations, its technical and engineering features have shown a similar development. Until this time the construction of artificial dentures and the replacement of lost teeth was almost wholly an empirical procedure depending on the judgment, manual skill and good taste of the operator.

Scientific studies of the engineering principles underlying the mechanism of the human dentition, made by W. G. A. Bonwill, of Philadelphia, and since prosecuted by his numerous followers, have brought the knowledge of masticatory movement and of the relationships of the teeth and their muscles and their control and thereto a state of completeness that enables the prosthetist by the aid of mechanical articulating devices to reproduce in the artificial denture a mechanism with possibilities approximating, both functionally and artistically, those of the natural tongue. The work of Alfred Gysi, of Zurich, constitutes the most advanced achievement in this field. In close relation to the progress is the continuing progress made in the artistic reproduction in porcelain of nature’s form and color. A notable exponent is Dr. J. L. Williams, of New York, and N. S. Esig, of Philadelphia. In 1894 Charles H. Mayo, the distinguished surgeon of Rochester, N.Y., expressed the opinion that the next great step in medical progress in the line of preventive medicine should come from the dental profession. A review of the progress since made would seem to indicate a reasonable prospect of the fulfillment of that prophecy.

DEPEW, Chauncey Mitchell (1842- ). American lawyer and politician (see 8,96), failed of re-election as U.S. senator on the expiration of his term in 1911. In 1914 he favoured the repeal of the Panama Canal Tolls bill. He assailed pacifism and after the sinking of the "Lusitania" (1915) urged a strong stand against Germany. In 1918 he presented to Peckskill, N.Y., a bronze statue of himself, which was erected in Depew Park, a plot of land purchased from the Indians in the 17th century by an ancestor, François du Puy. In 1910 he added much adjoining land to this park.

He is the author of Some Views on the Threshold of Four Score (1914), including speeches delivered 1912-14, and Speeches and Literary Contributions at Four Score and Four (1918, articles and speeches composed 1910-18).

DERBY, Edward George Villiers Stanley, 17th Earl of (1865- ), English statesman (see 8,69), was in Jan. 1915 created a Knight of the Garter. In Oct. 1915 he became director of recruiting for the army, and as such was responsible for a new scheme for a final effort on behalf of voluntary service. A large number of recruits were obtained by Lord Derby’s scheme, but as the numbers did not equal expectations the Military Service bill was introduced and carried in Jan. 1916. In Feb. 1916 Lord Derby became chairman of the naval and military air service joint committee, but resigned in April, becoming Under-Secretary of War in July. On the formation of Mr. Lloyd George’s Government in Dec. 1916, he became Secretary of War, and in April 1918 was appointed British ambassador to France. He retired from the latter office in Nov. 1920.

DÉROULEDE, Paul (1846-1914), French author and politician (see 8,74), died at Mont-Boron, near Nice, Jan. 30 1914. In 1910 he had published a collection of his patriotic speeches, and a volume La Ligue des Patriotes containing further extracts from them appeared two years after his death.

DESHANDEL, Paul Eugène Louis (1856- ). French statesman (see 8,01). During his absence from the presidential chair in the Chamber of Deputies after 1902, Deschanel carved out for himself a position of some political importance on the Committee of Foreign Affairs. He was president of this important committee when the Franco-German treaty of 1911, confirming the settlement of the Agadir incident, came before Parliament. He was reelected deputy in 1910, and on May 23 1912 he was chosen to succeed M. Brison in the presidency of the Chamber of Deputies. He was maintained in this office by the majority of the deputies, a fact that indicated that the Chamber was marked by much oratory of a literary nature, and by considerable dexterity in the treatment of the rowdy elements of the extreme Right and the extreme Left. He aimed at being the impartial Liberal Republican. During the World War he played a great part as the national orator. There were, indeed, few occasions of sorrow or of thanksgiving which his eloquence did not either lighten or intensify. He delivered orations more frequently than he made speeches. Whether it was to hold Ger-
man infamy up to universal execution, to sing the splendid victories of the dead of France, to pay a glowing tribute to an ally's achievements, or to console the widow and the orphan and spur on the living fighter, he always had at his command the delicate, if somewhat artificial, style of speech of the great Latins, which combined both the structure of the artist and the feeling of a man. Speech did not give to him a sufficient outlet for his literary gifts. He was prolific as a writer in reviews such as the *Revue de Paris*, the *Revue Bleue*, *Revue Hébdomadaire* and the *Nouvelle Revue*. His book numbers *Figures de Femmes, Figures littéraires* (both 1889), and a tribute to his political godfather Gambetta. His talents as a littérateur were recognized by his election to the French Academy on May 15, 1890. He married on Feb. 13, 1901 Mlle. Germaine Brice, and had three children.

It was a secret to none that M. Deschanel, throughout his long political life, nurtured one great ambition—he desired to become President of the republic. When in Jan. 1902 M. Poincaré's term of office came to an end, it was with some genuine reluctance that Clemenceau allowed himself to be put forward as a candidate to oppose Deschanel. That reluctance was justified by results. In the preliminary party ballot Clemenceau was beaten, and withdrew his candidature. Deschanel was elected President of the republic by the National Assembly on Jan. 17 1920 by an overwhelming majority. His term of office opened brilliantly, but his health was unable to stand the strain of office. In May 1920, while on an official journey to Montargis, he fell unobserved from the presidential train, and though he found his way to a signalman's box, and suffered no worse consequences than a nervous breakdown, he was temporarily incapacitated. His condition subsequently became such that on Sept. 20, 1920 he was obliged to resign his office, and to leave Rambouillet, where he had sought the quiet necessary for the restoration of his health. He then went into a private nursing home at Rueil where he sufficiently recovered to be able to stand successfully for the Senate in the elections at the beginning of 1921, though he no longer took an active part in public affairs. (G.A.)

**D'ESPERÉY, LOUIS FRANCHET** (1856-1930), French marshal, was born at Mostaganem, in Algeria, on May 25, 1856, and was commissioned from St. Cyr to the infantry in 1876. As a junior officer he saw much service in N. Africa and Tonking. For a time he was aide-de-camp to Freycinet, then Minister of War and premier. He served also in the expedition to N. China in 1900, after which he commanded an infantry regiment at home. He became général of brigade in 1906 and général of division in 1912. For a time he commanded the troops in Morocco, but in 1913 he was appointed to the I. Corps at Lille. He commanded this corps in the V. Army during the battle of the Frontiers, and at Charleroi the ungrateful task of protecting the right of Lanrezac's army during its deployment on the Somme. Brought up at last on to the battlefield to decide a decisive counter-stroke, he was at the moment of attack withdrawn again to protect the right rear of the army, the force which had released him having failed to keep the line of the Meuse. In the difficulties of the retreat which followed it was the I. Corps and its commander which formed, according to Lanrezac's own testimony, the stoutest element of the V. Army, and when that general was relieved of his command on the eve of the battle of the Marne, Franchet d'Espérey was his obvious successor.

Gen. Franchet d'Espérey commanded the V. Army during the battle of the Marne and the advance to the Aisne, and continued in command till the end of March 1916, when he was appointed to the general staff, in succession to Dubail. After holding this office for some eight months, he passed to the more active command of the northern group of armies, of which he was in charge throughout the campaign of 1917. In May 1918 he went to Salonika as commander-in-chief of the Allied armies in that theatre. His predecessor, Gen. Guillaumat, had worked out the main features of a general offensive on the Salonika front, and continued, in close cooperation with him, to support the claims and needs of such an offensive in the councils of the Allied High Command at Paris. Men and material were sent out in adequate numbers, and though Franchet d'Espérey, even with Guillaumat's assistance, was only able to obtain the decisive authorization to attack a few days before the scheduled date, his energy was equal to the task of hastening on the last stages of preparation and on Sept. 15 an offensive was launched that carried all before it. Bulgaria surrendered, and the pursuit was pushed with hardly a check into and through Old Serbia. After the final victory he remained in charge of the Allied forces in Europe, until a French, British and Balkan occupied territory, with headquarters in Constantinople. He was created a marshal of France early in 1921.

**DÉTAILLE, JEAN BAPTISTE ÉDOUARD** (1848-1912), French painter (see 8.110), died in Paris Dec. 24 1912.

**DETOIT** (see 8.113).—Commencing with the recovery from the industrial depression of 1907-8, the city of Detroit entered upon a period of growth almost without precedent among large cities. The area of the city in 1907 was 35.65 sq. m., but by the end of 1918 had increased to 83.58 sq. m. With reference to a portion of this area a peculiar condition existed. The villages of Hamtramck and Highland Park were originally outside territory into which the population and business of Detroit overflowed. By annexations in 1916 and 1917 their outer boundaries were brought two miles within the city limits, but they still retained their separate municipal administrations. Together they covered 4.83 square miles. The pop. of the city as estimated from the Water Board enumeration of families was in 1907 about 306,000. In 1910 the U.S. census record was 465,766. The census of 1920 gave a total of 1,088,835 within the city limits, distributed as follows: under Detroit municipal administration 993,739; village of Hamtramck 48,615; City of Highland Park 46,490. A canvass made late in 1920 by the various city agencies for Americanization indicated that about 70% of the population was either of foreign birth or foreign parentage. Poles, Germans and Russians represented the largest numbers, though there were large accessions from south-eastern Europe. In a single automobile plant there were 34 nationalities represented. A canvass of the public schools taken in Dec. 1920 showed 55% of the pupils of American-born parentage, 50-5% being white and 4-5% coloured. In 45% of children of foreign-born parents Polish ranked first and Russian next. In the three years ending with 1920 a large amount of work was done by the Board of Commerce, the Board of Education, and leading manufacturers in teaching the English language and the elements of citizenship through public night schools and factory schools.
ous other changes in Detroit's manufacturing industries. Freightcar building, which had largely disappeared by 1908, has been
entirely continued. The carriage and furniture factories were for
the most part changed to the making of automobile accessories,
and clothing manufacture diminished. Meantime some of the
men who manned the mills and foundries have found work in the
first or near the front in the following lines: aluminium castings, brass
products, computing machines, druggists' preparations, soda ash
and kindred alkalies, stoves and varnishes.
The movement for the accommodation of the increasing traf-
cy caused by this industrial expansion there were great enlarge-
ments by the transportation lines. The Michigan Central tun-
nelled through an immense new passenger and freight office
building. That road and the Grand Trunk and the Pere
Marquette made great additions to their freight yards, stations and
sidings, and the outer belt line was extended. The Pennsylvania
lines, after establishing a belt line through Toledo with a belt line
of their own round a portion of the city, and ample freight and passenger
facilities. The Detroit, Toledo and Fronton, which was suffering
for lack of funds and equipment, was purchased by the Henry Ford
interests, with great improvement in its facilities for service as a
coal road. In lake freight transportation 1916 was the maximum
year. The number of passages by vessels through the Detroit river
that year was 37,852, set registered tonnage 76,560.

Administration.—Under a charter adopted by popular vote
June 25 1918, the methods of municipal government were
materially changed. In place of a Board of Education of one
member for each ward there was a Board of Education of five
elected two or three at a time on a general ticket and holding office
for six years. The old Board of Estimates, consisting of two mem-
bers representing each ward, was likewise abolished. Revenue
appropriations and bond issues to be determined by the mayor
and common council. The mayor's final judgment was conclusive upon
all appropriation items, unless reversed by a vote of seven out of
the nine council members. The city manager system, which
ward was displaced by a council of nine members all elected at one
time on a general ticket. The mayor, city clerk and city treasurer
were elected, but all other administrative officers and commissions
were appointed by the mayor, without reference to the council, and
were subject to dismissal by him without trial. Nominations, two
for each office to be filled, were made at non-partisan primaries.
Blank for voting was also non-partisan, and the time of election
was separated from that of the state and national contests. By
special legislative enactment the police and recorders' courts were
combined in one with seven judges, holding office for four years and
having both civil and criminal jurisdiction. In the cases,
juries were all chosen at one time on a non-partisan ticket.

DE VALERA, EDWARD (Eamon) (1882- ), Irish repub-
lican leader, was born Oct. 14 1882, near Charleville, Co.
Cork. His father, Vivian de Valera, was a Spaniard; his mother,
whose maiden name was Kate Coll, came from near Burrea, Co.
Limerick. He spent his childhood and boyhood among his
mother's people, and was educated first at the national school
and later at the Christian Brothers' school, Charleville. He then
went to Blackrock College, Co. Dublin, where he gained a reputa-
tion both as a student and an athlete. Here he worked at Latin,
Greek, French and English literature, and at his favourite
subject, mathematics. He won a middle grade exhibition in 1895,
and in 1899 one in the senior grade. Entering the Royal Univer-
sity in 1901, he won the next year a second class mathematical
scholarship. He went as teacher to Rockwell College, and while
there graduated with a pass B.A. degree in mathematical science
in 1904, and proceeded to the B.Sc. degree in 1914. In 1919 he
passed the examination for the diploma in education (teaching).
For a time he worked on a thesis on quaternions for his M.A.
degree, but he never presented it. He also attended lectures in
mathematics at Trinity College, Dublin, where he unsuccessfully
competed for a scholarship. Returning to Dublin, he taught
mathematics, Latin, and French in the principal Roman Catholic
colleges, including the old University College, St.
Stephen's Green; Belvedere; Clonliffe; Dominican College,
Eccles Street; Loreto College, St. Stephen's Green; and Carysfort
Training College for teachers. He examined in mathematics for the
Irish Intermediate Board of Education in 1912 and following years.
He unsuccessfully attempted to become an inspector of national
schools. He was also a regular writer for the Catholic press and
rapidly acquired a knowledge of Irish (Gaelic), and in 1914 he
was able to read difficult bardic Irish poetry. He took charge of
the Irish Summer College at Tawin founded by Casement.

On the foundation of the Irish Volunteers in 1913, he threw
himself heart and soul into the new organization. Sinn Fein had
turned to the use of violence in 1909, and to this organization
De Valera belonged, though he assumed no leading share in it till
the Easter rebellion of 1916. When Casement was captured he
was one of the leaders of the Irish Volunteers, who were
present at the surrender of the rebels. He was arrested in
Dublin, and was tried for his part in the rebellion, but ultimately
acquainted with the English Government, and was discharged.
He was sentenced to life imprisonment, and was released in
1917, the moment the Sinn Fein government was established.

In the agitation, in the early part of 1918, against " conscrip-
tion" De Valera took a leading part. But in May the dis-
scovery by the Government of another plot for a rising, to be
combined with a German invasion, led to his re-arrest together
with some 150 other prominent Sinn Feiners. He was imprisoned at Lincoln, in England, but on Feb. 3, 1919 he, with two other Irish prisoners, escaped and, ultimately, made his way to the United States. Here, working with the same restless energy as in Ireland, he was successful for a time in enlisting a large amount of public sympathy for the Sinn Fein cause, especially in Irish and German-American circles. He was received as "President" by the civic authorities of New York (under Mayor Hylan's Tammany administration) and in other cities where the Irish vote predominated, presented with their "freedom," and otherwise honoured. His attempt, however, to persuade the party conventions, assembled to nominate candidates for the presidency, into making the independence of Ireland a plank in their programmes, completely failed, and the Irish question was not mentioned in the programme of either party. With the election of Mr. Harding to the presidency, it became clear that De Valera's efforts to involve the United States in a quarrel with Great Britain about Ireland had broken down, and in the spring of 1921 he returned to Ireland, where in June and July negotiations were opened with him by the Government with a view to an Irish settlement (see Ireland: History).

In 1910 De Valera was married to Miss Sinead Ni Fhllannagain, one of the most popular teachers and earnest workers of the Aodh Ruadh and Colmcille branches and of the Linnster College.

DEVENTER, SIR JACOB LOUIS VAN (1874-1945), S. African general, was born in the Orange Free State in 1874. A colonel on the permanent staff of the S. African Defence Force, Van Deventer was appointed to the S.W.A. command, 1914-15, where he had a distinguished record in active service. His real gifts as a general, however, were not fully appreciated till he went to German E. Africa, to fight in Gen. Smuts's campaign against the Germans there. So well did he acquit himself in that field that when Gen. Hoskins, who had succeeded Gen. Smuts in the chief command, ceased to hold that post in 1917, Van Deventer was appointed commander-in-chief of the Empire Military Forces in E. Africa. He was then a major-general, and was given the temporary rank of lieutenant-general on becoming commander-in-chief. Shortly afterwards he was created K.C.B., in recognition of distinguished services in the field. As commander-in-chief he showed the same qualities which had secured for him this high promotion and it was under his auspices that the campaign was brought to a successful end. Van Deventer left E. Africa at the end of 1918, sending a message of thanks to the administrator of Southern Rhodesia, in which he expressed his sincere thanks for the unfailing cooperation of the Rhodesian troops, British and African, in the campaign.

DE VILLIERS, JOHN HENRY DE VILLIERS, BARON (1842-1914), first Chief Justice of the Union of South Africa, was born at Paarl, Cape Colony, in June 1842. Descended from the Huguenots who settled in that part of the Cape, he was educated at the South African College, Cape Town, and went to Utrecht and Berkin universities. In 1865 he was called to the bar by the Inner Temple, and in the same year returned to South Africa and began practice as an advocate of the Supreme Court of Cape Colony. His success was immediate. Entering Cape politics in 1866, he was elected a member of the House of Assembly, became attorney-general of the Colony in 1872, and two years later was appointed Chief Justice of the Cape. In that high office he publicly confounded critics of his appointment. The Roman-Dutch law of the Colony, admirable in its logic and symmetry, was ill-fitted to the applications of modern conditions, and it was the life-work of de Villiers to adapt it to these needs. This he did with a conspicuous success which has secured for his name a place high on the roll of those great judges who have done the work of British civilization in many parts of the world. De Villiers was knighted in 1880, was created a K.C.M.G. a year later, and in 1910 was raised to the peerage on his assumption of the post of Chief Justice of the newly formed Union of South Africa. He died Sept. 2, 1914.

In the work of moulding the instrument of union he had borne a great if not a decisive part. Throughout his career he had taken a constant interest in the politics of Cape Colony and of South Africa—an interest which had never degenerated into partisanship, which had throughout been inspired by a true and enlightened patriotism, which had never lacked the touch of courageous plain speech at the many moments of crisis through which his country and passed. Universal recognition of the outstanding qualities made the appointment of de Villiers as president of the National Convention inevitable, though it must be said that, as the work of the Convention drew towards completion, there were murmurs—and not without justification—that long years on the bench had done something to affect his natural aptitude for presiding over the deliberations of such a body. These criticisms, however well justified, should not detract from the greatness of his achievement, both as a judge and as a figure in the tortured public life of South Africa during the hazardous years of his career. As a judge he touched genius. Acquitted of the seemed in the civil laws of Roman-Dutch law, he added to these gifts the art of keeping steadily in mind the practical needs of the life of his country as affected by his judgments. Equity rather than precedent was his mentor. With the bar his relations were those of a wise and revered adviser. During repeated visits to Great Britain he shared with known distinction in the work of the Judicial Committee of the Privy Council, and the value of his assistance to that body was recognized more than once in public by his colleagues.

DEVONPORT, HUDSON EWE BANKE KEBARY, 1ST VISC. (1836-1922), English politician and man of business, was born at Uxbridge Sept. 1, 1836, and educated at Clarendon College. He entered the firm of Kebar & Tonge, tea merchants and shippers, of London and Calcutta, subsequently becoming senior partner. In 1892 he entered Parliament as Liberal member for Devonport, and from 1905 to 1909 was parliamentary secretary to the Board of Trade. In 1898 he was created a baronet, and in 1909 was elected chairman of the Port of London Authority, being prominent in this capacity during the strike of transport workers and lightermen at the London docks in 1912. In 1910 he was raised to the peerage. He was appointed first Food Controller in 1916, and in 1917 became secretary to the Sugar Commission, but had to retire owing to ill-health. The same year he was created a viscount.

DEWAR, SIR JAMES (1842-1913), British chemist and physicist (see 8.157), published (with G. D. Liveing) Collected Papers on Spectroscopy (1915). In 1916 he received the Copley medal of the Royal Society, and the Franklin medal of the Franklin Institute of Philadelphia in 1919.

DEWEY, GEORGE (1857-1917), American naval officer (see 8.139), died in Washington Jan. 16, 1917, and three days later was buried in the Arlington National Cemetery. By special provision Admiral Dewey was never retired but continued in active service up to his death, for the last seven years being president of the Naval War College. To the last he continued to urge the building of large battleships, citing their superiority in the battle of Jutland in the World War. He published his Autobiography in 1913.

DIAZ, ARMANDO (1861-1943), Italian general, was born in Naples Dec. 6, 1861. He entered the artillery and served in that branch and in various staff appointments, until his promotion to major, when he transferred to the infantry. He served in the Italo-Turkish War in command of a regiment and was wounded at Zanzur in Sept. 1912. In 1914 he was promoted to major-general, and, after commanding the Stenna Brigade for a short time, was transferred to the general staff. On Italy's entry into the World War he was attached to the supreme command as chief of the operations department. He held this post till June 1916, when he was promoted lieutenant-general and took command of the 49th Division, which in Nov. of that year distinguished itself by the capture of Volkovnjak, an important position on the northern rim of the Carso. He visited the French front in Jan. and Feb. 1917, and in June he was given special promotion and confirmed in command of the XXIII Corps, which he had held temporarily from its formation in the previous March. Under his direction in the battles of April, this corps won a considerable success between Korite and Selo, on the Carso.
In Nov. 1917, after the Caporetto disaster, Diaz succeeded Cadorna as chief of the general staff. He was confronted with a very serious situation, but he brought to bear upon it all the needful understanding and resolution. Under his direction the battle front was successfully reconstituted, and the work of reorganizing the Italian army was carried out. At the instigation, and under the close personal supervision, of Diaz much was done to improve conditions for the soldiers at the front and for their families at home. Under his command the double attack of Berwick and Conrad was broken up at the battle of the Piave (June 1918) and the armies of the Dual Monarchy were destroyed by the battle of Vittorio Veneto (Oct.-Nov. 1918). For his services Diaz received the collar of the Annunziata, the highest Italian order. In Nov. 1919 he was nominated army general and retired from his position as chief of staff, and later, upon the reorganization of the army and Ministry of War, he was appointed vice-president of the Army Council. He also became a Senator and in 1919 he received the freedom of the City of London.

As a division and corps commander Diaz displayed high military qualities. His position as chief of the general staff was rendered delicate by the fact that the British and French divisions which were sent to Italy after Caporetto were not at first placed directly under his command, and his personal qualities were specially adapted to render collaboration easy. Diaz has been criticized for excess of caution in delaying his final attack upon the Austro-Hungarian armies. It is possible, though by no means certain, that he might have attacked with success sooner. But an earlier victory might very well have been less complete, and anything less than complete victory would not have served the cause of Italy or of the Allies.

DIAZ, PORFIRIO (1830–1915), president of the republic of Mexico (see 5.172), died in Paris July 2 1915. In April 1910 he was elected president for the eighth time, but as the result of widespread opposition to what was regarded as a prolonged dictatorship, a revolution broke out the following Nov., headed by Francisco I. Madero. Because of his age the President could not head his army personally, and in May 1911 was forced to resign. With his family he went to Spain, and thereafter until his death lived in various European capitals.

DICEY, EDWARD (1832–1911), English writer (see 8.178), died in London July 7 1911.

DIESEL, RUDOLF (1858–1913), German engineer, was the inventor of the Diesel oil-engine (see INTERNAL COMBUSTION ENGINES), the possibilities of which, however, had hardly been realized till after his untimely death. He fell overboard the Antwerp-Harwich mail steamer on Sept. 30 1913, and was drowned.

DIGGLE, JOHN WILLIAM (1847–1920), English divine, was born at Strawberry Hill, Pendleton, March 2 1847. He was educated at Manchester grammar school and Merton College, Oxford, where he graduated in 1870, being ordained in 1871. After many years of energetic work in various parishes he was in 1892 made examining chaplain to the Bishop of Carlisle, Dr. Barsley. Four years later he became archdeacon of Westmorland and canon residuary of Carlisle. In 1902 he became rector of St. Martin's, Birmingham, in 1903 was made archdeacon of Birmingham, and in 1905 became Bishop of Carlisle, where his energy and industry brought him a great reputation. He died at Rose Castle, Carlisle, March 24 1920.

DIGGLE, JOSEPH ROBERT (1849–1917), English educationalist, was born in Lancs. May 12 1849. He was educated at Manchester grammar school and Wadham College, Oxford. He took orders, but resolved later to devote himself to public work. In 1879 he was elected for the Marylebone division to the London school board, on which he remained until 1897, being chairman from 1883 till 1894. Diggle was an active member of many committees for the betterment of the conditions of the working classes, and published Pleas for Better Administration upon the London School Board (1881 and 1883). He died at Oxford Jan. 16 1917.

DILKE, SIR CHARLES WENTWORTH, 2nd Bt. (1843–1911), English statesman (see 8.271), died in London Jan. 26 1911, and was succeeded by his son, CHARLES WENTWORTH DILKE (1874–1918), who died in London Dec. 7 1918. The baronetcy went to Sir Fisher Wentworth Dilke (b. 1877), a cousin of the 3rd Bart.

DILLON, JOHN (1851—), Irish Nationalist politician (see 8.273). The Irish members endeavoured unsuccessfully to censure the conduct of the Speaker in regard to the suspension of Mr. Dillon on March 20 1903. He was prominent that year in Parliament in his attacks on the Government for the revival of the Crimes Act, and in the following year he helped forward Mr. Wyndham's Land Purchase Act. For several subsequent years he played a comparatively subordinate part both in Ireland and in Parliament; but in 1909 he appeared as a leading apologist of cattle-driving, telling the House of Commons that the grazing system in Ireland had become an abomination. He aided the parliamentary progress of the Home Rule bill mainly by a judicious silence. In the years before the World War he had been very critical both of the increased naval preparations, which he said were the result of a bogus naval scare, and of Sir Edward Grey's policy in Egypt and Morocco. But he followed his leader, Mr. Redmond, in urging Ireland to take her share in the war against Germany, and spoke at the meeting in the Dublin Mansion House on Sept. 25 1914, when the platform was occupied by the Lord Mayor, the Lord Lieutenant, Mr. Asquith (Prime Minister), the Chief Secretary, and Mr. Redmond. In Parliament, however, he showed himself opposed to compulsory service and the setting up of a Munitions department; and after the Dublin rebellion he said he was proud of the rebels, accused the Government of washing out the word Nationalist in a sea of blood, and declared that Sir John Maxwell's system of military rule had done more to spread disaffection in Ireland than all the organizers of Sinn Fein. He did not show himself very sympathetic or hopeful in regard to the various suggestions of Mr. Lloyd George for settling the Irish question. In July 1918, as Mr. Redmond's successor in the leadership of his party, he brought forward a motion that the Irish policy of the Government was inconsistent with the principles for which the Allies were carrying on the war, advised calling in President Wilson to settle the question, and bitterly denounced what he called the outrageous coercive system in force in Ireland. But the violence of his language did not save him from the vengeance of Sinn Fein who now dominated that country; he, along with almost the whole of the Constitutional Nationalist party, lost his seat at the general election of Dec. 1918.

DINANT, Belgium (see 8.274).—The town was almost completely destroyed at the beginning of the World War by German forces invading Belgium, who here endeavoured to force the passage of the Meuse, the left bank of which was held by the French. On Aug. 23 1914, the Germans rushed the town, and, on the pretext that the civil population had fired on them, they set fire to the town and shot hundreds of the inhabitants en masse. In all 665 persons, or about one-tenth of the total pop., were killed, among them being 71 women and 109 infants, many of the latter only a few weeks old. Of 1,653 houses only about 600 remained. A minute inquiry into the charge, held subsequently, completely established the innocence of the inhabitants. The rebuilding of the town was being actively pursued in 1921.

DINES, WILLIAM HENRY (1855—), English meteorologist, was born in 1855, the son of G. Dines, also a meteorologist. He was educated at Woodcote House school, Windlesham, and afterwards entered Corpus Christi College, Cambridge, where he obtained a first-class in the mathematical tripos in 1881. He has been a leader and, out some investigations for the Royal Meteorological Society on the subject of wind forces, and in connexion with this work designed the Dines pressure-tube anemometer. In 1901 he commenced researches into the problems of the upper air, and designed or perfected several instruments for use with kites, as well as a form of the Hargreaves box-kite, which proved of great value. In 1905 he was appointed by the Meteorological Office director of experiments in connexion with the investigation
of the upper air, and in 1907 designed a meteorograph for use with balloons. He also produced, in conjunction with Dr. Napier Shaw, the microbarograph and a recording mercury barometer, as well as various other instruments. From 1901 to 1902 he was president of the Royal Meteorological Society and in 1903 was elected a fellow of the Royal Society. He was a member of the International Commission for Scientific Aeronautics, and became an hon. or corresponding member of various foreign scientific societies. He is the author of many important papers on the phenomena of the upper atmosphere which appear in the Transactions of the Royal Society, the Geophysical Memoirs of the Meteorological Office and elsewhere.

**DIPLOMACY** (see 8.294).—The general effect of the World War on the principles and practice of diplomacy, defined as the science and art of conducting negotiations between sovereign states, has been very great, for better or for worse; but in general it may be said that the war did not give the initial impulse to, but merely greatly strengthened, forces which had been long at work modifying the traditions of diplomacy and adapting it to new social and political conditions.

Long before the war the gradual development of a sense of the community of interests among civilized nations, and of the public law which was the outcome of this sense, had raised diplomacy to a far higher plane than that which it had occupied in the 18th century. Before the war, too, the progress of democracy had produced great changes in diplomatic practice. Delicate negotiations were, indeed, still conducted in secret, as they always must be; but publicity had already become a recognized diplomatic weapon to be used on occasion, and ambassadors, though still accredited to courts and governments, were sometimes—notably in the case of the United States and Great Britain—solicited for qualities likely to appeal to peoples. Already, too, democratic sentiment was demanding open diplomacy, with popular control, while a host of publicists had long been busy devising schemes for an international order which, were it possible to realize it, would revolutionize diplomacy by establishing among the nations—to use President Wilson's language—"not a balance of power, but a community of power; not organized rivalries, but an organized common peace."

**General Effects of the War on Diplomatic Practice.**—These tendencies received a fresh impetus from the outbreak of the war. This disaster was widely ascribed to the machinations of diplomats, who denounced the war as a class, as in league with capitalists and munition manufacturers to stir up war, as fraudulent trustees of the nation's welfare, who, in their pitiful game of international chicanery habitually used language "false-friendly, circumlocutory, and non-commital, full of duplicity and secret reserves" (e.g. J. A. Hobson, Towards International Government, pp. 67, 69). The cure for this was to be swept away the diplomatic tradition altogether; to replace the trained diplomatic service by men directly representing popular opinion; and to secure effective "democratic control" by giving the deciding voice in all international questions to legislative bodies. These remedies for an assumed evil had the support of many sociologists and of many democratic politicians, especially in countries where parliamentary action on treaties was already required. Extend the system of democratic control, they argued, and crown the international edifice with a legislative assembly representing collective humanity, and peace will be forever assured, since the "peoples" never want war. This solution of the international problem, which ignored the fundamental difficulties, seemed to receive support in the highest quarters when President Wilson put forward his "program of the world's peace." The very first of the Fourteen Points condemned "secret diplomacy." In future there were to be "open covenants openly arrived at, after which there shall be no private international understandings of any kind, but diplomacy shall proceed always frankly and in the public view." A "general association of the nations" was to be formed, in place of the partial alliances of former times (Point XIV), and peace was to be made secure "by the organized major force of mankind."

The incorporation of the Covenant of the League of Nations in the Peace Treaty was an effort to realize the President's ideal. From the point of view of the present article its main interest lies in the fact that it set up permanent machinery for that "diplomacy by conference" to which the work of settlement after the war gave a powerful development. For the rest, it cannot be said that the history of diplomacy from the time of the Armistice onward revealed any striking change in the old methods. Indeed, in so far as the traditional methods were confessedly discredited, the change was sometimes for the worse. The sounding phrases which had heralded the Peace Conference had only—as President Wilson himself confessed—raised in the hearts of millions of people hopes which could not be realized; and the enforced departure of the victorious powers from the promises and professions which they had made in their time of trouble did not inspire admiration for the new diplomatic morality. Nor was the assertion of this morality in the Great Treaty a happy one. The preambles of treaties of peace in earlier times had perhaps been tinged with hypocrisy, since it was customary to describe the peace to be concluded as "Christian, universal and perpetual"—which nobody believed to be the truth. But even this pretense had its use, since it at least placed on record an ideal. In addition to this, however, it was usual to state that there was to be "complete oblivion of the past," a treaty of peace being conceived as a settlement of all outstanding differences and as clearing the ground for an entirely fresh start in the relations of the contracting parties (Satow, ii., p. 180). Whatever may be said of the guilt of the German nation in respect of the origin and conduct of the war, as justifying a departure from this tradition, the fact that in the Treaty of Versailles it was departed from is momentous. For the first time a treaty of peace was made to contain confession of guilt on the part of the vanquished party, a confession permanently humiliating to a whole people. The old diplomacy, which was wholly practical, would not have made the mistake of introducing into what was intended as the foundation of the permanent order of the world a full charge of political dynamite of this description. The Allied statesmen of a hundred years ago did not thus humiliate France, even after the fresh outburst of the Hundred Days, though they were equally persuaded of her guilt and public opinion clamored for her humiliation and dismemberment. But we were trained diplomats, able to look into a future in which France could no longer, if she wished to come again into a useful member of the European body politic. They cared not a rap for public opinion.

In general it may be said that the Peace Treaty of 1919 was the work of politicians, not of diplomats; and this fact marks a significant change in the practice of diplomacy. Before the war the conduct of international affairs was, in Europe at least, in the hands of the trained diplomatic body working in connexion with the various Foreign Offices; and this international business was conducted according to an elaborate code of rules, established by custom or by convention, which had been devised as the result of long experience, to ensure its smooth working. At the Conference of Paris diplomats were present, but they played but a secondary part. This was perhaps inevitable in view of the passionate interest of the peoples in certain aspects of the settlement, which forced those responsible for it to combine the functions of diplomatist and demagogue. But it had an unfortunate repercussion on the professional diplomatic service, of which it lowered the prestige.

This was especially the case, perhaps, in Great Britain. Even before the war there had been a tendency to pass over the "diplomatic" for the "diplomat." Great prestige was given to important embassies, which were occasionally, though as yet exceptionally, given to eminent party politicians. It is the system which has always prevailed in the United States, sometimes with excellent results—as in the notable succession of ambassadors to the Court at The Hague.
of St. James's—but more often perhaps with results less satisfactory. Whatever may be said for this system, however, there can be no doubt that its considerable extension by the British Government since the war has dealt a severe blow at the diplomatic service; for how can men be expected to serve a long and arduous apprenticeship to a profession when they realize that its great prizes are given to outsiders who have served no apprenticeship at all?

Less obviously harmful was the outcome of the attacks from democratic quarters on the system of recruiting the diplomatic service in England. The object of this system, which demanded of candidates for examination nomination by the Foreign Secretary on the recommendation of persons of position and proof of the possession of an income of £100 a year, was to ensure the maintaining of the service by gentlemen, that is to say by those who had "at least had the opportunity of mixing in society where good manners are to be expected." In this system certain modifications were made as the result of a report issued in 1914 by the Royal Commission on the Civil Service. One of its recommendations was that the diplomatic establishment of the Foreign Office and the diplomatic corps abroad should be amalgamated, up to and including the grades of assistant secretary of state and minister of the lowest grade. This involved the abolition of the property qualification, which did not apply to the Foreign Office, and it was recommended that, in place of this, members of the service employed abroad should receive a suitable foreign allowance. After the publication of the findings of the Commission the recommendation of the Foreign Secretary was made dependent on the report of a board of selection composed of members of the Foreign Office and of the diplomatic service. In this there was nothing revolutionary; and the effect of the putting in force of these recommendations has been to widen the area of selection for the service. The danger lies in the denunciation as undemocratic of any principle of selection other than by the strict test of written examination. But the qualities required for a diplomatist, as Sir Ernest Satow rightly points out, cannot be ascertained by means of a written examination, which only affords evidence of knowledge already acquired, but does not reveal the essential ingredients of character (p. 183). The character required for an efficient diplomatist will always be that implied in the best sense of the word "gentleman," meaning a man honourable, well educated, of good address and manners, and able to hold his own without self-consciousness in any company.

The whole body of rules and conventions for the regularizing of international intercourse, which is known as International Law, is the work of diplomacy, and it is the work of diplomatists to apply them. It follows that to be efficient they must be trained in them, and it is folly to suggest that the place of the trained diplomatist can be taken by a popular representative without experience or technical equipment. As Mr. Denys P. Myers has pointed out, by far the greater mass of diplomatic work consists in giving particular application to rules already universally admitted, a matter straightforward enough, but demanding technical knowledge. The remaining portion of the work is disproportionately difficult, since it consists in adjusting disputes about matters to which the application of existing rules is doubtful, or to which they admittedly do not apply, or in giving the advice, or explaining the rules as questions of high policy. In such debates the diplomatist is necessarily an advocate; his object is not justice, but the advantage of the country he represents; and therefore "the art of which Socrates spoke, of making the worse cause appear the better, is inherent in every negotiation" (Myers, p. 298). Certainly the attempt of President Wilson to set up a standard of Right as the "acid test" of all claims between nations has altered nothing in this, and can alter nothing so long as nations differ in their conceptions of what Right is. Diplomacy must continue to be, in this aspect of its activities, the frank advocacy of particular interests, even though the dispute be heard before the high court of the League of Nations. But this advocacy has been subject to certain rules, and in the interests of peace—which it has in course of time elaborated a highly technical phrasology of which the object has been to convey a plain meaning without being unapprovingly offensive. This method may be "circumlocutory" but it is more calculated to keep the peace than democratic "plain-speaking." A peccant Government informed that such and such an act will be considered "unfriendly" will perfectly understand the threat conveyed, and it will be easier for it to yield than if the threat had been uttered in more unequivocal fashion. In short, the conventional forms used in diplomatic intercourse have a very practical use. In the words of the late Mr. E. C. Grenville-Murray, "they regulate the precise words of respect and courtesy necessary to be used on every occasion: they deprive argument of its heat and expostulation of its acuteness."

Secret Diplomacy and Democratic Control.—In spite of President Wilson's denunciation of secret diplomacy, the negotiations before and after the Conference of Paris followed almost exactly the old practice. The organization of the conference itself was modelled closely on that of the Congress of Vienna in 1814. As at Vienna, all business of first-class importance was settled by the representatives of the Great Powers in secret conference, and the plenary sessions, to which alone the Press was admitted, were almost admittably mere full-dress parades intended to produce an illusion of publicity. By a curious irony it was indeed President Wilson himself who was most violently attacked for neglecting the "public relations of peace," and for the purpose of particular negotiations, the accredited agents of the United States—whose appointment was also subject to the advice and consent of the Senate—by personal agents of his own (Corwin, p. 64). The victory of the Senate over the President in the matter of the Treaty of Versailles was widely assumed to have settled in favour of the Senate's view about the long controversy—it had raged intermittently since the days of Washington—about the powers of the President and the Senate respectively over the conduct of foreign affairs. President Harding, however, was hardly in office before he asserted as vigorously as any of his predecessors the sole right of the President to conduct negotiations. The right of the Senate to ask for papers has long been admitted, but the right of the President to refuse, in the public interest, to submit them seems equally clear (Corwin, p. 84 seq.).

The outcome of this controversy illustrates the fact that the war and the negotiations which followed have left the questions of secret diplomacy and of democratic control very much as they were before. So far as democratic control is concerned, wherever parliaments exist, foreign relations come under their review, and can be controlled by their power of the purse; and it is their own fault if this control is not effective. "The ultimate misfortune of war," says Mr. Myers, "depends everywhere upon legislative financial support." But while control of broad policies is thus assured, there is no control of the processes of negotiation. It is, indeed, hard to see how such control could be attempted without creating a hundred difficulties and dangers for one which it would obviate. The point was admirably stated by Mr. Arthur Balfour in the House of Commons on March 19 1918, on a motion for a Standing Committee of Foreign Affairs:

1 "I think the British world perfectly understands the broad ends for which British diplomacy works. What is not plain, what is not easy, is the actual day-to-day carrying out of the negotiations by which these ends are to be attained. A Foreign Office and a diplomatic service are great instruments for preventing,
as far as can be prevented, friction between states which are, or which ought to be, friendly. How is the task of peacekeepers—cause that is largely the task which falls to diplomats and the Foreign Office which controls diplomats—to be pursued if you are to shout your grievances from the house-top whenever they occur? The only result is that you emit public feeling, that the differences between the two states suddenly attain a magnitude they ought never to be allowed to approach, that the newspapers of the two countries, itself, to Chatillon a year or two back, where they had no interest, which might end, have ended sometimes, in international catastrophes."

Mirabeau had said much the same thing in the French National Assembly in 1790, and subsequent history bore out its wisdom. It was not the diplomats but the oratorical heat of the Legislative Assembly that plunged Europe into the wars of the Revolution. It was not public opinion, but the wisdom of the diplomats on either side, which saved Great Britain and the United States from a renewal of war during the critical years that succeeded the Peace of Ghent in 1814. Had Castlereagh listened to the outcry of the British press and Parliament, had James Monroe and John Quincy Adams listened to the outcry of the American press and Congress, there would have been no hundred years of peace between the two countries. Instances might be multiplied. The world remembers the wars which diplomacy has failed to avert; it has forgotten, or has never heard of those—and they are many more—which diplomacy has averted by a conspiracy of silence.

Diplomacy by Conference. —The most striking development of diplomatic practice since the beginning of the World War has been the increasing practice of direct negotiations in conference between the heads of governments, or between the principal ministers of departments concerned in the subject under discussion. The practice is, of course, not new. The similar circumstances of the great war against Napoleon had produced similar results in the long series of conferences from that of Châtillon early in 1814 to the Congress of Verona in 1822; and Castlereagh had at the outset commended the convenience of the system, saying that it had the advantage of saving the time that would have been occupied in arranging the whole machinery of war in a way efficient and almost the simplicity of a single State. The practice arose in both cases from the necessity of reaching swift decisions. It is clear, indeed, that the problems to be solved by the Allies during the war were too varied, too technical, and generally too urgent to be dealt with solely through the ordinary diplomatic channels. The practice of direct negotiation between the heads of governments was an obvious counsel of expediency, and began early in 1915 with the visit of M. Millerand to London. In Feb. of the same year there was a meeting of Finance Ministers in London; but the first meeting of the heads of the Allied Governments was that at Calais on July 6. On October 14, a conference in Paris, it was decided in principle to establish a permanent machinery for co-ordinating the efforts of the Allies; and on Jan. 19, 1916, at a meeting of Mr. Asquith and M. Briand in London, rules for the establishment of an Allied Committee were approved by them. This plan was first applied at the great conference opened at Paris on March 26, at which the prime ministers of France, Italy, Belgium and Serbia were present, together with representatives of Japan, Russia and Portugal. It is unnecessary to give here a list of the further conferences that followed. The significant thing is—to quote Sir Maurice Hankey—that "in the forcing-house of war the governmental machinery of a veritable League of Nations had grown up, whereby the will of the Allied peoples to win could be put into effect" (p. 15). The system of diplomacy by conference thus revived reached its fullest development, of course, in the great Peace Conference at Paris; and in the League of Nations an attempt was made to give it a permanent organization.

In addition to the advantage of rapidity of decision arising from this system, the claim has been made for it that the statesmen ultimately responsible for the policy of their respective countries become personally well acquainted, and that the intimacy and even friendship which tend to develop out of these meetings make possible an interchange of confidences which would otherwise be impossible. This is, of course, perfectly true. It is also true that, in view of the closer interdependence of the nations and the vast complexity of their economic relations alone, the old system of diplomacy is no longer sufficient and that "diplomacy by conference has come to stay" (ibid., p. 23). If this means that the conferences of experts on this or that matter of international interest are to continue, then nothing is to be said against it. If it means that periodical meetings of heads of governments are to be erected into a permanent system, the case is far more doubtful. It may be doubted whether the cause of peace will permanently gain by taking the conduct of all serious international negotiations out of the hands of trained diplomats and putting them into those of politicians unversed in diplomatic technique and sensitive to every shifting current of public opinion. Certainly the unrestful world left by the Peace Conference gives evidence enough of the disastrous results of the sounding-plates which heads of governments have been made to put much effect on public platforms. Nor is a rapid decision on matters of controversy by any means always a good thing. The world has often been saved from war by the diplomatic dragging out of negotiations until public excitement on either side has subsided. Finally, there is the objection to too frequent conferences urged by the British Government at the time of the Congress of Aix-la-Chapelle in 1818, which has not lost its validity. They tend, as Lord Bathurst put it, to "keep the mind of Europe afloat," by suggesting to discontented peoples that no settlement is final and that, the machinery for change being in operation, it will lead in the end to something better, and that all agitation will suffice to set it in motion. It may be that the conference system will—as the creators of the League of Nations maintain—provide a safety-valve for the expansive forces of nationalism; but there is a danger that it may operate in another way, by not allowing these forces to cool. The introduction of an organized legislative element into international relations is thus somewhat of an experiment, and no one can say confidently how it will work out. In any case, however, there will still be room for the old diplomacy in its quasi-legal function of applying the laws of the Powers to their relations, and in its trained ability to adjust differences lying beyond it.

Functions and Rights of Diplomatic Agents. —The new and far more complicated conditions under which the World War was fought naturally added fresh problems to those which the old writers on diplomacy had discussed, as to the activities proper to those representing the interests of their Prince at a foreign court. Such questions were raised during the war more especially by the activities of the diplomatic agents of the belligerent states accredited to neutral governments. The duty of these agents being to forward the interests of their own states, what limits are there, if any, to the powers, a long or short, that such a diplomat takes? In effect, the answer to this question was found, not in establishing new principles, but in applying old principles to new conditions. The old definition of the ambassador as "an honourable spy" certainly applied during the war. In all neutral countries it was the duty of diplomatic agents to collect information useful to their governments, and to act as centres for an active propaganda of their views and aims. In certain cases, e.g., Switzerland and Holland, neutral countries were made the bases of propaganda and espionage in enemy countries, and these activities were carried on more or less under the supervision of the ministers accredited to the neutral countries. So long as this propaganda did not pass certain bounds there was nothing in this that did violence to the traditional principles of diplomacy, though propaganda had never before been organized on so vast a scale. Nor was the organization of a spy system, centred in neutral countries, a violation of diplomatic propriety, since in this respect all the belligerent nations exercised equal rights.

It was otherwise when diplomatic privileges and immunities were used to cover indirect attacks on the enemy through neutral interests. The most outstanding instances of this arose from the efforts of the Central Powers to interrupt the supply of arms and ammunition to the Allies from the United States. In Sept. 1915 the interception of a letter from Dr. Dumba, Austro-Hungarian ambassador in Washington, to Count Burian proved that the Austrian embassy, with the approval of the German, was con-
tempting financing strike movements on a large scale in the United States in order to hamper the manufacture of munitions. At the instance of the United States Government Dr. Dumba was recalled. Count Bernstorff had previously been forced to apologize for his want of diplomatic courtesy in publishing, without first submitting it to the American Government, a denunciation of the un-neutral conduct of that Government in permitting the export of munitions of war to the Allies. Even more serious, hoisted the plots were hatched by imperiling its neutrality. Captain Boy-Ed and Captain von Papen, the naval and military attaches to the German embassy, had been active in a plot to destroy American munition factories and American ships carrying munitions. Their subordinates, who were not covered by diplomatic immunity, were imprisoned; the two attaches were recalled at the instance of the United States Government. The same fate befell Count Luxburg, German minister in Buenos Aires, the author of the famous advice that ships carrying food from the Argentine to the Allies should be "spurios versenkt" (sunk without leaving a trace). These notorious cases, characteristic of many others, involved no new statement of principle, for they were clearly condemned by the traditional standards of diplomacy. "The ambassador," Callières had written in the 18th century, "may suborn the Prince's subjects for the purpose of obtaining information, but not for the purpose of plotting against their master." Equally clear was the principle condemning the practice of the German diplomatists, especially in the United States, of plotting attacks on enemy states (e.g., Canada, Ireland) under cover of their immigrations. This was an abuse of diplomatic privilege, since it injured the state in which the plots were hatched by imperilling its neutrality.

In the Diplomatic Practice of Lord (later Viscount) Punchard (1915) may be found a list of cases in which the diplomatic service from 1894 to 1903, puts the case for "democratic control"; an appendix contains the findings of the Royal Commission.

Disarmament Conference: see Washington conference.

Divorce (see 8.334).-(1) United Kingdom.-In the law of divorce administered in England and Wales there was no change between the last report except in the procedure by poor persons, and in Scotland and Ireland there was no change at all. But in England since 1910 the subject has become one of acute controversy, and there has also been a remarkable increase in the number of divorces granted. The report of the Royal Commission appointed in 1909 was not published till 1912. The appointment of the Commission, and the Majority Report advocating increased facilities for divorce, were both backed by an influential body of prominent persons outside the Commission itself. The inquiry was dominated throughout by the late Lord Gorell (formerly Sir Gorell Barnes) who had previously practised in and presided over the Divorce Court, and who held very strong views in favour of the extension both of the reasons and facilities for divorce in all classes of society. But the recommendations of the Majority Report have been strenuously opposed, especially in the Church of England, which has been practically unanimous in condemning the present system of divorce and opposing its extension.

Most of the recommendations of the Commission were, however, embodied in a bill which passed the House of Lords in 1920, but which was not adopted in the House of Commons. A new bill was introduced in the House of Lords in 1923 to proceed with the recommend-ation of the chairman of the Commission mentioned above. The bill is based on the recommendations in which all the members of the Commission were in accord. The Lord Chancellor has also presented a report embodying the reform of procedure so as to give easier divorce to the poorer classes.

The Commission took evidence from lawyers and officials to a much greater extent than from any other class, and much of the Majority Report was highly technical and official. The point of view of the ordinary man and woman is better represented by the Minority Report, published in 1912 in the same Blue Book (Cld. 6478). Women were represented on the Commission by Lady Frances Balfour and Mrs. H. J. Tennant—the latter of whom added a valuable separate memorandum to the Majority Report. The Minority Report agrees to certain changes in procedure intended to bring divorce within the means of labour and the poor middle-class, but strongly warns the public on the experience of France and the results of the 1907 act.
liable as co-respondents. There are improved provisions as to the custody and maintenance of the children and for preventing the partition of their patrimony during the proceedings.

A British subject domiciled in England or Wales but resident in any other British possession who has obtained a divorce there may apply to the High Court in England to register the decree as a decree nisi. The presence of the husband has not been required and where he has been declared null and void by the Court of the husband's domicile, the High Court may pronounce the marriage null notwithstanding that the marriage was valid according to the law of the place where it was celebrated. This has been very hard cases of French and other laws. In France the want of the parents' consent makes an otherwise valid marriage which has taken place in England void, so that the English subject so married remains married in England though lawfully married in France. The present refusal to comply with a decree for restitution of conjugal rights is "desertion" it is proposed to abolish, but on the other hand refusal of marital intercourse without reasonable cause is to be deemed desertion, and if one party has in good faith requested the other to return to cohabitation the refusal so to do within "a reasonable time" is to be deemed desertion. Neither desertion nor cruelty without adultery was to be a good ground for divorce (see below). This bill further proposes to regulate separation and maintenance orders by Courts of Summary Jurisdiction to be granted for cruelty, habitual drunkenness, or venereal disease. The bill provides for the first four years only unless converted into a decree for judicial separation in the High Court. The applicant who obtains one of these summary orders is to have police protection against the defendant, and maintenance is to be collected by a court official. An important provision of the bill is to make it contemptible to publish any report or pictorial representation of the matrimonial proceedings until the conclusion of the case, and to exclude the public but not the reporters in the discretion of the judge.

This bill was almost uncontroversial as originally introduced but the advocates of divorce insisted on desertion being made a sole ground, and the bill (May 1921) was so printed in the House of Commons. This produced a reaction and the increase of divorce cases in 1920-1 accentuated the differences of opinion.

The reasons for the recommendations of the Commission on other points also demand more notice. The most serious problem raised is the question of allowing adultery by the husband to be the sole ground for divorce. This was treated by the majority very superficially as a question of the equality of the two sexes before the law; but in reality it is a much more serious problem. The idea of divorce by mutual consent is rejected by the majority, not so much on principle as on the ground that there is no demand for it. But divorce by mutual consent is already de facto in existence, and if the husband's adultery is made a sole cause it will be greatly extended. This is a point on which, among those well acquainted with the facts, there is no great difference of opinion (see Minority Report p. 150: evidence Mr. Justice Bargrave Deane, p. 848). It has been recognized law in England for a generation past that refusal by the husband to obey a decree to return to his wife, coupled with proof of adultery, entitles the wife to an immediate divorce. It has therefore become the common practice, where both parties desire a divorce, for the husband to leave the wife, who writes him a letter asking him to return. He refuses. She brings her suit. An order is made on the husband to return in 14 days, which he disobeys. He lets the wife know where proof of adultery can be found and a divorce is the result. This is not "collusion" in law, but it is what the public mean by collusion, and the number of these cases was even in 1918 nearly as great as the average number of divorces in 1857 and has been increasing. If there were any desire to decrease the number of divorces this should be stopped. But the 1921 bill on the contrary proposes following the Majority Report that the husband's adultery alone should be a sufficient ground for divorce. No wife will ever commit adultery in order to get a divorce; because her adultery, if acknowledged, makes her a social outcast; but there is no such ostracism of the husband. At present the husband is deterred from seeking a divorce if he is obliged to admit cruelty. Desertion for three years, as proposed in both the bills, is not quick enough to be any temptation to collusion. But there could be no doubt that if the husband's adultery alone is made a sufficient ground it would greatly increase the number of divorces.
DIVORCE

years of which, however, nearly half were refused. The total number of husbands' petitions in 1817 were 1,067 against 638 by wives. There were 1,783 petitions allowed, 1,705 in 1917 and 1,788 out of 2,688 in 1918.

Scotland.—In Scotland, after the Reformation, adultery was introduced as an element is, which is in four scriptural grounds, and as a consequence of the abolition of the pope's jurisdiction in Scotland. Prior to the Reformation, marriage had been looked upon in Scotland, as in other Roman Catholic countries. A Parliamentary Act, the Reformation Act, is said to have been regarded from the point of view of a contract, of a peculiar solemnity and far-reaching nature, but which might be dissolved consistently with public morality, and divorce for adultery considered as an open transaction. Where a wife petitioned for divorce in the year 1575 on the ground for divorce, four years being then fixed as the period for which the desertion must subsist, and that period has been maintained until the present day. From the evidence of Lord Salvesen (vol. I, p. 254) it appears that in 1908 110 degrees for divorce were granted for adultery, of which 59 were at the instance of the husband and 51 at the instance of the wife; and that, in the same year, 81 degrees for divorce were granted for desertion, of which 26 were at the instance of the husband and 61 at the instance of the wife; and the statistics show that the number of divorce cases has, relatively to the population, continued to increase.

It is a law in Scotland since 1600 that the guilty spouse cannot marry the paramour during the lifetime of the other spouse, but in practice this has been generally evaded by not putting the name of the paramour on the divorce list, of which proportion of the divorced husband's property allowed to the wife, and children of the law by Scotland is believed to have a considerable effect in reducing the number of divorces.

In the State of Utah, although the majority of the population are Roman Catholics, and where, apparently, conditions of life differ materially from those in England, divorce a vinculo of parties there domiciled is only obtainable (as in England before 1869). Private Act, 1860, after a divorce a mensa et thoro has been granted by the King's Bench Division of the Irish High Court (which now exercises the powers of the old Ecclesiastical Court of the Isle of Man). Since the passing of the Divorce and Matrimonial Causes Act, 1882, there have been 35 Private Divorce Acts (Mr. Roberts, 42,624).

Isle of Man.—Divorce a vinculo can only be granted by Act of Tynwald, founded on a decree of judicial separation granted by the Chancery Division of the High Court of Justice in the Isle of Man, at which, by the Ecclesiastical Civil Jurisdiction Act, 1884, has jurisdiction in matrimonial matters, and follows the principles upon which the marriage is dissolved, including the domicile of the petitioner; or, on the ground that the husband has been in the last five years frequently or habitually employed, has had sentences for three years in the aggregate, and has habitually left his wife without support.

New Zealand.—By the Divorce and Matrimonial Act 1908, 50, and 1920, No. 70, either husband or wife can obtain a divorce for adultery or wilful desertion for three years. If the wife is living separated and the husband leaves her without reasonable maintenance for three years, he is deemed to have wilfully deserted her (Act of 1913). If either husband or wife fails to comply with a decree for restitution of conjugal rights the other can obtain a divorce forthwith, and the Court may in its discretion dissolve any marriage on the petition of either the husband or wife, where the parties have been, or separate for three years under decree of judicial separation or magistrate's order or deed or merely by mutual consent (Act of 1920). When a husband has deserted his wife, or is absent from her or the wife, if a natural born British subject, can divorce him if he has left New Zealand for more than 12 months (Act of 1910). Habitual drunkenness for four years coupled with cruelty or by leaving the wife without means of support, or, in the case of the husband, by desertion for four years, is also a ground for divorce. Other grounds are conviction and sentence of seven years or upwards for attempting to take the life of the petitioner or any child of the petitioner or respondent or their husband or wife, or conviction of a child under sentence of lunacy for a term of seven years or upwards, or of a lunatic confined in New Zealand for an aggregate period of seven years within 10 years of the filing of the petition.

Queensland.—By the statutes of the Queensland, Matrimonial Causes Jurisdiction Act of 1864 (28 Vict. c. 29) and Matrimonial Causes Act of 1877 (59 Vict. c. 13), the provisions of the imperial statutes (20 and 21 Vict. c. 85, 21 and 22 Vict. c. 93, 21 and 22 Vict. c. 108, and 22 and 23 Vict. c. 61) are made applicable by statute in Tasmania, so that the law is substantially the same as in England.

South Australia.—In South Australia divorce is granted on the same grounds as in England, except that in the case of adultery the ground for desertion in a wife's suit one year's desertion is substituted for two years.

Tasmania.—The provisions of the imperial statutes (20 and 21 Vict. c. 85, 21 and 22 Vict. c. 108, and 22 and 23 Vict. c. 61) have been made applicable by statute in Tasmania, so that the law is substantially the same as in England.

Victoria.—In Victoria the petition may be presented and decree granted on the same grounds as in England, with the same effect; in addition to the above, on the petition of a petitioner domiciled for two years in Victoria, a decree may be granted on the ground of desertion for three years; on the ground that the respondent husband has been a habitual drunkard for three years, or on the ground that he left his wife without means of support, or has been guilty of cruelty; on the ground that the respondent wife has been a habitual drunkard for three years, and has neglected her domestic duties, or rendered herself incapable of discharging any domestic duties for three years, under committed sentence for a capital crime, or under sentence of penal servitude for seven years or upwards; on the ground

follows: in Prince Edward I. and New Brunswick, adultery, impotency, or consanguinity, and, in Nova Scotia, cruelty as well.
of a conviction within one year, previously for attempts to murder, to murder a spouse, or to attempt to murder, or to attempt to assault or to assault the respondent or her with intent to inflict grievous bodily harm, or on the ground that the respondent has repeatedly during that period assaulted and cruelly beaten the petitioner; or on the ground that the respondent husband has been, in the preceding five years, five or more times convicted of certain crimes; or, on the ground that the respondent has been sentenced in the aggregate to imprisonment for three years, and has habitually left his wife without means of support; or on the ground that the respondent husband has been guilty of the conjugal residence, or coupled with circumstances or conduct of aggravation or of repeated acts of adultery.

Western Australia.—Until 1912 the divorce laws of this state, which are modelled on the English laws, did not recognise the grounds, in all respects to the laws of England, but Act No. 7 of 1912 contains material alterations in the law.

The causes upon which the divorce may be granted, as enumerated in the Act are: (1) adultery; (2) malicious desertion for five years; the ground that the respondent (husband) has been a habitual drunkard for four years, and has either habitually left his wife without means of support or has been guilty of cruelty towards her; or, the husband, being the petitioner, that his wife for a like period has been a habitual drunkard, and has habitually neglected her domestic duties or rendered herself unfit to discharge them; on the ground of imprisonment for three years under committed sentence for a capital or sentence for seven years or upwards, or, the wife being the petitioner, that the husband has been in the last five years frequently convicted, has had sentences of three years in the aggregate, and has either habitually left his wife without means of support or has been guilty of cruelty towards her; further, on the ground that the respondent is a lunatic or a person of unsound mind, has been convicted of conviction for attempt to murder the petitioner or inflicting grievous bodily harm on him or her; further, on the ground that the respondent is a lunatic or a person of unsound mind, has been convicted of the preceding five years or other convictions, or in accordance with the provisions of the Lunacy Act of 1903 for a period or periods not less in the aggregate than five years within six years immediately preceding the suit and is unlikely to recover.

(III) European Countries

It should be kept in mind that in all countries the Roman Catholic Church absolutely forbids its adherents to apply to the civil courts for a divorce a vinculo, and in modern European states there is frequently a conflict between the law of the State and the law of the Church on this subject. In certain cases the Church permits the spouses to separate and will sometimes annul a marriage if properly approached.

Austria.—In Austria, among Protestants, divorce may be granted on the ground of adultery, namely, the adultery of the wife, condemnation for crime, immoral habits, infectious diseases, ill-treatment, threats or serious vexations, unconquerable avarice; and among the Jews by mutual consent, or on the adultery of the wife.

Belgium.—In Belgium, divorce is granted on the following grounds: (1) adultery, or desertion by the husband; (2) infidelity, or the husband, if he shall have kept his mistress in the common residence, violence endangering life (exces), cruelty (sévices), grave indignities (désordre) or other grave harm of one of the parties, leading to a separation involving loss of civil rights, mutual and unwavering consent of the parties expressed in manner prescribed by law.

Bulgaria.—By the law of the orthodox Greek Church, and therefore in the law of the state, divorce is granted only on the ground of the mutual consent of the parties, and is always obtained on the grounds of adultery, cruelty, threat or designs against the life of the other party to the marriage, absence of the husband for four years if his whereabouts are unknown, or, if his whereabouts are known, without sending his wife means of support; impotence; insanity; epilepsy; idiocy, or syphilis supervening after marriage and incurable; sentence to severe or degrading punishment for theft, fraud, embezzlement or homicide; unabated stagnation of charity of adultery made by one party to the marriage against the other; unnatural crime of the husband upon his wife; restraint on religious liberty; drunkenness, when accompanied by squandering property in a disorderly manner; sentence of death or of an otherwise disorderly or disolute manner of life; abandonment of the husband by the wife, driving him from his home without sufficient grounds followed by refusal for three years to live with him again.

Bulgarian divorce, which had already been introduced for the first time in 1792, but had been abolished at the Restoration in 1816, resumed its place in the Civil Code in 1834. The grounds upon which it is now permitted are adultery, violence endangering life (exces), cruelty (sévices), grave indignities (désordre); condemnation of either spouse to an afflictive punishment.

Germany.—By the German Civil Code of 1900 all the previous laws of the federal states have been abolished, and the absolute grounds upon which decrees for divorce are now granted throughout the German Reich are adultery, bigamy, crime against nature, attempt on the life of the other party to the marriage, malicious desertion for one year, insanity of three years' duration after the marriage, destroying intellectually two parties, and marrying another. The Court has the power to grant divorce on the ground of serious breach of conjugal duties, and dishonourable or immoral conduct, under which all vices and bad habits are included, unless the Court is satisfied that either of them is slight, or is a temporary indisposition.

Greece.—Divorce in Greece is regulated by the Roman and Byzantine laws, in accordance with the provisions contained in the collection of Harmonopoulos. The grounds for divorce are established in the Code of the civil marriage, in the important amendments and are, on the petition of the husband, adultery; that the wife attempted the life of her husband, or, being aware of plots against it, has not disclosed them to him; that the wife has, without the husband’s consent staying the night at another house, except the house of her parents; without her husband’s consent attending races, theatres or sports; against her husband’s wish attending dinners or bathing in the company of men; procuring abortion. On a wife’s petition, the grounds are, that the husband entertained schemes against the sovereign, or, being a spy, has not denounced them to the authorities; that the husband has attempted the life of his wife, or, being aware of plots against it, has not disclosed them to her, or undertaken to prosecute the authors of them; that he has endeavoured to procure her to commit suicide; that a wife has been guilty of adultery against her; adultery in the conjugal home; adultery in the same town, if persisted in; impotence of husband, existing before marriage and continuing at least for three years; the husband’s habitual immorality.

Prussia.—In Prussia, each religious denomination was governed by separate regulations, but in that year marriage and divorce in Hungary and Transylvania were regulated by the Civil Code for the whole of the empire. The absolute grounds upon which divorce is permitted by the State (see note above), without distinction of creeds, are adultery; unnatural crimes; bigamy; desertion; attempt on life or serious maltreatment endangering life; threatening or depraving existence; danger or risk of serious sickness or imprisonment for five years. The discretionary grounds are violation of marital obligations, other than above; inducing or attempting to induce a child of the family to a criminal act or immoral life; the refusal of the husband to. continuing an immoral life.

Italy.—No divorce is permitted.

The Netherlands.—Adultery and malicious desertion under Roman Dutch law, but, beyond that, in the last few years; grave injuries or ill-treatment endangering life; a lapse of five years after a judicial separation (by consent or otherwise) without reconciliation, are now grounds for divorce.

The Netherlands.—Adultery and malicious desertion under Roman Dutch law, but, beyond that, in the last few years; grave injuries or ill-treatment endangering life; a lapse of five years after a judicial separation (by consent or otherwise) without reconciliation, are now grounds for divorce.

The Norwegian Act of Aug. 29, 1909 has effected radical changes in the law. Either party to the marriage is now entitled to a divorce, where, at the time of marriage, the other spouse, without the knowledge of the former, has suffered from a physical defect or a mental disease, or from a contagious and venereal disease, or from venereal disease in an infectious form, or from insanity; or (the husband being petitioner) where the wife has been made pregnant by another man; or where the husband is guilty of certain crimes dealt with in the General Criminal Code, such as the contracting and transmitting, or exposing anyone to, an infectious sexual disease, which has been contracted from the petitioner, and cannot be explained by any cause other than adultery, or where the petitioner has committed bigamy, or is guilty of a crime involving bodily injury to the other spouse, or of any deliberate crime by which the other spouse suffers injury in body or health; or cruelty to children; or exposing them to conditions which might clearly be dangerous to their morals; sentence of death or of an otherwise disorderly or disolute manner of life; abandonment of the husband by the wife, driving him from his home without sufficient grounds followed by refusal for three years to live with him again.

Portugal.—Prior to 1910, there was no law of divorce in Portugal. But in 1909, the Law of April 20, 1909, passed its last stage before the Senate, and was approved by the President on May 5, 1909. See also Report of Divorce Commission, Appendix XXII, Report of Divorce Commission, pp. 152–3., the causes for divorce are: (1) adultery; (2) conviction of one of the five major crimes specified in Articles 55 to 60 of the Penal Code; (3) adultery; (4) a conviction of a crime for not less than three years; (5) absence for not less than four years, during which the absentee gives no tidings of himself or herself; (6) incurable lunacy, three years or more; (7) a miscarriage or a stillbirth of a child caused by the petitioner or his wife’s fault; (8) confinement to a penitent authority; (9) separation de facto by mutual consent for 10 years; (10) inveterate gambling habits; (11) incurable contagious disease or any disease which induces sexual aberration.
Further, by Article 34, the non-success of a suit for divorce instituted for causes 1, 2, 3, 4, 5, 9, a foresaid affords sufficient cause for the respondent in such previous actions petitioning for a divorce by mutual consent, subject to the provisions laid down in those sections.

**Romania.**—In accordance with the laws of the orthodox Greek Church, only a divorce by mutual consent, in which both parties appear to be guilty of adultery, is permitted. The law makes no provision for divorce by mutual consent, subject to the provisions laid down in those sections.

**Russia.**—In Russia, before the revolution, the ordinances of each church embodied in the General Code of Laws laid down the grounds for divorce to be be disposed of by the court.

For the members of the Russian Church, and for "the Old Believers," the grounds upon which decrees of divorce could be made were: adultery; impotence; desertion; illegitimacy at marriage; absence of the respondent for five years without news; sentence of a court, upon which one of the parties to a marriage was condemned to loss of civil rights involving deportation; the entrance of both parties into a religious order, in cases where there are no children needing parental care; the conversion of a non-Christian spouse to the Russian Church, provided such a party or the other party to the marriage desires the dissolution. Members of the Greek Church are subject to the same law.

The law of Poland, before the revolution of 1836, under which there were separate regulations for the members of the Roman Catholic, the Greek Orthodox, the Greek Unfried and Protestant Churches, for members of different religious communities, made it possible in some cases where the religions of the parties to the marriage are different.

**Spain.**—No divorce is permitted.

**Sweden.**—The grounds for judicial divorces are adultery, illicit intercourse with another party, after betrothal or the intercourse of the wife with a third party after betrothal; malicious desertion for one year, provided the absconder has left the kingdom; absence without news for six months, or one year by the party on the marriage on the life of the other; on the grounds that either party is suffering from bodily incapacity, or has concealed the fact of being affected with an incurable contagious disease; civil desertion for three years, or one year, etc.; on the grounds that which is pronounced incurable. Divorce may also be obtained by direct appeal to the king's royal prerogative, where one party has been condemned to death or civil death; or condemned for a gross notorious and permanent offense or the discovery of a wrongful marriage; or he party has been imprisoned for at least two years; on the ground of prodigality, drunkenness, or violent disposition, or incurable asexuality and hate, which has lasted after one year's separation a mensa et thoro.

**Switzerland.**—Prior to Jan. 1 1876, the different cantons of Switzerland had individual laws regulating divorce, but after that date the matter was regulated by a federal law throughout the country, and is now regulated by the Code Civil of Dec. 10 1907 which made but little change in the law then existing. The grounds laid down by that code are adultery; attempt by one party on the life of the other (suicide); desertion; the commission of an infamous crime by one party, or base conduct by one party rendering married life intolerable; malicious desertion for two years; insanity rendering married life unbearable, and which after three years' duration by pronouncing incurable; continuing married life unbearable.

(IV.) **United States**

Statistics concerning marriage and divorce are not compiled annually in the United States. The period 1867-1906 was thoroughly covered by two Federal reports, and in 1917 a government appropriation became available for continuing the investigation to the end of 1916. Because of the World War, however, it was decided to postpone the gathering of statistics for the whole decade and to make a special report for the year 1916 alone. This report was issued in 1919 by the Census Bureau. Figures for a single year may register abnormal fluctuations, but it is apparent that divorce was rapidly increasing from the following figures for the years 1867, 1906 and 1916—

<table>
<thead>
<tr>
<th>Year</th>
<th>Divorces</th>
<th>Marriages</th>
</tr>
</thead>
<tbody>
<tr>
<td>1867</td>
<td>1,040,778</td>
<td>852,290</td>
</tr>
<tr>
<td>1906</td>
<td>112,936</td>
<td>72,062</td>
</tr>
<tr>
<td>1916</td>
<td>43,015</td>
<td>24,931</td>
</tr>
</tbody>
</table>

From 1867 to 1906 the number of divorces granted totalled 1,274,341, each period of five years showing percentages increasing at the rate of about 10%. The number of divorces per 100,000 pop. in 1916 was 112 as compared with 84 in 1906. It is noteworthy, however, that four states—Colorado, Maine, South Dakota, West Virginia—and the District of Columbia reported fewer divorces in 1916 than in 1906. The following table indicates causes of divorces in 1916, excluding 3,334 cases for which statistics were not given—

<table>
<thead>
<tr>
<th>Cause</th>
<th>Divorces</th>
<th>Granted to Husband</th>
<th>Granted to Wife</th>

<td>2,445</td>
</tr>
</tbody>
</table>

It appears that 31.1% of the divorces were awarded in 1916 to the husband and 34.9% to the wife. For 1906 to 1910 the percentages were 32.1 and 67.5 respectively. It is probable that the wife more frequently has legal ground for divorce. Of the total number in 1916 desertion was the most frequent ground, and cruelty next, these two causes accounting for 65.1% of all. Of the 108,707 divorces noted in the table above, 69,036, or 63.5% were granted in the state where the marriage had taken place, as compared with 76.3% for the period 1887-1906. It is not possible to determine the extent to which wife does not acquire same state for the purpose of obtaining a divorce, as duration is constantly shifting, but many changes of residence are made for this purpose and the tendency appears to be growing. The obligation of uniform state divorce laws was discussed in 1914 at the conference of governors, but the conflicting views held in different sections of the country do not point to early action. There is a growing demand, especially on the part of church authorities, for an amendment to the Federal Constitution to empower Congress through legislation to regulate marriage and divorce.

**DIXMUDE,—Djemal Pasha (Ahmad Djemal) (1875—),** Turkish politician and soldier, was born at Baghdad about 1875. His father, a person of some distinction, gave him a careful French education, and placed him in the army, where his energy and activity speedily brought him to the rank of lieutenant-colonel. As such he went to Salonika, where he spent five years, and not only gained an intimate understanding of the Young Turk ideas, but became their most able supporter. In 1909, when Djemal went as governor to Adana in Cilicia, he was charged with the task of strengthening the Young Turk ideas and the elimination of contrary currents. It was in administrative matters that Djemal's talents were most conspicuous. In 1911
he was made governor of his native town, Bagdad, but a year later he was sent to the Balkan War in command of a division, and subsequently contrived to become Vail of Constantinople.

After silence more filling a military rôle for a short time as commander of the I. Corps at Constantinople, he handed over the command to the German general, Liman von Sanders, and devoted himself to politics. At that time Djemal, Talaat and Enver constituted a triumvirate which was the only effective Turkish Government, and already a certain antagonism, which had its roots in personal ambition, had sprung up between Djemal and Enver. Djemal obtained the Ministry of Public Works and immediately afterwards the Ministry of Marine. Djemal gave Adml. Limpas the English naval mission a free hand, as Enver did the German military mission. In the spring of 1914 Djemal attended the French fleet manoeuvres, and on Aug. 19,

1914, a few days after the outbreak of the War, he wished the home-going Frenchmen glory and victory. He was unwilling that Turkey should attach herself to Germany at once, even though the victory of the Central Powers might be certain. Enver, fearing Djemal’s influence in Constantinople, banished the Minister of Marine, at the end of 1914, to Syria, as commander-in-chief of the IV. Army. There his military achievements were insignificant, but he fought the plagues of locusts and the epidemics, exerted himself over the cultivation of the land, the draining of the marshes, the building of new and the improvement of old streets, even began the work of afforestation, and made efforts to raise the level of public education. In Oct. 1917 he was removed by order of Enver from the command of the IV. Army and made commander-in-chief of all the troops in Syria, Palestine and the Hejaz, with the exception of the army operating on the Sinai front. This edict led to disorder and friction. Djemal’s power was not lessened south of the Taurus, but he took no more interest in the conduct of the military operations. In Dec. 1917 he betook himself to Constantinople, and, greatly to the wrath of Enver, resumed his activities as Minister of Marine. However, he was given no more opportunities, either political or military. When, in the autumn of 1918, Turkey, and with her the Young Turk Government, was broken in pieces, Djemal Pasha was forced to flee, and he repaired to Germany where he wandered about under an assumed name. Later he obtained refuge in Switzerland, and subsequently he made his way to the East.

In 1921 he was reported to have found employment as military adviser to the Amir of Afghanistan.

DOBSON, HENRY AUSTIN (1840–1921), English poet and man of letters (see 8,352), died at Ealing Sept. 2 1921. His later work consisted of prose essays, notably At Prior Park (1912), Rosalba’s Journal (1913) and Later Essays (1921), all studies of the 18th century, and A Bookman’s Budget (1917).

Of the battle cruisers, of the most important naval engagements in the World War was fought near the Dogger Bank on Jan. 24 1915 between the British and German battle cruiser squadrons.

Movements of the British fleet had led the Germans to suspect some scheme for blocking their harbours was afoot, and Rear-Adml. Hipper was despatched at nightfall on Jan. 23 to reconnoitre off the Dogger Bank. His force consisted of the four battle cruisers of the First Scouting Group, the “Seydlitz” (flag), “Derfflinger,” “Moltke” and “Blücher,” four light cruisers of the Second Scouting Group, and 22 destroyers of the 5th Flotilla and the 11th and 18th Half Flotillas. Intelligence of the departure of the German fleet had been intercepted at the British Admiralty, and Vice-Adml. Sir David Beatty (later Earl) put to sea from the Forth at 6 p.m. on the evening of the 23rd. With him were the five battle cruisers of the 1st and 2nd Battle Cruiser Squadrons, the “Lion” (flag), “Tiger,” “Princess Royal,” “New Zealand” and “Indomitable,” and the four light cruisers of the 1st L.C.S. under Commodore W. E. Goodenough in the “Southampton.” His orders were to proceed to a rendezvous in 55° 13’ N 3° 12’ E, 150 m. from Heligoland, where he was to meet Rear-Adml. Sir John Jellicoe with the 1st, 3rd and 10th Flotillas, mustering three light cruisers and 30 destroyers. Behind him to the northward was the

Fleet. The 3rd Battle Squadron (seven King Edward VII. class) had left Rosyth two and a half hours after him and the commander-in-chief had put to sea from Scapa with the battle-fleet. In the hope of intercepting the enemy on his way back Commodore (S) had been ordered to proceed towards Borkum with the “Lurcher,” “Firedrake” and four submarines. In heavy guns the British force was decidedly superior. The British battle cruisers mounted 24 13-5-in. and 16 12-in. against the German 8 12-in., 20 11-in. and 16 8-2-in.

Beatty reached the rendezvous at 7 a.m. It was a winter morning with a calm sea and good visibility. His battle cruisers were in a single line ahead with Goodenough’s light cruisers a couple of miles on the port bow. Course was altered to S. by W. at 18 knots. Ten minutes later the “Arethusa” was sighted to the south-eastward about 7 m. on the port bow. The “Aurora” and “Unattached,” the two other Harwich light cruisers, were still some 15 m. to southward of her out of sight. Hardly had the “Arethusa” been identified by the “Lion” when flashes of gunfire were seen to the S.S.E. This was the “Aurora” engaging the “Kolberg” coming up from the S.E. on the port bow of Hipper’s squadron. The “Kolberg” was hit twice and withdrew at 7:25 a.m.

At the sound of the guns Admiral Beatty ordered his light cruisers to chase to the southward. The “Southampton” had hardly gone a couple of miles when the “Aurora” was seen on the starboard bow, and soon afterwards enemy battle cruisers were sighted on the port bow to the south-east. Dense clouds of smoke were pouring from their funnels and they were evidently getting up steam for full speed. It was now ten minutes to eight. Beatty’s unexpected appearance had come on Hipper as an unpleasant surprise, and he turned to the S.E. and made off at full speed with Beatty some 13 to 14 m. behind. Beatty’s position at 8:30 a.m. was about Lat. 54° 56’ N. Long. 3° 40’ E., and the two forces had settled down to the long rush to Heligoland 140 m. away (see fig. 1). When the chase commenced the British

battle cruisers were in single line ahead on a S.E. by S. course working up to full speed. The “Arethusa,” “Unattached” and “Aurora” now took station about 5 m. on the “Lion’s” port bow in a ragged line abreast 500 m. apart. Goodenough with his squadron was further off on the port bow steaming hard after the enemy. Hipper was 11 m. sharp on the “Lion’s” port bow on a S.S.E. course in full flight for Heligoland with his light cruisers and destroyers ahead of him sharp on his starboard bow. The action about to commence took the form of a long chase in which speed was the principal consideration. Here Beatty’s squadron had a considerable margin of superiority. It maintained an average speed of probably 26 knots; while Hipper’s may have done just over 23 till the “Blücher” fell out, and something over 24 afterwards. By 8:45 ft. the range of the “Blücher” had come down to 22,000 yd. at 5 m. minutes past nine the Vice-Admiral hoisted the signal to engage. At 9:11, some 17 minutes after the first shot, the “Lion” obtained her first hit on the “Blücher.” About ten minutes later, at 9:20 a.m., a movement of some sort was observed among the enemy destroyers, and in
expectation of an attack British destroyers were ordered to take station ahead, but none of them except the "M" class had the speed to do so and the remainder accordingly dropped back to clear the range. At 9:53 the "Lion" made the signal to engage corresponding ships in the enemy's line, not intending it to refer to the "Indomitable," which had dropped some way astern, but the "Tiger" took it to include the "Indomitable," and instead of firing at the "Derfflinger," the second ship, concentrated on the "Seydlitz," leaving the "Derfflinger" uninfured. At 10:02 4:30 a.m. the "Seydlitz" was hit by a salvo of 8-inch. The "Blücher" sent a 17-inch shell through her armour aft. Five minutes later a 13-5-in. shell crashed into the after turret of the "Seydlitz," wrecking a portion of the stern and igniting a charge in the working chamber under the turret. The flames roared up through the turret and passed through a connecting door into the adjoining one, setting the charges alight there and turning both turrets into furnaces where all the guns' crews perished. The "Blücher" was now having trouble with her engines, and at ten o'clock drew out of the line going heavily. The range increased for a time partly due to the "Lion" slowing down to 24 knots at 9:53 to allow the line to close up, partly to the enemy turning away for a time. The "Blücher" was on fire by this time and had dropped behind to a position 3 or 4 m., on the "Seydlitz's" port quarter. At 10:22 Adml. Beatty, to bring the rear of his line into action, ordered his battle cruisers to form on a line of bearing N.N.W. and to proceed at utmost speed. But repeated hits were telling on the "Lion," and at 10:45 she was dropping back. As it was clear that she could no longer maintain her place at the head of the line, Beatty at 10:47 made a signal "too close the enemy as rapidly as possible consistent with keeping all guns bearing," but the "Tiger" was the only one to receive it and then only the words "close the enemy." About 10:50 a.m. the "Lion" received a bad hit on the port side aft, which holed the feed tank and did serious damage in the engine room. This was the crisis of the action; at this moment the wash of a periscope was seen on the starboard bow (in a position Lat. 54° 9' N. 5° 15' E.), and Beatty immediately made a signal to alter course eight points to port. This was hauled down at 11:02 A.M. and the squadron turned to N.N.E. (see fig. 2).

But the "Lion" was no longer able to perform the duties of a flagship. Her wireless and her searchlights were out of action, she had fallen out of line and the rest of the squadron was drawing every moment farther and farther away to the northward. The "New Zealand" was some way behind, and Rear-Adml. Sir Archibald Moore, the second in command, whose flag was flying in her, had not grasped the intention or nature of the turn. It was urgently necessary to resume the chase. Beatty therefore ordered two signals to be made—compass B (course N.E.) and A.F. (attack the rear of the enemy). "Lion" was to "proceed to rear of the enemy. Repeat the signal the Admiral is now making." These all went up practically at the same time, and had they been understood in the sense in which they were made would have redeemed the situation. Unfortunately Rear-Adml. Moore only received the first two at 11:21 A.M. and then read them as meaning "attack the rear of the enemy bearing N.E." The "Blücher" was then bearing roughly N.E., and taking them as an order to attack the "Blücher" he steered towards her. Hipper altered for a few minutes to the S., bringing a heavy fire to bear on the "Tiger," which received seven hits at this time, then resumed his course E.S.E. and drew rapidly out of range. The "Lion" in a crippled state steamed slowly to the north-westward, while the remainder of the squadron some 6 or 7 m. off began to circle round the "Blücher," whose fate was now sealed. The destroyers "Meteor" and "Miranda" attacked her, but she was still in action and sent four shots into the "Meteor" wrecking her boiler room. At 11:58 A.M. the "Ariete" came up and fired two torpedoes into her. She ceased firing, listing heavily with fires raging fore and aft. Hipper was now some 15 m. off, only 70 m. from Heligoland, and Rear-Adml. Moore apparently did not think it worth while to continue the chase. It was not till 11:52 A.M. that he assumed active command and made his first signal to form single line ahead and steer west. Beatty meanwhile had transferred his flag to the destroyer "Attack" and was racing after his squadron. About half-past twelve he reached the "Princess Royal," hoisted his flag in her and was about to resume the chase. But pursuit was now hopeless, and the situation not too favourable. The "Lion" could not go 10 knots and the High Seas Fleet was supposed to be coming up. Accordingly at 12:45 P.M. the squadron turned back. Hipper meanwhile made for home and got in touch with the German battle-fleet about 2:30 P.M. The "Blücher" had been lost, the "Seydlitz" seriously damaged and the "Derfflinger" hit three or four times. When Beatty turned home Jellicoe was hastening down to him with the battle-fleet. They met at 4:30 P.M. and it remained only to get the "Lion" home. They tow in the "Indomitable" and screened by the 1st and 2nd Light Cruiser Squadrons and two flotillas she reached Rosyth safely the next morning.

The loss of the "Blücher" was quickly reflected in German naval policy. Adml. von Pohl took Adml. von Ingenohl's place as commander-in-chief of the High Seas Fleet with definite instructions to revert to a more cautious policy. On the British side the results were generally regarded as disappointing. It was believed that, had the pursuit been pressed, the "Seydlitz" and "Derfflinger" might have shared the "Blücher"'s fate, but it must not be forgotten that the range was still over 18,000 yd. and the enemy's speed not seriously diminished. The battle, however, had a very real result. It foiled the German initiative of the day, made Beatty chief, and put an end to raids on the English coast for over a year.

See also Filson Young, With the Battle Cruisers (1921).

The following is a list of the forces engaged—

**BRITISH**

**1st Battle Cruiser Squadron.**
"Lion" (flag), Vice-Adml. Sir David Beatty, Capt. Alfred Chatfield, 28 knots (designed).

Armament 8 15-in., 16 4-in. ("Tiger" 16 6-in.).

**2nd Battle Cruiser Squadron.**

DOGS (WAR).—That dogs could be usefully employed as auxiliaries in the prosecution of war, as was the case in the World War of 1914-8, is not a modern discovery. Both Greeks and Romans used them for offensive and defensive purposes and for maintaining communication on the field of battle. War-dogs are mentioned by Plutarch and Pliny, and Strabo describes how, in Gaul, dogs were armed with coats of mail. In the Middle Ages and in early modern history there are many stories, some of them no doubt legendary, of the participation of dogs in war. In the Crimean War, dogs were employed on sentry duty; in the American Civil War they were used both as sentries and guards. An ancient writer, Censorinus, noted that guard-dogs could discriminate Christians from Turks, and a modern authority has stated that dogs employed during the war of 1914-8 could even detect men of unfamiliar regiments. Instinctive fidelity and keen scenting power make the proper sort of dog peculiarly suitable for training as an auxiliary in war. Further, a dog very readily acquires a sense of danger; and it was noted, during the World War, that dogs, if unable to reach or uncertain of a particular destination, would make their way back to their kennels. They would never cross the zone to the enemy. The same instinct for hurring to the rear was, it may be added, observed in stray horses and mules.

Despite his acknowledged suitability, however, no modern systematic training of the dog for use in war began until the latter part of the last century. About that time the movement made considerable headway in Germany, mainly because of the energetic championship of the animal-painter, Jean Burgantz. In France, too, some progress was made and some official encouragement extended; but in England, apart from the private efforts of Lt.-Col. E. H. Richardson, no action was taken, and it was not until 1917 that a British war-dog training school was established at Shoeburyness.

In Germany there was, at first, a great difference of opinion on the question of the most suitable breed for training. Poodles were originally decided upon, because of their high degree of intelligence, but poodles suffer considerably when exposed to the heat of the sun and, though they have sharp scent, they are extremely short-sighted. The St. Bernard was then experimented with. The record of its ancestors at the Hospice was distinguished enough; but it seemed to have been forgotten that the Hospice dog, besides being short-haired, was also of lighter build than the modern St. Bernard. The pointer was next tried; but though it has unquestionably the necessary intelligence and physical strength, the hunting instinct is so deep-rooted in this breed as to be ineradicable except after years of labour. One principle the German authorities had insisted upon from the outset—that "a military dog cannot be produced from cross-breeds." The Scotch collie, pure-bred for centuries, was, therefore, some 20 or 30 years ago regarded with great favour in Germany as a potential war-dog. J. Burgantz, indeed, in his book on the subject of the war-dog, dated 1892, pays eloquent tribute to the collie's qualities. Later, however, the collies fell into disrepute; and during the World War the great bulk of the dogs employed were Airedale terriers, as well as Scotch and German collies. Of the 6,000 war-dogs in the field) were German shepherd-dogs. Indeed, according to the returns of the German Society for Ambulance Dogs (Oldenburg) of 1,678 dogs sent to the front up to the end of May 1915, 1,274 were German shepherd-dogs, 142 Airedale terriers, 230 Dobermanns and 15 Rottweilers. The figures remained in a like proportion throughout the war. The ambulance dogs were able to distinguish between the dead and the apparently dead; the former they left untouched, even passed with signs of disgust, the latter they succoured. The English and French armies found it impossible to employ ambulance dogs on the western front during the late war; but the German army seems to have employed them, especially during the Russian retreat on the eastern front, with conspicuous success. It is indeed officially recorded that thousands of German soldiers owed their lives to ambulance dogs. Messenger-dogs also continued an acknowledged part of the organization of the German army. An infantry company was able to look after 12 dogs, while a battalion might have six, the allotments being made by the Messenger Dog Section (Meldehundstafel) at the Army Headquarters. The breeds chiefly employed for message-carrying work were German sheep-dogs, Dobermanns, Airedale terriers, and Rottweilers. The Germans, unlike the British, employed the dogs on the double-journey. "liaison" principle—that is, with two keepers, and the dog travelling backwards and forwards between both. In the British army the messenger-dog was trained to make the return journey only to the one keeper. British war-dogs, which were placed under the signal section of the Royal Engineers, were employed principally in maintaining communication, though sentry-dogs did valuable work, especially in Salonika; but a British war-dog school was not established until 1917. Many types of dogs were used. Thus, of a total of 340 dogs sent to France from the school within a certain period, 74 were collies, 70 lurchers, 66 Airedales, 36 sheep-dogs, and 3 retrievers, the remainder being made up of 13 different breeds. A central kennel was established in France at Etaples. The training course at the school lasted about five or six weeks and the dogs and their keepers were then sent overseas. From Etaples the dogs were allotted to sections of the army, and each sectional section consisting of about 48 dogs and 16 men. From these kennels the dogs and their keepers in the proportion of one man to three dogs were sent up for duty in the trenches.

The war-dog training school of the French army was established at Satory about the same time as the English school was set up at Shoeburyness. Shepherd-dogs of various kinds, Airedale terriers and Scotch collies were mainly employed. Each French infantry battalion was allotted six dogs, the allotments being made from the Army Headquarters' kennels. The U.S. army did not use dogs.

In determining a particular dog's suitability for war training, his physical condition should first be considered. "Sturdy, thin is unsuitable for use in war. Castrated dogs, on the other hand, lack courage and temperament and are useless for work in the field. With regard to age it has been said that the dogs chosen for war training should not be less than one year and not more than four years old."

(C. E. W. B.; E. S. H.)

DOHERTY, CHARLES JOSEPH (1855- ), Canadian statesman, was born at Montreal, Quebec, May 11, 1855. He was called to the Quebec bar in 1877, and became a Q.C. in 1887. He was elected to the House of Commons for the St. Ann's Division of Montreal 1908, being re-elected Sept. 1911 and in the by-election consequent upon his taking office as Minister of Justice in Nov. 1911. He was professor of civil and international law in McGill University for several years before entering the Government. He became a member of the Unionist Government in Dec. 1917. In 1920 he was made a Privy Councillor and the same year was made a member of the Canadian delegation to the first assembly of the League of Nations at Geneva.

DOLLAR SECURITIES MOBILIZATION.—In the British system of war finance, 1915-7, an important part was played by the mobilization of securities. During the World War enormous supplies of war materials of all descriptions had to be purchased by England from abroad, and in addition, owing to the withdrawal of labour from production in the Allied countries, abnormal quantities of goods had to be obtained from the same sources.
DOLLAR SECURITIES MOBILIZATION

The exchange facilities available were entirely inadequate for the purpose of making the payments necessitated by these purchases, and artificial methods had to be adopted to provide in suitable foreign currencies the funds required. The natural procedure was by borrowing, and by the realization of such assets as were marketable in the conditions existing.

Though in some instances, and more particularly in the early days of the war, it was possible to effect loans abroad on the credit of the borrowing countries, it was found necessary to a large extent to provide collateral security in addition. The various securities quoted on the Stock Exchange and others of similar nature held in the Allied countries formed the natural and most fruitful field for obtaining suitable collateral and for providing the assets most readily marketable abroad.

Before the introduction of any official control a considerable amount of securities of the United States of America and other foreign countries was sold abroad, on account of the relatively high prices obtaining and the favourable terms on which the proceeds could be remitted home, owing to the fall in exchange rates which had already taken place. Even after the introduction of official action these natural sales continued, though necessarily in decreased volume. The funds provided by means of these sales and from loans effected abroad without collateral security supplied in the main the necessary sums to pay for the purchases made, but as the demand for goods and raw material became more insistent the British Treasury found it necessary to take on Old prayer and July it no longer could the securities then considered as collateral be tendered. The securities then considered as collateral for the purposes of the Treasury were therefore the Bank of England to purchase American dollar securities by private treaty or through the London Stock Exchange and forward them to New York for sale. By this means securities of the nominal value of $233,000,000 were obtained before the end of the year and the pressing requirements of the Treasury were satisfied.

By Dec. 1915, however, it had become apparent that this somewhat haphazard method of purchasing available securities was not altogether satisfactory nor likely to achieve the desired results, and it was therefore decided to adopt a more comprehensive scheme. Accordingly, the Treasury appointed a committee of the Bankers' Clearing House, with a permanent secretary of the Treasury as chairman, the deputy governor of the Bank of England as deputy chairman, and four members, two of whom were nominated by the Bankers' Clearing House and two by the Committee of the London Stock Exchange. The management was placed in the hands of Mr. (afterwards Sir) George May, the secretary of the Prudential Assurance Company.

In order to obtain some idea as to the volume and class of securities available a circular letter was sent to all the larger investors, such as insurance companies, banks and trust companies, asking them to submit lists of American dollar securities held by them, with a view to selling or loaning the Treasury. Active operations were begun in Jan. 1916, at the National Debt Office in Old Jewry, by the issue of a list of 54 selected American dollar bonds which the Treasury was prepared to purchase. The prices offered were based on the current New York closing quotations of the previous evening, the New York percentage price being converted into the London sterling price at the existing rate of exchange with accrued interest.

In illustration of the procedure adopted it may be mentioned that the official prices were not only posted up at the London Stock Exchange but by a special arrangement were telephoned by the General Post-Office to all the provincial stock exchanges at about 10 A.M. This enabled the country stockbrokers to deal promptly with the committee by means of a short telegram stating the amount they wished to sell and quoting the official number assigned to the particular security. Such bargain held good provided that the telegram was handed in at the provincial post-office not later than 2 o'clock (later extended to 4 o'clock) on the day of the sale. As regards London dealings, the bargains were booked over the counter at the National Debt Office. To facilitate delivery of securities a branch of the Bank of England was installed in Old Jewry and on the Bank's officers devolved the duty of accommodating the securities in good order and paying the purchase money. It is interesting to note that brokerage was paid by the Treasury and not by the seller, while un stamped bonds were accepted on the same terms as those bearing the English stamp. In the early days of the scheme the payment was made at the seller's option in British or American dollars, the Exchange Department then being issued. In this way the double purpose was served of obtaining the necessary funds by making a credit in New York and increasing subscriptions for British Government securities. Additional lists of bonds and shares for which the Treasury was willing to pay were published from time to time, and special prices were made for suitable securities not appearing in a published list. Since it was essential for the Treasury to obtain the largest possible credits in New York at the earliest possible date monies were entered in shares with large par values, and bulk prices were quoted for large and comprehensive blocks.

The scheme was successful from the outset, as will be seen from the fact that securities to the value of over £60,000,000 sterling were obtained in the first ten weeks of its operation.

During the first months of the Committee's existence no securities had been taken on loan, but towards the end of March 1916 a deposit scheme, subsequently known as scheme A, was introduced. Briefly the scheme was as follows:—

Securities were to be deposited for a period of two years from the date of deposit, the lender to receive all interest and dividends on the securities deposited by him, plus an additional 1% per annum on the nominal amount. During the currency of the loan the lender was entitled (1) to have his securities sold in New York at the current sterling rate of exchange, or (2) to obtain the release of his securities in New York against payment to the Treasury agent there of a sum in dollars equivalent to their American value, a similar sum being paid by the receiver to the depositor in London at the current sterling rate of exchange, or (3) to have the securities in New York sold for him at the current sterling rate of exchange, or (4) to have the securities converted into American dollars and sold in London at the current sterling rate of exchange.

The Treasury was also prepared in most instances to purchase for sterling the deposit certificates in London at the current American prices of the securities, for sale abroad, and under such circumstances the securities were used as collateral to secure further credits. Though there was no intention to realize the deposited securities except in an emergency, the right to do so was reserved to the Treasury as otherwise the securities would have been useless as collateral for loans in New York.

In Aug. 1916 a further loan scheme, B, was brought into force. It differed from the previous scheme in that (1) deposit was for a period of five years from a fixed date, instead of two years from the date of deposit; (2) under it were included many colonial and foreign stocks and bonds in addition to the purely American securities; and (3) the right to realize securities as given under scheme A was limited to American securities having a market value in New York. Further, it was given to depositors under scheme A to transfer to scheme B, and this operation was most successfully done.

The securities purchased were sold immediately a suitable opportunity offered, and those remaining unsold, together with deposited American dollar securities, were used for short borrowing as required. The main use, however, to which the deposited securities were put is illustrated by the particulars of a typical loan floated in the United States of America prior to the entry of that country into the war.
emphasized by the fact that in spite of the large amounts of securities purchased and deposited a still more drastic step had to be taken.

On Jan. 21, 1917, a regulation issued under the Defence of the Realm Act came into force, by which the Treasury was given power to requisition securities. The first order under this regulation was issued on Feb. 17, 1917, and required owners or custodians of specified securities to deliver them up in return for an amount of compensation based on the current market values. Holders of securities not ordinarily resident in the United Kingdom and certain other holders were exempted from the terms of the order. The compensation was payable within seven days of the transfer, and power was given to reduce its amount in case of late delivery. Altogether four such orders were issued, the number of securities included being 1,056. On March 1, 1917, deposit scheme B was closed to new deposits, except in regard to securities subject to the extra 2s. 6d. tax and which had not previously been included in the list of requisitioned securities. A little later, when the securities under scheme A began to fall due for return, depositors were given the option to extend the term to five years. Nearly all such depositors availed themselves of this offer.

In addition to the purchase and loan schemes which have been described above, the American Dollar Securities Committee undertook to acquire and deposit for the purpose of securing the disposal of the Treasury in America. In this connection may be illustrated arrangements with various Canadian provincial and municipal authorities for the purchase of their sterling securities in London. But the Canadian undervalue of American dollar securities for sale in America. Similar plans were adopted in the case of certain American industrial companies. Further, arrangements were made with certain British corporations to issue their own loans in America and place the dollars obtained at the disposal of the Treasury, the latter looking after the American loan and providing the English company with sterling in London. As an instance, reference may be made to the issue by the Central Argentine railway of a $15,000,000 loan in America.

The labour involved in connexion with the operations and more particularly with the loan scheme, was of considerable magnitude, and it was necessary to adopt every device in order to lessen the work, which in the main had to be carried out by a staff collected in a time of emergency. In the early days an agreement was entered into with the agents of over $100,000,000 bearer securities, the coupons of which had to be encashed in London, to pay the coupons on deposited securities, plus the additional ½% per annum, and for this purpose they were supplied with schedules giving such information as would permit of the calculations and payments being made. In Sept. 1917 this procedure was discontinued, and thereafter the work was taken over by the National Debt Office.

With regard to the registered stocks on deposit, much duplication of work was avoided by the railway companies and other paying agents undertaking to keep the Treasury register and pay the increased interest as it fell due. By this means it is estimated that the authorities were relieved from the preparation, etc., of about 350,000 dividend warrants each year. Further, certain approved agents were appointed to accept deposits of amounts of less than $5,000 each, the securities being handed over in bulk to the Committee; payment of interest on the aggregate amounts was made to such agents, who in turn distributed the sums received among the individual depositors.

The United States of America was naturally the chief source of supply, both for munitions of war and for goods, and therefore the financial arrangements already referred to were mainly directed to the provision of dollars in order to effect the necessary payments. In a smaller degree, however, payments had to be made to other countries, and certain of the securities obtained by the Committee were used to meet these obligations.

The United Kingdom was, of course, preeminently the holder of foreign securities, and she therefore played by far the greatest part in the efforts made towards mobilization in the Allied interests. But France also held a considerable amount and had a deposit scheme of her own, though on nothing like the same scale as that of the United Kingdom. In her scheme no purchases of securities were made, but a considerable volume of private sales to the United

States of America was effected, both directly and through London, and to a certain extent purchases of French holdings made by the American Dollar Securities Committee through the medium of the banks of France and England.

The total amount of securities dealt with under the British mobilization scheme, including those bought by the Bank of England prior to the appointment of the American Dollar Securities Committee, was as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purchases</td>
<td>$2,160,000,000</td>
</tr>
<tr>
<td>Deposits</td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>$2,160,000,000</td>
</tr>
</tbody>
</table>

These particulars may be to some extent amplified. Thus, the purchases consisted of:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dollar bonds</td>
<td>$680,000,000</td>
</tr>
<tr>
<td>Dollar shares</td>
<td>$241,000,000</td>
</tr>
<tr>
<td>sterling bonds and shares</td>
<td>$27,800,000</td>
</tr>
<tr>
<td>Sterling bonds</td>
<td>$4,100,000</td>
</tr>
<tr>
<td>Registered stocks</td>
<td></td>
</tr>
<tr>
<td>Home Railway debentures</td>
<td>$17,500,000</td>
</tr>
<tr>
<td>French bonds</td>
<td>$500,000</td>
</tr>
<tr>
<td>Kredit Anleihen</td>
<td>$150,000</td>
</tr>
<tr>
<td>Fl. 5,400,000 florin bonds</td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>$798,000,000</td>
</tr>
</tbody>
</table>

Similarly the deposited securities were made up of:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dollar bonds</td>
<td>$162,000,000</td>
</tr>
<tr>
<td>Dollar shares</td>
<td>$303,600,000</td>
</tr>
<tr>
<td>Sterling bonds</td>
<td>$150,000,000</td>
</tr>
<tr>
<td>Registered stocks</td>
<td>$72,000,000</td>
</tr>
<tr>
<td>Home Railway debentures</td>
<td>$17,500,000</td>
</tr>
<tr>
<td>French bonds</td>
<td>$500,000</td>
</tr>
<tr>
<td>Kronen Anleihen</td>
<td>$150,000</td>
</tr>
<tr>
<td>Fl. 4,400,000 florin bonds</td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>$525,100,000</td>
</tr>
</tbody>
</table>

The total number of different securities dealt with was 7,027.

The total amount of American dollar securities which passed through the hands of the Committee was thus approximately $2,160,000,000. In addition, a number of probably $350,000,000 were sold direct to America through the ordinary channels, making in all, say, about $300,000,000. Various estimates have been made of the total amount of American securities held in Great Britain before the war. The data available on which to base any such estimate are very vague and uncertain in their nature, and the present writer is inclined to believe that any such estimates can only be regarded as more or less intelligent guessing. In his opinion the total amount of American securities held in Great Britain before the commencement of hostilities was certainly not greater than $600,000,000 and probably nearer $500,000,000.

The operations of the Committee underlined the necessity for which it was formed, as during its existence the rate of exchange practically remained constant at about 4.761 dollars to the £. Although securities were purchased and taken on loan after the Americans came into the war the amounts obtained were not great, and it is believed that practically all available American securities suitable for sale or collateral for loans had been dealt with.

It is difficult to see what course could have been taken in order to obtain the necessary credits abroad in sufficient amount when these securities had been exhausted, but speculation on this point would be idle since the necessary credits became available after and on account of the entry of the Americans into the war. (G. E. M.)

DOLLAR STABILIZATION.—Under the existing currency system, the so-called ""level of prices"" is largely at the mercy of monetary and credit conditions. The rise of prices will rise or fall with the flood or ebb of gold or of paper money or of bank credit. Evidently a rise in the level of prices is a fall in the purchasing power of the dollar or other monetary unit, and vice versa. The purchasing power of money has always been unstable because a unit of money, as at present determined, is not a unit of purchasing power, but only a unit of weight. It is the one inconstant unit of measurement left in civilization. Other units—the pound, yard, bushel, etc.—were once as unstable and crude as the dollar, sovereign or franc still are; but, one after another, the other units have all been stabilized or standardized. Short weights and measures cheat the buyer; long weights, the seller. So unit of money which changes the purchasing power is always playing havoc between contracting parties. When prices are rising—in other words, when the purchasing power of the dollar is falling—the creditor and the creditor-like classes suffer injustice. The sufferers include savings-bank depositors, bondholders, salaried classes and wage-earners. In the great upheaval of prices—i.e. in the United States, depreciation of the dollar—which took place between 1896 and 1921 such injustice amounted to over a hundred billion dollars. On the other hand, when prices fall, as they did between 1873 and 1896, it is other classes—debtors, stockholders, farmers and independent business men generally—which suffer. The indirect effects of falling or rising prices—i.e. of a rising or falling dollar—are equally bad. These indirect effects include industrial discontent
Dodon (either over the "high cost of living" or unemployment) and economic crises and depressions.

Hitherto there was ample excuse for the unstable monetary units of various countries. No instrument for measuring their aberrations had been devised. Likewise, until weighing scales were devised, weights could not be standardized, and until instruments for measuring electrical magnitudes were invented, electrical units could not be standardized. But for many years the "index number" of prices has provided an accurate instrument for measuring the value of the dollar in terms of its power to purchase goods. An "index number" of prices is a figure which shows for a specific period of time the average percentage increase or decrease of prices. One of the most suggestive signs of the times is that this instrument for measuring changes in the purchasing power of money has recently been utilized in adjusting wages and salaries to the high cost of living, i.e. to the depreciated dollar. A number of industrial concerns, banks, and some official agencies, have amended wages by the use of an index number of the prices of commodities.

It has been contended by some economists that this principle may be utilized in the future more generally to safeguard agreements made at one date to pay money at another date. Such corrections of the dollar would gradually break down the popular superstition that "a dollar is a dollar"; for every time we correct the dollar, we convict it of needing corrections; and ultimately the correction might be applied, not, as at present, as a patch on the dollar from the outside, but by incorporating it in the dollar itself. Various methods for accomplishing this have been proposed. The one perhaps best known is Prof. Irving Fisher's proposal to vary the weight of the gold dollar so as to keep its purchasing power invariant. Instead of a gold dollar of constant weight and varying purchasing power, what is needed, he contends, is a dollar of constant purchasing power, and, therefore, of varying weight. It is not proposed, of course, to remint gold coins, but simply to count an ounce of gold bullion as being the equivalent not always of $20.67 (as at present) but of as much more or less than that sum as is required from time to time in order to keep the purchasing power of the dollar constant.

In other words, the proposal is to vary the price of gold according to its worth relative to other commodities, instead of, as at present, keeping it artificially constant at $20.67 an oz. pure or £1 75 s. 10d. an oz. 11 s. 2e fine. In this way, Professor Fisher contends, we can control the price level, lowering it, raising it, or keeping it from fluctuating much, if at all. Thus, if Mexico should adopt the dollar of the U.S. (instead of its present dollar of half the weight of gold), the price level in Mexico would be disadvantageously cut in two. Again, if the U.S. should adopt the Mexican dollar, the price level in the U.S. would be disastrously doubled.

That is, the more gold in the dollar, the greater its buying-power; and on the contrary, the less gold in the dollar, the less its buying-power. On this principle he had acted, in the proposal which he has published, that the dollar's buying-power shall be—that is, the level of prices shall be. It can be kept from changing greatly just as easily as it could be made to change, simply by periodical adjustments of the price of gold, each adjustment being made in accordance with the index number of prices. By this method, in conjunction with any of the sound systems of banking, Professor Fisher contends, variations of more than one or two per cent could easily be prevented except under the most extraordinary conditions.

Rev. C. M. Doughty of Theberton Hall, Suffolk. In 1875 he made an adventurous journey through northern Arabia, remaining nearly two years in the country, and, after many hazards and hardships, finally emerging at Jidda (see 2.257). He published the results of his observations in a work since recognized as a basic work to rank with the records of the Elizabethan voyagers. *Travels in Arabia Deserta*, issued by the Cambridge University Press in 1888, received at first little recognition and brought its author no material reward. But gradually its fame spread amongst travellers and lovers of literature until the rare copies of the first edition were scarcely procurable at any price, and in 1921 a facsimile reprint of the two volumes was issued at £9 9s. The value of Doughty's work as a traveller had by that time secured universal recognition; nothing was left for any future explorer to study between Damascus and Mecca which Doughty had not already closely studied, and in 1912 the Royal Geographical Society bestowed on him his Founder's gold medal. He had done other work previously, and he published several volumes; but he remains, in the estimation of the literary world, the author of one book. It should, however, be noted that in 1886 he brought out *On the Jôsêdal-Brac Glaciers in Norway*, and a collection of inscriptions copied by him in Arabia was published by the Académie des Inscriptions et Belles-Lettres in 1884. His later years were devoted to poetry and poetic drama. In 1906 he published an epic in six volumes *The Down in Britain*, followed by *Adam Cast Forth* (1908), *The Cliffs* (1909), *The Clouds* (1912), *The Titans* (1916) and *Mansoul*, on the *Mystery of the World*.

DOVER, England (see 8.453).—Pop. (1921), inclusive of the garrison, 43,645; estimated civil pop. (1920) 41,448. The municipal boundaries were extended in Nov. 1921 so as to include an area of about 70 ac. in the River Ward destined for housing purposes; at the same date the various piers and jetties of the harbour were brought within the municipal area. A new general post-office was completed in Biggin St. in 1914. Two new churches have been erected—Charlton church, a large building in the early English style which takes the place of a small church dating back to the Middle Ages since demolished, and St. Barnabas church, built between 1890 and 1912. The Duke of York's Royal Military School was transferred from London to Dover in 1907, an extensive series of buildings of the bungalow type having been erected on the Eastern Heights near Fort Bourgne. The Connaught barracks near the castle with accommodation for an infantry battalion were completed in 1915. The Dover Patrol memorial obelisk on the cliffs E. of the town was unveiled by H.R.H. the Prince of Wales on July 27, 1921.

The Dover harbour scheme—in addition to the construction of piers and a breakwater to enclose the Admiralty harbour with a perimeter of about 47 m., completed in 1909—included the reclamation of about 112 ac. upon the harbour (eastern) side of the railway pier, to provide for a new marine station and berths for the continental mail packet steamers and other vessels. Both these projects were sufficiently completed in time to be of service during the World War.

The reclamation wall is 2,260 ft. long, and the landing-stage upon the Admiralty pier extension, 702 ft. long and 20 ft. wide. Altogether six berths are provided. The stage is built on open pile work and is provided with a covered passenger steamer and a dry dock. The berths rise 18 ft. 9 in., need tides 15 ft., and range 11 ft. Reinforced concrete piles support the foundations of the passage to an inset landing-stage, and also the foundations of the marine station. At the outer end is a lighthouse 88 ft. above high-water level, the light visible for 14 miles. As at Chatham, large colliers drawing four fathoms can berth alongside the pier to unload into railway trucks.

To provide railway communication to the Prince of Wales' pier, and to the harbour quays, the Harbour Board, in 1902, constructed a new swing bridge to carry passenger trains as well as ordinary vehicular traffic; during the war this bridge proved indispensable in the transport of many passengers and vehicles.

The Harbour Board acquired parliamentary powers, in 1920, to construct, by arrangement with the Government, an enclosed wet dock upon the Admiralty harbour side of the Prince of Wales' pier, and an area of 50 ac. at the depth of 30 ft. below low water; and to build spring tides. The entrance lock is to be 100 ft. wide, and additional quays, transit sheds, coaling-tips, and connexions to the inner dock basins will be provided.

DONALDSON, SIR J. (1831-1915), British scholar (see 8.456), died at St. Andrews, March 9, 1915.

DONNAY, CHARLES MAURICE (1859- ). French dramatist (see 8.457), wrote several fresh plays after 1910: *Le Ménage de Malbîre* (1912); *Les Éclaireuses* (1913); *L'Impromptu de Paquetage* (1916); *Le Théâtre aux armées* (1916). He also published some war-time essays and addresses: *La Parisienn e et Guerre* (1916); *Premières Impressions après 1917*; *Lettres à la Dame Blanche* (1917); *Pendant qu'ils sont à Noyon* (1917); *La Chasse à l'Homme* (1918).

DOUGHTY, CHARLES MONTAGU (1843- ). British explorer and writer, was born in 1843, the youngest son of the
On its completion, the Admiralty harbour became the base of the battleships and armoured cruisers of the Atlantic Fleet.

In 1911 the defence of the Straits was handed over to the destroyers and submarines and a camber in the northern corner of the harbour was completed for them just before war broke out.

In Aug. 1914 the Sixth Flotilla of destroyers and submarines formed the naval force guarding the Straits, with their base at Dover.

During the war Dover was entrenched, the perimeter being nearly 6 m., and a division of troops manned the defences. The Swingle aerodrome was an instructional school for the final training of officers before leaving for France, and the Guston aerodrome the H.Q. of the R.N.A.S., afterwards the R.A.F. Dover was subjected to repeated air raids, the first raid on England taking place at Dover on Dec. 24, 1914. There were several Zeppelin raids in 1915-7, but the defence prevented any serious damage. In all, 184 bombs were dropped on the borough and 370 in the immediate vicinity, and the total death toll was 25. The castle was hit several times by bombs but beyond a few chips in the walls of the keep no trace of damage remains.

Of 100 men lost their lives in the blowing up of the monitor "Glatton" in Dover harbour on Sept. 16, 1918, and 155 were drowned in the mining of the "Malaya" off Dover on Feb. 24, 1916.

At the close of the war Dover harbour was abandoned as a naval base, the camber was leased to a private company for the breaking up of old battleships, and the Admiralty in 1921 were offering to lease the naval harbour for commercial purposes.

Dover castle has been placed in the care of the Office of Works as an ancient historical building and a considerable amount of restoration and preservative work has been carried out on the Roman harps and the late Norman towers and walls. In recent years many tiles bearing the letters CI Br have been found in the area between the Western Heights and the Dour, indicating that Roman Dover occupied this site. The tiles show from their stamp that they were made by artisans belonging to the Roman British fleet. As they have not been found elsewhere except at Roman siege, they appear to indicate that Dover was the chief Roman port to the continent.

The chief feature of the industrial development in the district was the opening up and working of the Kent coal-field. The H.Q. of the chief colliery company is at Dover.

 Authorities.—"The Port of Dover," Jour. of the Royal Society of Arts (April 15, 1910); Engineering Supplement of the Times (April 24, 1914); J. Bavington Jones, The Annals of Dover (1916).

DOWDEN, EDWARD (1843-1913), English writer (see 8,456), died at Dublin April 4, 1913. See his Letters, edited by E. D. and H. M. Dowden (1914).

DOYLE, SIR ARTHUR CONAN (1850-1930), English novelist (see 8,461), was one of the originators of the Volunteer Corps during the World War, the first corps being formed by him at Crowborough, Sussex, in Aug. 1914. In this, the 6th Sussex Batt., he served for four years as a private. He also did much propaganda work, and issued various pamphlets on war subjects, also a six-volume history of the war which was extensively read in America. He visited the war zones twice, and published The British Campaign in France and Flanders, 1914 (1916) and A Captive of War, 1916 (1918), as well as a volume of verse, The Guards Came Through, and other Poems (1916). His other writings since 1910 include The Case of Oscar Slater (1912); The Poison Belt (1913); Danger (1918) and His Last Bow (1918).

He became an ardent spiritualist and published A New Revelation (1918) and The Vital Message (1919), following these up by an active campaign of lecturing and controversy on the possibility of proving by spiritualism the continued existence and conditions of human life after death. A public debate between him and Joseph McCabe on the subject took place in 1920.

DRAMA (see 8,502).—The decade 1910-20 was one of paramount importance in the history of English drama and the English theatre. Apart from the temporary, but substantial, effect of the World War, which lasted for nearly half of the decade, other causes of wide influence profoundly affected both the drama as a part of literature and the theatre as a commercial organization during that period. In the United Kingdom great changes in the constitution of theatrical enterprises were brought about abruptly and almost catastrophically. The government of the theatre by actor-managers ceased with dramatic suddenness and was replaced by the government of syndicates comprised, for the most part, of persons innocent of all knowledge of acting or drama and concerned primarily, if not exclusively, with the production of large profits quickly returned. In those theatres where the actor-manager was not replaced by a commercially minded syndicate, his place was taken by what may be called the producer-manager.

The three great actor-managers of the English theatre, Sir Herbert Beerbohm Tree, Sir George Alexander and Sir Charles Wyndham, did not outlive their reign; the era of the actor-manager ended simultaneously with the war, on July 2, 1917; Alexander March 16, 1918; and Wyndham Jan. 12, 1919. The normal process of nature, whereby one generation or tradition is slowly merged in another, was in their case mercifully suspended. In 18 months the actor-managerial system, which had been immensely powerful, was in ruins, and its chief protagonist, men of ability and taste, were dead, spared from the humiliation of neglect and supercession. It was a system undeniably disadvantageous to the drama as an art, since it tended to make the play subordinate to the player and restricted many playwrights to the production of plays with good parts for particular persons, but there is no doubt that the actor-managers, especially the three named, were possessed of ambition and much taste and that they worked successfully to restore dignity to the theatre. They were directly associated with many of the most interesting plays that were written during their reign, and Tree, Alexander and Wyndham could claim exemption from the charge so frequently and justly brought against Sir Henry Irving, of doing nothing whatever to encourage the work of meritable modern English dramatists. Sir Herbert Tree's annual Shakespearean festival, held often at grave financial disadvantage to himself, was a real tribute to taste and culture, despite the serious complaints fairly made about his methods of production. Sir George Alexander, more than anyone else, made the way to the stage easy for the writer of distinguished comedy and was chiefly responsible for the career as a dramatist of Oscar Wilde. Sir Charles Wyndham, less consistently ambitious than his colleagues, followed an honourable tradition and was responsible for the modernization of farce from buffoonery.

The decline and fall of the actor-managerial system coincided with the disappearance from the centre of London of the music-hall in which a succession of "turns," sparingly produced but highly individualized and having no relationship with each other, formed the programme. Three well-known music-halls ceased between 1910 and 1920 to be music-halls. These three, the Oxford, the Tivoli and the London Pavilion, were the centre from which radiated an elaborate ganglion of music-halls throughout Great Britain and Ireland. The Tivoli was demolished and its site remade, in 1921, unoccupied. The Oxford became, during the war, a theatre and in 1920, under the management of C. B. Cochran, was re-named the New Oxford, where an elaborately produced but less highly individualized form of music-hall entertainment, with a light touch to the decor and culture, was provided. At the London Pavilion, also controlled by Mr. Cochran, a skillfully contrived form of what is called "revue" became the standing entertainment. Specific reference to "revues" will be made later, but here it may be said that they are not "revues" in the French sense, a commentary on contemporary affairs, but a mingling of musical comedy and music-hall entertainment in which individual ability is made subordinate to general impression. The chief characteristics of this new entertainment, seen perhaps at its best in the roof-garden productions in New York, are expensive dresses, handsome scenery, fine and even beautiful effects both in groupings and lighting, and a particular insistence on feminine beauty.

This change in the character of the London West End music-hall coincided with the great growth in popularity of the cinema.
or picture-palace, or "movies." During the decade, almost all of the London suburban theatres became picture-palaces. Many of the provincial theatres, especially in small towns, also became picture-palaces. A variety of reasons caused this change to take place, some of which were financial and others connected with altered taste. The kinemas were at once cheaper and more comfortable than the theatres and they offered a more consistently attractive programme. The inhabitants of a London suburb often had a great predilection for the comfortable and continuous performance of popular variety at the local kinema as could be seen in a kinema in the centre of London, but they could not hope to see a play performed at the local theatre by a company as capable as that acting in the same play in the West End. On the contrary, they might expect with certainty to witness a very inferior exhibition of acting. Precisely the same process was observable in America, where, owing to the competition of the "movies" and the inferior quality of travelling companies, what were known as "one-night stands" ceased to be profitable enterprises and were almost entirely abandoned.

These were the three main changes in the nature of theatrical entertainment during the decade 1910-20; the disappearance of the actor-manager and the substitution for him of the commercial syndicate; the disappearance from the centre of London of the music-hall of marked personality and the substitution for it of the music-hall with elaborate effects and mechanical skill; and the collapse of the suburban and provincial theatre before the advancing kinema. These changes, although they hardly cause satisfaction, are of the nature of constructive changes, and they probably possess permanent characteristics. The commercial syndicate may result in more efficient administration in the future, and the performance of plays by great actors. It has not yet shown a desire to produce drama equal in merit to that produced by the actor-manager, but the system is still young and it was considerably handicapped by its inauguration during the war and remains handicapped by the high cost of production. The great virtue of these syndicates is likely to be of an administrative character. Many theatres, in London and the provinces, are coming under the control of a single syndicate, and this universalisation of theatres will enable a particular firm to arrange its tours on a more economical and comfortable system than has hitherto been the case. The old individual system unavoidably resulted in touring companies sometimes spending a week in Edinburgh, the next week in Bristol and the third week in Newcastle-upon-Tyne. In a properly organized theatrical system, such tours will no longer take place, but will be arranged so that the journey from town to town will be short and easily accomplished by motor-car or lorry.

The change in the music-hall has brought about a great development of the mechanical and pictorial side of that entertainment, and in some of the spirited personality of the superseded form can be found for the new form, the change will be of considerable value. The danger is that human qualities are subordinated to machinery and spectacular effects. In the case of the cinema development has been progressive and is likely to continue so. Film-manufacturers are constantly engaged in experiment, and they will in time invent a machine which will enable them to exhibit pictures in three dimensions, in natural colours and with some effect of the human voice. This will be done by means of an instrument which is a combination of gramophone and stereoscope, aided by some process of colour-photography. The film-firms, particularly in America, are endeavouring to improve the quality of the film-play and, since they offer very handsome monetary rewards to authors, are likely to succeed in their attempt. Many of the most distinguished dramatists of the world are engaged in writing scenarios for the "movies," and several of them have announced that they will in future write only for them.

**Reperatory Theatres**—The survey in the earlier article (see 8,475) ended at a period when, in spite of many undesirable things, the drama was in a healthy condition. Plays of merit were being written and produced, not only in London, but also in the provinces where there were still a number of the repertory theatres, stimulating the imaginations of young authors. Conservative managers were receiving original work with less hesitation or hostility than had been accorded to it for several generations. The long and, in many respects, valuable domination of the theatre by dramatists such as Sir Arthur Pinero and Henry Arthur Jones, was declining before the end of the century. The majority of serious writing in the years 1910-20, one in Scotland (the Royalty, directed by Alfred Waring) and one in Ireland (the Abbey, directed by Lady Gregory and W. B. Yeats). The last was the oldest as it has proved to be the last of the repertory theatres. The distinguished career of this theatre, there was a most ambitious attempt to establish one in London, at the Duke of York's theatre, where the long Charles B. Cochran (who was in his prime) opened it in 1910, and later, a company of the notorious impresario, John laughing, produced theatre, which was identical with what is used to be called "stock" companies. Mr. Frohman's gallant enterprise failed. It lasted for 17 weeks; but from Feb. 21 to June 17, 1910, and during that period there were 19 plays and two lengths, were produced. The values of the plays and their authors are as follows:—Justice by John Galsworthy; Missalliance by Bernard Shaw; Old Friends by J. M. Barrie; The Servantess by George Meredith; The Third Pound Look by J. M. Barrie; The Mudras House by H. Gravaille-Ballad's Path by Anthony Hope and Cosmo Gordon-Lennox; Chains by Elizabeth Baker; Trelawney of the Wells by A. W. Pinero and M. A. Macfarlane; The Man of the House by H. Granville-Barker; A Woman of No Importance by Pinero; these plays were in one act (the third, fourth and fifth in the list).

The original scheme, of a strictly repertory theatre similar to the Comédie Française, was not maintained, nor does the history of the repertory theatres in the United States and Canada suggest that scheme is ever likely to succeed in a country where the people are disinclined to make the research through newspaper advertisements which a programme of irregular performances involves. For good plays produced during the season, were produced by Frohman on the British theatre which will not easily be shaken off and may never be shaken off. Trelawney of the Wells, the most popular of the plays performed during the season, was performed in eight weeks, which clearly signifies that the promoters of the scheme had to revise their plan, partly to satisfy the public demand and partly to recoup themselves for the losses sustained on the unsuccessful productions. A second scheme has attempted the establishment of other repertory theatres on Comédie Française lines in England, for example the Everyman theatre at Hampstead, established in 1910 by Norman MacDermott. The repertory theatres steadily increased in number until, at the outbreak of the World War, there were seven of them operating regularly and a number of others operating for short periods during each year. None of these theatres are, indeed, were constantly embarrassed by insufficient funds. But they perfume a most valuable service to young actors and young dramatists: to the first, by giving them continuous and varied employment which, although more monotonous than an unremunerative life, is more likely to be of service to them; to the second, by giving them the greatest of all instruction to a dramatist, the public performance of his work, and by bringing before them the work of established dramatists, British and foreign, which other young men would have difficulty in finding in book form. Ison, Strindberg, Hauptmann, Schnitzler, Maeterlinck, Rostand, Verhaeren, Sudermann, Tolstoi, Chekhov, Shaw, Galsworthy, St. John Hankin, Granville-Barker, Arnold Bennett and dein Masefield among the modernistic redefining of Shakespeare, Ben Jonson, Congreve, Beaumont and Fletcher, Goldsmith and Sheridan among the classics—the work, in quantity, of all these plays was brought to the knowledge and even to the intimacy of provincial playgoers who, but for the repertory theatres, would have had to subsist in the theatre on the more popular of the pieces produced in London and sent on tour. A similar service is performed in America by the old touring companies and the"little" or "summer" companies established as "an intermediate stage between the bad and the good." Out of these repertory theatres came a number of young dramatists, many of whom are resident at the city in which their plays were first performed, of whom at least one n an was a genius, John Millington Synge (d. 1909) and another was a poet, Eugene O'Neill (d. 1919) and John Drinkwater (b. 1882) and Lennox Robinson (b. Oct. 4, 1886). John of the Gleys, and The Shadow of the Glen, were produced in 1892 and are still regarded as his best work. One of the plays, Deirdre of the Sorrows, is unfinished. Of the remaining three, The Tinker's Wedding (in 2 acts), The Well of the Saints (in 3 acts) and The Playboy of the Western World (in 4 acts) have all achieved an importance partly because of its merits, but chiefly because of the anger which it aroused among the more sentimental of the Irish people, who, accustomed to the Romantic style in which subject or oppressed life, could not endure the realistic treatment of the plays. A long succession of poets had insisted on one aspect of the Celtic
character, its idealism and generosity and romance, with the result that people disbelieved in the other aspect of it, the cruelty and grinding selfishness of its materialism. The man within him could not see all the emotions or creed, set down what he saw in words of acid beauty, and the Irish people, horrorsocked, pronounced him to be a liar, a degenerate and even a traitor. The violence of their anger against The Playboy of the Western World, a play which included mains a man of genius of whom his countrymen, when they take pride in him at remain reluctantly proud. He and Lennox Robinson in America, People when of America. in evening and in second of Lennox Gregory, William Boyd and T. C. Murray, Padraic Colum, the late Semm Ursuly and St. John Ervine. W. B. Yeats has written plays for the Abbey theatre, but they are more contrivingly contrived than those of Stanley Houghton. He puts a little more than romantic spirit in the mouths of his people, that is separating himself very distinctly from the Syngar. His principal merits are great technical skill, veracity of character and speech, and natural exploitation of both emotions and logical form. For any drama which is worth something, there is little work which is not a false or a bitter or a baseless thought, which has to last as drop considerably below the level of his first. But of all the Irish dramatists, he has the greatest comprehension of the theatre.

Synge after writing a number of meritable pieces of unconscious, presented the Gaiety theatre, Manchester, with a comedy in three acts, entitled Hindle Wakes, which, to fill an emergency, was first performed before the Stage Society June 16 1913 in a cheap and tawdry theatre. It was put on that evening bill at the Playhouse and afterwards at the Court, receiving in all more than 100 performances in London. It had greater success in America than the one that had managed to last ever since, but it failed to be popular in America. Hindle Wakes is not a profound play, nor has it conspicious literary qualities; but it is fresh and forcible and it deals with a question of sex in a direct, natural, and unusual manner. In 1910, Synge returned to the United States and there would have grown into a dramatist of distinction (he was 32 when he died) is not a matter which can profitably be discussed. The plays which came after Hindle Wakes—The Perfect Cure and Trust the People—did not sustain the reputation it had made for him, as they seemed to be written deliberately for commercial purposes and failed to realize them—The Perfect Cure was performed for four nights only—it is probable that Houghton would have returned to the Abbey theatre had he been asked to perform another. He did not however ever become a first-rate dramatist, he would have become a very competent and meritable one. The Gaiety theatre, Manchester, gave an evening at the Playhouse and afterwards at the Court, receiving performances of Hindle Wakes. Two principal are Harold Brighouse and Allan N. Monkhouse, the first-named being the author of Hobson's Choice, which had great popularity in America and London, and the second-named the author of The Englishman's-Education. The following words, that the stage is their first concern, whereas most of the generation between them and Shaw came to the theatre from the novel and the sociological survey.

The "intellectual" or "highbrow" school is, in what is called the commercial theatre, there was observable a great increase in the quality of the plays produced. The younger dramatists who were without any intellectual pretensions were indirectly affected by the work of Shaw, even when it was reproduced by them. Plays by Hubert Henry Davies, Rudolf Besier, Alfred Sutro, Bernard Fagan, Somerset Maugham and J. E. Harold Terry were notably better in quality than plays written by their predecessors at any time. The dramatists were on their way to becoming definitively of the "intellectual" school which am made of fibre for those who produced them. They have already been named in connexion with the commercial theatre of the early 1920's. But this is the fact that the stage is their first concern, whereas most of the generation between them and Shaw came to the theatre from the novel and the sociological survey.

The "intellectual" school, which flourished as a movement, with a sombre play, The Man of Honour, changed his metier completely and very soon reached a level of mediocrity. The very next year, he was dead. The title, The Fulfilling of the Law, in which special appeal was less direct. The situation at the outbreak of the war, therefore, was one of great hope and of considerable achievement. A fine type of play had been produced and was being played in the London theatres. Of Shaw, strong among the intellectuals and distinctly felt among the commercial dramatists, was even discoverable in the work of the melodrama, which was being made more and more strongly in the interest. A more enterprising form of management was obtaining a hold on some theatres, and even in minor matters, as stage décor, a newer and better spirit was informing productions. The war was not, however, the end of the world. The old order was fading away. Demand was made for a high level of acting throughout the cast, for better team-work, and actors were busy forcing the Actors' Association into a trade union for the purpose of improving their conditions of employment.
Stage Production.—Simultaneously with this improvement in the kind of play and of the quality of the acting there was also an increasing attention to scenic and stage decoration, both from the point of view of scenery and of lighting, was undergoing a profound change, due chiefly to the work of Sir Henry Irving and later, by Sir Herbert Tree. Both of them were consummate actors, each having achieved a supreme merit of enabling a manager to perform a Shakespearean play as it was written by his author and with no other "cuts" than were necessary by a different code of manners or by the practice of his time. Sir Henry Irving was the pioneer of decorative artists in Florence and printed his theories in various books of which the principal one is The Art of the Theatre. His influence on stage decor has been immense. The famous Moscow Art theatre admittedly derives from him, and it is indisputable that Herr Reinhardt, the great German producer, owes much to him (see Reinhardt und seine Bühne, by Ernst Stern and Heinz Herald, Berlin, Euloyer & Co.). In England Craig's influence is wide and admitted. Decorative artists, such as Norman Wilkinson, Claude Lovat Fraser, (d. June 18 1921), Hugo Rumbold, Charles Ricketts and Albert Rutherston, derive from him, as do producers such as Griffith and Magie and, of course, they were all associated with Craig in the production of Shakespeare works. The appearance of a large engineering works, and its very complicated machinery requires the attention of a large staff of skilled mechanics. There is not likely to be any growth in the extent of engineering-production, for such work will not entirely disappear from the theatre. We are likely to achieve a reviving stage in every theatre, with deep cellars into which whole "sets" can, if necessary, be dropped, and by means of this matter, of solid things, by special effect. It will then be possible to reproduce a Shakespeare play in a great variety of scenes, without elaborate "cuts," in a very short time. In America, where electricity is much cheaper than it is in England, this has already been done. Among the results of this, that production is in a more advanced state than it is in England. Some of the more modern English producers, such as Basil Dean, had to import electrical apparatus from America.

The movement for greater simplicity in stage decor received some impetus in England from the employment of Craig by Sir Herbert Tree to make the scenery for Macbeth. A quarrel, followed by litigation, prevented the experiment from being completely made, but it moved the profession from being decorativeness and brought the question of "necessity" and "value." It was not, however, until Granville-Barker began his remarkable season at the Savoy theatre with the production of The Great God Brown, that the question of the necessity and value of the theatre. It was then that the stage production and of course the stage production. The theatre became known as the English actress as a dramatic and decorative one. A number of plays, old and modern, English and foreign, were produced, and the result was that Craig became a brilliantly successful and in several instances, exceedingly popular, and the question was asked, "Is it not possible to obtain the degree of beauty at which he aimed—the use of a golden-faithful actress in A Midsummer Night's Dream, for example—introduced a new aesthetic element and a new attractiveness in itself, into a world where insubstantiality was the primary requirement, and took, moreover, the English quality out of the play—but it is impossible to deny high tribute to him for the quality of his work which also shows that a play can be produced at the Savoy. It became the rule that any Shakespeare play produced at the Savoy, in addition to the three Shakespearean plays already named, were The Tragedy of Man by John Masefield; The Huon, translated from the Norwegian of H. Wiers-Jensen by Masefield; The House of Bernarda, translated from the Spanish of Federico de Madrazo; The Doctor's Dilemma by Bernard Shaw; a translation of Moléric's Le Mariage Forcé and Alfred Sutro's translation of Maeterlinck's The Blue Bird. These productions were all in the non-musical vein and were works for the Savoy, Barker, had conducted a short season at the St. James's Theatre, which was called "Shakespeare's Demons," Androcles and the Lion by Shaw, followed by a Hareleighade composed by Dion Clayton Clathrop and himself. Simultaneously with all the other productions there was a season of modern English plays at the Kingsway, producing The Eldest Son by Salisbury, worthy, followed by revivals of his own play, The Vessey Inheritance, Shaw's very popular piece, Fanny's First Play, and Arnold Bennet's great popular success, as well as popular as Milestones which he wrote in collaboration with Edith Knolke. Mrs. Shaw seemed to be on the crest of a high wave of popularity, for her play, First Appearance, been performed for more than 600 times, but his five-act comedy, Pygmalion, with Sir Herbert Tree and Mrs. Patrick Campbell, was a failure. The season was of great interest, for April 11, 1914, ran for 118 nights, a long run for any play in so large a theatre. Two plays by Galsworthy, The Mob and The Fugitive, were not popular successes and were barely on the general high level. Galsworthy's The Fugitive, which was the first play to precede the war, apart from the production of The Adored One, were confined to one-act plays, of which The Twelve-Pound Look was written and produced by Sir Herbert Tree. These attempts to revive the short play at its best. Others of these productions, notably The Will and Rosalind were very near the level of The Twelve-Pound Look.

Effects of the World War.—The situation, then, at the outbreak of the World War was one of extraordinary interest in the English theatre. The theatre season 1913-14 had closed with considerable brilliance. Plays of merit had been extensively performed in London and in the provinces, and the repertory theatres were in a fairly healthy condition. A rich level of acting had been discovered. Production was on a genuinely artistic scale. The season of 1914-15 seemed likely to open still more brilliantly than the season just concluded. There was even talk of a national theatre at which the English drama would be performed. Unfortunately, the 1914 Great Britain declared war against Germany and immediately the great revival of the English theatre languished and seemed to have disappeared. The big London theatre soon ceased to be. In 1921 the Gaiety theatre, Manchester, produced from the hands of Miss Horniman to a cinema syndicate. A gallant effort to attract a decent standard of plays was made by some well-known producers. Lord Lytton, L. N. Heil, Mme. Galsworthy, the director of the Playfair, and the producers

857
that theatre rents rose rapidly to absurd figures: a common rent at any time between 1915 and 1921 for a theatre in the centre of London was £500 to £500 per week. All other expenses, owing to the high cost of living and the unprecedented prices, were greatly increased, apart from the entertainment tax imposed during the war (which did not benefit, but rather harmed, the theatre manager) remained at the pre-war figure. Slight increases, after the war, were not enough. In two cases, the economic situation in the theatre was that the revenue remained at the pre-war figure while the expenditure was on the post-war scale. Such a situation as that is only possible when the theatre is filled with an audience, each member of which has paid for his seat. In pre-war times a play could be profitably performed before an audience occupying three-fourths of the seats. A manager could even make ends meet although half of the seats were unsold. But after 1921 he was forced to figure out a production for four or five weeks if he had a reasonable hope that thereafter profitable audiences would assemble for the performances. In 1921 a manager could not hope to make money out of a production unless the theatre was fully occupied at each performance. If a play failed to draw enough people to fill all or nearly all his seats, that play could not be continued in his programme. The financial burden was too heavy for the producer; and for this reason many meritorious pieces which might have been "nursed" into popularity were withdrawn immediately after production because they had not at once taken hold of popular fancy. The plays which suffer from this economic situation are undoubtedly of the better kind of which profit from it are the plays without merit other than that of a spectacular character. The best illustration of the effect of this situation on the drama is to be found in the remarkable popularity of the plays of the metropolitan playwrite, written by this author. This play, a variant of the theme of Ali Baba and the Forty Thieves, was produced at His Majesty's theatre—a theatre with an honourable tradition. It ran for six and a half years, setting a record of over 2,000 consecutive representations. Every device of colour and light and costume was used in this production. The appeal made was almost exclusively to the eye, very little to the ear when the theatre is filled with an audience, all records for consecutive performances at one theatre and earned large fortunes for those who were concerned in its production. In spite, however, of the difficult economic situation, of the change in need of the theatre and government of the theatre, there was a remarkable recovery of quality on the English stage after the signing of the armistice, and plays of quality began to appear, not timidly, but almost arrogantly. A play by Galsworthy, The Skin Game, which combined heroism between arise and plutocacy (in which both sides are badly besmirched) and susceptible of allegorical application to the war and the treaty of peace, was performed with great success at the St. Martin's, and a political comedy, entitled the Grain of Mustard Seed, by H. M. Harwood, produced at the Ambassadors had a singularly successful "run," singular because of the fact that political plays are rarely acceptable to English audiences. But there were other signs of the better days of the Haymarket with enormous success. In this play he treated the problem of life after death in a fashion which divided playgoers sharply into complete devotees or complete sceptics. The Skin Game was a sold-out success, but Mary Rose hardly won the favour in New York that it had won in London. The most interesting post-war success was the popularity with which Gay's The Beggar's Opera, a now classic opera house, received. It was not, however, a success in America. Rostand's Cyrano de Bergerac was revived with notable success by Robert Loraine, and Bernard Shaw's Arms and the Man, also revived by Loraine, had astonishing success with ex-soldiers on account of its anti-romantic treatment of war. Shakespeare's plays are extensively produced. A working-class theatre in the Waterloo Road, London (popularly known as "the Old Vic"), had maintained the standard of good drama throughout the war, and this theatre, handsome by lack of funds and rather amateur acting, steadily built up an audience for good plays. After the armistice its work was amply rewarded. The Old Vic," became the one theatre in London that could con on side on, and as the quality of the acting was much improved, they could also depend on competent performances. Bernard Pagan in 1920 reconstructed the Company, and announced that it would be reformed the Aramis, scapital theatre, where four of Shakespeare's plays would be produced annually. But the economic situation made gallant enterprises difficult, and it remains to be seen how far good intentions will be able to make a high quality theatre contribute. The transaction, however, of transition nearly always causes more pessimism than good hope.

United States

In America, the theatre, after the end of the war, was in a healthier state than in England. This is more true of New York perhaps, than of the rest of the country. Playgoers in that city seem more willing to patronize good things and to support new enterprises than playgoers anywhere else. A remarkable organization entitled The Theatre Guild of New York has, in three years, raised itself from an obscure, impoverished and unknown position into that of the only first-class theatrical enterprise in the world which is a great financial success. The Theatre Guild grew out of the activities of a small group of enthusiasts who were known as the Provincetown Players and the Washington Square Players. These players gave performances, usually of one-act plays, in small theatres near Washington Square. They were akin to the movement, very widespread in America, known as the Little Theatre or Community Theatre movement, which consists of societies of amateurs producing plays primarily for their own entertainment rather than for profit. The Theatre Guild, when established, secured a long lease on an old theatre, the Garrick, in West 35th St., and began operations with the production of Bonds of Interest, translated from the Spanish of Jacinto Benavente. This play (Los Intereses Creados) has been done in England both under the American title and under that of The Bliss of the World. It was not a financial success, and the capital of the Guild, about $500, was almost exhausted when the directors decided to produce John Ferguson, a four-act tragic Irish play by St. John Ervine. This play was not expected to be financially successful, but it falsified anticipation. It was performed in New York for nine months, and enabled the Guild to establish itself more securely. Subsequent productions, including Masefield's The Faithful, were not quite so profitable, but the season ended with greater hope than it had begun. In the following season Tolstoy's The Power of Darkness, St. John Ervine's Jane Clegg, Strindberg's The Dance of Death, and other plays were performed, of which Jane Clegg, which ran for five months, was the most financially successful. The third season included the first production in English of Bernard Shaw's Heartbreak House, as well as A. A. Milne's Mr. Pim Passes By. Both these plays made much profit for the Guild, the first-named running for 150 performances. The success of the Theatre Guild and of John Ferguson caused an immediate effect on theatrical entertainments in New York, and one interesting result of it was that a young American dramatist of Irish descent, Eugene G. O'Neill, was given an opportunity of producing his plays at a first-class theatre. He had already become known as the author of one-act plays when his six-act tragedy, Beyond the Horizon, was produced at the Morosco theatre in New York. This play, most skilfully acted, had a great success, and those who saw it at New York gave it, in their hearts, a gold medal. It felt encouraged to maintain their hopes when they contemplated O'Neill's work. In 1920 he produced a strange play in eight scenes, entitled The Emperor Jones, which is what may be called a one-part play, dealing with the journey of a negro into a West Indian forest where he lapses into primal terror. This play was produced by the Provincetown Players and the principal part was acted by a remarkable negro actor, Charles Gilpin. O'Neill is perhaps the most significant figure that the American theatre has produced since the death of William Vaughn Moody, and the quality of his work justifies hopes of raising the standard of American drama to a considerable height.

American dramatists display great technical excellence in their work, and together with the growth of new theatres, the result is a constantly growing amount of a curiously crude character. There is probably more mechanical ability among American dramatists to-day than among any other dramatists in the world, but this ability is seldom related to artistic power in a personal way. The trend is towards the serious, to discontent with slick sentimentality, and young writers throughout the country are endeavouring to relate technical excellence to plays in which life is truly treated. Dramatic craftsmanship is more closely associated with American drama than in England, and in many of the colleges and universities students take a course in dramaturgy. The most interesting experiment of this kind is that conducted by Prof. George Baker, of the University of Pennsylvania. The players, who, in what is popularly known as the "47 workshop," instructs his pupils in the writing and production of plays from the point of view of author, producer, actor and critic. Many of his pupils have written complete one-act plays, and several of them have successfully produced more ambitious pieces. One of the ablest of American dramatists and, at the same time, the least prolific, is James Forbes, the author, among others, of The Chorus Lady, The Show Shop and The Famous Mrs. Fair. Forbes produces mainly satirical comedies of stage-life, but the last-named piece deals with ordinary life and is a very able bit of work. Other
notable dramatists are Edward Sheldon whose Romance, with Doris Keane in the principal part, was extraordinarily successful in England; George Broadhurst—his Bought and Paid For was described by Arnold Bennett as one of the best commercial plays he had ever seen; and George Grossmith, whose The Whole Part was an addition to the repertory of the Stadtbund. 

Mitchell, the author of a brilliant comedy, The New York Idea; Augustus Thomas, whose The Witching Hour, The Harvest Moon, As a Man Thinketh and The Other Glimpses are plays of unconquerable interest; the late Charles Klein; Eugene Walter, author of two particularly able realistic plays, Paid in Full and The Easiest Way; Channing Pollock; A. E. Thomas; Booth Tarkington who, more popularly known today as a novelist, once ranked with Bennett and Asa Griggs Candler. The comedy light comedy called Clarence; Zoë Akins; and Susan Glaspell. The condition of the theatre in America at the end of the decade 1910-20 was more hopeful than that in England because of the greater gen-
eral enthusiasm in America and because of the capable desire, especially in New York, to support original enterprises.

The standard of acting in America so far as actresses are con-
cerned, is higher than in England but there is more all-round-

efficiency among English actors than there is among American

The latter excels in character-parts—of course, due to the larger number of actors, actresses, and engagements in England. With the exception of John Drew there are few American actors who can interpret characters such as were acted by Sir George Alexander. It is very difficult to discover either actors or actresses in American productions who can even approach in their spirits the remarkable method of acting in general. It is more difficult to approach it in its pure form than to achieve the same end. There was less acting ability among the younger members of the English theatrical profession at the end of 1920 than at any other period in the history of the English theatre. In America, on the contrary, there was marked growth in technical skill among young actors and actresses.

GERMANY

In 1910, the condition of the drama in Germany was very curious—declining in Berlin, but flourishing in the provinces. Metropolitan taste was tickle and vulgar; provincial taste was steadfast and of high quality. The result of this odd reversal of customary positions was that the theatres of Berlin, where audiences showed no interest in dramatic productions, were more remunerative than in the interior of the country. More experiments were made outside Berlin than were made inside it, not only in the quality of the plays performed, but also in the methods of production and the interior economy of the theatre. Volksbühnen (people's theatre) were organized in many places, at which performances of classical and modern pieces were given at very moderate prices. The two Freien Volksbühnen of Berlin, which were typical in most respects of all the other people's theatres, had between them a membership of 60,000 persons, to whom a considerable number were working-
men. These Freien Volksbühnen contracted with various theatre-
musicians, and they engaged artists of the highest order for the larger and the two, Die Neue Freie Volksbühne, was spending £25,100 a year in 1910 on plays produced at 11 different theatres. This society even started a building fund, which in that year had raised £5,000. A joint fund was also established to hold 2,000 persons. The members of this society paid one shilling for each performance witnessed, and seats were allotted by ballot. A full house was 600 persons, but the theatre was filled on Wednesdays and Saturdays. The theatre was under the direction of Stefan Grossman, a dramatist. The Cologne Stadt-theater organized performances on lines similar to those of the Volksbühnen, on Sunday afternoons before audiences drawn from workmen's societies which were allowed to nominate the play to be produced. In 1909, the trade unions of Cologne chose Galsworthy's Strife for performance, and this play was received with enthusiasm. A Deutsches Volkstheater was in process of erection in 1909. Each subscriber to this society was to be admitted to one performance per week in a season of 40 weeks and to receive a theatrical paper, delivered free of charge, together with free admission to all performances. The society was packed with shillings! The number of Stadttheatres was increasing rapidly, and considerable sums were subscribed or owned by the local theatre. The following is a sum of sums paid by German cities and towns: Berlin, £37,260; Hamburg, £14,660; Danzig, £13,000; Bremen, £6,000; Dortmund, £6,000; Essen, £4,000; Elberfeld, £4,000; Aachen, £3,500; Breslau, £3,500; Düsseldorf, £2,500; Magdeburg, £2,500; Kottowitz, £1,500; Thorn, £1,000; Michaeler, £1,000; and 215 other towns more or less. The result of these emoluments was that the German drama was vastly more popular in 1910 than it had been in 1900. Hermann Sudermann, who had reached the apex of their powers in 1910 and were beginning to yield place to new men, of whom the chief were Joseph Gregor and Theodor Fontane, while the latter was writing his Stories of the Restaurant. Hermann Sudermann, who had reached the apex of their powers in 1910 and were beginning to yield place to new men, of whom the chief were Joseph Gregor and Theodor Fontane. 

But apart from the extraordinary experimental character of much of German drama and stage production during this time, the general range of theatrical entertainments was very varied, extending from farcical realistic plays of the soil, such as Sudermann's Stradtbünder, to purely poetic plays, such as Medea, by a young dramatist of promise, Hans Leiber (1888). German theatre produced many foreign plays, equally diverse in character, ranging from Shaw's plays to plays by Jerome K. Jerome, Henri Christin, and several English dramatists of the time (1912) had much popularity in Germany, and so had many French dramatists. Just before the outbreak of the World War, a number of allegorical plays were being performed, such as Haus am Meer by Stefan Zweig and Mutter and Geisterleben by W. von Molo. But, apart from the extraordinarily experimental character of much of German drama
with more practicability, from Gordon Craig. Prior to the war he was known in England as the producer of The Miracle, Oedipus Rex (with a splendid Robert Harris and Mary MacCorkle in the principal parts) and Samson. His taste is for spectacular pieces of an ambitious nature. He was in 1921 in charge of Das Grosse Schauspielhaus (the Great Arena theatre), which was opened in 1919 and has seating capacity for 35,000 persons.

FRANCE

In 1910, the theatre in France gave less occasion for satisfaction than the theatre either in England or in Germany. The traditions of decent drama were, of course, maintained at the Comédie Française, the Antoine and the Odéon, but, broadly speaking, plays of quality were not produced in number and the structure of a very varied and productive industry was being changed. The old state of affairs could not last, and after 1910 until the outbreak of the World War, when the French theatre for obvious reasons ceased to function, there was a reaction against the old French drama. The French theatre, which had not previously offered much hospitality to foreign plays, began to open its doors, not widely, indeed, but slightly to plays written by foreigners. Shakespeare suddenly came into fashion. Hamlet was produced at the Comédie Française, King Lear at the Antoine, Julius Caesar at the Orange Fêtes, and Romeo and Juliet at the Odéon. Camille de Saint-Croix organized several performances of some Shakespeare plays which were highly successful. Shaw's plays was performed in Paris, but without much favour.
The most interesting play produced in Paris during the first five years of the decade was undoubtedly Edmond Rostand's Chocolat, which had been anticipated. It was performed seven years before and was performed for the first time at the Porte-Saint-Martin in 1910. It had not the great success of Cyrano de Bergerac, but it caused much discussion. Lucien Guiry played the part originally intended for the late Edmond Rostand, which was also played on the stage by Maude Adams. Rostand, who was born in 1868, died in 1918.

Another death of great importance to the French theatre was that of Jules Claretie, who, after controlling the Comédie Française for 28 years, died in 1915. Claretie conducted the difficult affairs of the national theatre with very great skill and diplomacy, and showed clearly that while a national theatre is not a forcing-house for genius, it is a place in which plays by honourable men are given. After the war, he was succeeded by Albert Carré, who remained in charge of the theatre until he was called up for military service during the war, when he was succeeded by Emile Fabre, a dramatist. Paul Héroux, the dramatist, died Oct. 25 1915, and Mme. Régane, the famous actress, June 14 1920.

Much useful, if not particularly significant, work was done by French dramatists from 1910 to 1915, but none of the disintegrating and insufficient influences detectable both in the English and the German theatres appeared to affect the French theatre. Stage décor, for example, is singularly poor in France, where, on the other hand, the standard of acting is very high. In addition to Rostand's play, another production was created by Robert Bottini, L'Un Soir d'Amour et La Vie Verolee—the first of which, done at the Comédie Française, was hardly so successful as the second, done at the Théâtre des Arts, with the Wolf and Mme. Hervieu, after which the play was produced at the Théâtre des Arts. Guiry's play Debardeur was also produced. A translation of this play, done into rhymed couplets, has been made by H. Granville-Barker, and was produced in New York in 1921 with great success.

Edmond See's Saison Outre-Mer was produced in 1910. Sacha Guiry, rapidly acquiring a high place in France as a dramatist and an actor, was responsible for Pasteur, a farce entitled Le Mari, La Parente, or The Parent which sufficiently indicates the nature of the piece, and a comedy called Mon Père Avait Raison. The Guiry's, father, son and daughter-in-law, gave a season of their plays in London in 1920 which was exceedingly successful. (St. J. E.)

DRESDEN, Saxony (see 8.574).—The pop. of Dresden, according to the census of 1919, was 529,326; in 1910, without some suburbs since incorporated, it was 548,308. Dresden was perhaps harder hit by the World War than most other towns in Germany. The whole structure of its economic life had been dependent upon visitors, especially foreigners, and the outbreak of the war brought this to a sudden stop. In addition, the shortage of food, serious everywhere, was more especially felt in Saxony and her capital, which were dependent mainly upon industry. Lastly, the revolution swept away the life of the Court, which meant a great deal for Dresden. With the revolution came the development of extreme political tendencies among the working classes of Dresden, which led to constant disturbances, strikes, etc., although the violent and sanguinary encounters associated with the insurrectionary movement in western Saxony, were less widespread in Dresden. But the assassination of Neurig, the majority Socialist Minister of War, on April 12 1919, and the sanguinary street fighting of Jan. 9 and 10 of the same year, are sufficient proof that the capital of Saxony was not immune from scenes of violence. After 1914 the expansion of the city came to a complete standstill, and in 1921 Dresden, like other towns, was suffering severely from lack of housing accommodation. After the revolution there was a majority of extremists in the Municipal Council, and the financial position of the city had become very precarious.

The collections and museums will doubtless maintain the reputation of Dresden as a centre of art. The Royal Opera, which enjoyed a world-wide reputation before the World War, has not been able as a State Opera to maintain its high artistic level. Industry came to a complete standstill during the war—the manufacture of cigarettes, for instance, which was very flourishing, had to be given up owing to lack of raw material—but by 1921, some recovery had taken place and Dresden showed signs of returning prosperity as a resort for visitors. (C. K.)*

DRINKWATER, JOHN (1882—). English poet, playwright and critic, was born at Leytonstone, Essex, June 7 1882 and educated at the Oxford high school. After twelve years' work as an insurance clerk he began to devote himself to theatrical enterprise, and became manager and producer to the Pilgrim Players, who developed into the Birmingham Repertory Theatre Company. His first volume of poems appeared in 1908 and his first play Capella (in verse) in 1911. He subsequently published several volumes of verse, critical studies on William Morris (1912), Swaburne (1913) and others, and several plays, of which Abraham Lincoln (1918) was produced with great success both in London and in America.

DRIVER, SAMUEL ROLLES (1846–1914), English divine and Hebrew scholar (see 8.585), died at Oxford Feb. 26 1914. His later works include Four Papers on the Higher Criticism (with F. Kirkpatrick, 1913).

DROYSEN, GUSTAV (1838–1908), German historian (see 8.590), died at Hallie in 1908.

DUBAIL, AUGUST VON EDMOND (1851—). French general, was born at Bellfort April 8, 1821. At the age of 17 he entered the military academy at St. Cyr, and on July 15 1879 was appointed a sub-lieutenant of infantry, having passed seventh out of 310 candidates. He took part in the Franco-German War and was captured at Metz in Oct. 1879. Released in April 1871 he rejoined his regiment, and served with the army of Versailles in the operations against the Commune. He was appointed captain and transferred to the 81st Inf. Regt. in Nov. 1878. From Oct. 1870 to Feb. 1883, and again from Nov. 1883 to Jan. 1886, he had an appointment as professor at the École Spéciale Militaire St. Cyr. In June 1886 he was made a chevalier of the Legion of Honour. In Oct. 1887 he was promoted lieutenant-colonel; and in Oct. 1901, while still in Algeria, was made a colonel and given command of the 1st Regt. of Zouaves. On returning to France he took over the Alpine Brigade at Grenoble. In 1906 he became commandant of St. Cyr—an appointment which he held for three years. He was made a divisional commander on Dec. 25 1908, being appointed to the 14th Div. at Bellort. He later commanded the IX. Army Corps. In 1911 he was made chief of the general staff and a member of the Superior War Council. On the
outbreak of the World War Gen. Dubail took over the L Army, which (with the II. Army under Gen. de Castelnau on the left) was responsible for the offensive into Lorraine, and later for the defence of the eastern fortress line against the armies of Prince Rupprecht of Bavaria. The stubborn resistance of Dubail and Castelnau not only nullified the threat of invasion but insured a pivot for future French manoeuvres; it prepared the way indeed for the Marne victory. Gen. Dubail was given the Grand Cross of the Legion of Honour (Sept. 18 1914). On the withdrawal of the II. Army to the Somme, Dubail took charge of the whole line between Verdun and the Vosges, and when in Jan. 1915 the armies along the front were grouped under three headquarters of groups of armies, Dubail was placed in charge of that of the east, comprising the III. of Verdun, his old I., and the Vosges force. In Oct. of the same year he was awarded the medaille militaire. On April 6 1916 he was made military governor of Paris. He was placed in the "Second Section"—on reaching the age limit—in April 1916, but retained his appointment as military governor of Paris. After his final retirement he was appointed Grand Chancellor of the Legion of Honour.

DUCLAUX—JAMES MARY F. (1856— ), Anglo-French poet. Du was born in 861, published after 1910 a volume of essays, The French Ideal (1911); a study of Madame de Sévigné (1914); A Short History of France (1918); Twentieth Century French Writers (1920) and a life of Victor Hugo (1921).

DU CROS, WILLIAM HARVEY (1846-1918), British manufacturer, of Huguenot descent, was born in co. Kildare, Ireland, June 19 1846. He was educated at the King's hospital, Dublin, and became founder of the pneumatic tire industry and a pioneer in automobile construction. From 1916-8 he represented Hastings in the House of Commons. He died at Dalkey, co. Dublin, Dec. 21 1918.

Ductless glands (see 8.633).—Much new work on the physiology, pathology and medicine of the ductless glands has been done since 1910. There are two ways in which the consensus partium in the animal economy is brought about. The best known of these is that which occurs through the nervous system. But it has been recognized during recent years that other agents take part in this process of coordination. These are called the ductless glands through their products the internal secretions, which have also been called hormones. The latter have, however, been renamed autodoid substances by Selye, and divided, again, into groups: those with excited metabolic processes and those which depress them. The former autocoids are called by him hormones, the latter chalone.

In the glands of internal secretion, or as they are sometimes called the endocrine organs, the material secreted is passed away not through a duct but by means of the veins leaving the organ. This material when it reaches the general blood stream acts in the manner of a chemical messenger, or of a drug, producing effects upon various organs and tissues of the body. The ductless glands which we shall have to consider are (1) the adrenal gland; (2) the thyroid gland; (3) the parathyroid glandules; (4) the pituitary body; (5) the pineal gland. It is probable that the thymus is not an organ of internal secretion. In addition to these certain other glands furnished with a duct and providing an ordinary or external secretion are supposed to supply the body with internal secretions also. This applies to the pancreas. Further, the gonads (reproductive organs) have an endocrine function. The Adrenal Gland.—For many years it has been customary to refer to the cortex and the medulla of the adrenal body as the suprarenal capsule. But comparative anatomical studies have shown us that this is an incorrect view of the problem. It is only in mammals that the terms cortex and medulla as applied to the two parts of the organ are strictly appropriate. In elasmobranch fishes we have to deal with a series of paired chromaffin bodies in connexion with the sympathetic ganglia, and with an interrenal body placed in the middle line between the two halves of the kidney. The first of these is the homologue of the mammalian medulla while the interrenal body corresponds to the mammalian cortex. Even in mammals a trace of the original arrangement still persists, e.g., the sympathetic ganglia contain groups of chromaffin cells and there are other outlying masses of chromaffin tissue. The cortex also is not the sole representative in mammals of the original interrenal body. So that the problem before us is by no means to discover the function of a single organ but to ascertain the significance of the chromaffin tissues (of which the adrenal medulla is only a part) and of the cortical tissues (of which the adrenal cortex is only a part, albeit the principal one).

The chromaffin tissues everywhere are adrenalin, the formula for which is:

$$\text{HO} < \text{CH (OH). OH}_2 \text{NH. CH}_3$$

This substance is generally supposed to constitute the internal secretion of these tissues. When injected into the circulation of a living animal it produces effects similar to those brought about by stimulation of the sympathetic nervous system. That is to say, its action is sympathicotonic. The most striking of such effects are constriction of arterioles and an enormous rise of blood pressure, dilatation of the pupil and inhibition of the muscular coats of the alimentary canal. Small doses often produce results qualitatively different from medium or large doses.

The secretion of the chromaffin tissues does not appear to be essential. It is tolerably certain that if it does not help to maintain the normal blood pressure. It is possible that it is important for the activity of muscular structures under circumstances of physiological and especially of emotional emergency. Of the functions of the adrenalin we know nothing at all, and yet we are justified in regarding this portion as the adrenal body in the true sense of the word. Experimental and clinical evidence has taught us that it is the chemical factor which is essential to life. It seems probable that it has to do with the development of the organs of reproduction. Tumors of the adrenal cortex are frequently associated with sexual precocity in young children.

The disease which in factable to a lesion of the adrenal body is that known since 1855 as Addison's disease. The most striking symptoms are a peculiar bronzing of the skin, extreme muscular weakness, low blood pressure, vomiting and other symptoms produced by a toxic action on the sympathetic nervous system. The pathogenesis of the skin pigmentation cannot be correlated with anything we know of the physiology of the gland. The muscular weakness is supposed to be pathognomonic and attributable to the absence of the cortical secretion. The cases are always fatal, and treatment with adrenal substance seems to be of no use.

The Thyroid Gland.—The thyroid is developed as an outgrowth of the embryonic pharynx between the first and second branchial clefts. It is at first single and solid, but later becomes bilateral and divided up into closed vesicles. It is doubtful how far the lateral rudiments or post-branchial bodies take part in the formation of the mature thyroid in mammals. The vesicles have a peculiar "colloid" material which contains iodine. The blood supply is very rich and nerves are provided from both vagus and the sympathetic.

Extrication of the thyroid produces varying results according to the kind of animal employed and according to its age. The symptoms are not always very clearly defined, but they consist in general terms of the manifestations of sluggish metabolism. In young animals there may be almost complete cessation of growth though there is a tendency to adiposity. The symptoms differ from those of myxoedema in the human subject.

Diseases of the Thyroid.—Myxoedema.—This condition is found in middle-aged or elderly persons, and is the result of a congenital defect in the thyroid gland. The skin becomes altered, hands and feet swollen, lips and tongue enlarged. The oedema does not put on pressure, and there is mental dullness. The symptoms present in fact those of hypothyroidism. The disease is clearly due to deficient thyroid secretion, and may be kept in abeyance or permanently cured by treatment with thyroid substance.

Myxedema.—This is the only way by atrophy of the gland at the time of birth. The growth of the skeleton is arrested and the nutrition of the muscles and skin is seriously affected, so that the children are deformed, and, as a result of lack of mental development, idiotic. Treatment with thyroid substance is often beneficial.

Simple Goitre.—The precise pathological condition varies in different cases. The commonest form is now very generally considered to be due to an infection from drinking water containing inorganic iodide. The disease can be treated by the administration of this substance and sterilization of the water. Small doses of iodides have been found useful as a prophylactic when administered to children in goitrous districts.
DUCTLESS GLANDS—DU MAURIER

Esophalamic Goitre.—This disease is characterized by the three cardinal symptoms, enlargement of the thyroid, protrusion of the eye-balls and a rapid heart beat. It is usually ascribed to an over-secretion of the gland, though, according to Kesselheim, it is more likely due to a disturbance of function of the organ. Complete rest often suffices to cure the condition, though many surgeons recommend removal of a large part of the gland.

Kendall believes that he has isolated the active principle of the thyroid gland, and to this he gives the name of thyroxin. It is alleged that this substance may be used instead of thyroid substance in cases of hypothyroid insufficiency, and that the results are as satisfactory as when the gland substance is employed.

The Parathyroids.—In the great majority of mammals there are four parathyroids, two in relation with each lobe of the thyroid. The glands do not contain vesicles but consist of solid masses of cells. They are developed from the epithelium of the third and fourth branchial clefts. Most observers do not believe that they are functionally related to the thyroid.

Extrication of all four parathyroids is rapidly fatal in the case of many animals. Where death does not occur it is usually assumed that accessory parathyroids are present. It is certainly true that in many of the herbivora such accessory glands are frequently present. The symptoms which occur after extrication are those of tetany—muscular spasms, rapid respiration, salivation, etc. The condition is now usually called tetania parathyropra, and Koch and Noel Paton ascribe it to intoxication by guaninid. They believe that the parathyroids control the metabolism of guaninid and in this way exercise a regulative action upon the tone of the skeletal muscles.

Idiopathic Tetany.—Since the symptoms of this disease strikingly resemble those of tetania parathyropra, it is now very generally believed that they are due to disease of the parathyroid. It is sometimes alleged also that paralysis agitans, chorea, epilepsy, and eclampsia are due to disturbance of the functions of these bodies.

The Pituitary Body.—The pituitary body consists of two principal portions, the anterior or glandular, and the posterior or nervous. The former is developed as an evagination from the ectoderm in the buccal region. The posterior portion is an outgrowth from the base of the brain. Covering the latter is a secreting glandular portion called the pars intermedia.

The glandular portion seems to give rise to substances which are essential for the proper development of the skeleton and other tissues of the growing animal, and Robertson states that he has succeeded in isolating from this lobe a substance called tethelin, which hastens growth in young animals. Pituitary feeding is stated to increase the output of eggs in laying hens.

Extrication experiments seem to point to the anterior lobe as the part which is essential to life. But from the posterior lobe certain active extracts can be obtained. These extracts when injected into the circulation of a living animal produce a rise of blood pressure which is more prolonged than that produced by adrenin, but a second injection may produce a fall. The extract produces a sthenic effect upon uterine contractions and upon those of the intestine and bladder. It also causes dilatation of the pupil and constriction of the bronchioles. Pituitrin also causes a marked increase in the flow from the kidney and the mammary gland. A striking effect on metabolism produced by the administration of pituitary substance is a lowering in the tolerance for sugar.

DISEASES OF THE PITUITARY.—Hyperpituitarism.—Overgrowth of the pituitary or excessive secretion of any portion of it gives rise to increased growth of the bones of the extremities and of the face, and, if it occurs in young subjects, to gigantism, when, as in older subjects, it chiefly affects the face and the ends of the long bones, the condition is called acromegaly. Diminished sugar tolerance usually supervenes as the other parts of the organ become affected. There may be actual glycosuria and frequently polyuria.

In cases in which the condition the body does not grow, although there may be marked failure in sexual development. Sugar tolerance is very pronounced and there is arrested mental development. In cases which do not fall into this class the child has become obese and increased sugar tolerance are the most striking symptoms.

A functional relationship between the pituitary and the other ductless glands (especially the thyroid) is more than probable.

The Pinea1 Gland—This tiny structure has usually been considered as belonging to the group of "vestigial remains," and its chief interest to morphologists centres round its homology with the median eye of reptiles. It is developed as an outgrowth from the third ventricle of the brain. But even in lower vertebrates there is some evidence that a glandular constituent has to be reckoned with. Within the last few years numerous writers have urged that in mammals, including man, the gland is of considerable importance, and that it belongs to the group of glands furnishing an internal secretion.

Extrication experiments have been carried out in some animals, and it is stated that removal of the organ accelerates growth of the body and especially of the reproductive apparatus, or at any rate hastening of the development of the reproductive functions.

Tumors of the pineal gland are associated with abnormal growth of the skeleton in children, and with early and precocious development of secondary sex characters. It is therefore a matter of interest to examine the results with the exnt of extrication experiments it is asserted that the tumour gives rise to a condition of hypopituitarism. It will be remembered that the common tumours of the pituitary body are considered to be adenomata and to give rise to a hypersecretion.

Injection of extracts made from the pineal gland give rise to no special effects upon the blood pressure, respiration, secretion of glands, or other functions which can be investigated by ordinary methods. It is therefore unlikely that the results of extracts over a long period to growing animals hastens the growth and development of the reproductive organs. If these statements are correct they only indicate the present stage to complicates the problems for it is certainly contrary to expectation to learn that removal of an organ from an animal and its administration to the animal as food or drug will produce similar results. The whole subject has, however, as yet been neglected.

It is probable that in the case of some of the ductless glands, it is probable that our experimental technique is too faulty or too limited to enable us yet to draw any just conclusions.

The Testes.—The effects of castration in man have been known for a very long time. The absence of hair from the face, the undeveloped larynx and the persistent soprano voice resulting, and the tendency to gigantism and obesity are among the most striking of the characters of a eunuch. In male stages the anthers do not grow, and in the cock the comb falls to develop. These results do not occur in females. As with all other ductless glands and under favourable conditions these secondary sexual characters may be induced if a testis is transplanted from another animal. So that they must be attributed to a specific internal secretory system.

The elements of the testis which are usually supposed to furnish the internal secretions are the interstitial cells of Leydig. These are an epitheliod character forming lipid granules. These structures are strikingly similar in all vertebrates. It is evident that the data testis, but they are more marked in some animals than in others.

Injection of extracts of the testis was observed many years ago by Béryl-Des-Séquard to have a rejuvenating or stimulating effect upon the subject so treated, but it is doubtful whether the effect is specific or more marked than with other extracts.

The Ovaries.—It is well known that if both ovaries are removed from a young animal the uterus does not develop, menstruation does not occur, and the mammary glands fail to grow.

Extracts made from the ovary produce certain effects upon smooth muscle, but it is not certain that these effects are specific. The corpus luteum appears to be concerned with the fixation of the embryo in utero and with the growth of the mammary gland and the secretion of milk. As in the case of the testis there is a tendency to attribute the internal secretions of the ovary to certain cells, the interstitial cells, which are not present in all animals or at any rate are not present during all periods of their life.

Extracts of the ovary have been employed in the same manner as those of testis, and the same criticism applies.

The Carotid Body.—Situated at the bifurcation of the carotid artery and consisting, in many animals, of only a few cells, it is not known that the carotid body, or carotid gland, carries out any important function. Among the constituent cells are a few that are chromaffin variety, and these are capable, presumably, of furnishing a small amount of adrenin to the general circulation.

The Cooygeal Body.—This structure is included in our list because it has been alleged that it contains chromaffin cells. This, however, does not appear to be the case. The body is apparently an arterio-venous anastomosis.

DU MAURIER, GERARD (1875— ), English actor, was born at Hampstead March 26 1873, the son of George Du Maur-
The XI. Army, under Gen. von Mackensen, was organized as a shock group, consisting of eight German divisions from the western front, the two divisions of the Austrian VI. Corps, and the 11th Honved Cav. Div.; and it assembled behind the right wing of the Austrian IV. Army. This latter was also placed under Mackensen, who himself was subordinated to the Austrian High Command. These two armies were to carry out the main attack in West Galicia, while the armies of Dankl N. of the Vistula and those of Boroevic, Böhm, Linsingen and Pfanzer were to display all possible activity and engage the enemy in their front so as to prevent him from detaching troops to the main attack. Simultaneously two demonstrations in the Praszynska and Novgorod areas, and a raid on Memel, were planned.

After the completion of the assembly of the XI. Army, the distribution of the Austro-German forces in West Galicia and the Carpathians was as follows: In West Galicia, on the Lower Carpathian, the heights of Wolf and the heights of Gorlice were held by the Austrian IV. Army under Archduke Joseph Ferdinand (7 inf. divs.). To the right of this, the XI. German Army, under Gen. von Mackensen (10 inf. and 1 cav. divs.), lay by Luzna and Gorlice as far as Malastów. The Austrian III. Army, under Gen. von Boroevic (14 inf. and 2 cav. divs.), stretched from Malastów in a salient curve S. of the Carpathian crest by Zhor to Virava. Thence the Austrian II. Army, under Gen. von Böhm-Ermolli (14 inf. divs.), held its position as far as the heights W. of the Uzok pass. From here by Zawaikła, on both sides of the Orawa and the Oportales, by the Wyszków heights to the sources of the San, the Austrian XI. Army, under Gen. von Linsingen (9 inf. divs.)

Next came the Austrian VII. Army, under Gen. Baron von Pfanzer-Baltin (8 inf. and 5 cav. divs.), curving on the line Solotwina, Ottnia, Horodenka Zalesecziki, and along the Dinicster and the frontier.

On the Russian side there stood in the area S. of the Vistula, and on the Carpathian front, the III. Army (Gen. Radko Dimitrijev), the VIII. Army (Gen. Brussilov), the Stry detachment and the IX. Army (Gen. Lechitski)—in all some 40 inf. and 16 cav. divs. with at least 10000 Opolchiev brigades.

The Break-through of Gorlice-Tarnów (May 2-5).—By the end of April all the preparatory measures for the offensive were complete, and on May 1 the preliminary bombardment on the front of Mackensen's Army Group began; this was followed at 6 a.m. on the 2nd by four hours' intensive fire by some 1500 guns of all calibres, on a scale far surpassing anything yet known. The Russian trenches, on which many months' labour had been expended, and which were sited with great skill, were soon so shattered that the infantry, who had advanced to assaulting distances, were able to storm them. On the night of the 2nd the Austrian IV. Army, the combined division under Field-Marshal-Lt. Stöger-Steiner, forced the line of the Lower Dunajec by a surprise attack, and during the next 24 hours all the Russian troops in the area north of the San were completely expelled. The Austro-Hungarian IV. Army, which had to carry the very steep, unsuited, and detestable ridge of Krasna and the ridges of Sapiecha and Sarnau, was also in the end successful, after severe fighting, assisted in some measure by the effect of the XI. Army's break-through. Meanwhile the remaining Austro-German armies kept the Russians on their right and central sectors constantly in action and the lines were completely broken through. The Austrian X. Corps, fighting on the left wing of the III. Army, had a large share in this success. By 5 P.M. it had stormed the Russian positions on the heights S.E. of Kielce-Kielce, and E. of Malastów, and continued its advance up till a late hour of the night.

The Austro-Hungarian IV. Army, which had to carry the very steep, unsuited! and detestable ridge of Krasna and the ridges of Sapiecha and Sarnau, was also in the end successful, after severe fighting, assisted in some measure by the effect of the XI. Army's break-through. Meanwhile the remaining Austro-German armies kept the Russians on their right and central sectors constantly in action and the lines were completely broken through. The Russian III. Army alone succeeded in concentrating strong reserves (III. Caucasian Corps and 63rd Res. Div.) in the vicinity of Jaslo.

The Russian offensive was crowned by the 3rd with the utmost energy: the XIV. Corps stormed hills 419 and 402, while the IX. Corps on the right wing of the army captured the heights E. of Gronnik. Up to midnight the XI. Corps had made little progress, but, however, it came up against a series of strong positions, which were captured during the evening, and its right wing reached Wapienne, the centre Biezcz, while the left wing occupied the heights and the ridge of Bierz. The left corps of the III. Army stormed Ostra Gora, the Russians in front of it establishing themselves on the E. edge of Magura.

By the 4th such rapid progress had been made that it was possible to extend the attack on the whole front of the XI. Army.
In the course of the 8th the Russian positions were once more attacked, with the Sanok and Wislok rivers in front, and the Russian army were stormed along the whole E. bank of the Wislok. Both here and in the front of the centre and right of the IV. Army, the fighting was heavy; the Russians were driven by the latter from the heights beyond the Bokuwica valley, and by the former from the Bokuwica pass. In front of the newly formed group under Gen. von Kirchbach, composed of Stöger-Steiner’s Div., the German 47th Res. Div., and certain Landstorm formations, the left wing of the IV. Army, the Russian IX. Corps fell back in the afternoon to the new line prescribed.

Meanwhile, Boroevic had also pressed the Russians hard and by 3 P.M. the Russian left was broken, and during the afternoon the strong Bokuwica valley, and to retire to the line Zarszyn–Bukowsko–Szanawecz, where they once more took up strong positions. As a natural result of the retreat of the III. Russian Army, the whole of Brussilov’s VIII. Corps, and certain other formations, fell as far as the W. wing of the VI. Army, and by the evening the Russian X. Corps, with the W. wing of Linsingen’s, at once took up the pursuit.

On the 9th, however, violent resistance was once more encountered, particularly of which were the Germans in the region, and the Austro-Hungarian 111. and III. Armies, from the Ostry hill to Besko. The Russian posit d’oppozi at the latter place was much endangered by the withdrawal of the Russian front fighting against the Austro-Hungarian corps, and its direction to the deep Stobnica valley. It was naturally necessary to hold it, as also the strong front Bukowsko–Szanawecz, in order to secure Brussilov’s undisturbed retreat. Despite a violent counter-attack delivered by three newly arrived divisions attix the retreat of the Russian corps, and the driving back of the Austrian army on the Stobnica, the Russians were forced to abandon Besko on the evening of the 9th.

When on the 10th Böhm’s left wing, pressing forward by Baling, reached the area Szende captured Szende, and the gallant XI. Corps of Boroevic’s left took Zarszyn, the strong position of Bukowsko became untenable; and by the evening of the 11th the Russians had fallen back along the whole front of the Lower Vistula valley, and the area Sanok-Zagorz. Meanwhile the XI. Army had stormed the Stobnica position and advanced its front. Of the Archduke Joseph Ferdinand’s army Kirchbach’s corps on the evening of the 11th retook the Vistula valley and the road to the Lower Wislok valley. During the night of the 12th the IX. Corps secured Rzeszow.

The Russians, after some minor rear-guard actions, had also fallen back along the whole front before the II. Army, so that on the 12th the Austrian field army advanced with great vigour on the Upper Wislok, while the right had pushed the Upper Wislok, and the Southern Army was. At this point may be said to have ended the battle of Rzeszow, with the effective occupation of the whole area north of the enemy line N. of the Vistula. The Russians now prepared to make a fresh stand on the strong defensive line of the San below Przemysl, where they had constructed strong lines of defences, with their flank threatening the Doniezer marshes at Wielki Błoto, and the angle made by the Vistula and the San. Up to this point they had lost 130,000 prisoners, 100 guns and 300 machine-guns.

Essays up to the Battle of Przemysl (May 12–23).—The Russians, fortunately, had abandoned the Wislok line, now restraining the strong Austro-Hungarian X. Corps, advancing from the W., encountered the 48th Inf. Div. of the Russian XXIV. Corps under Gen. Korhinsky, then in junction with Field-Marshal-Lt. von Berndt’s Cavalry Detachment, forced the greater part of it to surrender, and counted the men who were captured some days later by Emmich’s troops.

By the evening the Austrian XVII. and VII. Corps had reached the San, and the German 47th Res. Div. While the Russians evacuated their positions below Tarnow as far as the Vistula, the Austro-German troops occupied Tarnow and initiated a pursuit in the area W. of Pilzno.

In view of these successes, it was to be expected that the Russian XXI. Corps would shortly be compelled to evacuate the Lupków pass which would shake the whole Russian front along the Carpathian to the E. of it. The rolling-up of this line seemed to ensure the complete strategic success of the five days’ “breakthrough” battle of Gorlice–Tarnow in which Radowitz’s army had been driven back more than 20 m. on a front of 100 m., while their retreat was stopped, by the 10th, by the advance of the Pursuit and Battles at Sanok and Rzeszow (May 6–11).—After his severe defeat, Radowitz’s plan was to hold the Lupków pass with his left wing, and, supported upon this, to bring the pursuit to a standstill. But in the face of the Austrian advance, the picking up of reserves, by bringing up reserves. Troops were sent to him from other fronts, and by the 8th he could again dispose of 18 inf., divs. 3 cav. divs. and 5 cavalry corps. The orders were, therefore, that the offensive operations should be continued with all possible vigour. Mackensen’s army was to push forward over the stretch of the Wislok between Besko and Frysztok on Mrzyglock and Tyczyn, and the Archduke Joseph Ferdinand’s army Boroevic’s II. Austrian Army was to join up corps by the left wing in proportion to the progress of the attack.
DUNAJEC-SAN, BATTLES OF

S.W. stormed the works on the 15th, and on the 16th entered Jaroslaw and crossed to the E. bank of the San.

The IV. Army reached the Russian lines on the Vistula-San angle on the 16th, and on the 17th captured a portion of the W. bank of the San as far as the Wisłok. S. of the Wisłok the XI. Army had established itself on the left bank of the San, in face of the fortress girdle of Przemysl and the heights around, which was the initial objective of the Russian 2nd Army. In the meantime, as far as Husaków before the S.W. and S. fronts of Przemysl, while the II. Army had worked its way forward to the entrenched line extending over Krużlów to the Wielki Bloto. S. of the San the South Army had advanced to the front of Cherny's XI. Russian Army back on Stryj and Dolina, which had been formed out of the Stryj detachment early in May. Pankratz's Army was compelled to withdraw before the Russian IX. Army (Löffler's Corps back on San). Moreover, all the Russian preparations and the made preparations to hold this line, while cooperating with its reinforced left wing in the offensive of the Southern Army.

N. of the Vistula IV. Army was also forced back by the arrival of DAnti and Woyrsch to the line Nowo Miasto-Minszże-Ilza-Opatów-Klimontów, after heavy fighting in the Czarna and Lyza Gora area, and small rear-guard actions elsewhere. Before the IX. German Army the Russians held ground.

In 14 days fierce battle the Central Powers had gained a great victory, and had pushed back the Russian "steam-roller" some 110 m. eastwards, besides securing 170,000 prisoners, 128 guns, 368 field batteries, and 412 heavy guns.

A pause in the operations now ensued, which was devoted to the preparations for a further offensive, to comprise the forcing of the San line, the capture of the fortress of Przemysl, and the storming of the Russian right of the fortress. The San itself at this season was not a serious obstacle, and its passage presented no difficulties itself; but on the far bank there existed strong and well-prepared positions, so that thus failed in the Russian plan to reinforce and strengthen their front E. of the Vistula by some 9 divs. at the beginning of May. The fortress of Przemysl had been reconstructed by the Russians, and the position of their fortifications by the erection of heavy artillery would therefore be necessary, and the strong positions S.E. of the Vistula also demanded a carefully planned attack. It appeared, moreover, that the Russians had recovered their strength in this sector, and the attack on the fortified San would be required to tear an energetic resistant to the pursuit. Built and prepared, the attack of heavy artillery and bridges forward and forward.

As the front became shortened during the advance, the Austrian VIII. Corps was on May taken out to the line on the III. Army front, and transferred to the IV. Army group, attached to Kirch- bach's group where it was to be assigned the part of storming Sandmierz. The 41st Hanover Inf. Div. was also transferred from the III. to the I. Army, coming into line on the 19th at Tarnów.

During the 19th the I. Army continued its advance on the San, while the VII. Army reduced the fortifications at Black. Before the 23rd they attacked the Russian Vistula line. 40000 Russian prisoners were taken, with 3 guns and 9 heavy guns. While the pursuit continued, the Russian right wing was still in action and the pursuit continued on.

On the 20th the II. Army advanced on the San to the line Radwa–Zapalów (on the Lubaczów–Laszy–Laszy. On the 26th the XXII. Army corps captured the villages of Niemowic and Chotyniec, capturing the line Zaleska Wolga–Zapalów. The Russian advance was stopped, and the advance continued.

At the beginning of the month the 5th Army corps captured the villages of Miechów and Chotyniec, capturing the line Zaleska Wolga–Zapalów. The Russian advance was stopped, and the advance continued.

A violent and extremely effective artillery preparation begun early in the morning made it possible to carry out the offensive on the 25th, and finally on the 26th. Corps to capture the bridge-head of the river. The Russian right wing, which was forced to fall back before the 25th, was captured by the Russian left wing, and the Russian right wing was driven forward on the E. bank of the San to the line Radwa–Zapalów (on the Lubaczów–Laszy–Laszy. On the 26th the Bavarian II. and German 111th Divs. already on the 24th reached the heights S.W. of Zablotie. The 26th the XXII. Army corps captured the villages of Miechów and Chotyniec, capturing the line Zaleska Wolga–Zapalów. The Russian advance was stopped, and the advance continued.

The pursuit of the Russian 12th army, had been captured by Woyrsch's army and by the 5th Army corps, and on the 15th it had reached the San, and from there established strong resistance on the 16th on the line Kopriwa–Klimontów, advanced to the attack but failed to break through; the same fate befell the II. Corps on his left wing, which had to retreat with the 5th Army corps. Woyrsch’s right wing, which was in touch, was also held up; on his left wing, however, the 16th Inf. Div. took Ruski Brod near the source of the Radanka and drove the enemy back in flight. In the course of a battle on the 17th a large number of Russian prisoners were lost; the Russian left wing was attacked. In the course of a battle on the 17th a large number of Russian prisoners were lost; and on the 18th the 11th and 12th Corps, the Russian right wing, was captured by Woyrsch's army. After the capture of Bredow's positions, and they also exercised considerable pressure against Danti's right wing. All their attacks, however, were beaten off.

On the 20th the main body of the Austro-Hungarian 7th Cav. Div. came into action on Stryj's right, and the 41st Hanover Inf. Div. from the III. Army, on the II. Corps' left; and the Russians in this part of the front were only able to hold back before this corps and Bredow's army. They only managed to hold the line of Brody on the Kamienno–Wasniów–Kobylyan. The pursuers worked forward to this on the 24th. Nothing of moment occurred in the centre and on the right wing of the Russian army, or on the fronts of Kövess's army group and the German IX. Army.

The Austrian attempt to break through in the mountain area N. of Kielce, to relieve the pressure on their retiring troops N. of the Vistula, had failed as early as the 10th.

S. of the Vistula there now began the violent struggle to prepare for since the 12th, which in the battle of Przemysl, was to introduce the second phase of the great spring campaign in Galicia.

The capture of Przemysl on the 25th was, as already stated, the first stage of the attack by Mackensen's army, which had been planned four days earlier, began along the Sido in an E. and S.E. direction. At the same time the II. and III. Armies were to advance to a N.E. direction along the San, and after taking Przemysl, were to break through the field army away from the fortress from the S. The IV. Army, securing the San crossing at Sieniawa, was to direct its main effort against the strong Russian positions in the area between the San and the Vistula, and then advance with the left wing of the army to continue its attacks in the Drohobycz-Stryj area. As early as the 24th the XI. Army forced back the enemy along the whole of the front on a counter-attack. The German XII. and Austro-Hungarian Corps, on this and the following days, accomplished the brilliant feat of storming Radymno, which the Russians had erected into a powerful bridgehead by means of three exceptionally strong lines connected with the main defense.

The Russian advance had made every effort to check Mackensen's advance, particularly by means of violent counter-attacks at night, but in vain. Mackensen's advance had progressed so far to the E. that it was successful as far as the village of Miechów, which consolidated his positions in this area, partly in order to counter a Russian offensive which was just beginning, partly in order to await the moment when the II. and III. Armies should be able to deliver a direct assault on Przemysl from the south.

A violent and extremely effective artillery preparation begun early in the morning made it possible to carry out the offensive on the 25th, and finally on the 26th. Corps to capture the bridge-head of the river. The Russian right wing, which was forced to a violent counter-attack at night, but in vain. Mackensen's advance had progressed so far to the E. that it was successful as far as the village of Miechów, which consolidated his positions in this area, partly in order to counter a Russian offensive which was just beginning, partly in order to await the moment when the II. and III. Armies should be able to deliver a direct assault on Przemysl from the south.

The pursuit of the II. Army and the whole of the III. continued on the 24th with the utmost energy. On the previous night a Russian counter-attack had pressed the XVIII. Corps back, but on the 24th the XVIII. Corps made a breakthrough largely owing to the arrival of the 13th Landwehr Inf. Div.

Field-Marshal Lützow's corps (7th Inf. Div. of the IV. Corps) carried it out on the XVIII. Corps, on the 25th. The Polish Corps, under General Miasto, delivered violent attacks on the 18th. While the pursuit continued, the Russian right wing was driven forward on the E. bank of the San to the line Radwa–Zapalów (on the Lubaczów–Laszy–Laszy. On the 26th it was able to storm two hills north of Husaków, but against this the two Polish Corps, under General Mackowsky, had already the day before launched a violent counter-attack on the Russian positions, which were in part concreted and consisted in places of seven successive lines of trenches. Owing to the lack of heavy artillery the attack here could progress only by systematic...
sapping, and in this manner it had, by the 28th, worked its way up to the Russian wire entanglements.

Meanwhile the Russians had resolved on a counter-offensive with support from the S. wing of the IV. Army. Their plan was to advance from the N. and E. over the San at Sieniawa and to the S.W. of it, and thus to put a term to Mackensen’s progress.

On the 27th the Russians delivered a surprise attack upon the Sieniawa bridge-head. The Austro-Hungarian 10th Div., consisting in part of untrustworthy Czech troops, gave way, and was thrown back to the W. bank of the San to clear the lower Luiwa river. (Gen. Irmanov) delivered a surprise attack upon the Sieniawa bridge-head. The Austro-Hungarian 10th Div., consisting in part of untrustworthy Czech troops, gave way, and was thrown back to the W. bank of the San to clear the lower Luiwa river.

The bridge-head was not taken, and the Germans withdrew to the line of their original position. Meanwhile the 12th Div. of XV. Corps was also making a movement towards the S. wing of the IV. Army. On the 27th the Russians made an advance in the sector of the 28th Div. of the 2nd Army, and the 29th Div. of the 3rd Army had been ordered to the right.

On the 27th the Russians renewed their attacks in this area and on the San. On the Lusczczówka they succeeded in penetrating the lines held by the German X. Corps, but were driven out by a flanking movement. On the 28th they renewed their attacks in the Sieniawa area and made vain attempts to pass the San. The X. Wing of the IV. Army, in conjunction with the I. Army on its left flank, placed an immediate barrage in the rear of the S. Army and on the right flank of the X. Army, threatening to attack the fortified line Machów-Rudnik, and by the 26th had forced the Russians back to the S. of Greców. The Russian attack at Sieniawa, however, necessitated the immediate withdrawal of force from this part of the front, and in consequence the Russian right wing was in danger of the further development of the X. Army’s offensive. On the 30th, therefore, there was a temporary cessation of activity; at the same time indications were observed of a renewed Russian blow against the inner flanks of the X. Army. The X. Army Command continued to press the Russians to their rear in the Sieniawa area and made no serious attempt to renew the offensive, which was given up on the 31st.

On the 27th the 12th Div. of XV. Corps was also making a movement towards the S. wing of the IV. Army. On the 27th the Russians delivered an unexpected and unsuccessful attack on the Lusczczówka and the positions of the VI. and XLII. Corps at Chotyniec.

On the 28th the Russians renewed their attacks in this area and on the San. On the Lusczczówka they succeeded in penetrating the lines held by the German X. Corps, but were driven out by a flanking movement. On the 29th they renewed their attacks in the Sieniawa area and made vain attempts to pass the San. The X. Wing of the IV. Army, in conjunction with the I. Army on its left flank, placed an immediate barrage in the rear of the S. Army and on the right flank of the X. Army, threatening to attack the fortified line Machów-Rudnik, and by the 26th had forced the Russians back to the S. of Greców. The Russian attack at Sieniawa, however, necessitated the immediate withdrawal of force from this part of the front, and in consequence the Russian right wing was in danger of the further development of the X. Army’s offensive. On the 30th, therefore, there was a temporary cessation of activity; at the same time indications were observed of a renewed Russian blow against the inner flanks of the X. Army. The X. Army Command continued to press the Russians to their rear in the Sieniawa area and made no serious attempt to renew the offensive, which was given up on the 31st.

The Battle of Stryi is an important battle that took place in World War I. It was fought on September 24, 1914, between the Russian and the Austrian-Hungarian forces. The battle resulted in a Russian victory and forced the Austrians to retreat. The battle was a crucial event in the course of the war and had a significant impact on the outcome of the conflict.
the passage of the Lomnica, and pressed on towards Halicz and Jezowsk, while Gerok entered Stanislau.

The task of the Southern Army, to roll up the hostile line in front of Tarnawa and Zaleszczyki, was, therefore, made the primary one when it had reached the line Halicz-Stanislau. The right wing of the Russian IX. Army had indeed been in retreat since June 9. Pfanzer-Baltin’s army had been forced back behind the Pruth by a combined advance of the Southern and the Russian II. Army in early July, and Kolomén did it continue to hold a position somewhat in the nature of a bridgehead on the N. bank. Its line ran from Delatyn, which it enclosed N.E. of Pasieczna to the Porechino area, where it touched Gerok’s right. On May 22 the Russian troops pushed their advance and entrenched themselves along their whole front; they had some 11 inf. and 8 cv. divs as against 8 Austro-Hungarian inf. and 2 cv. divs. The advance of Czibulka’s army delivered an unsuccessful attack against Pfanzer’s left wing under Field-Marshal-Lt. Count Schönburg; and next day they turned against the neighbouring corps, the XIII., S. of Nadworna, which was in forward position. On May 24, 1898, the Russian 4th Inf. Div. managed to force a passage to the S. bank of the Pruth at Sadzawa, but was thrown back to the Pruth next day, after heavy fighting, by the hastily reinforced Eastern Group under Field-Marshal-Lt. von Czibulka.

In view of the change which had meantime taken place in the situation on the German Southern Army front, the Russians determined to move the 36th Div. into the S. of Delatyn, in order to secure a fresh success against the VII. Army, and to slow the progress of the Southern Army’s advance. During the whole of the 9th they assailed the 5th Inf. Div. and Czibulka’s group with the utmost violence, but were answered by a prompt and vigorous counter-attack under Pfanzer. By evening, however, the Austro-Hungarian troops, reinforced by some battalions from the neighbouring groups and by and 10th cv. Divs., succeeded in driving them back to the line Krosno-Lokavsky-Laczkowicka, and in holding their ground firmly.

At noon on the 4th Pfanzer-Baltin, hearing that the Russian XI. Army was withdrawing on its whole front, issued orders to Commandant of the 4th Group, and to Baron von Rhenen, commanding the XII. Corps, to come to the assistance of the offensive, which would also relieve Czibulka’s hard-pressed troops. Schönburg was to advance eastwards with his main body on Bohorodczany, and with a view to covering his right flank, while Pfanzer directed his attack against Nadworna and Krausa. The evening Schönburg had succeeded in getting forward to the heights S.E. of Maniawa, and to the line Kryckza-Jablonska-Majdan-Krasna. His advance came to a standstill, however, and by the next morning the enemy had begun to make itself felt. During the 6th the Russian attacks on Rhenen’s and Czibulka’s front entirely ceased, and in front of Schönburg’s group rearward movements suggested that the Russian front itself was about to be withdrawn.

The 7th Pfanzer-Baltin assumed the offensive all along the line. The Russians were thrown back again on the Pruth at Sadzawa, and the 36th Div. in their turn threw it to the S. bank. The XII. Corps got well beyond Nadworna, while Schönburg continued his attack in an easterly direction, and by nightfall stood on the Bystrycza Nadzwierszczna at Grabowice. Marshall’s corps too overran the enemy and broke the line of the 1st Corps, which was now directed against Nadworna and Krausa. The evening Schönburg had succeeded in getting forward to the heights S.E. of Maniawa, and to the line Kryckza-Jablonska-Majdan-Krasna. His advance came to a standstill, however, and by the next morning the enemy had begun to make itself felt. During the 6th the Russian attacks on Rhenen’s and Czibulka’s front entirely ceased, and in front of Schönburg’s group rearward movements suggested that the Russian front itself was about to be withdrawn.

The next day, the 8th, brought the Allied troops to the Pruth again. The centre and left wing forced the Russians back from the line of heights N.E. of Ottynin and Obertyn and S.W. of Horodenka. At this date Field-Marshal-Lt. von Kaiser assumed command in place of Gen. von Marschall, who had been appointed to a command in the Southern Army.

Meanwhile, however, events on the Southern Army’s front taken an unfavorable turn, which had its repercussion on the operations of the VII. Army. Gerok’s corps and the German 5th Div. of the Dernov corps had been forced back beyond the S. of the Southern Army to its left, which was in a perilous position. This transfer, together with the fact that Schönburg and Rhenen were pushing eastwards, would not fail to create a gap in the area of Stanislau which would involve considerable danger to the inner wings of the Southern and VII. Armies if the Russians became aware of it in time. The direction of the VII. Army’s advance, therefore, had to be altered. At 10 a.m. on the 9th, therefore, the direction of Lemberg, would have been a serious influence on the Russian situation, both in the battle of Przemysl and on the Lower Dniester.

On the 7th the right of the XII. Russian Army reinforced by 2 divs. 8th and 14th cv. Divs. of force attacks against Szumrany’s group, which were driven back by the 8th to the line Donzów-

Bliże-Medjencie. At the same time a similar counter-blow was delivered against Bothmer in the Zarawano area; he held his ground successfully on the 8th, but on the morrow the superiority of the enemy became apparent, and on the 10th, after a desperate struggle, he was forced to retire. On the 11th Pfanzer-Baltin’s army, reinforced by 1 div. of the 4th corps and by 2 divs. of the Austro-Hungarian 4th and 9th Divs., advanced on the Zarawano and Przymel areas, under cover of a strong cavalry screen, and on the 12th took up a position on the line Delatyn-Bewgów in the region of Halič, and Alto and Zaleszczyki, and on the 13th drove the Russians out of the area with great gain. Meanwhile Szumry’s troops, after an abortive attack on the 14th, had to retire from the Zarawano, and on the 15th the 4th and 14th Inf. Divs. approached Zaleszczyki, where the Russian front was still holding firm. The 15th saw the Allies reinforcing their position further, and the 16th they were still in the same position. The 17th the 4th and the 14th Inf. Divs. crossed the Pruth at Zaleszczyki, and next day moved to the east of Nyzno, where the 5th Inf. Div. crossed the Pruth west of Zaleszczyki, and on the 18th the Russian Army was forced to retire from the area of Zaleszczyki, and on the 19th the Allies were in full possession of the area of Zaleszczyki, and on the 20th they were still in the same position. The 21st the Allies were in full possession of the area of Zaleszczyki, and on the 22nd the Russian Army was forced to retire from the area of Zaleszczyki, and on the 23rd the Allies were in full possession of the area of Zaleszczyki, and on the 24th the Russian Army was forced to retire from the area of Zaleszczyki, and on the 25th the Allies were in full possession of the area of Zaleszczyki, and on the 26th the Russian Army was forced to retire from the area of Zaleszczyki, and on the 27th the Allies were in full possession of the area of Zaleszczyki, and on the 28th the Russian Army was forced to retire from the area of Zaleszczyki, and on the 29th the Allies were in full possession of the area of Zaleszczyki, and on the 30th the Russian Army was forced to retire from the area of Zaleszczyki, and on the 31st the Allies were in full possession of the area of Zaleszczyki, and on the 1st of the XII. Army, which adjoined it, extended from S. of Zarniwa in a circle W. of S.W.

DUNAJEC-SAN, BATTLES OF THE
of Moscisla to the S. edge of the Wielki Bloto. This army comprised the Beskid Corps, the Austro-Hungarian IV., XV., XVIII., and V. Corps—14 divs. and 1 Landsturm Hussar brigade.

The Russian front was held by the III. Army from the Vistula to the Oder, on the right by the Przemysl, and by the Lemberg, and by the Lubaczow, and the Austrian 26th Landwehr Inf. Div., across the San at Ubeszn and Lezachow, to the Adriatic, near the possession of the last-named place, which was held despite Russian counter-attacks.

At dawn on the 13th the XVII. Corps stormed the strong points of the hostile line at Sieniawa and Jukowa Gora, E. of it. These strong points were technically strengthened. Units of the IX. Corps had meanwhile passed to the E. bank of the San, including the whole of the 10th Div., which came into action in support of the XVII. Corps. On the same day Maackensen and Bohm opened the main attack along the whole front. They had now succeeded in getting forward to Malastow, and to the N. of this the Guard advanced victoriously on Krakowice. On the other hand, the II. Army at first was held up by the force of the Vistula, and the battle lasted a day. On the 13th the X. Army pushed forward on Corbus, the third day being the main day of the battle of the XXII. Army. The battle of the N. wing of the XI. Army succeeded in passing the Lubaczow, and the Austrian 26th Landwehr Inf. Div. crossed the San at Ubeszn and Lezachow, to the Adriatic, near the possession of the last-named place, which was held despite Russian counter-attacks.

During the latter part of the month the Russian forces under General Behr's Corps, which had already reached the Weichsel, were not in a position to undertake a counter-attack. The II. Army was then detached from the general Russian forces and was sent on to the Adriatic to the north of the Austro-Hungarian line.

The II. Army entered the Adriatic on the 13th and was joined by the II. Army on the 14th. The army was now in a position to advance towards the Adriatic and to the Austro-Hungarian line. The battle of the X. Army was the main day of the battle of the XXII. Army. The battle of the N. wing of the XI. Army succeeded in passing the Lubaczow, and the Austrian 26th Landwehr Inf. Div. crossed the San at Ubeszn and Lezachow, to the Adriatic, near the possession of the last-named place, which was held despite Russian counter-attacks.

Their advance was the result of the successful operations of the II. Army, which had already reached the Weichsel, and of the II. Army on the 14th. The army was now in a position to advance towards the Adriatic and to the Austro-Hungarian line. The battle of the X. Army was the main day of the battle of the XXII. Army. The battle of the N. wing of the XI. Army succeeded in passing the Lubaczow, and the Austrian 26th Landwehr Inf. Div. crossed the San at Ubeszn and Lezachow, to the Adriatic, near the possession of the last-named place, which was held despite Russian counter-attacks.

or important, any real progress having been checked by the World War, while in the rush to make up for loss of time post-war developments have also been few and far between.

As regards wool-dyeing, the most striking feature was the continued demand for the fast colours produced by means of vat dyes (indanthrene dyes, thioindigo red, etc.) which were introduced prior to 1914. These colouring matters, of which a wide range is now available, are being extensively used, in spite of their high price, for dyeing casement cloths, warp or weft threads to form the pattern in "grey" or unbleached piece goods which are subsequently bleached in the piece, and for the production of the fastest class of work in calico printing. Effects are thus obtained, even in bright colours and tints, in a degree of fastness formerly unknown, and this circumstance should go far to restore the confidence in the permanence of high-class coloured cotton goods.

Of colouring matters produced on the fibre, aniline black 1 is by far the most important, and is used in increasing quantity. This black may be produced on the fibre by different methods, but the one almost universally employed to-day is a modification of Lightfoot's original process patented as long ago as 1863. Commercially known as a "copper black," it is obtained by impregnating the material with a liquor containing aniline salt, copper sulphate and chromic acid. The colouring matter is then removed, washing the goods through a hot solution of bichromate of soda. This latter treatment constitutes the improvement in Lightfoot's process.

The production of insoluble azo dyes on the fibre, which was originated by Holliday in 1880 and has since been improved upon, is largely employed especially for the brilliant para-nitroaniline red, a colour which also lends itself to the production of cheap but very strikingly effective "beta" dyes. The substitution of the amide of beta-oxy-naphthoic acid (naphthol A.S.) for beta-naphthol in the preparation may be regarded as a distinct recent advance in this class of dyeing, for the resulting colours are not only fuller and more level but the new colouring matters are tinctuary about as strong as those obtained with beta-naphthol. A still further improvement has recently come about by which the number of operations have been reduced and the process simplified by a modification of the procedure for steaming. To this end the fabric is padded with a mixture of naphthol A.S. and a nitroso compound (the nitrosoamine obtained from diazotized ortho nitro para-toluidine) and the colour developed by steaming in a rapid age. It appears likely that this class of colour will have considerable application in the future.

Among the direct cotton colours a complete range is now available (of the benzo fast red and other types) which yield shades of marvellous fastness to light, a property which was rarely shown by earlier representatives of this class of dye. For goods such as casement cloths this property is naturally an advantage, for the colours are not subject to fading, but are not only cheaper, but cheaper.

Other improvements in cotton-dyeing relate mainly to labour-saving devices in the dyeing of yarn. Dyeing in the cop, "cheese" or on the beam (for warps) is more largely practised than formerly and is being employed for this purpose. The principle in all of these is, however, the same, i.e. instead of the yarn being moved about in or passed through the dye liquor, the material to be dyed is held in situ and the dye liquor is caused to percolate slowly by pumping or other suitable contrivances. It is easy to understand that only such colouring matters as can be obtained in perfect solution can be employed for this kind of dyeing. The process requires skilled management to get good results, but since can be achieved with certainty it not only saves much labour but the yarn remains in a better condition. In hand dyeing and washing the turning of the hanks to ensure uniformity of treatment requires much hand labour which is now largely dispensed with by the use of suitable machinery for the purpose.

As regards wool-dyeing no great changes have taken place in the ordinary run of bright and most fancy colours, which are mainly got with acid dyes. For blacks and browns and other sombre colours which were formerly dyed only almost exclusively with mordant dyes (and are still so dyed for the best class of work), two classes of azo dyes have come into prominence which are rendered faster by means of chromate or bichromate of soda.

Diamond black may be taken as a type of the first class. The wool is dyed with this colour in the ordinary way in an acid (acetic) bath, and at the end of the operation bichromate of soda is added to the bath and the boiling continued for some time, this additional treatment resulting in a considerable improvement in fastness and at the same time darkening the shade. Colouring matters of this type are known in the trade as after-chrome colours. The other class consists of "beta" and "meta" azo colours, and chrome brown may be taken as typical. The dye-bath is made up with colouring matter, chromate of soda and ammonium sulphate. When the temperature of the bath approaches the boil ammonia is given off and the bath is gradually cooled, colouring matter and some of the chromium to be taken up by the fibre. As in the case of cotton, machine-dyeing is now largely practised in this class of wool, the "beta" azo colours being used in bleaching and in yarn. Here also a considerable saving in labour is effected and the valuable qualities of the fibre are much better preserved.

As far as silk-dyeing is concerned, what changes have occurred are not of sufficient importance to merit special mention here. Artificial silk, especially that obtained from viscose which comes into the market in ever-increasing quantity, is dyed like cotton, but requires more care in manipulation since in the wet condition its tenacity strength is considerably diminished.

Effects of the War.—During the years preceding 1914 Great Britain had been drawing roughly nine-tenths of its requirements in coal-tar dyestuffs (about 18,000,000 tons valued at £2,000,000 annually) from abroad—mainly from Germany. It was therefore clear at the outbreak of war that, unless the deficiency could be made up the British trade in coloured textiles would be severely handicapped as soon as the stocks in hand were exhausted. As early as Sept. 1914 a strong committee of British chemical manufacturers, colour manufacturers and colour users, styled the "Dye Suppliers Enquiry Committee," was inaugurated in Manchester under the auspices of the Society of Dyers and Colourists to discuss means of meeting the situation. The committee held numerous meetings at which various recommendations were made, some of which were ultimately taken up by the Board of Trade. The cardinal point which it was sought to elucidate was the wants of the colour users, and to this end it was sought to make a classification of the imports before suggesting any definite course of action. The users were therefore appealed to, but although the majority readily responded several large users, including two of the large combinations, refused to cooperate and the whole scheme fell through. The list, which would have been of great use and would not have taken long to compile, was completed and published at the instance of the Board of Trade five years later. In the meantime, stocks had long since become exhausted, and in spite of the enormously increased activity of the English colour makers and of the timely assistance of the Swiss colour works, the supply was nothing like equal to the demand. The enormous profits realized by makers were largely devoted to extending and improving their works, but the prices of dyestuffs—both artificial and natural—nevertheless soared to unheard-of figures. The shortage of dyestuffs was brought home to the public by the miserable quality of the colours in wearing apparel offered for sale. Khaki for the army was dyed on wool mainly with a colouring matter of the meta-series, whereas for cotton the old method (in which chromium and iodine salts supplied the colour without the use of any dyestuff) was available, but khaki shades were also dyed largely with sulphur colours. Indigo for navy clothing was not available in sufficient amount to go round, and its place was taken on wool by an azo dye known as coomassie blue. For indigo-blue shades on cotton sulphide blues were mainly employed.

The principal makers of coal-tar colours in England in 1914 included the following firms: Ivan Levinstein & Co., Blackley; Ivan Levinstein & Co., Huddersfield; Closs & Co., Droylsden; The Clayton & Aniline Co., Manchester (owned by a Basle firm and largely concerned with intermediates); The British Alizarine Co. of Silvertown; a works at Bromborough owned by a combine of three German colour works, and a works at Ellesmere Port owned by another German combine. The two latter were sequestrated by the Board of Trade and subsequently disposed of.

\[1\] Through an oversight the copper sulphate (10 parts) was omitted in the recipe given in 8.751. The total volume of the liquor (200 parts) should also have been stated.
DYEING

to British manufacturers. In 1915 a company was formed with Government assistance to take over and extend the works of Real Holliday & Co. of Huddersfield under the style of British Dyes, Ltd. The amount of capital was £5,000,000, half of which was taken up by the Government and the other half largely by dye users, and it was decided at the time that the principal new works of the company should be established at Huddersfield, where a large tract of land for the buildings and yards had been purchased. Although at the time no efforts were spared to accelerate building and equipment demand for colours still largely exceeded supply. Encouraged by the huge profits which were being made other works soon came into existence in various parts of the country, and each of these supplied its quota for users and for export. It may be said that in 1921 the development of the industry in England had proceeded so far that makers were in a position to supply a fair proportion of the colouring matters which were formerly imported—at a price. Considering the difficulties with which the makers had to contend in the way of having first of all to put up plant for the manufacture of the necessary intermediate products and then for the colouring matters themselves, in face of all the engineering and building restrictions which were accentuated by war conditions, great credit is due to the organizers and workers alike for this great achievement. Many processes were of course known to the chemists in pre-war works, and these offered little difficulty in a larger output. The intermediate products required for the manufacture of theazo dyes alone (the largest and most important class of the coal-tar colours) had to be first worked out in the laboratory before being put into operation on the large scale, for they had previously all (with the exception of aniline and toluidine) been obtained from Germany. In 1897 a plant was working in Manchester for the manufacture of two of the most important of these intermediates—beta-naphthol and alpha-naphthylamine, and German colour makers at that time actually drew their supplies of the latter product from England. But a few years before they were offering their own products for sale in England at prices lower than they could be produced at, with the result that the British manufacture was given up and imports were made from abroad. What was necessary in the way of preliminary work in the case of intermediates was naturally also required for the new colouring matters introduced, and this of course also required not only time but the undivided attention of a large number of skilled chemists. Another difficulty which the British colour makers were up against was the shortage of acids, especially oil of vitriol and fuming sulphuric acid or "oleum." This meant the huge additional burden of having to erect new chambers and contact plant without which progress would have ceased.

After 1918, the British Government, recognizing the importance of dye manufacture as a "key" industry to the most important of the manufacturing industries—the textile industry, and in view of the fact that the colour industry and the manufacture of high explosives had something in common, decided to extend their support of dye-making as a national industry, and a new concern was launched under the style of "The British Dyestuffs Corporation, Ltd." The new firm included British Dyes and Levinstein, Ltd. (which had previously bought up Claus & Co.), and started off with a capital of £10,000,000. Lord Moulton, who during the whole period of the war had undertaken the arduous and difficult duty of supervising the explosives branch of the Ministry of Munitions, was elected the first chairman of the new company. He possessed an intimate knowledge of some branches of the colour industry, and had from the outset taken a keen interest in their war-time development. The vast new works which have been erected by the company at Huddersfield are well planned and substantially built. Once in proper working order they should go far towards meeting the whole of the requirements of the British textile industry.

After the signing of peace at Versailles it was not unnatural that the German colour makers should have desired to re-open their trade in coal-tar colours with England, and as the British consumers had been so long accustomed to the excellent products which they had supplied, German colours again began to be imported. The legality of this procedure was challenged by the British Government, who caused a consignment of pyrogallol acid to be impounded under a Proclamation dated June 25, 1919. But in the test case against Mr. John Brown, trading as Brown & Fourth, Mr. Justice Sankey held that the Proclamation was illegal and invalid. Subsequently some thousands of tons of German-made dyestuffs were imported, and it soon became clear that the regenerated British industry would receive a severe check through foreign competition. To obviate this the Dyestuffs Bill, which it had been intended to bring in immediately following the Sankey judgment, was prepared and passed somewhat hurriedly (but not without opposition) through both Houses of Parliament and came into force on Jan. 15, 1920. The Act gives protection to the colour-manufacturing industry for a period of ten years, and is worked on the basis that no dyestuff may be imported which can be satisfactorily made in Great Britain. All imports in dyestuffs must pass through the hands of a licensing committee appointed by the Board of Trade. It was difficult to conjecture how this arrangement would work in the long run, but unless the prices of the British-made products were to be very materially reduced from their existing standard they were likely to constitute a drain on the textile industries which would not be justified. As long as the Act remains in force internal competition could operate as the only check. The colour users in England were quite prepared to pay a reasonable price for the possession of a colour industry of their own, and are large shareholders in the Dyestuffs Corporation. In this respect there is a precedent which, though well known in some circles, is not very common knowledge. About the year 1879 the manufacture of alizarine was almost entirely in the hands of the German works. They formed a combine and demanded an exorbitant price for their products, whereupon the United Turckey-red Co. and other large British users of alizarine founded in 1882 the British Alizarine Co. Ltd. and in spite of all foreign competition was a flourishing concern from its inception and has remained so ever since. Had it not been for the existence of these works (the only alizarine works in the world outside Germany) the English calico-printing trade would have almost gone out of existence during the war.

The difficulties which the British textile industry had to face owing to the shortage of dyestuffs was the lot of all other countries with a textile industry which were at war with Germany. In Belgium and France the industry was located almost entirely in the war zone. Nevertheless the French were not slow to resuscitate their old-established colour-making industry. Italy never had any native industry and was supplied for war purposes either with dyed material or with dyestuffs largely from England. In Russia a works was started previous to the revolution under the management of Swiss technical chemists with a capital of £1,000,000. Japan appears to have had a fairly large stock of German dyes, but before these gave out colour works were started in that country which are reported to have been worked successfully. In India the position was very bad, and recourse was had largely to the indigenous natural dyestuffs, which were, after all, not very long since, the only dyes used there. The position in the United States and in Canada was very much the same as in England. The United States did, however, the advantage of having come into the war much later, although in 1917 their stocks of foreign-made dyes must have been at a very low ebb. Several American colour works of considerable capacity had existed prior to 1914 and had been protected by a 30% ad valorem import duty, plus a fixed duty of 7 cents per pound, on foreign dyestuffs. Without having to appeal to the State for further assistance, new and important works were started under the supervision of Swiss or German scientifically and technically trained chemists, private capital being abundantly supplied for the purpose.

It has been computed that, taking the world's production of artificial dyestuffs as 100, the distribution in 1913 was as follows: Germany 74.1, Switzerland 7, Great Britain 6.5, France 5.4.
DYEING

United States 2-3, Austria 1-6, Russia 1-1. In view of the great changes which have taken place these figures are now of course no longer valid. What the figures were in 1921 was not even approximately known, but it is certain that the world's producing capacity, as distinct from actual production, was far in excess of any likely demand.

A good deal has been said and written about the correlation of dyestuff manufacture and the manufacture of high explosives, poison gases and other products required for chemical warfare. As far as the manufacture of high explosives is concerned, two main products, namely picric acid and trinitro toluate (T.N.T.), come into consideration. It is not very generally known that the French, some time before 1914, and some time after the war, manufactured a dyestuff long before the French introduced it as an explosive. As a dyestuff it has long since been discarded, having been replaced by other coal-tar yellows of greater fastness which are not subject to any official restrictions. Both of these substances are nitro compounds of the aromatic series, and, like those manufactured as intermediates for dye-making, require, besides the coal tar common to both, large quantities of sulphuric acid, oleum and nitric acid (all products of the so-called "heavy chemical" industry) as raw materials. The nitrating operations are similar in both cases, but the plants required to process the former are limited to the size of the nitrating vessels which it is neither safe nor economical to exceed. Once the process is standardized on a unit of plant any increased production is obtained by increasing the number of units. Naturally any plant producing such nitro compounds in a colour works could in an emergency be turned to account to produce such a substance as T.N.T., but the amounts required for any serious military or naval operations would be vastly in excess of what could be turned out with the nitrating plants of even large colour works. Nitrating is only one of a large number of important operations required in colour manufacture, and some dyestuffs are manufactured entirely without the help of this operation. The idea which seems to have become prevalent that the plant in a colour works is capable of turning out anything from a finished dyestuff to mustard gas or any new product that may come along is untenable. What is really wanted in this respect is a body of alert, scientifically and technically trained chemists. The best guarantee for the requirements of "chemical warfare" in the future is the possession of a successful colour industry, for the chemist best suited by training and habit of mind to cope with an emergency problem is the colour chemist.

United States.—The dyeing industry of the United States during 1910-21 grew commensurately with the textile industries. An important advance was made in the production of fast colours on cotton goods. This was in keeping with the rapidly extended use of cotton in high-grade wearing apparel and the increase of steam laundries, displacing household washing. Modern laundry methods of rapidly cleansing and whitening fabrics necessitated the use of strong chemicals, destructive of the colours formerly employed in dyeing cotton. The demand for laundry-fast colours was met by the introduction of the so-called "vat" dyes of which indigo was long the only representative. The extended use of the dye known as sulphur black to take the place of aniline black for cotton hosiery and piece-goods was also worthy of note. The silk industry in America also grew largely, consuming more raw silk in manufactures than any other country. This led to the great extension of silk-dyeing, chiefly in the industrial centres of South Manchester, Conn., Paterson, N.J., and Lancaster, Pa.

The World War at first threw the dyeing industry in the United States into confusion owing to the uncertainty of trade relations with Germany, the more so when the Allied blockade put a complete embargo on Germany's exports. It was then seen how dependent America had been on Germany for dye-stuffs, and it was estimated that manufacturing industries with products valued at about $4,000,000,000 might soon be thrown completely out of gear by a lack of dyestuffs. In the confusion which resulted all manner of expedients were adopted in the production of colours with a consequent reduction in the fastness and quality of dyeing. Dyestuffs became so scarce that exorbitant prices stimulated the erection of many dyestuff factories in various parts of the United States. Large amounts of capital were freely invested in the new industry, and many chemists became engaged in dyestuff research and manufacturing.

Previous to the war the United States had a small dyestuff industry distributed among about five plants. The manufactures, however, were limited chiefly to the assembling of the coal-tar intermediates imported from Germany for the production of the finished dyes, so that the new industry had to be built from the ground up. To the great credit of the American chemist and chemical manufacturer it may be said that in a very short time the more important dyes were successfully made in the United States in such quantity that practically no dye-consuming industry was forced to shut down by reason of a lack of dyes. Indigo and sulphur black were soon produced on a large scale, as well as the required acid dyes for wool and silk, in the case of the basic dyes, and a complete line of the direct cotton dyes. In 1920 there were 2,200 manufacturing dyestuffs and related coal-tar chemicals. These employed about 7,600 chemists and nearly 20,000 workmen and the total value of the finished products amounted to over $122,000,000. There were 256 different intermediates manufactured, and 360 different dyes. The total production of dyes amounted to over 88,000,000 lb. as against a pre-war importation of about 70,000,000 pounds. The total value of the finished dyes was given as $95,000,000, so that the average price per pound was about $1.07. Over 18,000,000 lb. of synthetic indigo was made, about twice the pre-war importation, indicating great extension in the production. The American association was engaged in making the larger part of the nitro-dyes, and also grew up many of the related branches of the coal-tar chemical industry, such as colour lakes for paints, lithographic and printing inks; coal-tar pharmaceuticals; flavouring and perfume materials; photographic chemicals and synthetic tannins and resins. The great growth of the industry created a constant demand for increasing quantities of coal-tar distillates, which form the raw materials of the dyestuff industry, and this led to a rapid increase in the number of by-products coke ovens. In 1920 the production of coke in by-product ovens amounted to about 60% of the total.

The great production of dyes in the United States during the period 1917-21 led to the building up of a considerable export trade, particularly to South America and the Orient. The total dyestuffs exported from the United States in 1920 amounted in value to nearly $80,000,000, of which $22,450,000 was for coal-tar dyes. This export trade, however, showed a rapid falling off from the beginning of 1921, due both to the general business depression throughout the world and to the fact that the German dyestuff manufacturers were again active in foreign trade.

At the close of the war the American dyestuff manufacturers quickly realized that unless they had suitable Government protection they could not maintain aggressive competition from Europe. In 1916 they petitioned for, and obtained the passage of, a bill placing a tariff of 35% ad valorem and a specific duty of 5 cents per pound on most dyes. When hostilities ended certain Government regulations were also applied to the importation of dyestuffs and related products from Germany so that such importations were licensed to bona fide consumers and were limited to dyes that could not be satisfactorily obtained from the American manufacturers. In the meantime Congress was petitioned for an embargo on importation of dyes from foreign sources except under adequate licence regulations which would restrict the imports to dyes not manufactured in the United States. This was in keeping with a similar action by Great Britain, France, Italy and Japan, all these countries deeming it highly expedient to foster and build up a self-contained dyestuff and coal-tar chemical industry as a measure of national defence.
In the matter of natural dyes, the United States has long occupied a leading position. Many of the principal natural dyes are of American origin. Logwood, fustic, cochineal and the red-woods are all American products, discovered in, and still obtained from, Mexico, Central America and South America, as well as the West Indies. During the war a product very closely resembling fustic and known as osage orange was also developed in the United States and in 1921 was being produced in considerable quantities. As the dye usually employs the colouring matters of the dyewoods in the form of suitable extracts, there has long been developed in the United States a considerable industry in the manufacture of these extracts, generally in connexion with the manufacture of tannin extracts. This industry is in no way associated with the coal-tar dyestuff business. The great scarcity of dyes during the early part of the war resulted in an abnormal expansion of the dyewood extract industry, which rapidly declined as the manufacture of synthetic or coal-tar dyes increased. In former years natural indigo was extensively used in dyeing, and in early colonial days large quantities of this dye were cultivated in the south. As the growing of cotton increased, that of indigo was neglected, so that most of the indigo used in the United States was imported, chiefly from the Far East. A considerable supply, however, has been obtained from Central American provinces and the West Indies. The advent of synthetic indigo soon displaced the natural product, so that little of this vegetable dye was used in America, although the United States in 1921 manufactured all it needed of this most important dye. After the war, owing to the shifting of the centres of trade, the United States became an important market for the sale and manufacture of furs. This resulted in the building up of an extensive industry in the dyeing and finishing of furs which will without doubt become firmly established as an important adjunct to the general dyeing industry in America.

**DYSENTERY (see 8.755**).—This term is now employed to designate a clinical syndrome characterized by the passage of blood and mucus consequent upon the pathogenic actions—primarily upon the large bowel, leading to ulceration—of certain animal or vegetable forms of life. The advances in our knowledge of dysentery made during 1910-20 were considerable, and were in great measure due to the combined independent efforts of bacteriologists, bacteriologists and entomologists in their unremitted investigations and laboratory researches, to their fruitful collaboration with the physician, also to the extensive experience gleaned through the World War. Dysentery as a disease is widespread throughout the world and works in all continents and many countries have shared in the progress of it. This was, moreover, essential, as certain causal organisms amongst the helminths can only complete their life-cycle in the particular regions where their primary host, a lower animal, exists in nature.

Again, climatic factors play a rôle in the incidence of certain types of dysentery; and the organisms, their rôle and specific lines of treatment and prevention, can be best studied where the disease prevails. Thus American workers in Manilla firmly established by experiments on condemned prisoners that there is but one, *Entamoeba histolytica*, of the five amoebae found in man which is pathogenic to him, and finally cleared up the confusion by determining its life-cycle and differentiating it from the *E. coli*, an amoeba living also in the large bowel of man.

From Hong-Kong we learned the specific action of cimetine, an alkaloid obtained from *Iphecaena*, on amoebae; and its application with such beneficial results to man was first made in India. Though amoebic dysentery was not until recently considered a disease of the tropics, and rare in temperate countries, relative researches on inhabitants of several temperate countries show a small percentage to harbour the *E. histolytica*, some without complaint of dysenteric symptoms. The conditions of climate, sanitation, food and living may favour individual resistance as well as susceptibility to acute symptoms. Recently a few workers in England have concluded that there are two or more strains of the *E. histolytica*, distinguishable by the size of the cyst each forms. French physicians in Indo-China have observed that in one region the *E. histolytica* gives rise to more severe dysentery and is less amenable to treatment than in another, thus raising the question of a difference in virulence amongst strains.

In Manilla in 1916 a new and distinct species of *Bacillus dysenteriae*—*Bacillus dys. Shiga*—was first found.

In England and France the presence of bacteriophage has been determined. If a few drops of the filtrate from a culture of the dysentery bacillus Shiga be placed in a new growth of this bacillus, the micro-organisms are dissolved. The action is considered due to the development of an ultra-microscopic micro-aggregate which destroys the bacillus and appears to be specific.

As dysentery may be due to diverse organisms, the causal one or its generic name is employed to specify the origin, thus—amoebic, bacillary, *Spirochaetic*, ciliar and helminthic dysentery. When there are evacuations of blood and mucus associated with inflammation and ulceration, not due to an organism which acts primarily and specifically on the lower bowel, but which may primarily attack another part of the body (e.g. tubeercle, syphils), or to carcinoma, or due to an impacted foreign body or mechanical irritation, the condition is termed, to distinguish it, pseudo-dysentery. When an ulcer is low down it can be termed proctalgia, and in women proctitis.

It is important to determine the causal organism in a sporadic dysentery case or in an epidemic, not only because of the specific treatment necessary but to assure adequate prevention of its extension; and laboratory collaboration for this is essential.

It has been amply exemplified that dysentery cannot be diagnosed on the presence of blood and mucus in the stools with accompanying abdominal pain and tenesmus. One or more of these symptoms may be absent, for they depend on the extent or site of the ulceration. In the contact or healthy carrier of the *E. histolytica* there may be no signs past or present, the *E. histolytica* of the carrier being only a harmless commensal with the human host, and the first sign of the presence of the disease may be a liver abscess, a very rare condition outside tropical regions. It is only by investigating these contact carriers in the laboratory that the disease can be detected from cysts in the faeces.

Dysentery has always been the most dire disease accompanying war. During the World War, despite our greater knowledge of its causes and of prophylactic measures to counteract it, its invaliding rôle was considerable in all armies, especially those fighting in tropical countries where the conditions favoured it, and in parts of eastern Europe where sanitary control was not scrupulously exercised and there was a large number of admissions to military hospitals which follow testify to its ravages amongst British troops, and many others there were who did not seek hospital treatment. The comparatively small death-roll was no doubt due to the application of the advances in our knowledge that dysentery may be due to diverse organisms, each having a specific line of treatment to be directed against it. Most deaths were due to *Bacillus dys. Shiga*.

In France there were 11 cases in 1914; 1916, 5,764; 1917, 6,531; 1918, 12,211 cases—figures which are relatively small when compared with the number of troops there. In East Africa 1917, 9,359 cases, 317 deaths; 1918, 1,636 with 38 deaths. In Mesopotamia 1916 (6 months), 1,939 cases with 126 deaths; 1917, 4,860 with 151 deaths; 1918, 5,458 with 26 deaths; 1919, 1,919 with 81 deaths. In Italy 1918, Forward Area, 897 cases with 17 deaths; Lines of Communication (Toranto), 146 cases. In Salonika 1916, 5,087 cases with 152 deaths; 1917, 5,842 with 124 deaths; 1918, 9,318 with 155 deaths. On the Gallipoli Peninsula figures were not obtainable, but it is estimated that nearly every soldier who landed on the peninsula suffered from dysentery or diarrhoea and few escaped the former disease. Several hundred cases of dysentery are caused by the culture of fresh sterilized water, fly pests, fatigue, hastily improvised resting places and sanitary arrangements, prolonged periods in trenches—all were important factors conducive to susceptibility in man. In Italy, for example, the dysentery spread very rapidly amongst the troops, and the number of admissions to military hospitals which follow testify to its ravages amongst British troops, and many others there were who did not seek hospital treatment. The comparatively small death-roll was no doubt due to the application of the advances in our knowledge that dysentery may be due to diverse organisms, each having a specific line of treatment to be directed against it. Most deaths were due to *Bacillus dys. Shiga*.

In the United States, dysentery during the war while not particularly virulent was sufficiently prevalent to warrant a study of its incidence. The figures for the whole country show that in 1917, 1918, and 1919, respectively, 7,310, 3,665, and 3,844 cases were reported. From a study of the mortality figures we find that in the same years the number of deaths were 97, 38, and 51, respectively, a very low percentage compared with the mortality from pneumonia. The incidence of dysentery was observed to be greater in America than in other countries, and was probably due to unsanitary conditions and unhygienic practice. From the reports of the United States sanitary commission we learn that the great majority of cases occurred amongst the negro troops, and that the ratio of cases was much higher in the tropical than in the temperate regions. In 1919 the mortality was reported as 2.5 per cent of the cases, and of this mortality the number due to dysentery was 3.9 per cent, as compared with a mortality of 3.2 per cent due to pneumonia. In tropical and sub-tropical regions the percentage of amoebic to...
DYSENTERY

other dysentery cases was approximately 12. More particularly in
Gallipoli combined infections were not uncommon and there were
cases suffering from dysentery and enterica at the same time.
During 1920, of 6,193 returned troops chagrin was noted for
dysenteric cases. Stools were still harbouring E. histolytica and over 80%
of these were intermittently or constantly passing blood or mucus; two acquired a liver abscess when in England as a complication of dysentery. One case of
B. dysenteriae-+++; one case had mixed amoebic and bacillary (Shiga) infection, and three mixed amoebic and sporadic, and six soroioic dysentery.

By reason of the variety of the causal organisms, the clinical symptoms and pathological characters to which each gives rise and the specific treatment directed against it, each type of dysen-
tery has been a preparative to a common type, amebic and bacillary, discussed in greater detail.

Amebic Dyentery (also called Ameboiasis, Loschialis or Tropical Dysentery, the latter because of its early endemity and greater incidence there).—The causal organism, E. histolytica (Loesch 1871), a species of the genus Entamoeba, affects man alone in nature, though the dog and cat and recently the pig are infected experimentally. The E. histolytica in its life-cycle in man passes through three stages—a large vegetative stage when living within the tissue in a large bowel, then an amoebicidal, and lastly a pre-cystic or minute stage found in convalescents and in carriers when the amoebae are much smaller, live on the mucous membrane within the bowel, but which may pass through the menstrual discharge as well as the peritoneal cavity and its symptoms following; and a cystic stage. The amoebae increase in numbers by division of the parent into two, but it is only the pre-cystic or minute stage which is capable of germinating. The amoebae, in fact, rounded or ovoid form, develop a firm outer shell and are transformed into cysts with the characteristic one to four nuclei and containing chromatoid rods which possibly act as food stores. Since it is impossible to grow amoebae in the laboratory, the amoebae, once infected, the continuance of the Entamoeba in nature is thus provided for. These cysts do not resist drying, but retain their vitality for two weeks if kept moist in the faeces or in water. They may remain viable for a month by direct contamination with faeces through handling soiled linen, by flies carrying them on to food, by soil or by drinking contaminated water; and prophylaxis must be directed accordingly.

Clinical symptoms are the characteristic hallmarks of infection, its by chronicity with tendency to recrudescence of symptoms.
The onset is insidious, the sufferer first noticing a feeling of debility and lassitude with an increase of stools, soft in character, for several days. These may clear up and be the only sign noticed or may light up again and assume true dysenteric characters months later. Most often the initial stage is followed on by an acute exacerbation of symptoms, dependent in their degree upon the extent of the infec-
tion, in the large bowel. Then an amebicidal, soaked in alkaline enteric fluids, occurs and the symptoms of the primary amebic ulcer may appear. The ulcer may penetrate through the outer muscular walls of the large bowel, giving rise to perforation and accompanying peritonitis, or, by penetrating a blood-vessel, they may be carried off in the blood stream and give rise to an abscess in the liver, to which the blood first takes them, or, as most exceptionally happens, an abscess in the brain or elsewhere. Healing is brought about by the development of a wall, which leads to a thickening of the walls and constuction of the lumen which, if extensive, produces subsequent chronic constipation; or, what is rare, to stenosis and blockade. Diagnos is quickly made by examination of the stools in the normal case, and the development of both amebae and cysts in the stools of the patient, which should include a free flushing of the bowel by a dose of castor oil with tinct. opii; or, followed by magnesium (or sodium) sulphate in hourly or two-hourly half of dracon dose. A small dose of ipecac may be necessary to relieve the abdominal pain and straining. The diet must be light and easily assimilated. Milk and raw foods should be withheld.

The symptoms subsist for one to three weeks and no further trouble may supervene. However, the patient not infrequently is left with symptoms, generally slight, from cicatization of the bowel; or, from persistence of the entamoeba, becomes a convalescent carrier (Chagas); or, it may develop acute symptoms. The treatment of the carriers is one of considerable importance not only for the individual, but may develop acute symptoms or a liver abscess. But some of the carriers present no symptoms at all and carriers pass the etiological power of the entamoeba to others. The life-history of the disease is a remarkable one for the use of appendicectomy wounds not having given sufficiently encouraging, with solutions of quinine, tannin or, as recom-
ended by the French, of neosalvarsan. Indigo-Carmin is a local, and should be all times kept in the present of every person who is known to be infected, for the carrier to reside in a temperate region. Amebic hepatitis and a small abscess of the liver are cured by injections of emetine hydro-
chloride or neosalvarsan, but a large abscess needs surgical inter-
vention.

Bacillary Dyentery.—While sharing with the amebic the clinical dysentery syndrome above described, it differs therefrom in the shorter of the incubation period, generally 24 to 72 hours, by its sudden acute onset with elevation of temperature, which may persist several days or more, and other symptoms of toxemia; extreme uncontrollably, a local and regional type of dysentery, and occasionally hypotonic, typhoidal or urico-gangrenous in character. Outbreaks of dysen-
tery in armies, prisons, concentration camps and ships are generally localized to certain types or regions and occur only in places where disease occurs, but in temperate regions this latter fact is practically limited to sporadic cases.

The bacillary dysentery group comprises species of bacilli geneti-
cally related: 1. B. dysenteriae Shiga (Chagnon and Widal 1888, Shiga 1898, Kruse 1900), a well-defined homogenous species, known as the true dysentery bacillus since it alone contains endo-
toxins which are pathogenic to man and experimental animals.
2. B. dysenteriae Shiga (Smith 1921, Andrews 1918, Broughton Alcock 1918), another homogenous species and one which contains endotoxins acting severely on rabbits but less pathogenic to man.
3. B. dysenteriae Shiga (Smith 1921, Andrews 1918, Broughton Alcock 1918), another homogenous species and one which contains endotoxins acting severely on rabbits but less pathogenic to man.
4. A further group which employs bacilli characterizing it from the general properties, and power to ferment certain sugars, e.g. Bacil-
lus of Strong, Castellani, Guy d'Herelle and others, each capable of producing a mild clinically dysenteric syndrome in man.

Clinical symptoms are the characteristic hallmarks of intestinal lesions and the toxicity of the causal bacillus. Infections with B. dys.
Shiga are characteristically the most severe. The ulcerative lesion is not confined to the seven or eight sites which characteristically occur in the large bowel, causing inflammation with accumulation of lymph, and necrosis of the submucous layer and superficial erosions of the mucosa. An exudative fibrinous exudate is formed and spread over the surface of the bowel wall, and the superficial ulcers with raised red edematous edges. These may
deepen by continued microbial action and even penetrate through into the peritoneum, lead to peritonitis, or gangrene may set in in the damaged necrose tissue, and in either case death follows unless urgent intervention is early. Repair proceeds along the same lines as in amoebic cases, but, the ulcers being generally more superficial, the permanent damage is not so great.

The stools have a characteristic microscopic appearance, as numerous epithelial cells and large macrophage cells are present in the mucus. Macroscopically the stool most often consists of mucus, like cloudy-grey jelly streaked or stained by bright red blood, or the mucus may be bile-stained in a diarrhoea-like stool or, in very severe cases, there are sheets of necrosed mucosa.

The bacillus dysentery is readily isolated by culture within the first days, but afterwards it becomes difficult as the microbial life in the necrotic tissue becomes a flora of proliferating organisms. The bacillus of Shiga, which has been the only species isolated from the blood stream, has been found therein in only four or five cases. The bacilli dysenteriae, as judged by post-mortem findings, pass to the mesenteric glands along the lymphatics, but are arrested there. After the cessation of the symptoms the percentage of cases retaining the causal organism in the bowel is very small, as testified in the figures given above. If the patient becomes a carrier of *B. dys. Shiga* the stools will continue to be in part muco-purulent, even up to three or more years. The property of agglutinating the causal organism and other strains of the same race is present in the blood after the first week and may last for only eight or ten days in mild cases, but when the infection is prolonged this property of agglutination persists for a longer period. *B. dys. Shiga* infected cases generally agglutinate also the *B. dys. Flexner-Hiss* in a lesser degree, but the converse does not hold. *B. dys. Flexner-Hiss* cases agglutinate several species of the group, rarely only the strain isolated from them. *B. dys. Schnitz* cases do not appear to develop agglutinins even for their own organism.

The general and symptomatic treatment given above for amoebic dysentery is similar, but the specific treatment widely variant, and this is directed towards neutralizing the toxins which further the clinical symptoms. It is the anti-Shiga serum, prepared by inoculating the bacilli with their contained endotoxins into the horse, which is the most efficacious; and as it is the infection with *B. dys. Shiga* which is most severe, its utility is considerable. It has been employed also in cases due to *B. dys. Flexner-Hiss* with apparently satisfactory results. A polyvalent horse anti-serum made by inoculating strains of both these groups has also been extensively given in cases of either infection and, with this, amelioration of symptoms has followed. The injection of anti-serum should be as early in the illness as possible and in large doses dependent upon the severity of the cases, e.g. 60 c.c., 40 c.c., 20 c.c., on successive days in a severe case; and with this treatment free saline purgation is continued until the stools become fecal. Thereby rapid amelioration follows, complications are rare, and the bacilli quickly eliminated from the body. In the early complications of bacillary dysentery anti-serum therapy again gives good results.

The general prophylactic measures to be taken are comparable to those against infections with *E. histolytica*, but it should be remembered that bacilli are lower vegetable organisms and can proliferate in suitable environment outside the body. Dependent on several factors, bacillary is more contagious than amoebic dysentery. Encouraged by successful results following inoculations of typhoid with an amoebicidal vaccine, some series of inoculations with a vaccine of *B. dys. Shiga* were made in epidemic areas during the war, as this was the bacillary organism so prevalent and so toxic in epidemics during war conditions. Its contained toxins give rise to acute local reactions and as a result antitoxin formation, i.e. by having the heat-killed bacilli with normal serum (serum-treated) or with specific horse anti-serum (sensitized), or by inoculating both specific anti-serum and bacillary emulsions on approximating days, or by giving an absorbed specific anti-serum and bacillary emulsion simultaneously, or by emulsifying the bacilli in oil. The series of inoculations made by various workers gave encouraging results. Vaccine-therapy employed to rid the convalescent carrier of *B. dys. Shiga* has not been successful. In striking contrast with *B. dys. Shiga* the killed and untreated emulsions of the *B. dys. Flexner-Hiss* group give rise to no reaction, even in high doses.

**Spirochaetic Dysentery, due to Spirochaeta eugyriae** (Le Dantec 1900, Wener 1910, Fantham 1916).—Investigation of this type of dysentery is in continued progress, and evidence is increasing that this spirochaeta is capable of living upon the mucous membrane of the large bowel and maintaining a chronic form of dysentery. It is seen in considerable numbers in the mucus and occasionally also within the lining cells of the glands. Occasionally there is also blood present with the mucus which is being continually passed with feces. An acute condition with passage of blood and mucus only has been observed. This spirochaeta is resistant to intravenous injections of neosalvarsan or tartar emetic alone; and treatment by an arsenic-containing compound, some at the same time as a local washing of the bowel with irrigations containing eucalyptus has given the most encouraging results.

**Helminthic Dysentery.**—The chief helminths which give rise to dysentery are the bilharzia worms, *Schistosoma mansoni*, in Africa, South America, West Indies, and *Schistosoma japonicum* in the Far East. Bilharzia dysentery is characterized by the passage of mucus and clots of blood due to the presence of the ova which the adult female worm lays in the capillaries of the wall of the rectum. This form of dysentery is extremely common in Egypt. The discovery of the intermediate snail host and the specific action of sodium or potassium tartrate in killing these worms in man is an advance of considerable value.

Other trematodes **which may cause dysenteric symptoms are Fasciolopsis buski, Heterophyes heterophyes and Paragonimus westermani**. Normally the last is a lung fluke, but it occasionally occurs in cysts of the intestinal wall, when it gives rise to the passage of blood and mucus in the stools.

In heavy infections with hook-worm (*Ancylostoma duodenale*, present in England in the mines of Cornwall, and *Necator americanus*) blood and mucus are sometimes passed in large quantities, and these cases may be mistaken for true dysentery. Thymol given orally rapidly kills off these worms.

**Ciliar Dysentery, due to Balantidium coli** and known to occur in Japan and the Philippine Is., is rare elsewhere and needs but mention. A specific remedy has not yet been found.

(W. B. A.)
EAKINS, THOMAS (1844-1916), American painter (see 8.792), died at Philadelphia June 25, 1916.

EAST, SIR ALFRED (1849-1913), English painter (see 8.899), was knighted in 1910, and died in London Sept. 28, 1912.

EAST AFRICA: MILITARY OPERATIONS, 1914-8.—The outbreak of war found all the combatants in East Africa unprepared for offensive operations. But the advantage inclined to the Germans, for they had forces on the spot sufficient for defence, which was not the case in respect to the British protectorates bordering German East Africa. The Belgian Congo was also without adequate means of defence.

Hostilities were entirely unexpected. So little was the Government of British East Africa anticipating war with its German neighbours that the bulk of the Protectorate Force, a battalion and a half of the King’s African Rifles—negro troops officered by Europeans, together with the Uganda battalion of the same force, was, in Aug., 1914, engaged against recalcitrant tribesmen in Jubaland, on the borders of Italian Somaliland, 500 m. away. In short, all the British protectorate lay open to invasion. But Lt.-Col. von Lettow-Vorbeck, commander of the forces in German East Africa—the one German soldier who earned a high reputation in the colonial campaign—knew that his opponents would be reinforced from overseas, and contemplated nothing more than an offensive-defensive. His total force, when the war began, was just under 5,000, including 260 Europeans.

The British had the advantage of the command of the sea, and the ports of German East Africa lay open to attack. So keenly did the governor of the protectorate, Dr. Heinrich Schnee, realize their helplessness that one of his first orders was to forbid any action to be taken which would lay the ports open to bombardment. As in the case of the governors of British Dominions and Colonies the governor of German East Africa was also commander-in-chief of the forces, and Dr. Schnee asserted his authority in that respect despite the protests by von Lettow. Indeed, Dr. Schnee and many of the Government officials at Dar-es-Salaam, the capital and chief port, had “little stomach for a fight,” and when on Aug. 8 two old British cruisers, the “Astraica” and “Pegasus,” steamed across from Zanzibar to Dar-es-Salaam, by the governor’s orders and without the knowledge of von Lettow, negotiations for surrender of the port took place. The ships had no force to garrison the town, but the Germans signed an agreement “which forbade us to undertake any hostile act in Dar-es-Salaam, while the enemy was not so bound” (von Lettow). The same day Dr. Schnee left Dar-es-Salaam for Morogoro, a pleasant hill station with European amenities, 140 m. inland by train. The high-power wireless station at Dar-es-Salaam which communicated with Berlin was destroyed.

Despite the attitude of the governor, von Lettow determined to carry on the fight to the utmost possible limit. He had taken up his command in East Africa in Jan., 1914 convinced that “the universal war,” as he calls it, might be imminent, and that if it broke out it was his duty to combat as many of the enemy as he could and for as long as he could.

The country was highly favourable to protracted defence by a resolute and ruthless commander, such as von Lettow proved. A very large proportion of the country is covered by “bush,” that is an undergrowth sometimes more or less open, but usually dense, from which rise trees to a height of some 30 feet. This bush covers hills and valleys and even dry desert, and in the coast region develops into luxuriant jungle. Much of it is infested by the tsetse fly. Some areas are covered with dense forests, others with elephant grass growing 6 to 10 or more feet high. The valleys of almost all the rivers are swampy and fever stricken; during the rains vast areas become inundated; in the dry season, away from the rivers, water is often lacking; wild animals constitute a real danger, especially to the wounded. The climate is tropical and very unhealthy save on a few high plateaux, and in certain hill districts malaria is endemic. These conditions existed throughout German East Africa, a country nearly double the size of Germany. The “bush” was the greatest asset of the defence. As the Germans wrote (in 1918), “in the African bush, with its limited visibility, it is practically impossible to enclose an enemy determined to escape.”

The method is simple—when a force is so hard pushed that destruction is inevitable if resistance continues the order is given to “line for bush,” whereupon the force splits up into parties of threes and fours and vanishes into the bush. Pursuit is hopeless, and the scattered enemy, if well trained, reassembles at an appointed rendezvous. Moreover, so dense is the bush over many thousands of square miles that considerable forces may be on the march within a mile of one another, without being aware of each other’s existence. These factors explain why, given sufficient armament and food, von Lettow was still in the field when the Armistice was signed in Europe, in spite of his isolation and the superior forces that after 1916 were brought against him.

Von Lettow had drawn up his plan of campaign before hostilities began, and as the best means of defence had determined to take the offensive against the enemy’s most sensitive spot. This he rightly conceived to be the line of the Uganda railway (which runs from Mombasa to Victoria Nyanza). The line is parallel to and about 30 m. distant from the (then) Anglo-German frontier. It passes through the Highlands, where the British European population is concentrated with Nairi in chief town. On the “German” side of the frontier are the Usambara hills and the Pare mountains, presenting a wall-like face to British East Africa, with few passes. But between the northern end of the Pare mountains and the towering slopes by Kilimanjaro, which rise farther north, was a distinct “gap” forming the usual passage-way between the German and British protectorates. A railway from Tanga, the port of Usambara, ran to Moshi, on the slopes of Kilimanjaro, and at the western end of the “gap.” At its eastern end, in British East Africa, is Taveta. This place was seized by the Germans on Aug. 15 and was used by them as a jumping-off ground for raids on the Uganda railway, raids which included the design of occupying Nairobi.

At the outset, or shortly afterwards, a design was also entertained by the Germans of capturing Mombasa and holding it long enough to wreck the harbours and destroy the great railway bridge from the island to the mainland. This was rendered possible by the return to Dar-es-Salaam in Sept. of the cruiser “Königsberg” (it had sailed from that port shortly before the declaration of war). It was then arranged that a force should march along the coast from Tanga on Mombasa, while the “Königsberg” attacked it from the sea. On Sept. 20 the “Königsberg” appeared off Zanzibar and destroyed the “Pegasus,” which was in the roads undergoing repairs. Mombasa, was to be attacked on Sept. 25. But the “Königsberg” did not keep its engagement, ships of the Cape Squadron under Vice-Adm. King Hall intervening. Harried by the British, but not overtaken, the commander of the “Königsberg,” Capt. Loof, in Oct. ran his ship aground in the shallow waters of the Rufiji river, south of Dar-es-Salaam. The land force which was to cooperate with the “Königsberg” was already at Vanga, just within the British border, and it began its march of 50 m. along the coast on Sept. 20. It attacked Gazi, 25 m. from Mombasa, on Sept. 23, was repulsed and forced to retire to the frontier on Oct. 1.

Apart from raids along the coast and on the Uganda railway the Germans made a series of incursions into the frontier districts of Uganda, the Belgian Congo, Rhodesia and Nyasaland. For

1 Von Lettow records that at first many officers were loth to obey his orders, because, apart from the governor’s attitude, they believed that “under the Conny Act” they were obliged to be neutral. In fact the German Government made neutrality proposals on Aug. 23, 1914. These were rejected by the Allies (see Africa: History).
these minor operations the Germans had the advantage of a central position, interior lines and better means of communication. The railway from Dar-es-Salaam to Kisgoma on Lake Tanganyika had been completed about six months before the war began, and during Aug. the small steamer "Hedwig von Humboldt" was manned and armed by German sailors from Dar-es-Salaam, sank the only hostile boat on the lake, a small Belgian vessel. Thus the Germans had command of the 400 m. of waterway on Tanganyika. On the two other lakes, Nyasa and Victoria, the British, however, early obtained command.

The operations in all theatres other than on the British East Africa frontier were regarded by both sides as subsidiary. At first the British had to consider purely defensive measures. At the outset the East Africa Protectorate Force was under the command of Lt.-Col. L. E. S. Ward. Volunteers were called for, and engineering work proceeded, but it was not until Oct. 1914, that the white settlers in British East Africa. The King's African Rifles were recalled from Jubaland and were in action by September. An Arab detachment was raised on the coast by Lt. (subsequently Maj.) A. J. B. Wavell (an adventurous soldier who had made the pilgrimage to Mecca), and it rendered good service until its gallant commander was killed in action Jan. 6 1916. But outside help was needed, and the Government of India consented to send a force, officially called as "Indian Expeditionary Force B." The first regiment, the 29th Punjabis, arrived at Mombasa at the end of Aug., and with them Brig.-Gen. J. M. Stewart, who took command.

Plans for an offensive were now formed. It was decided that the bulk of the force from India should land at Tanga and occupy the Usambara Highlands, the most healthy and most developed region of German East Africa, and in which lived the majority of the German settlers. The landing finished, it was intended to advance along the railway from Tanga to Moshi. At the time Tanga was attacked Gen. Stewart was to demonstrate against Taveta, and to sweep round by Longido (N. of Kilimanjaro) to Moshi. Brig.-Gen. A. E. Aitken was selected to command the Tanga expedition. India was then being heavily drained of troops for service in France, and for East Africa troops that were not all of first-class quality had to be employed. The strength of the force was about 7,000, including one British unit, the 2nd Batt. Loyal North Lancashire Regiment. The force sailed from Bombay towards the end of Oct. and the transports arrived off Tanga harbour early on Nov. 2.

The attack had been expected, news of the expedition having reached the Germans through captured Indian mails, and at the end of Oct. von Lettow had arranged with the district commissioner, Auracher, that Tanga should be defended, whatever were the instructions of Dr. Schnie. On receiving a summons from the commander of H.M.S. "Fox" for unconditional surrender Herr Auracher went on board and stated that Tanga was an undefended place and said that he must obtain special instructions. The British, therefore, refrained from bombarding the town, and meanwhile von Lettow was hurrying down reinforcements by rail. On the evening of Nov. 2 Gen. Aitken landed one and a-half battalions at Ras Kasone, two m. east of the port. It advanced through dense jungle to the outskirts of the town, became heavily engaged and had to fall back. The British were reinforced and the fight was renewed on Nov. 3. It was indecisive, but in the evening the officer in command, Capt. Baumstark, believing that Tanga could not be held against another attack, had collected his force four m. W. of Tanga, leaving patrols only in the town. That evening von Lettow arrived, passed through deserted Tanga, and reconnoitred the British camp at Ras Kasone. Von Lettow's plans for the morrow were, while defending Tanga itself, which he reoccupied with two companies of Europeans, to place most of his troops in the bush along the Ras Kasone-Tanga road and attack the enemy in flank. The fight was renewed on the fourth. The British and Indian troops advanced through coconut and rubber plantations and entered Tanga town. By this time fighting was severe and general, and so von Lettow was forced to make a counter-attack on the British left, which, he states, he was able to outflank by means of his two reserve companies. Supported by machine-gun fire, this outflanking force was able to push its attack home, and soon the British were in full retreat to Ras Kasone. The fight continued in the dense bush till after nightfall, the Indian and British troops eventually getting back to their camp. The next day, Nov. 5, they were reembarked, and taken to Mombasa. The attack on Tanga had been a complete failure. The casualties in Aitken's force were, according to an India Office statement, 705, including 141 British officers and men. Sixteen machine-guns were lost. Von Lettow gives the German force engaged as "little more than 1,000." Fifteen Germans and 54 askaris were killed. The number of wounded was not stated. After this action Aitken was removed from his command, but in Dec. 1920, after a fresh investigation by the War Office, he was declared "not guilty of culpable negligence," and was awarded the O.B.E. for the failure.

The simultaneous attack on Longido, N. of Kilimanjaro, also failed. The Germans—about 800 strong—were strongly posted, and covered the only permanent water supply available. Stewart's attacking force numbered about 1,500. After a night march of 15 m. across a waterless region, the attack began on the morning of Nov. 4 and continued till 7:30 P.M. The whole movement—typical of many operations in this theatre of war—was tersely summed up by an officer who wrote, "We marched all night, attacked at dawn, fought all day, and then having failed to turn the Germans out, came back here as we had no water."

Following the failure at Tanga no new offensive was undertaken by the British until the early months of 1916. The intervening period was one of preparation on both sides, with, on the part of the Germans, frequent and sometimes successful attempts to raid the Uganda railway, and on that of the British, defensive and retaliating raids of the same kind. Of the engagements of this period that at Jassin was the most notable. Following the failure of the German march on Mombasa, the British force on the coast advanced S., crossed the German frontier and occupied (Jan. 2 1915) the buildings of Jassin plantation, which was garrisoned by some 300 Indian troops. Von Lettow thinking that a land attack on Tanga was intended got together a force of 1,500-1,600 men, and attacked Jassin on Jan. 17. After 48 hours' fighting, the Indian troops, having expended all their ammunition and being without water, surrendered. Attempts by the King's African Rifles (in camp 10 m. distant) to relieve them failed. But the German losses, especially in European officers, were serious, and the expenditure of ammunition made a heavy inroad on von Lettow's small stock.

The period of preparation was spent on the British side largely in raising new troops and in the organization of transport. In April 15 Col. M. J. Tighe, who was in charge of the railway, was appointed to command the troops in East Africa and to prepare for the new offensive. His force was increased by two newly raised white regiments, the 2nd Rhodesian and "Driscoll's Scouts" (25th Batt. R. Fusiliers). While parrying the raids on the Uganda railway—which were numerous and daring, but taken as a whole, ineffective—Gen. Tighe organized occasional offensives, such as the successful attack (June 1915) on Bukoba, the German base on Victoria Nyanza for operations against western Uganda. This raid was made by Gen. J. M. Stewart, and it affords an illustration of the great distances to be covered in the East African operations. Natroni headquarters, was 327 m. by rail from Mombasa, the base, and 237 m. from Kisumu, railroad on Victoria Nyanza. Thence Stewart's force had to go by steamer 240 m. before reaching Bukoba. To aid his operations Gen. Tighe began the building of a railway and pipe line across the 70 m. of desert between Voi, on the Uganda railway, and his advanced posts near Taveta.

The other theatres of operation in East Africa were much worse off for means of communication. To reach the German frontier bordering Nyasaland, Rhodesia and the Belgian Congo was a journey of from 2,000 to 3,000 m., including hundreds of miles by Lettow's "little car" on animal and mechanical transport. This involved the employment of vast numbers of carriers.
in regions where local supplies of food were often non-existent. Thus in northern Rhodesia a road 400 m long had to be cut through treckless bush, in which the areas of cultivation were infinitesimal. The Germans were better off in that, besides their two railways, they had constructed several main roads before the war, and during the war other roads and some light railways were laid down. And the German troops had not such long distances as had their opponents to cover on foot. Nor were they troubled by lack of food (at least not before 1917). The natives had been compelled to establish large food depots at all military stations, while Usambara, in or near which the bulk of von Lettow's force was quartered for 22 months, was a land of plenty. But the necessity that they were under of guarding the coast and to a lesser extent the N.W. Aug. 1915. The German forces were organized in as well as the troops proper. This number had been increased by Feb. 1916, when the German force was at its maximum strength, probably over 20,000. Exact figures cannot be given as the number of carriers and batmen who acted as combatants is unknown, but the rule was to arm 15% of them. Von Lettow himself says that the total numbers enrolled during the war were "about 3,000 Europeans and 11,000 askaris (natives); the figures of casualties and captives show that the number of whites on the German side was nearer 4,000, and an official German return gave 2,217 Europeans and 8,897 askaris in the service. But the number of the German settlers in Usambara and other districts, almost all of whom were ex-soldiers and many ex-officers; a few Boer settlers; German residents at Zanzibar who had been allowed by the British to cross to the mainland; some 500 sailors from ships in harbour, including over 400 men of the Imperial navy, and a few visitors to Dar-es-Salaam. These last had come to attend fêtes to mark the formal opening of the Dar-es-Salaam–Tanganyika railway, and among them was a retired Prussian officer, Maj.-Gen. Wahle, who rendered von Lettow good service. The German forces were organized in two main bodies, consisting of 200 askaris and 16 Europeans; a few of the companies were composed almost entirely of whites, two companies were mounted. The askaris were drawn from the most warlike tribes of the country, and were very well treated. Von Lettow himself was ever careful of their needs and shared their hardships on campaign. He won and retained throughout their respect and devotion. Besides his regular force von Lettow had in the earlier stages the help of various levies; and the anti-Moslem policy of Dr. Schnee having been reversed he also obtained the support of a number of Arabs (support which proved of little value). His movements were not, for a considerable time, handicapped by disaffection among the natives; some tribes near the border of British East Africa were deported because of doubt as to their sympathies, and the converts of the British missionary societies were in general regarded as enemies and were very badly treated, many being executed. Fear of a native rising was felt among the Germans when the war broke out, but the fear proved groundless. "It was not" (writes von Lettow) "till the enemy had penetrated the country that the natives became a real danger to us; and then it was indeed very great. The native has a fine sense of the transfer of real power from one hand to the other. Even then, with the natives hostile, the askaris (who had them their women and children and carriers) were faithful to their leader, and more resolute than many of the Germans.

That they obviously had the advantage inspired the German native troops with confidence, and the hard training they had before Nov. 1914 and March 1916 made them, as the event proved, very formidable opponents in their own country of white and Indian troops. And months before the onslaught of Gen. Smuts they had also been rearmed with modern weapons.

On Feb. 28 1915 a blockade of the whole coast of German East Africa was proclaimed, and the British Government stated that German ships had to make "a timely, thorough and thorough effective." The task of the reinforced Cape squadron under Vice-Adm. King Hall in watching 600 m. of coast line provided with many excellent naval harbours was difficult, and in fact several vessels got through. In Dec. 1914, before the blockade was proclaimed, Dar-es-Salaam was visited and the German ships which had taken refuge there sunk. In April 1915, when the Germans were in greatest need of more ammunition, the blockade was broken in a remarkable manner. The "Rubens," an English ship of 3,000 tons seized at Hamburg, had been loaded with arms and ammunition, had ducked the blockade and was reported at sea. (It was expected) was sighted by H.M.S. "Hyacinth" four m. off Mombasa, N. of Tanga. The "Rubens" got into the bay, severely damaged and on fire. The crew fled ashore; the ship was boarded by bluejackets, who found her timbers up and battered down; the party was recalled and more rounds having been fired into the vessel the admiral steamed away under the impression that she would burn herself out" (Brig.-Gen. J. H. V. Crowe). Subsequently the Germans salvaged at leisure nearly the whole of her cargo, though a great part of the cartridges had been damaged by sea water. But there were only 537 Mauser 98 rifles to rearm the force, which previously, for the most part, used the M 72 rifle. (A year later, at another critical period of the war, the Germans were again reared, by another blockade runner.)

The operations against the "Königsberg" also resulted in a valuable addition to von Lettow's armament. The cruiser had remained shut up in the shallow waters of the Ruijfi, but in July 1915 the light-draught monitors "Severn" and "Mersey," sent specially from England, succeeded in setting it on fire. The cruiser was then blown up by Capt. Loof, who with his officers and crew joined von Lettow. The "Königsberg's" armament, which included 10 4-inch guns, was salvaged, and these 4-inch guns landed on the reefs of the Ruijfi. The Germans also recaptured with its guns the 300-ton steamer "Adjudant" (originally taken by the British at Dar-es-Salaam), which had run aground off the Ruijfi in Feb. 1915. The "Adjudant" was transferred by rail to Lake Tanganyika.

Plans for the conquest of German East Africa took shape in the summer of 1915, but their execution had to be delayed until Britain could put a sufficient force in the field. This force was not forthcoming until the close of 1915, when Gen. Botha, Prime Minister of South Africa, having conquered German South-West Africa, agreed to provide a force for service in East Africa. At the time Gen. Twigg had under him 10 regular infantry regiments supplied by India, including the 40th Pathans and the 120th Baluchis brought from France, a squadron of the 17th Lancers (Indians), Imperial Service troops, the 27th and 28th (Indian) Mountain Batteries, and the Calcutta Volunteer Battery. Of white troops there were, besides the two regiments

1 The Usambara line (Tanga-Moshi) and the Central railway (Dar-es-Salaam–Tabora–Tanganyika).
2 Dr. Ludwik Deppe, a surgeon with von Lettow's force, who appears to have kept careful records, states that there were 3,629 casualties among the whites up to the end of Nov. 1917. He puts the casualties of the German force in the field at any one time at 3,300 whites and 15,000 askaris. These included the non-combatant services.
3 In like manner the 4-inch guns of the disabled "Pegasus" were removed and added to Gen. Twigg's artillery. It is noteworthy that the captain of the "Königsberg" had the breech-blocks of his guns thrown overboard, but they were salvaged by the officer commanding the land detachment at the Ruijfi delta.
raised by the settlers in East Africa, the 2nd Rhodesian Regiment, the 25th Batt. Royal Fusiliers and the 2nd North Lancashires (the only regular British infantry unit in East Africa). There were also the battalions of the King's African Rifles, but at that time the value of negro troops was not sufficiently appreciated. Though they were best adapted for warfare in equatorial Africa, they ultimately bore the brunt of the fighting—and, though von Lettow had shown the way, the raising of new native regiments was neglected at first by the British.

The plan adopted by the British in conjunction with the Belgians was for a concerted attack on three sides. The object was not only to defeat the enemy, but effectively to occupy the country, so as to render impossible the splitting up of the German forces into guerrilla bands doubling in all directions (Gen. Smuts). This aim was achieved with one remarkable exception, the Wintgens-Naumann raid (see p.383, note). But when von Lettow was driven eventually into Portuguese territory the whole remaining German force became a guerrilla band, with an unlimited field for doubling and redoubling. The scheme evolved in 1915 was to strike the main blow with the force in British East Africa, whilst the Belgians were to operate in the north-west and a second British force in the south-west of the German protectorate. This second force was gathered on the Nyassa-Rhodesia borders, and Brig.-Gen. Edward Northey assumed command of it in Jan. 1916. When, in March 1916, the Portuguese entered the war, they undertook to guard the southern frontier of German East Africa. Thus the Germans had enemies on every side, and had no opportunity (which the Germans in Cameroon took) of escaping capture by retirement into neutral territory.

When Gen. Botha's Government undertook to send forces to East Africa it had to rely upon volunteers to redeem its promise. But a force already organized and originally destined for service in Europe—the 2nd South African Infantry Brigade (under Brig.-Gen. P. S. Beves) was diverted to East Africa. A mounted brigade under Brig.-Gen. J. L. Van Deventer, and a brigade consisting of five batteries of S.A. Field Artillery, with all necessary administrative and other units, were also formed so that the South African contingent was complete and self contained. Later this contingent was increased by another infantry brigade, a second mounted brigade and the Cape Boys Battalion† (under Col. Morris). All these troops except the 2nd mounted brigade had reached East Africa by Feb. 1916, before the offensive began.

When South Africa furnished this contingent—the largest body of white troops which had taken the field in tropical Africa—the Home Government offered the command to a South African, Gen. Smuts. Smuts was Minister of Defence in the Union Cabinet; the political situation in South Africa was uncertain and he declined the offer. Gen. Sir Horace Smith-Dorrien was then selected for the post, but while at the Cape on his way out, in consequence of ill health, he resigned his appointment. Again appealed to, Gen. Smuts accepted the command and reached Mombasa on Feb. 10. He adopted, with some modifications, the plan of campaign which Gen. Tighe had originated.

Gen. Tighe had had a very difficult task, and the moral of his force, predominantly Indian, had suffered through being so long on the defensive. It altered completely with the opening of the offensive. Before the arrival of Gen. Smuts the railway across the waterless waste between Voi and Taveta had been taken to Serengati, within five m. of the German post on El Odolorbo (otherwise Salvation hill), which blocked the main approach to the Taveta gap. Skirmishing had been going on around Salvation hill since March 1915. The hill was without water, which was taken to the Cape Boys from Taveta in donkey carts. "Strangely enough," wrote von Lettow, "it did not occur to the enemy to interfere with it [the transport] and thus render the mountain untenable." The first action in which the South Africans took part was an attack on Feb. 12 1916, on Salvation. Brig.-Gen. Malleson with the 1st East African and 2nd South African In-

† The "Cape Boys" are coloured men, all with a strain of white blood, from the Cape Province.

fantry Brigades, supported by artillery, assaulted the strongly entrenched German positions, approached through thorn bush. Little progress was made and the Germans, reinforced from Taveta, counter-attacked and compelled Gen. Malleson to retreat. The British casualties were 172, of which number 130 were among the South Africans. They suffered through ignorance of warfare conditions. "The South African Infantry," wrote Gen. Smuts, "had learned some invaluable lessons in bush warfare, and also had opportunity to estimate the fighting quality of the enemy."

Gen. Tighe intended to force the enemy from the Taveta gap by a double movement. One force, under Gen. J. M. Stewart, was to sweep round Kilimanjaro from the north; another, under Gen. Malleson was to attack Taveta. The forces were to join hands at Kahe, a place on the Tanganyka railway S. of Moshi. Gen. Stewart, who had the 1st East African Division (infantry) and Van Deventer's mounted brigade, was at Longido, some 90 m. from Kajjado, the terminus of the Magadi branch of the Uganda railway and Stewart's base for supplies. The chief alteration in Gen. Tighe's plans made by Gen. Smuts was to bring back Van Deventer's mounted brigade to the Taveta side and to use it for a turning movement which would render a frontal attack on Salaita hill unnecessary. The infantry which were to follow up Van Deventer's movement consisted of the 2nd East African Division, of which Gen. Tighe was placed in command.

Four days after reaching Mombasa Gen. Smuts telegraphed to Lord Kitchener that he was prepared to carry out the occupation of the Kilimanjaro area at once; two days later (Feb. 25) Kitchener's sanction for the operation was received. There was a good reason for haste as the Kili-

tions.

The Germans were apparently unprepared for the turning movement executed by Van Deventer's mounted men, who got behind Taveta, and forced the enemy to evacuate Salaita hill, though on this point von Lettow asserts "our want of artillery obliged us to look on quietly while the enemy executed unskilful movements at no great distance from our front."

Van Deventer's movement began on March 8, and on the next day his men were astride the Moshi road behind Taveta. Salaita hill was evacuated by the Germans on that day and new positions were taken up by them covering the gap between the North Pare mountains and Kilimanjaro. Von Lettow himself, with the bulk of his force, was at Himo, five m. from his front, and he was aware that behind him Gen. Stewart's column was advancing. That column, in Gen. Smuts's plan, was to cut off von Lettow's retreat, and in view of the greater distance it had to cover had started from Longido on March 5. Stewart's column met with many difficulties, and through it had no serious encounter with the Germans its record was much slower than had been anticipated. Meanwhile the attack on the position west of Taveta was delivered on March 11. The road to Himo and Kahe passed between two hills, Raeta and Latema. Maj. Kraut held both
hills and the pass or nek between them; no turning movement was possible and the order was given to Gen. Malleson, commanding the rst Brigade of the 2nd East African Division, "to clear up the position and, if possible, make good the nek." The whole region was densely bushed. The advance began at 11:45, and the 130th Baluchis and the 3rd King's African Rifles were sent forward to seize a spur of Latema. The defence was very strong and by 4 p.m. little progress had been made. At this hour, writes Gen. Smuts, "Gen. Malleson, who was seriously indisposed, asked to be relieved of his command." Gen. Tighe then assumed personal direction of the operations. The 2nd Rhodesian, the 3rd King's African Rifles, and the 130th Baluchis now attempted to gain the Latema ridge. The enemy, well hidden in the bush, and supported by accurate machine-gun fire, kept, however, possession of the ridge. Finally, the 5th and 7th South African Infantry Battalions, brought up as reinforcements and led by Lt.-Col. Byron, were sent in to make a night charge with the bayonet. Here and there small parties, which became isolated, gained the crest. Col. Byron got within 30 yds. of the main enemy position, but with 20 men only, and was forced to retire. Tighe then drove the rear guard of the enemy out of the path and entered the valley of the Latema. At 4:30 a.m. March 12 Smuts ordered Tighe to draw back his force. This operation was in progress when news came that the enemy was in full retreat. Von Lettow states that about 11 p.m. on the 11th a telephonic message from the Raeta position informed him that the enemy had penetrated into the position in great force and that to avoid the risk of having his communications cut he ordered the troops with him, forming his left wing, to fall back towards Kahe. When he discovered the mistake made it was too late to alter his dispositions. Maj. Kraut then evacuated the Latema-Raeta position, and the whole force retired to the Kahe position, abandoning Moshi and Kilimanjaro. Gen. Stewart's division had not played the part expected; it was not until March 13 that it reached Bomba Jangombe, 25 m. N.W. of Kahe. Here Gen. Stewart was informed by telegram that the enemy had already avoided encirclement, and his force was brought into New Moshi on the 14th. On the 19th Gen. Stewart left for India. Later experience showed that the difficulties of encirclement were greater than then supposed.

Von Lettow's new position—known as the Kahe-Ruwa—stretched, S. of the Moshi-Taveta road, from Kahe railway station, near the Ruwa (Pangani) crossed the railway, eastward along the northern end of a large lake (Rungani) a region of forest, bush, swamps and rivers. On March 18 he was attacked from the Latema nek direction by a force under Brig.-Gen. S. H. Sheppard (who had commanded the 2nd East African Brigade under Gen. Stewart) and on March 20 Gen. Van Deventer was sent westward from Moshi to turn the enemy's rear at Kahe. He reached and—after some sharp fighting—seized Kahe station on the 21st, but owing to the difficulty in getting his force across the Pangani could not cut off the enemy. On the same day Sheppard fought a very determined and apparently indecisive action on the northern front—a South African Brigade which was to have aided him "was so impeded in the dense bush that it was unable to exercise any influence on the fight." (Gen. Smuts). But under cover of night the German force was withdrawn to Lemberi station, 20 m. S. of Kahe. Von Lettow retired in perfect order with practically all his stores and guns, except one of the "Königsberg's" 4:1-in. guns, which was blown up.

The fight of March 21 marked the conclusion of the Kilimanjaro operations. They had opened the door into German East Africa and had greatly inspired the British. They had done more, for though von Lettow's force was intact and its moral still high, its supply of ammunition had been greatly depleted. British, Russian and American muskets and rifles, which brought the Germans most welcome supplies, including four 4:1-in. field howitzers, ammunition for the "Königsberg's" big guns, 5,000,000 rounds of 78-smalls, 12 machine-guns, medical stores, provisions and clothing (for women as well as men), the ship, the "Maria," which had come via South America, the East Indies and Madagascar, entered Sudi Bay, near Lindi, in the far south of German East Africa, in the middle of March unobserved by the British patrolling vessels. She was discovered early in April, fired into and damaged. But she completed the discharge of her cargo, and got clear away. The value of this reinforcement to von Lettow is difficult to over-estimate.1

The military problem as it presented itself to Gen. Smuts and to Col. von Lettow respectively was very different. Smuts knew that the Belgians were ready to strike from the N.W. and the Nyasa-Rhodesia force from the S.W. and von Lettow was also aware of the fact. But in a large country as German East Africa those operations were likely, if not intended, to effect the main forces. Von Lettow's position was comparatively simple; he could not prevent the enemy from developing its offensive in the manner he chose, but with his superior mobility he could adapt his movements to meet his foe's tactics.

Gen. Smuts had four possible alternatives: (1) to advance from Victoria Nyanza on Tabora, the chief town in the interior (this was ruled out as it was thought, and proved to be the case, that the Belgians could deal with Tabora); (2) follow the enemy down the Tanga railway through Pare and Usambara (this was rejected as it was the enemy's chosen ground, and where he was strongest); (3) advance direct inland from Kilimanjaro; (4) land a force at Dar-es-Salaam and advance along the Central railway. Gen. Smuts chose the third alternative; whether it was better than the fourth is questionable. An advance along the line of the Central railway had obvious advantages. The railway traversed the protectorate in an east-west direction from end to end; its occupation would have cut the German forces in two and materially helped the operations of the Belgians and Gen. Northe. Dar-es-Salaam, the ocean terminus of the railway, lay at the mercy of the British navy; it was the capital of the protectorate; its occupation would have much political as well as military importance, and would have given the British a sea base 200 m. nearer South Africa than Mombasa and reduced land communications to a much greater extent. And the shortening of the lines of communication was a vital matter. Smuts, however, decided against Dar-es-Salaam "partly because the prevalence of the S.E. monsoon at that period (April) made landing of a large force on that coast an operation of great difficulty, and even danger, partly because a prolonged campaign on the coast immediately after the rainy season would mean the disappearance of the advantage of my army from malaria and other tropical ailments."

Moreover, von Lettow by retiring along the Tanga railway had left the road into the interior "wide open and unguarded." At that time, April 1916, it was not realized that the climate of the interior was little less deadly than that of the coast, and that whatever course was adopted a large proportion of the army—especially among the white troops—would be affected by malaria and other tropical ailments. Also Gen. Smuts was misinformed as to the extent and severity of the forthcoming rainy seasons and the difficulties of communication he was well aware, and slightly to lessen them the railway from Voi to Taveta was carried through the Latema gap and joined to the Tanga railway at Kahe. This railway was completed on April 25 1916. It was cut through swamps and virgin forest and thousands of men had to be employed to keep the rails from sinking in the mud. Kahe, by rail, was 210 m. from Mombasa; from Kahe the advance into the interior had to be made by other means of transport. Smuts made large use of motor lorries.

Smuts's plan for his new campaign was, briefly, as follows: A mounted force under Van Deventer was to make a rapid advance

Alternativa Plans of Campaign: Smuts's Choice.

1 A remarkable attempt to carry medical and other comforts to von Lettow in 1917 by air failed. Zeppelin L 59 (known as "The Balkan Terror") under von Butlar, carrying supplies, left Yambol, Bulgaria, on Nov. 21 1917, crossed the Mediterranean, and keeping along the edge of the Libyan Desert, reached the latitude of Khartum on Nov. 23. Then von Butlar received a wireless message (Return, East Africa occupied). He got back to Yambol on Nov. 25, and then stopped. This L 59 flew的梦想 distances, 1600 m. The next morning it was thought that the L 59, which was observed passing over the oases in the Libyan Desert, intended to bomb the Assam Dam.
S from Arusha (a place 40 m. W. by S. of Moshi) to Kondoa, Iringa—the chief strategic point in the interior of the northern part of the country—thence advance to the Tanganjika railway and turn E. along that line to Morogoro. Smuts himself, with the rest of his force, after clearing as much of the Pare and Usambara regions as was necessary for his purpose, was to turn S., passed the coast and E. of Van Deventer’s line of advance, also converging on Morogoro. It was hoped thus to corral von Lettow and bring him to a decisive engagement. Smuts had reorganized his forces since the March operations, and no longer had the aid of Gen. Tiede, who was given a command elsewhere and created a K.C.M.G. Smuts formed his army into three divisions, the first under Maj.-Gen. A. R. Hoskins (Inspector-General King’s African Rifles), the second under Van Deventer, the third under Maj.-Gen. Coen Brits. The first division was made up of the two East African Brigades; the two other divisions were composed of South African troops, supplemented by batteries of Indian and other artillery. On April 3 Van Deventer took the road across the Masai Steppe to Kondoa, which place he occupied after a smart engagement on April 19. *Eu route* the garrison of Lol Kissale, 17 Germans and 404 askaris with two machine-guns, had been surrounded and forced to surrender. It had been a brilliant march of some 200 m., but Van Deventer had lost hundreds of animals through horse-sickness, and though only some 80 m. from the Central railway he could advance no further. Then the rainy season set in and cut off Van Deventer for several weeks. Meanwhile von Lettow made rapid preparations to meet Van Deventer’s thrust. Three companies were brought from near Lake Kivu in the N.W. and by steamer on Lake Tanganjika to Kigoma, whence they took train to Saranda (the nearest point on the railway to Kondoa), while von Lettow himself with 15 field and two mounted companies marched from Korogwe on the Tanga railway to Kimamba on the Central railway—a distance of 123 miles. Maj. Kraut remained in charge of the force left in Usambara. The rains began while the troops were on the march, but by the beginning of May von Lettow and his force had occupied a strong position a little S. of Kondoa. A good deal of minor fighting followed but neither side made a general attack. (In May, owing chiefly to the privations caused by the rains, Van Deventer could barely muster 3,500 rifles—a number inferior to that of von Lettow.) And in June, during the period of waiting, the Belgian advance towards Tabora began to have effect on von Lettow’s own position. Gen. Smuts was also moving. His advance could not begin until May 15, the rains having turned much of the country into a lake. It took an armoured-car detachment under Lt.-Comm. Whittall, R.N., sent to reinforce Van Deventer, 35 days to cover 75 m. (in the dry season the journey took three days).

When Smuts advanced Maj. Kraut retired, skilfully, by the railway to Handeni. Equally skilful was Smuts’s advance. The main column under Gen. Sheppard and Beves marched, through the densest bush, down the left bank of the Pangani, W. of the Tanga railway; a smaller force under Gen. Hannington followed the railway; a third column under Lt.-Col. T. O. Fitzgerald entered the Pare mountains through a gap (the Ngulu gap) on the east. Outflanked, Kraut had no option but to retire; he had strongly fortified the railway line, but had, apparently, not believed that an advance along the fever-haunted valley of the Pangani was possible. By June 15 the conquest of Usambara was completed by the occupation of Korogwe, whence the Tanga railway descends to the coast plain. Smuts put off the occupation of the Tanga region, and formed another division to advance to the coast. This division was 24th April in the Rukusu valley. It had been definitely decided that it should be occupied. On June 24 a determined effort was made to clear up Kraut’s force, the Germans being attacked simultaneously on three sides. In this action the Kashmiris and the 25th Fusiliers (familiarly known as “Old and Bold”) earned special distinction. The Germans fought with great determination, and when the day was lost scattered in the bush and thus escaped. They reformed in strong positions in the Nguru hills.

After this fight Gen. Smuts was compelled to halt, forming a large standing camp on the Mshia river. The force had covered about 250 m. since May 22; water was short and the transport had reached the limit of its capacity. Malaria had greatly reduced the force—several units had no more than 30% of their original effective—and the troops were on half rations. The interval was devotedChildress (at Mshia camp) was occupied in clearing out Kraut’s ‘left flank; that is, the northern coast region. This was almost done by Indian and African troops under Brig.-Gen. W. F. S. Edwards (Inspector-General of Communications), with the help of the Cape squadron, now under Rear-Adm. E. F. Charlton. At this time Gen. Smuts had already reached the conclusion that white troops were not best suited for campaigning in tropical Africa (nor were the Indian troops particularly suited for the work), and that a much larger negro element was needed. By his direction the raising of new battalions of the King’s African Rifles was undertaken, but the need was urgent for immediate reinforcements by trained black soldiers. These were found in West Africa. The Gold Coast Regiment had volunteered for service soon after its return from the Cameroon campaign; its offer was accepted and it sailed in June for East Africa and was in action in July. At the end of Aug. volunteers were called for a Nigerian overseas contingent and there was a ready response, but the Nigerian Brigade could not reach East Africa till Dec.—Jan. 1916–7. Meantime a battalion of the West India Regiment and the Gambia Company had joined Smuts. The coast operations, in which the navy played a great part, were successful; Tanga was occupied on July 7, Pangani on July 23, Sadani on Aug. 1 and Bagamoyo the terminus of the old slave road from the great lakes on Aug. 15. The British base was removed to Tanga, a saving of 75 m. sea voyage and over 200 m. rail transport. Dar-es-Salaam was occupied on Sept. 4, but it took three months before the port could be used as the new base.

While Smuts was still at the Mshia river von Lettow had brought most of his force from Kondoa to the Nguru hills. An attempt to surprise the British camp was unsuccessful owing to “the remarkably dense bush.” When on June 24 Van Deventer, reinforced, resumed his offensive the German detachments left on his front gave way, nor was their retreat marked by the skill usually displayed by the Germans in their retreats. Van Deventer was delayed by the difficulties of transport, but by the end of July he was in possession of some 100 m. of the Central railway—from Kilimanjaro to Kilimandahja—and on Aug. 9 had concentrated his division for an advance E. on Morogoro. Farther W. the Belgians were beginning to close in on Tabora. Von Lettow was obliged to leave his forces in that region to their fate, but (at the end of June) he had sent reinforcements to the detachments opposing Gen. Northey’s advance from the south. His own position now appeared critical. He withdrew Maj. Kraut and most of his force S. to Kilosa, on the railway, W. of Morogoro, leaving Capt. Schutz, with a few companies, to oppose Gen. Smuts, who resumed his advance on Aug. 5. Von Lettow’s plan was to get away with as much of his stores as he could. Kraut’s force did not remain at Kilosa, but crossing the railway struck S. in the direction of Mahenge, a military station in the middle of a healthy plateau, to which plateau the detachments which were opposing Northey were falling back.

Gen. Smuts’s effort, to use his own words, “to bottle the enemy up in Morogoro” failed. Schutz, after fighting an action at Dakawa on the Wami river on Aug. 16, retired on Morogoro, leaving a broken bridge across the Wami. Smuts sent forces to outflank von Lettow, but in vain. While von Lettow was finding his way to a position of his own, he was to find it abandoned, and partly destroyed, by the enemy. Von Lettow had gone with his force into the Uluguru mountains, which lie immediately S. of Morogoro, by a track the existence of which was unknown to the British. With von Lettow was Dr. Schnee, the governor.

Gen. Smuts had taken measures intended to prevent von Lettow getting away from Morogoro by roads leading E. and W. of the Uluguru hills; he had not anticipated a retreat into the hills themselves. Brig.-Gen. Ensll was sent with the 2nd Mounted
Brigade to guard the western exit from the hills. This movement von Lettow had foreseen and had posted troops to meet an advance in this direction. Meanwhile the rest of his men, with as much of the stores as could be collected, were being moved through the mountains to Kissaki. To prevent von Lettow’s escape E. of Morogoro Smuts’s main force had crossed a waterless desert 25 m. long, a move which the enemy had not expected, and it was this march which caused the hurried evacuation of Morogoro. Exhausted as were his men Smuts determined to make another effort to corner von Lettow. For some three weeks very bitter fighting continued in the Uluguru hills, in which the Germans gained several miles over the S.E. of Kissaki, with considerable stores, was captured by the British. Von Lettow could neither remain in the fertile and healthy hill region nor escape W., but he was able to retreat S.E. towards the Rufiji, where he formed an extensive camp on the further side of the Megeta river, which he continued to occupy for months. In short, the limit of endurance had been reached by Gen. Smuts’s troops, further pursuit was impossible and the second rainy season was approaching. “Gen. Smuts,” writes von Lettow, “realized that his blow had failed. He sent me a letter calling upon me to surrender, by which he showed that as far as force was concerned he had reached the end of his forces.”

Von Lettow is entitled to this deduction, but by his energy and driving force Gen. Smuts had surmounted obstacles which appeared insuperable, and in conjunction with the Belgians and Northeys had conquered fully two-thirds of the German protectorate, including the chief areas of European colonization and both the railway lines. This had been done in a period of seven months, and was a very considerable achievement. Civil administrations were set up in the conquered regions.

The operations of the Belgians had been carefully planned and were thoroughly successful. While such troops as were available were engaged in defending, as best they could, they could be used on any part of the Congo fronts, a special force of a little over 10,000 men—all natives of the Congo—was raised and officered by Europeans. All supplies for this force, except food, had to be imported, a long and tedious process. A railway completed in Sept. 1915 from the upper Congo to Lake Tanganyika gave some help as, for example, when two small, fast and comparatively heavily armed British motor boats were taken from Cape Town to Tanganyika in sections. These boats took nearly six months to complete the journey of some 3,000 miles from the Cape to Tanganyika. Launched on the lake in Dec. 1915 they soon obtained mastery of its waters, by capturing, sinking or bottling up the enemy steamers. This achievement was of much assistance to the Belgian operations.

The organization of the new Belgian force was confided to M. Tombeur, acting Vice-Governor-General of Katanga, and an ex-officer, who in Feb. 1915 was made commander-in-chief of the Belgian Congo troops with the rank of Colonel (subsequently Major-General). All the fighting men were infantry and gunners—there were, all told, 60 machine-guns and 12 field pieces. The force was divided into a Southern Brigade (under Lt.-Col. Olsen) and a Northern Brigade (under Col. Molitor). Olsen’s brigade was stationed along the Rufiji river line, as local and Tanganyika; Molitor’s N. of Kivu along the Congo-Uganda border. Tombeur’s headquarters were established at Kibate, just N. of Lake Kivu. Molitor’s brigade was partly stationed in British (Uganda) territory. It had the help of the Congo Carrier Corps, consisting of natives of Buganda (of whom 8,429 served in the corps), while Gen. Smuts made himself responsible for supply arrangements to Molitor’s headquarters, which were at Lutobo, 170 m. W. of Victoria Nyanza. This was a great advantage as from Monbasa to Lutobo is barely 1,000 miles.

The defence of the region had been entrusted to Maj.-Gen. Wahle, whose “western command” extended from Lake Nyasa to the Uganda frontier. Von Lettow had withdrawn part of the troops to strengthen his main force. Wahle, whose headquarters were at Tabora, was instructed not to decide a decisive action, but when compelled, to fall back on Mahenge. From about mid-July to the end of Oct. Wahle was cut off from his chief.

The terrain for the first part of the Belgian operations was extraordinary. North of Kivu rise the Mfumibo mountains, a range of lofty, active volcanoes; farther N.E. extends a tangled mass of hills, for the most part heavily wooded, and numerous small lakes and rivers. On the German side was the mountainous, fertile, and thickly populated region of Ruanda—but newly conquered and still preserving its native government. A narrow passage between Lake Kivu and the Mfumibo mountains afforded the only practicable route for the invasion of Ruanda from the Belgian side. On the S.W. side there was an easier approach. Col. Molitor’s plan was to attack from both sides of Kivu and to make a third advance from Lutobo. The campaign began on April 4 with holding attacks by Maj. Rouling at the N. end of Kivu, where the Germans, under Capt. Wintgens, held very strong positions at Kissani on the west river Sebea. By the middle of May the Belgians by their converging movements had “nipped off” Ruanda. They next repeated the manoeuvre on a larger scale. Olsen crossed the Ruwadi at the N. end of Tangan- yika and met Col. Molitor’s force E.; Molitor was forced to withdraw, and Olsen’s force, after a six days’ march, reached the main railway from Lake Tanganyika on Kigoma—the lake terminus of the railway from Dar-es-Salaam and the port of Ujiji.

In its harbour was the Graf von Götzen "—launched in 1915 and the biggest boat ever seen on Tanganyika, the "Adjudant" (the vessel brought in sections from Dar-es-Salaam), and the tug "Wami." From June onwards they had been bombed by British seaplanes manned by Belgians. Olsen’s brigade occupied Kigoma on July 28 and Ujiji on Aug. 2, the German garrison retiring to the railway to Tabora, 200 m. E. Other Belgian detachments now crossed Tanganyika S. of Ujiji, and these and Olsen’s brigade advanced on Tabora.

Molitor’s brigade, whose objective was also Tabora, had the cooperation of a British column under Brig.-Gen. Sir Charles Crewe, a South African soldier, who was on Gen. Smuts’s staff. With a force of about 1,500 men Crewe captured Mwanza, the German port on the southern shores of Victoria Nyanza, on July 14. Thereafter the Molitor brigade marched W. and Crewe’s column E. of the road leading from Mwanza to Tabora. Both forces suffered from transport difficulties, excessive heat and lack of water, and both had to fight several stiff actions. Tabora was the most important and the largest place in the interior of German East Africa. The Germans had a large garrison; there were also Greek, Genoese and Indian traders and representatives of many African tribes. To lose the place would be a severe blow to the Germans had sent the enemy civilians they interned and also many of their soldier captives to Tabora. The British and Belgians interned numbered over 200, a large proportion being missionaries, women as well as men. All the Europeans—there were Belgians, Italians, French and Russians as well as British—were housed together, but their quarters were so decaying and ill-digested, with the object of lowering British prestige in the eyes of the natives. The Indian and African prisoners of war were treated with open brutality. One Brandt, commandant of Tabora, was directly responsible, he ordered the prisoners to be put on the same level as the prisoners’ camp at Kigoma. He was ordered to treat the prisoners with the same severity as the prisoners themselves.
EAST AFRICA, MILITARY OPERATIONS

Germans in Arab and African eyes, but though they fought strong delaying actions with Olsen's brigade W. and Molitor's brigade N. of Tabora they had no intention of holding out to the last, and in preparation for departure Gen. Wahl employed British, Indian and African prisoners in building a road towards Mahenge and established food dépôts along it. On Sept. 18 Wahl evacuated Tabora, leaving behind about 30 white (German) soldiers, some sick, some simply war-weary, a number of civilians (among them Frau Schnee), many prisoners of war and considerable military stores. The Belgians occupied the town the next day. Sir Charles Crewe's column, which, it was hoped, would have reached the railway line E. of Tabora before the Germans had time to get away, only struck the line a week later. Shortly afterwards the column was broken up and Sir Charles Crewe returned to South Africa. He had, said Gen. Smuts, "rendered very useful service." The Wintgens column in its retreat was engaged by a Belgian detachment at Sikonge, 40 m. S. of Tabora. Though Wintgens suffered serious loss he made good his escape. With this action the Belgian campaign of 1916 ended, just at the close of the dry season and at the same time that Smuts suspended his operations against von Lettow. Gen. Tombeur's organization had been thorough and methodical, and Cola. Olsen and Molitor had proved capable commanders. The Congo Carrier Corps was disbanded and returned to Uganda.

When the Germans evacuated Tabora the operations conducted by Gen. Northey from the Nyasaland-Rhodesian border had so far developed that some of Northey's columns were interposed between Tabora and Mahenge. Northey had taken the offensive on May 25 (1916). His fighting force was about 5,000 strong; it was made up of King's African Rifles (1st battalion), South African troops (infantry), Nyasa and Rhodesian volunteers, the Northern Rhodesian Police (natives under European officers), the British South African Police (Europeans), and, later, a battalion raised from the natives of northern Rhodesia. For the supplies of this small fighting force the administrations of northern Rhodesia and Nyasaland were responsible. Some idea of the effort required is seen from the fact that up to July 1917, out of a total native population of scarcely 2,000,000 in the two districts named, 395,000 were employed as carriers. Much of the supplies had to be carried, in canoe or on foot, fully 600 miles. There were in two main columns: a Nyasaland column under Maj. (temporary Lt.-Col.) G. M. P. Hawthorn, and a Rhodesian column under Lt.-Col. R. E. Murray. A third column under Lt.-Col. T. A. Rodgers co-operated with Col. Murray. The advance was along the 200 m. front between lakes Nyasa and Tanganyika; there was a great deal of detailed fighting, some German commanders, in von Lettow's opinion, too easily surrendering. Bismarckburg, the German port at the S. end of Tanganyika, was occupied by Col. Murray on June 8. Northey's main thrust was along the highroad which led from the Nyasa frontier by Neu Langenburg and Iringa to Kilosa on the Central (Tanganyika) railway—the road crossing the Tabora-Mahenge route. In an action on July 24 at Malangali Northey defeated the German force which sought to bar his progress, and on Aug. 19 the British seized Lupembe, a place 100 m. W.S.W. of Mahenge. On Aug. 29 Iringa was occupied. Exactly a week earlier Van Deventer had taken Kilosa, 120 m. N.E. of Iringa. Northey could have reached Iringa much earlier, but on Gen. Smuts's advice he "slowly down."

When von Lettow had been forced to take to the lower Rufiji district, it was decided that a joint effort should be made by Van Deventer and Northey to deal with the enemy in the Mahenge district. But before that could be done they would both have to cross the craggy valleys running up to the heights. Von Deventer's men were nearly spent after over six months' fighting, marching, privations and illness—Northey had to meet the troops of Gen. Wahl coming from Tabora. The Germans were in three columns, an eastern under Maj. von Langenn, a centre column under Wintgens, and a western under Lt. Huebener. Wahl was with the centre column. The western column lost touch with the others, which acted in close cooperation. Northey's columns near Iringa were much outnumbered. Although Col. Rodgers with a small body of South Africans made an effort to hold up the enemy on the night of Oct. 21 1916 the larger portion of Gen. Wahl's troops broke through the British lines. An attack made by Maj. Kraut the same day on Mkapa, in the Lupembe region, was regarded by the British as evidence of his knowledge of Wahl's movements; von Lettow states that this was not the case. The attack on Mkapa ended in a severe reverse to the Germans, but sharp fighting with Wintgens' column continued in the Lupembe area till the middle of Nov., by which time the Germans had occupied a chain of posts covering Mahenge, extending over 200 m., and facing Van Deventer's and Northey's troops. Huebener's column was still W. of Northey's lines, in the neighbourhood of Lake Rukwa. This was a region where there were neither British nor Belgian troops, and for weeks the British had been doubtful even of the existence of this column. It was eventually tracked down at Itembule by Col. Hawthorn and bluffed into surrendering. It numbered 54 Europeans and 249 askaris, and the booty included a 4½-in. howitzer (one of the guns from the "María").

The combined attack by Van Deventer and Northey against the Mahenge force was at length begun, on Dec. 24. The operation failed, though one of Northey's columns compelled the surrender of Maj. von Grawert and his detachment of 289 fighting men, including 39 Europeans. The main engagement was fought by Van Deventer's force—South African infantry and mounted men. The fight was at Muanga, 70 m. N.W. of Mahenge. It began on Christmas Day and continued till Dec. 28. The Germans were attacked front and rear, but, as Gen. Smuts wrote, "eventually escaped through the dense bush and forest under cover of darkness and eluded pursuit." The rains had begun and early in Jan. (1917) the operations had to be abandoned. Gen. Wahl had now under him in the Mahenge area 6,000 or more soldiers, of whom at least 1,000 were Europeans, with a large following of carriers, and he found some difficulty in feeding them all. To relieve the pressure he directed Kraut and Wintgens to take detachments S. towards the Portuguese frontier, and Kraut, crossing Northey's lines, reached the Rovuma, where supplies were found. Wintgens had separated from him and turned N.W. (see below). All this time communications between Wahl and von Lettow were slow and irregular.

Since the abandonment of the pursuit of von Lettow at the end of Sept. (1916) Gen. Smuts had been engaged in reorganizing his army and in shortening lines of communication by making Dar-es-Salaam his base. He evacuated 12,000 to 15,000 white troops (South Africans), their place being taken by the Nigerian Brigade (under Maj.-Gen. F. H. Cunliffe) and new battalions of the King's African Rifles. The German ports S. of Dar-es-Salaam had been occupied by the navy in preparation for a new offensive. Of these ports the chief were Kilwa and Lindi, Kilwa being the nearest to Dar-es-Salaam. A considerable force had been concentrated at Kilwa by mid-Nov., when Gen. Hoskins took over command in that area. On Jan. 1 1917, in conjunction with Van Deventer's and Northey's operations in the Mahenge region, Gen. Smuts opened a new offensive against von Lettow. Hoskins cooperating from Kilwa in the rear of the Germans. Smuts tried an enveloping movement on the Mgeta river, but again, after very stout fighting, the enemy got away; they were followed up towards the Rufiji and engaged on Jan. 4 at Behe-Behe, in which fight F. C. Selous was killed at the head of his company of 25th Fusiliers. Though severely handled the Germans "again slipped past" and crossed the Rufiji at Kibambe. The operations continued and were proceeding favourably when on Jan. 19 Hoskins had to hand over command of the entire body of the Rufiji into a vast lake; and in that region, uncomfortably enough, von Lettow was able to maintain himself.

In the middle of these Jan. operations Gen. Smuts gave up the command. At the request of Gen. Botha he went to England to become a member of the Imperial War Cabinet. Having handed over the command in East Africa to Gen. Hoskins Smuts sailed from Dar-es-Salaam on Jan. 20 for London. Gen. Van Deventer left East Africa at the same time, returning to South Africa.
In consequence of the heavy rains Gen. Hoskins had to abandon operations on a large scale, though by the end of Feb., the N. bank of the Rufiji was cleared of the Germans. Some idea of the difficulties caused by the rains may be gathered from the fact that in this area "patrol work had to be carried out for some time in canoes, and the men found themselves making fast to the roofs of houses which had lately formed their quarters" (Gen. Hoskins's despatch). Sickness among the European and South African units was not therefore unusual. As many as possible were sent to South Africa to recuperate, being recalled in May, when the dry weather permitted the offensive to be resumed. Meantime Gen. Hoskins utilized the period of the rains to undertake a thorough reorganization of his forces. The training of new battalions of the King's African Rifles was pushed on rapidly, and special attention was devoted to the improvement of communications. The difficulties of transport were very great; owing to the tea fly animal transport was no longer possible; both carriers and light mechanical transport, essential for a forward movement, were deficient. Gen. Hoskins by energetic measures largely overcame these difficulties.

To extend hard to realize, the operations—of the Germans equally with the British and Belgians—depended on the number, organization and distribution of native carriers. Complete statistics are lacking, but on the British side alone, first to last, over 500,000 carriers were employed. Those with the main forces were recruited from British East Africa (Kenya Colony) and Uganda, in both of which countries a Compulsory Service Act was put in force in March 1917. Uganda, which also found a large number of carriers for the Belgian troops, up to the end of 1917 had furnished a total of 173,900 porters (besides 15,000 men for the King's African Rifles). A still larger number was recruited in British East Africa; a fair number of carriers were also recruited in German East Africa itself. Gen. Northey, as already stated, obtained his carriers from Northern Rhodesia and Nyasaland. Many carriers were used in the first line, that is they took ammunition, water, etc., right up to the fighting men, and casualties in action amongst these carriers were numerous.

There was also serious wastage amongst the carriers from sickness and privations, especially among the men obtained from Uganda and British East Africa. This arose mainly from the difficulty in supplying them with their accustomed food. Tribes, like the majority of those in the Uganda Protectorate, whose staple food consists of bananas, sweet potatoes and beans, suffered from intestinal disease when placed on a grain diet. For example out of 3,576 carriers from Uganda employed in the coast region of British East Africa between Aug. 1914 and March 1915 only 2,650 returned. Sufficient care was not always taken by officers in charge to procure suitable rations. But these cases were exceptional, and the African Native Medical Corps, 1,000 strong, raised in 1917 (recruited mainly from the senior high-school boys in Buganda), did much to improve the health of the carriers. In 1918 the carriers in hospital numbered 7%. The West African troops had their own Carrier Corps, raised voluntarily in Nigeria, the Gold Coast and Sierra Leone. The South African troops also brought their own carriers and labour contingents, a total of 60,000 men being sent from the Cape.

Before the weather had improved sufficiently to permit the offensive to be renewed Gen. Hoskins was appointed to command a division in Palestine. Gen. Van Deventer returned from South Africa and took over the command on May 29, 1917. The position of the Germans at this time was bitly this: Von Lettow with his main force was at the Matunda river, with patrols and detachments pushed close to and S. of Kilwa. Maj.-Gen. Wahle had recently been transferred from Mahenge to command in the Lindi area, succeeding Capt. Looff. At Mahenge Capt. Tafel had taken over control. There were smaller German detachments between Kilwa and Lindi and near the Rovuma. There was indirect if not direct communication between all the German forces. Nowhere, as throughout the campaign, was there any continuous front. The columns under Northey contained the Mahenge force on the S. and W., and Van Deventer had at Iringa another column watching Tafel from the N.W. The rest of Van Deventer's force was to be engaged against von Lettow. That von Lettow might in the last resort retire into Portuguese territory had been foreseen; he had in fact contemplated that course ever since in Sept. 1916 he had been forced out of the Uluguru mountains. And German columns had already raided deep into Portuguese East Africa and were bringing back much loot and reports of a land flowing with milk and honey.

For his main operations Van Deventer had the choice of an advance either from Kilwa or Lindi. An advance from Lindi (which is situated on the estuary of the Lukuledi) appears to have had the prospect of the best results, as by pushing forces up the valley of the Lukuledi and joining hands with Northey's column E. of Nyasa the escape of von Lettow into Portuguese territory might have been prevented. But Lindi harbour was poor, that at Kilwa was good, and the main body of the Germans was concentrated near it. Van Deventer's formula was to "find the enemy and hit him hard," and he decided to attack on the Kilwa side. The Kilwa force had been under Gen. Hannyngton, but Hannyngton was then seriously ill and Gen. Beves was in temporary command. The advance began on July 5, in the direction of Liwale, it being hoped to force von Lettow to disclose his intended line of retreat. Three columns were formed, the forces engaged including South African infantry, King's African Rifles, the 23rd Punjab and two mountain batteries. After some sharp fighting the Germans fell back to Narungombe, where an engagement was fought on July 19. The fighting was very severe; the Germans delivered several well-sustained counter-attacks and the issue appeared doubtful. The fight showed that "the enemy's capacity for resistance had not in any way been weakened by the rainy season, and that the moral and training of his troops remained high" (Van Deventer).

After the fight at Narungombe the Germans, who were under Capt. von Liebermann, retreated south. Von Lettow regarded the action as an opportunity missed by von Liebermann and as further proof of the immense difficulty of carrying out successfully in the bush operations in which several columns are engaged. But Beves's offensive was spent, and his troops suffered heavily from sickness. It was not until mid-Sept. that a new Kilwa force was ready to take the field. In the meantime preparations had been made for the advance from Lindi. In Aug. Brig.-Gen. H. de C. O'Grady, a great fighting soldier, had driven the Germans from the estuary of the Lukuledi, and provided elbow room for a further advance. He also foiled an attempt made by von Lettow in person to surprise his force.

When in Sept. Van Deventer was at length in a position to begin the main advance Gen. Beves had been transferred to the Lindi command and Gen. Hannyngton had resumed command at Kilwa. The Nguyen Lilad Brigade had been at Kilwa since Aug., and Hannyngton had also three new battalions from India, including the 23rd cavalry. It was planned that the Kilwa force should sweep S. and the Lindi force W. so as to enclose von Lettow and prevent his breaking W. and consolidating with the Mahenge force. This period of the main advance, up to the end of
Nov., witnessed the hardest fighting of the whole campaign in East Africa. Relentlessly pursued by Hannayngton's columns von Lettow was compelled to fall back to the Lukuledi valley, the chief line of retreat being towards Nyango, a place 40 m. S.W. of Lindi, towards which Beves was pressing back Wahle's detachments. Early in Oct. Hannayngton detached the Nigerian Brigade (with which was the Gambli Company) to march to Nyango and join the Lindi force. Meanwhile other columns of the Kilwa force, including cavalry, were marching S., but further W., towards the mission stations of Lukuledi and Massa. At those places, and at Chitwa, S. of the Lukuledi river, were most of the German supplies.

The Nigerian Brigade, after a fine march of 80 m., reached its destination on Oct. 15. On that day two columns of Beves's force under Gen. O'Grady and Col. Tytler respectively had driven back Wahle's main body to Nyango and attacks were met by counter-attacks; the Nigerians at Mahiwa being driven back and very hard pressed. Nyango the Germans abandoned on the 16th, only to take up stronger positions on a ridge two m. S. on the farther side of a river bed. These positions the British in vain assailed; they were in turn counter-attacked on the 17th. Mahenge was then compelled to fall back to the river bed, the enemy pressure continuing until after dark.

Gen. Beves gave orders that the attack was to be resumed on the 19th. This order was cancelled by Gen. Van Deventer, and on the same day the command of the Lindi force was transferred to Gen. Cunliffe. On that day the Germans retired to the positions they had taken up on the 16th. The battle was over. Out of a total strength of 4,000 infantry engaged the British had 2,700 casualties, of which 28 were in the Nigerian Brigade. The 25th Fusiliers, reduced to a remnant in previous fighting, had 70 casualties out of 120 men who went into action. Von Lettow says that the German force was "some 1,500 men" and their casualties 510. This did not include all Wae's casualties in the retreat to Mahiwa, for on Oct. 15-8 the British captured in all 241 Europeans and 627 askaris. The total German force engaged was not fewer than 2,800. Von Lettow describes this fight as, next to Tanga, the most serious defeat suffered by the British, and says he adapted his tactics to those of Gen. Beves, who "threw his men into action regardless of loss of life and did not hesitate to try for a success ... by repeated frontal attacks." He (von Lettow) abandoned the idea of "an annihilating pursuit" as he learned that the enemy columns in his rear were threatening the Lukuledi mission station. He hastened to his relief and began the process of concentrating his forces to the Chwili region. The Mahiwa-Nyango battle gave him this advantage—it was 10 days before Gen. Cunliffe was able to resume the offensive. On Oct. 24 von Lettow had a conference with Dr. Schnee, who appears to have urged that the end had come, but, writes von Lettow, "I firmly stated my opinion that ... the war could and must be carried on."

Meanwhile Tafel's force had been driven from the Mahenge plateau with the help of troops furnished by the Belgians, whose cooperation had been sought. While columns of Nor- they's force, underCols. Hawthorn and Cunliffe, chased the enemy hard from the S. and S.W., the Belgians struck at Mahenge from the north. The main Belgian column, under Maj. Batlle, left the Central railway on Aug. 15, and made good progress through very difficult country. The Germans put up the usual strong rear-guard delaying actions, but when the Belgians attacked (Oct. 8) the last defence of Mahenge, Tafel ordered a general retreat. His has already been heavy and many of his askaris deserted. Both Hawthorn and Fair were drawing near, but Tafel succeeded in outdistancing his pursuers, whose long lines of transport had reached breaking point. Tafel chose the only route open to him—that leading S.E. in the direction of von Lettow. On Nov. 16 he broke through two weak detachments of Northey's force which gallantly endeavoured to bar his progress. A Belgian column, which had been sent round via Kilwa to Liwale, arrived only in time to engage Tafel's rear-guard. This was the end of the Belgian effort, and their troops shortly afterwards returned to the Congo. The pursuit of Tafel was taken over by the Kilwa force and his attempt to join von Lettow was frustrated.

At this time, mid-Nov., von Lettow's position was critical. The Lindi force had resumed its offensive on Nov. 6 and had joined hands with the Kilwa force on Nov. 12. Von Lettow had concentrated all his men near Chwili, but to remain there meant certain disaster. So leaving only a small body at Chwili to put up a delaying action—the place was taken by Gen. O'Grady on Nov. 14—he retreated eastward, i.e. towards the coast, along the time of his flight into Portuguese territory. He carried out this retreat without pause and constantly engaged, suffering losses every day, was in a foodless region and had lost nearly all his stores. On Nov. 17 von Lettow took what he calls a fateful decision. It was to abandon all idea of fixed bases; reduce his force—half-starved and very short of ammunition, break off fighting and get away to some district where food was to be found. At a place called Nambinda he left some hundreds of Europeans (many of whom, he states, were not unwilling to lay down their arms) and 600 askaris, and with the rest again eluded his pursuers by turning S.E. by an unsuspected path. While the British columns were following to pick up his retreaters at Rovuma, rapidly S.W., having determined to cross the Rovuma near its confluence with the Lujeenda, where was the Portuguese fort of Ngomano. At Nwali he shed more of his troops, and his force was now reduced to approximately 300 Europeans, 1,800 askaris and 3,000 bearers and other natives, including women and children. He marched along the Rovuma to the selected crossing place, and on the night of Nov. 25-6 he crossed the river into Portuguese territory. Gen. Wahle, Maj. Kratz and other tried leaders were with him and also Dr. Schnee. Two attempts to overtake him" failed by a few hours at both places, in spite of hard marching. So wrote Col. G. M. Orr, commander of one of the pursuing columns.

For a day or two Tafel and von Lettow had been near one another; Tafel had reached the Rovuma but not finding von Lettow turned back. Running into an Indian patrol Tafel again tried to turn south. But his force was too foodless and hopeless. On Nov. 27 a party of 37 Germans, 178 askaris and 1,100 followers gave themselves up to the British, and the next day, Nov. 28 1917, Tafel himself surrendered unconditionally with 19 officers, 92 other Europeans, over 1,200 askaris and some 2,200 other natives.

Not a single German combatant was left in German East Africa, and the conquest of the Protectorate was completed.

Campaign In Portuguese East Africa
lacked experience; there were not sufficient trained native soldiers and the military posts were widely scattered. Nor was any one post equal to a successful defence against the 2,000 and more veterans von Lettow had with him. Ngomano was attacked, and it surrendered after a gallant resistance in which some 200 casualties were suffered, including the commanding officer, Maj. Finto. Its loss gave the Germans just what they lacked—food, ammunition, and horses. They then broke into the Belgian Congo, and the 25th Cavalry being in pursuit von Lettow then marched up the Lujenda valley. He had no difficulty in keeping ahead of the enemy, and the rainy season having set in the Nigerians and 25th Cavalry were recalled in the third week in Jan. (1918) and the Germans had a short breathing space.

Gen. Van Deventer now sent home all his white and Indian troops, and the Nigerian Brigade also. Except for the Gold Coast Regiment (which was not sent back till Aug.) the 1918 operations were carried out almost entirely by natives—the King's African Rifles. There were, however, a considerable number of Europeans among the Portuguese forces, which were put under the supreme command of Van Deventer.

Given the character and extent of the country into which the Germans had entered, the known determination of von Lettow to continue the struggle and the proven difficulty of bringing him to a decisive action, "the 1918 campaign," said Van Deventer, "had perforce to be one of virtual extermination." Wide converging movements were undertaken. Gen. Northey sent columns from the E. and S. shores of Lake Nyasa, while the Gold Coast Regiment advanced W. from Port Amelia (a harbour midway between the Rovuma and Mozambique). This Port Amelia column was later strengthened and came under command of Brig.-Gen. Edwards. Between Feb. and the middle of May the Germans were engaged at several points from both sides, mainly in the central region between the Lujenda and Msalu rivers. Von Lettow then marched S. to the Lurio river, 200 m. from the point where he had left German territory, with no enemy in front of him except isolated Portuguese posts, from which he obtained more valuable supplies. He was pursued from the N., and an Anglo-Portuguese column started N.W. from Mozambique (to which port Gen. Edwards removed his base) to overtake him. But von Lettow, marching very quickly spent time, captured Ille, and in June reached the coastal region near Quilimane (Killimane), where he ravaged many rich plantations.

In this month Gen. Northey left, having been appointed governor of British East Africa and Col. (Brig.-Gen.) Hawthorn took his place. On July 1 von Lettow attacked a mixed Portuguese and British force at Nhamacurra, 25 m. from Quilimane, and after three days' fighting captured the place and inflicted very severe loss on the defenders. The approach of strong British columns then compelled von Lettow to retire. He marched parallel to the coast, in the Mozambique direction. He established himself at a place called Chalala, but when in mid-Aug. British columns closed in upon it, it was to find the camp evacuated. Von Lettow had turned N.W. again, and had taken his time being at this time being to raid the Blantyre district of Nyasaland. On Aug. 30 and 31 he was engaged by part of Hawthorn's force at Lomia, E. of Lake Shirwa, and suffered severely. "It was hoped that the enemy might have been captured, but the rugged country and the thick bush made operations very difficult, and he finally broke away to the northward."

Save that he could not replace his casualties (except to some extent by turning bears into askaris) von Lettow held the advantage in this campaign in northern Portuguese East Africa. It was nearly as large as France, most of it was fertile, and the natives, richly rewarded with guns and clothing, were in general friendly and useful. If hustled from one area there were others to which he could move. He was tied to no base and was an ideal guerilla leader. He had now, end of Aug., to decide his future course; he came to the conclusion that an attempt to invade British Nyasaland was too risky, as there the British communications were good. It was easier to go north. To reenter German East Africa would be a complete surprise to the enemy, who would imagine he was making for the Tabora region (where most of his askaris came from) and take precautions accordingly. This would give him an opportunity of turning in another direction, and keep his force in being. His casualties at Lioma had numbered 95, and he had lost stores, baggage and ammunition. By Sept. 1 his total strength had been reduced to 176 Europeans and 1,487 askaris. He suffered further loss in another encounter on Sept. 6, after which date he got clear of his pursuers. Gen. Hawthorn had sent scouts and reinforcements, and the columns which should have reached the N. end of the lake before von Lettow could get there; the steamer broke down, and when on Sept. 28 the Germans again reached the Rovuma they were able to overcome the weak posts stationed there. Avoiding places held in strength by the British, and keeping ahead of the columns in hot pursuit, von Lettow passed round the N. corner of Lake Nyasa, losing many carriers by desertion but recruiting a few askaris. He stayed at Ubeno some days and then (Oct. 17) set out for Rhodesia.

(At Ubeno Gen. Wahl and two other Europeans, sick or wounded, were left behind.) On Nov. 1 von Lettow attacked Fitie, just within the Northern Rhodesian border, hoping to capture its stores, but it was too strongly held, so the Germans turned S.W., making for Kasama, von Lettow now having some idea of penetrating into Belgian Congo. Kasama was taken on Nov. 9, but British columns were in its immediate neighbourhood and there were several patrol encounters. Necessity urged von Lettow onward. On Nov. 13 he was reconnoitring a crossing of the Chambel (the eastern head stream of the Congo) when an English motor-cyclist arrived with a message from Gen. Van Deventer announcing the conclusion of the Armistice. Von Lettow notified its acceptance of the Armistice on Nov. 14; the formal surrender was made to Gen. Edwards at Abercorn on Nov. 23. The force which surrendered numbered 30 officers and 125 other Europeans, 1,165 askaris, and 2,891 other natives, among them 819 women, with one small field gun, 24 machine-guns and 14 Lewis guns. Those who surrendered included Dr. Schnee and Maj. Kraut.

The troops employed by the Allies in East Africa included 52,339 sent from India (among them 5,403 British) and 43,477 South African whites. Other white troops employed (East African and Nyasaland settlers, Rhodesian volunteers and the 25th Fusiliers) numbered about 3,000, the African troops (King's African Rifles, Nigerians, Gold Coast Regiment, Gambia Company, Cape Corps—1,000 strong—and West Indians) about 15,000; an approximate total of 114,000, not reckoning Belgian native troops—about 12,000 in all—the Portuguese and the naval force engaged. The greatest number in the field at any one time, May to Sept. 1916, was about 55,000; the lowest number, in 1918, was some 10,000, all African, save the administrative services. The total British and Indian casualties was officially returned at 17,823 of these 2,762 were among the South African Forces. These figures are exclusive of casualties among carriers and of deaths and invalids through sickness, which among the South Africans alone exceeded 12,000.

The cost of the campaign to Great Britain, inclusive of Indian and South African expenditure and that of the local protectores to March 1916, was officially estimated at £7,200,000.

Authorities.—British.—The despatches of Generals Smuts, Hoskins, Van Deventer, Northey, of the High Commissioner for South Africa (Lord Buxton), the Governor of Nyasaland (Sir George Smith) and of Adm. Champion, published in the London Gazette, cover the operations, except the period up to March 1916, on the British East Africa frontier and the early naval operations, concerning which no despatches were issued. "The Times," History of the War, 1914 to 1918, 256, 180. The operations, under the late Gen. Brig.-Gen. J. H. V. Crowe, Gen. Smuts' Campaign in East Africa (1918), has an introduction by Gen. Smuts and an account of the operations. For the German treatment of prisoners, etc., see the late Paper in the London Gazette, 1917, and J. H. Briggs, In the East Africa War Zone (1918). For particular units see A. Buchanan, Three Years of War in East Africa (1919), chiefly about the 25th Fusiliers; Sir Hugh Clifford, The Gold Coast Regt., in the East African Campaign (1920); W. D. Downes, With the Nigerians in East Africa (1919); G. M. Orr, "The Indian Army in East Africa," Jnl. U.S. Inst. India (1919).
EASTERN EUROPEAN FRONT CAMPAIGNS.

Under this heading comes the general story of the campaigns of the World War which were fought between 1914 and 1917 on the front between the Baltic and the Black Sea. Till the summer of 1916, Rumania was neutral, and the theatre of war was limited on the S. by the northern extremity of that country. Thereafter, till the conclusion of the peace of Brest, the Russian and Rumanian fronts became one.

The story falls into three main parts, of which the first is considerably the most important. These are:—the open-warfare, free-maneuver campaigns from the outbreak of war till the establishment of a continuous trench line and the setting-in of trench-warfare conditions, along the whole front in Oct. 1915; the trench-warfare operations on the Russian front from that date to the peace of Brest; and the Rumanian campaigns of 1916 and 1917. The events of 1918 belong rather to the story of the Russian civil wars than to that of the World War, and may be summarized for the present purpose in two clauses:—the occupation of the Ukraine, for its economic exploitation, by German and Austrian forces, and the maintenance of a cordon, requiring large numbers of troops, along the frontier of Bolshevik Russia to provide against the contingency of a new eastern threat. The establishment of this line began in the summer of 1917, and in the autumn of 1918 it joined the Silesian line to the S. of the eastern, thus closing the last gaps, of which the most important is that lying between the Silesian and the Carpathian mountains—which is the gate to Vienna, and, owing to the higher cultural development of Germany and Austria, is strategically more penetrable even where geographical obstacles exist.

Crossing the whole width of the theatre, cutting off the salient from the corridors and the marshes, runs an almost straight barrier of water, constituted by the Vistula and its tributary, the San, from the Baltic to beyond Iaroslaw, and by the Dniester from the lakes S.W. of Lemberg to the Black Sea. This narrow gap is between the Silesian line and the corridor; between the lines of Groke and Brest-Litovsk. All railways connecting the salient with the interior of Russia, whether they approach by the northern corridor, the marsh or the southern corridor, converge on the Warsaw-Ivangorod portion of this waterline and thence make south-westward for Upper Silesia. Practically all railways from Russia to Austria-Hungary, on the contrary, traverse the gap of Grodek-Yaroslav. The main line from Russia to the German Baltic lands enters E. Prussia at Wirballen at the broad entrance of the northern corridor, and, at the other end of the theatre, a line from Bessarabia comes into the Bakuovina system at Czernowitz. Apart from these two, the whole length of the northern corridor is traversed by three lines from Dvinsk, Polotsk and Orsha respectively ending at Warsaw and Ivanograd; the central marshes by one from Gomel which at Brest-Litovsk merges with the third of the northern lines; and the southern corridor by two from Kiew and Berdichev respectively which at Kovel become one, ending at Ivanograd. The significance of the various lateral lines connecting these approaches lines is best judged by studying the map, and here it is enough to draw attention to (1) the line along the eastern base itself; (2) the line from Battice-Shavli-Vlina—Minsk with its accessory Vilna—Baranovichi—Brest; (3) the line Yaroslav and the lakes of Grodek—Vindavski Memel (4) the line Ivanograd—Warsaw—Mlava—Danzig; (5) the line Skieniwicze—Lowie—Wloclawek—Danzig. It should also be noted that, in the salient, no lines exist W. of Lodz and N. of Czenstochowa, and that in the northern corridor about Grodno and Augustow the Prussian and Russian railways carefully avoid contact. Of the road system, it may be said, broadly, that first-class roads are not numerous, and that they group themselves, in the main, on the same axes as the railways. In the area N.W. of Lodz-Czenstochowa, however, roads to some extent mitigate the absence of railways, and about Augustow the connection with E. Prussia, which the railways avoid, is, as regards roads, intimate.

Within each of these broad divisions—the salient and the two corridors—other natural features exercised a considerable influence. The chief characteristic of the northern corridor is the practically continuous waterline which defends its flank from attack from E. Prussia. Leaving the Vistula at Novogorodievsk below Warsaw, this line is formed by the lower Bug, the lower Narew, the Bobr, the lakes of Augustow and Suwalki, the middle Niemen to Sredniki, the Dubissa, the Vindavski canal which crosses the low Shavl waterhed, and the Vesta, prolonged by the Vindava to the Baltic. From the Niemen section to Novogorodievsk almost every important crossing—there are

German.—Gen. von Lettow-Vorbeck, Reminiscences of East Africa (English translation 1920); Dr. Ludwig Deppe, Mit Lettow-Vorbeck durch Afrika (1919); Dr. H. Schnche, Deutsch Ost-Afrika im Weltkriege (1919).

Belgian.—P. Daye, Les Conquêtes africaines des Belges (1918).
not many—is protected by permanent fortification of some sort. Its most vulnerable section is that at which the E. Prussian frontier makes contact with Augustowo-Suwałki-Kovno-Grodno. South of this region, on the stretch Rozan-Lomsha, owing to the absence of railways and first-class roads, military operations were never principal, but always dependent upon either those of Suwałki and Augustowo or those astirle the Warsaw–Mława–Danzig line. North of Kovno, at the broad entrance to the corridor, was the Vedris or Vedrus, a narrow valley through which wall a long as Kovno held out and kept the attack toward Shavli.

Frontally, of course, the corridor was protected by the Vishula and its fortresses Ivangorod, Warsaw and Modlin or Nowo-Kilsen (this last at the origin of the flank barrier just described), and behind this frontal defense were other successive lines—the middle Bug, the middle and upper Narew, the upper Niemen and its feeders, the Vilja system—not to mention partial barriers such as the Wieprz. But most of these rear barriers, in particular the Bug, tend in their upper course to turn southward, thus opening to an invader who stands N. of the San a succession of successive gates along the inner edge of the corridor, by which penetration is possible to Białystok or even to Baranovichi. Hence the special importance attaching, in the operations of 1914–5, to the lower San sector and the fortress of Brest-Litovsk.

The southern corridor, unlike the northern, lies partly on one side of the political frontier and partly on the other. No important natural barrier prevents either an Austrian irrigation from the S. as far (roughly) as the line Lublin–Kovel–Sarni, or a Russian irrigation through and past Lemberg (Lvov) to the Dniest. As has just been mentioned, the left wing of such an Austrian irrigation has the opportunity of seizing the gates of the southern corridor; no reciprocal advantage offers itself to the Russians since the Dniest line is doubled by that of the Carpathians. But, in particular, the fact that the whole Lemberg region is within the Austrian frontier narrowed the corridor normally open to the Russians to a mere strip of country. To protect this from being cut off from behind, the Russians had constructed a triangle of fortresses Kovno–Dubno–Lutsk. At its front end, where it joins the northern corridor and the salient, Ivangorod, Brest-Litovsk, and minor river courses and marshes were relied upon to seal the region of Chelm and Vladimir Velikij; in effect, a deep bay in the inner edge of the region, pressed too deep laid open its flanks to counter-attack both from Ivangorod and from Lutsk (Luck).

The geography of the interior of the marsh area needs little description. As above mentioned, much of it is tactically penetrable, but owing to the extreme paucity of communications, as well as to its physical difficulties, it is on the strategic plane essentially an obstacle and not a field of manoeuvre. Its outstanding geographical feature is its river system; the Pripyat itself runs W.–E., but it has numerous N.–S. tributaries notably on the S. side, and these tributaries sometimes form, with tributaries of the Dniest (flowing in the opposite direction), N.–S. waterlines of defence only broken at the watershed (Brody, for example) along which run the communications between Kovno and Lemberg.

In the forefront of the central salient, too, it is the waterlines that are the most important features. The course of the upper Warta; that of the Pilica; the position of Lodz (or rather Leczyska) at the divide of the Warta and Bzura systems; the course of the Nida meeting at its mouth the mouth of the Dunajec, one of the several Galicia rivers which double the San obstacle; lastly, the upper Vishula itself which forms the southern boundary of the salient—all these were important.

Practically the whole of this region belongs to the W. Russian plain, and has marshy valleys, feeble undulations, and great forests, some of these last still existing in primeval density, others already broken up by man's clearings and settlements. The only hilly mass is the Lysa Goza in the Kielez region of the salient. On the contrary, the Lemberg–Brody–Buczacza portion of the southern corridor, and all country between the San or Dniest and the Carpathians, is almost wholly a country of deep-cut valleys and high plateaux.

The German réfractaire opposed to the Polish salient is geographically similar to, but in point of human development very different from, that region. In Silesia, owing to its industrial character, the network of roads and railways is as dense as in western Europe. Without going west of Posen, no less than three complete lateral or circumferential railways join Upper Silesia to the trans-Vistula railways of E. Prussia. As, in face of these, no Russian lateral exists W. of Lodz it is easy to see how thickly was invested with all barriers of national importance, and so long as Kovno held out and kept the attack toward Shavli.

Of these two "bastions," E. Prussia was the more important as menacing the whole length of the northern corridor, from front to rear. Whereas the Lemberg region only projects from the San–Dniest barrier, E. Prussia has its whole length at right angles to the Vistula. It is served by so many railways that either end of this length is utilizable for the offensive.

The principal directions which this offensive may take are—from the eastern end of the province towards Shavli, from the same towards Kovno and Grodno, and from Mlava towards the Narew and, if and when that obstacle is overcome, on Siedlice or Białystok. We have seen that the first of these is inevitably a secondary or dependent operation. Between the other two the choice was always, for the German Command, difficult. Presuming the Narew forced, or Kovno taken, as the preliminary in either case, the one offensive leads close into the rear of the Warsaw–Ivangorod stronghold, while in the other the corridor is seized far back near its entrance; the one offensive therefore depended on how deeply the enemy was advanced in the Polish salient or how long the passive front of the "curtain" could be held, or what chance there was of cooperation from the lower San through the Bug "gate," and on other factors which had to be reckoned together on every occasion that an offensive was planned. But these two avenues (Kielce or Warsaw–Mława, and Vilna–Kovno [Grodno]–Insterburg) equally serve for Russian offensives, and the defensive characteristics of E. Prussia were nearly if not quite as important as its qualities as an offensive base.

The main feature of military geography in E. Prussia is the chain of the Masurian lakes which, in a sickle from N. to S. and then westward, protects the interior against attack from the E. or the S.E. The tongues of land which separate the lakes represent only a narrow frontage which has actually to be defended, and have the effect also of gathering communications, plentiful in the interior, at a few points of exit. To the S. of the lakes a number of tributaries of the Bobe–Narew system continue the water barrier, as against eastern attack, to the Narew; to the N. of them the river Angerapp presents a similar barrier as far as the Pregel, beyond which river smaller streams continue the line of defence with some gaps to the Niemen. Behind the lakes, the next important N.–S. barrier is the line of the Alle which, rising in the central Masurian lakes, runs to the Pregel at Weiβlau, whence from Tapiau to the Kursiche Haff runs the Deime. Other partial barriers to an invader's westward progress exist but are of less importance. Finally there is the German section of the lower Vishula which, intrigue at Danzig and fortified at Thorn and Graudenz, still bars access to Germany proper when E. Prussia has been conquered or evacuated.

Thus on the E. this province is singularly well protected. But it is to be noted (1) that the frontier, especially in the northern part, lies well in advance of the barrier, and that a policy of passive defence on the lake line forfeits a not inconsiderable region at the outset; and (2) that both the Insterburg–Johannisburg line and the Alle are turned by attack from the S., by Mława and Soldau, where the westernmost part of the lake system dies away. At the centre of the "sickle," on the other hand, the density of the lakes is highest and they not only afford local protection to this part of the region, but also enable the defending army to shift its weight from E. to S.W. and vice
versa without much fear of flank attack in doing so; while, on the Russian side, the paucity of communications in the foreground of these central lakes seriously impedes liaison between the northern or Gumbinnen and the south-western or Soldau groups of the invaders. Such shifts of the centre of gravity are, moreover, facilitated by the dense railway system lying behind the lakes. The frontier railway, which runs from Thorn, by Soldau, Johannishurg and Lyck (junction of the Russian Bialystok—Brest-Litovsk transversal), to Tilsit and Memel, lies outside all defensive barriers. But inside the barriers are some three other transversals, one being the Thorn—Insterburg—Wirballen section of the Berlin—Petrograd main line, and the others parts of a well-developed provincial system.

The military-geographical characteristics of the Lemberg region, the other potentially offensive base lying outside the Vistula—San—Dniester barrier, are less sharply marked and their influence is not so definite. Offensive possibilities lie in the direction of (a) Besarsandia, (b) Kiev, (c) Kovel, (d) the inner edge of the northern corridor, towards Brest-Litovsk. Of these, as in the case of E. Prussia, (a) is eccentric, except as a secondary element of (b); and (c) centres on a region which is ill-developed in communications, and therefore operations there are subsidiary to those on either flank. The important alternatives are therefore, speaking broadly, (b) and (d). In (b) Dubno and Rovno play the same rôle as Kovno in the N., and the results to be expected from a successful operation of this character are similar to, but smaller in scale than, the corresponding enterprise on the Nienem. (d) The operation, twice carried out and several times contemplated, offered many results and many risks, and its usefulness varied according to a number of factors like that of the corresponding operation from the N., with which, in fact, it was closely combined.

Defensively, the conditions of the Lemberg region were similar in some respects to those of E. Prussia. Waterlines opposed invasion from the E., while from the N. Lemberg was open. But the real obstacle value of the E. Galician watercourses,—Gnila Lipa, Zlota Lipa, Strypa, etc.,,—whose names were to become historic, is small, and, though N. of the Styr system and the uppermost streams of the Bug (Styr) have wide marshy valleys and are serious barriers, the watershed itself (Dubno—Brodly—Lemberg) is an open gate both for road and rail approach to the Galician capital.

The railways of the Galicia theatre, though far inferior to that of Silesia and Prussia, included two complete laterals N. of the Carpathians, and at least one S. of them. From the interior of Hungary and Moravia, over the Carpathians, to the San—Dniester barrier there were eight approach railways between Teschen in the W. and Czernovitz in the E., and four of these pass the barrier at or near the Gродек gap, converging on Lemberg and Rava Ruska. In the latter region itself the railways lie chiefly radially from Lemberg. It is to be noted that on the whole front N. of Lemberg the Russian frontier region is destitute of approach railways.

Finally, the Carpathians (of which Galicia to the San, to Lemberg and to the Dniester, is simply a glacial) are not as the sea is to E. Prussia, a definitive barrier, but rather a wall with many gates for the passage of an invader into Hungary and Austria. The mountains themselves are rather Vosgian than Alpine, and their main passes are low enough to be practicable for railways. At the W. and E. ends, the mountains broaden out into the Tatra and massifs, but in the centre the mountain zone is at its narrowest, and it is exactly in front of this that the Gродек gap breaks the forward barrier and allows these railway approaches lines to make for the Hungarian plain. West of the Tatra massif, the Troppau gap opens Moravia to an invader who has mastered Upper Silesia.

(C. F. A.)

II. THE CAMPAIGNS OF 1914

The Russian Plan of Campaign.—Two characteristics of the Russian Army were admitted on both sides as axiomatic, the relative slowness with which its total forces could be brought to bear and the numerically overpowering superiority of those forces when assembled and ready. Both these were summed up in the popular phrase of 1914, which likened the Russian Army to a steam roller. The axioms were not, however, independent. Only by waiting could the overpowering strength be realized, and by temporally forgetting this numerical advantage, it was possible for the Russians to act with partial forces and provisional objectives, almost if not quite as promptly as the armies of the Central Powers. Instead, therefore, of the usual stages of couverture and full-power action there would be, or might be, three—couverture, rapid partial action, and delayed full-power action—and the application of the geographical factors to strategy varied accordingly.

In all alternatives, the inclusion of the central salient, either in the couverture system or in the deployment for the main action, was impossible. In other words, it was militarily evacuated from the outset. In the alternative of delayed full-power action, the couverture would guard the outer flanks of the two corridors and the Warsaw—Ivanorod—Lutsk front, while the main masses assembled further back. Flask-guard groups would prolong the defence of the corridors respectively in the Shavli and of the Mlava—Breslau. No line of defence for the main bodies would be, substantially, Kovno—Grodno—Bialystok—Brest, and (for the Southern armies) points behind Rovno. But the abandonment of so large a portion of Poland would only be necessary in the case of Germany’s employing the major portion of her forces in the east.

In that case, especially if it arose in winter, it was calculated that the Russian forces on the couverture line would have to retire fighting, giving up Warsaw and possibly Ivanorod, but holding firmly at all costs on the middle Niemen front and at Brest. If that case did not arise, then the couverture was strong enough to enable the main masses using the northern corridor to detrain further forward. In proportion as the arrangements for mobilization and concentration were improved in the years 1910—14, and in proportion also as it became more probable that Germany would elect to employ the bulk of her forces on her French front, not only this forward concentration but also preparatory offensives delivered from the couverture line came to be considered.

In all cases the main object which was to be sought when the forces were fully assembled was practically the same. It was the destruction of the Austrian armies in Galicia, the occupation of the Carpathian line, and eventually an advance into Moravia and Silesia by Troppau and the Oder head, turning Breslau. The exact form in which this ultimate offensive would be realized could not be foreseen until the Germans and Austrians had shown their hand; meantime, the problem before the Russian general staff was to plan their couverture arrangements, their detrainments, and their now feasible preparatory offensives as to subserve this purpose.

Generally speaking, the couverture on the Narew—Bobr, that on the middle Niemen, and that in the Shavli region were disposed and directed to checking as long as possible any German attack on the flank of the northern corridor. It would be reinforced in situ to the strength of two armies and an independent group. If powerful German attacks developed it would offer an elastic defence, on one line after another, to protect at all costs the region of Bialystok—Grodno—Vilna during the troop movements in that area. If not, it was to take the offensive and, by conquering E. Prussia to the Vistula, definitely to secure the right rear of the future main effort. This conquest was to be carried out from the S. by Mlava, turning the lake barrier, by one army while the other pressed up against the front of the lakes and the Angorapp, so as to decoy the Germans and at any rate to prevent a rush upon Kovno and Grodno. The independent group about Shavli was to deal with minor enterprises of the enemy in its own area, and especially with landing threats on the Baltic coast as far as Riga. From that point inclusive, coast defence was entrusted to another army, with headquarters at Petrograd.

In the centre two armies, coming from the interior of the central and eastern railways of the corridor, were, if possible, to...

Plate III.
Mobilization and concentration proceeded rapidly. The cavalry divisions allotted to the Russian front were detained complete by the 7th day of mobilization, the infantry corps by the 13th day. On Aug. 14 the Grand Duke informed the French ambassador that the I. and II. Armies would open their offensive on the morrow, considerably sooner than was expected by the French, who only began their advance on that day.

The "preventive" offensive that was to lead to Tannenberg was thus launched on Aug. 14. Its objects were, partly, the accelerated fulfillment of the original plan of campaign (at the lowest, the active flank defence of the northern corridor, now being exercised by a mere 3 corps; the remainder, as assembled, to be assembled to watch Rumania.

In a case like this, the engagements were all assumed to be in progress before the full concentration had been effected. Including the Petrograd army, only 28 out of a total of 37 active corps were comprised in the dispositions, and the reserve divisions formed on mobilization were not counted upon for immediate service. The remainder, in so far as no new complications occurred to tie them to their peace regions (e.g. Caucasus), would become successively available and constitute a mass of manoeuvre or a pool of reinforcements, according to the course of events.

On mobilization, according to the allocation of troops was as follows:

I. Army (Rennenkampf). Niemen, including Shavli. II., III., IV., XX. Gd., I. Corps. (As soon as relieved by reserve divisions [XXVI. Corps] at Shavli. XX. Gd. was to proceed to IV. Army.)

First task: protection in front of Niemen line, on that line, or in advance of it, in the N. and W. as far as the area of Vilei. Second task: to bind the German forces on the lakes and Angerrapp.

II. Army (Samsonov). Nariew. VI., XV., XXIII., XIII. Corps.

First task: protection of Bohr-Narew-Bug line and reconnaissance into Miawa-Neidenburg region. In case of heavy German offensive, the region of Białystok to be protected at all costs. Second task: invasion and conquest of E. Prussia via Miawa, turning the lakes.

These two armies had each several reserve divisions allotted.

IV. Army (Evert). Concentration area Lublin - Grenadier. XIV., XVI. XVIII. Corps.

V. Army (Plihor). Concentration area Chelm. V., XVIII., XIX. and XXV. Corps.

Both for attack of N. front of Austrian armies in Galicia.

III. Army (Russky). Concentration Roivno-Dubno. IX., XI., XXI. Corps.

VIII. Army (Brisslau). Concentration S. and W. of Proskurov.

VII., VIII., XII., XXIV., III. Caucasian Corps.

Both for attack of N.E. and E. front of Austrians in Galicia.

The I. and II. Armies formed the northern-western front under Gen. Zholinsky (succeeded after the first operations by Ruszky), the IV., V., VI., VII., the south-western front under Gen. Ivanov, who combined the VII. and XIX. Corps.

The VI. Army (Grand Duke Nicholas) was the title of the Petrograd force, the VII. (Nikitin) that of the Odessa troops.

(In the event of German offensives developing on a large scale, requiring more reserve rear line troops, the I. and II. Armies was to be switched en route to the right of the I., and to it instead of the VIII., the XXIV. Corps was to go. It would also become part of the north-western front.)

The peace-time scheme, as thus outlined, was at once modified in the early days of mobilization, not so much in intentions as in allocations of force. No commander-in-chief of the whole was appointed before the war, as the Tsar was undecided as to whether to take command himself. At the outbreak of war the Grand Duke Nicholas, Commander of the VI. Army, was appointed. He had taken no part in drawing up the scheme, and his own ideas differed somewhat from it. He therefore formed a new scheme, or rather a modification of the basic scheme, whereby the Guard and I. Corps were dispatched to Warsaw (instead of to the I. Army) to form the nucleus of a IX. Army, and the VI. or Petrograd Army was reduced first to one corps, and then to reserve divisions only. The first corps to leave was the XVIII., originally intended for the IV. Army but assigned to the IX. (replaced in the IV. by the III. Caucasian Corps taken from the VIII. Army). The XXII. followed towards the end of August, joining the I. Army in lieu of the Guard and I. Corps. Further, a number of the reserve divisions accumulating behind the I. and II. Armies were constituted a little later as a X. Army with the mission of connecting the I. and II. Armies—but too late to avoid the catastrophe of Tannenberg.

In fact such a course of action was provided for in the Russian concentration scheme. But the alternative preferred by the Russians was an offensive, or two offensives, carried out by the readiest portion of their forces, and their alternative naturally engaged the attention of the Central Powers in the years after 1910, when the war-readiness of the Russian army was evidently being improved with menacing rapidity. The defence against such an attack could not readily be combined by the two Central Powers because of the solent W. of the Baltic; on the other hand, therefore, Germany and Austria-Hungary formed two theatres, either or both of which might be the target of enemy offensives of uncertain power. Further, the entire peace forces of the Central Powers, taken together, were not equal numerically to the peace forces of Russia, and the adhesion of Turkey, and still more that of Rumania, to their side was problematical. If the bulk of the Russian forces concentrated on the forward line, then there were only two practical alternatives for the Central
Powers, either (a) to concentrate as much as possible of the German army in the E. (relying upon the short and well-fortified defensive line of Lorraine and Alsace, doubled by the Saar and the Rhine, to hold up the French), and to take the offensive with 90 or 95 divisions, German and Austro-Hungarian, as soon as possible so as to catch the enemy in the act of detrainment; or (b) to stand on the offensive, each in his own theatre of war, resigned to give up territory in order to gain time for the annihilation of the French.

But that annihilation effort would require at least four-fifths of the German mobilizable forces, if it were to be carried out in the short time that the condition of the E. allowed, and in the case of Germany the territory that would have to be resigned was E. Prussia, bound indissolubly to the Hohenzollerns and to the Prussian army by ties of sentiment and tradition. Its abandonment was "unthinkable." Yet the force that could be spared to defend it was small indeed. The Reichstag had declined to sanction the creation of the three new army corps which would have eased the problem; and, in the event, one to two corps allotted in principle to the E. were taken at the last moment for the W. In short, the German army allotted to the E. was a minimum force. But it was not on that account authorized to give up any German guard;

Many Austrian authorities therefore favoured a withdrawal of the line of defence to the Carpathians, and probably the majority considered that nothing could be held on that line of the San-Dniester barrier. The problem then was difficult and observed proposed differences of opinion both within each country and between the two countries themselves were certain. Austria's strategy even in respect of her local problems depended largely upon Germany's, and no definite, binding convention appears to have been negotiated, either for the case of the offensive or for that of the defence. More, the interchange of views which did take place led to completely disjointed action. When the inner wing of the Austro-Hungarians was driving forward the offensive on Lublin and Chelm, the Germans in E. Prussia were under orders to retreat to the Vistula. The kindred of the Austrian general staff, was essentially active in temperament, and the wave of sentiment in favour of the undiluted offensive which swept through all European armies about 1912 strongly influenced him and his entourage. A scheme was prepared under which the left portion of the Austro-Hungarian army was to take the offensive from the lower San, northward on Lublin and Chelm, flank-guarded by an échelon directed on Vladimir Volynsk, while the right portion defended Lemberg against attack from the E. In cooperation with this left wing, a German army was to advance by Mlawa on the Narow line, force this, and effect a junction with the Austrian army about Siedlce. By this scheme it was hoped either to cut off a part of the Russian army and beat other parts in detail as they detainted—if the Russians were attempting to forward concentration—or to make good military occupation of almost the whole of Poland in the shortest time—if they were concentrating on the rear line Kovno-Brest. At the lowest, Conrad held, the protection of Galicia and of E. Prussia would be best assured by the offensive.

In how far Moltke agreed to this plan is doubtful. He had definitely committed himself to the Schlieffen scheme of putting France out of action before an eastern front came into existence, and though he had considerably altered its details, he had provided even less force for E. Prussia than Schlieffen had provided. Such evidence as is available tends to show that Moltke agreed with the scheme as the operative idea of the eastern offensive that was to follow the decisive defeat of France (expected to have been sufficiently achieved by about the 30th day of mobilization), but not as a preventive offensive to be launched while the issue in France was still undecided. Conrad, on the other hand, was determined to carry it out the moment he was ready, hoping, as he said, that Moltke would not "leave him sitting in the ink too long." The scale of the operation for him was only that of a preventive offensive, carried out substantially by about 27 Austro-Hungarian and 10 German divisions from the San and from the Mlava region respectively. This force, if it caught the Russians in the act of concentration, would create "favourable conditions for later operations" on a large scale.

Moreover, in the campaign, gen. K. Prussian I (VIII., Gen.-Oberst von Prittwitz and Gaftron) in active and reserve divisions (I., XVII., XX. Active Corps, I. Res. Corps, 3rd Res. Div.), for both the lake and the Mlava fronts. Apart from a number of Ersatz and Landwehr formations, most of which were intended for the defence of Thorn, Graudenz and Königsberg, this was all. In Posen province and in Silesia, there were only frontier guards of Landsturm, and the Landwehr and Ersatz garrisons of Breslau and Posen; as the salient facing these provinces was practically evacuated, no more was necessary, and indeed eight Landwehr regiments were grouped in Upper Silesia as a field force ("Landwehr Corps," von Woyrsch) to accompany and guard the left of the Austrian offensive.

Thus, the first campaigns in the E. were distinct and without connexion of idea or of date. The battles of both being described elsewhere, it is sufficient here to outline the campaigns of Lemberg and Tannenberg in succession.

The Campaign in East Prussia; August-Sept., 1914. The first requirement of the Russian scheme of operations being the free use of the northern corridor for the assembly of forces against the Austrian left, the troops disposed on the dangerous flank of the corridor were ready for action about ten days before the date set for the completion of the Lublin-Chelm concentration. In the original scheme, their mission was primarily defensive and in the second place offensive, but as early as Aug. 9 the Grand Duke determined to push forward both the I. and II. Armies on their offensive missions, in the hope of once compelling the Germans to hold back forces destined for the W. On the 14th, their concentration completed, these armies moved out of the detrainment areas, the I. (II., III., IV., and XX. Corps) under Rennenkampf on the axes Kovno-Gumbinnen and Suwalki-Margrabora, the II. (VI., XV, XXIII., XIII. and later I. Corps) under Samsonov on the axis Praisnysz-Soldau. Seven to eight cavalry divisions accompanied and preceded them. At the contrary, the E. from Minsk to Biala and round to Mlava there had already begun local engagements, especially on the axis Kovno-Gumbinnen, where Rennenkampf on the one side and von Francois (commander of the German I. Corps) on the other had both strong motives for activity, the Russians to thrust back the enemy's forces as far as the "corridor" as possible, the Germans to preserve the region between the frontier and the lakes as long as possible from occupation or pillaging. On the Mlava axis these episodes were fewer, for the Russian main bodies were more distant. The Germans were unable to prevent the enemy's mounted troops from ranging up to Soldau, but their Zeppelines reconnoitred the line of advance of Samsonov's main body.

Gen. von Prittwitz, in spite of his small forces, was confident. He placed the I. Corps (Francois) facing E. on and in front of the Angerapp, the XX. Corps facing S. between Allenstein and Soldau, the XVII. and I. Res. Corps and the 3rd Res. Div. in the interior, waiting on events. To the left rear of the I. Corps, the Königsberg main reserve—an Ersatz and Landwehr force numerically, but only numerically, equivalent to a corps—moved out N. of the Pregel to Insterburg. To the right of the XX. Corps was a frontier guard, also composed of Ersatz and Landwehr belonging to the fortresses of Thorn and Graudenz. To the E. v. Prittwitz, satisfied that no important threat was impending on his S. front, turned over the defence of that front to the Landwehr and Ersatz formations of Gen. von Unger, drew the XX. Corps to Orlitzburg, in readiness for an offensive to
wards Johannisburg, and brought the remainder of his forces to the E. front behind and on the flanks of the I. Corps, the 3rd Res. Div. (reinforced by one brigade and a screen of Landsturm posts) holding the lake barrier.

On the 17th took place the first serious encounter of large forces. Von François still maintained a forward position on the Kovno railway at Stallupönen, barely five miles inside the frontier; he was determined to defend offensively, and he inflicted a sharp blow on the central columns of the enemy before the others began to move. Between impetuous advance was driven in, and Prittwitz's, whose intention was by no means to fight so far forward, ordered the combat to be broken off and the troops to retire to the Gumbinnen position. There, on the 19th and 20th, the battle of Gumbinnen was fought. Claimed by both sides as a victory but in fact indecisive, since parts of each line gained successes or suffered failure, it ended in Prittwitz's ordering the battle to be broken off. To the astonishment of his corps commanders, he announced that he proposed to retreat over the Vistula. A grave crisis had arisen. The Russian II. Army, seemingly quiescent on the Narew, had in fact been cautiously advancing on the Mlawa axis, which was now defended only by second-line troops and, partially, by the XX. Corps—everything else, even mobile Landwehr brigades, having been brought over to the E. front by the order of the 14th. Such was the situation of the defences when, some time after noon on the 20th, reports reached Prittwitz to the effect that four or more Russian corps were approaching Mlava and Ortelsburg. He had three alternatives—to disregard the threat, win an effective victory at Gumbinnen, and pursue the enemy in such a way as to impose caution on all Russian forces in advance of the sensitive point of the "corridor", to leave a containing force about Gumbinnen, trust to the lake barrier, and bring back the main body by second-line troops, as so as to strike the flank of the oncoming II. Army; or to fall back beyond the sweep of that army's manoeuvre. The first alternative was eagerly advocated by von François, but the other corps had met with little success in the battle. It is probable that no reasonable hope remained of winning a thorough victory on the 21st, and nothing less would serve. The second alternative was not, at that moment, considered and the third was adopted in its most extreme form, retreat beyond the Vistula. The I. Corps was to move by train to Bischofswerder and Gumbinnen, and the XX. Corps to fight for time, and the remainder to withdraw westward under cover of these corps. A factor in the decision was the activity of Russian cavalry which, in large and small bodies, was appearing in the interior of the province.

In the Kriegsspiel exercises of peace-time, this problem had often been fought out, and the idea of sacrificing E. Prussia—on paper—was familiar. But, as the elder Moltke observed in 1866, "in practice one does not abandon provinces." On the 20th, apparently on the initiative of Lieut.-Col. Hoffmann of the staff of the VIII. Army, who sent a protest direct to supreme headquarters at Coblenz, Moltke cabled with Prittwitz by telephone, and urged him to try the alternative of a manoeuvre on interior lines. The army commander replied that this was impossible and that he might need reinforcements even to secure an escape to the Vistula. Thereupon Moltke relieved him of his command, opened direct telephone communication with von François and von Scholtz (XX. Corps), telegraphed to General-Oberst von Hindenburg, in retirement, to offer him the command, and summoned Ludendorff (deputy chief of staff II. Army) to act as chief of staff.

This situation, in fact, was less alarming than it had been on the previous day. But Rennenkampf's attack was a distinct and important activity; and Prittwitz recovered confidence, decided to hold the line of the Passage against Rennenkampf, and began to work out a scheme of attack against the Russian II. Army. But the order of dismissal reached him that evening.

On the 23rd Hindenburg and Ludendorff arrived at Marienburg (H.Q. VIII. Army). Already, after a conversation with Moltke, Ludendorff had (apparently on a suggestion from 'François') fixed Deutsch-Eylau and eastward, instead of Gosslerhausen, as the rendezvous of the I. Corps and ordered all available Errats and Landwehr units from Thorn and Grauden to strengthen von Unger, thus beginning to prepare a group of two active corps and other troops to check Samsonov. The other forces lately engaged at Gumbinnen were to remain, temporarily, opposing Rennenkampf—all measures designed, evidently, to arrest the sense of retreat and panic. Not until the staff of the VIII. Army had reported the situation in detail was a clear idea of possibilities formed by the new leaders. In principle the plan was adopted of holding up Rennenkampf, maintaining the lake region against any break-in from Lomzha, and concentrating offensive effort on Samsonov. Both the newcomers and the staff already on the spot were in agreement as to this. But it remained to be seen whether, and even how, it was to be accomplished. On the evening of arrival, Hindenburg reported to Coblenz "assembly of army at XX. Corps and enveloping attack planned for Aug. 26," but next evening, developing the idea in some details, he added: "mental determined but not impossible things turn out badly."

The intention was to disengage some, or even all, of the troops opposing Rennenkampf, and with them by a flank march close behind the lakes, to envelop Samsonov's right; to bring in the I. Corps and the nearest portions of von Unger's force against his left, and to hold him frontally with the XX. Corps. It was on this last that everything hinged. Short of a simultaneous effort by both Rennenkampf and Samsonov—the case feared by the Germans—pressure by the II. Army alone was of greater significance than that of the I. Army alone would be. Rennenkampf, however active, could only drive the I. Res. and XVII. Corps south-westward towards the Passarge (and the Königsberg troops into their fortress) and work a passage down the rear side of the lakes to join hands with Samsonov, whose VI. Corps was made to diverge towards Ortelsburg for that purpose. Samsonov, on the contrary, could by an energetic advance bring three corps (XIII., XV., XXXIII.) against Scholtz, and in case of success break into the midst of the new dispositions of his opponent. On the 23rd-24th this seemed probable, for on those days he attacked the XX. Corps and forced it to swing back from the line Gilgenburg–Orlau to the line Gilgenburg–Hohenstein. At that moment the 3rd Res. Div. at Hohenstein and even the first arrivals of the I. Corps at D. Eylau were being drawn into the fight to assist von Scholtz. The arrival of the I. Corps, destined for the flank attack on the W., was delayed by misadventures; and this western attack (I. and Unger) was itself becoming imperilled by the advance of yet another Russian Corps, the I., from the IX. Army forming at Warsaw. Of the other German corps not one was disengaged for its southward march before the 24th.

On the 24th, however, the withdrawal from Rennenkampf's front began. It was carried out in the midst of an emigration en masse, main roads being so crowded with refugees that troops were marched in some cases entirely by tracks and by-roads. Russian cavalry parties were by now riding about the country as far as the Passarge. The Angerapp line having been given up on the 22nd, the front of contact opposite the Russian I. Army now (24th) ran along the Deime and the lower Allé, astride the Pregel, to Allenberg, thence by Gerdaun to Angerburg at the N. end of the lakes. North of the Pregel, the Königsberg force was slowly retiring on its fortress and had left Wehlau. South of it there were withdrawal, each in succession and covered by the rest, the XVII. Corps, which was directed on Bischofsburg–Ortelsburg; the I. Res. Corps, directed upon Seeburg; and finally the 6th Landsturm Brigade from Lützen, the key of the lakes, to the same region. Only the Königsberg force, one cavalry brigade, and some Landsturm, remained in front of the Russian I. Army.

Meantime, Samsonov continued his methodical advance, but very slowly—the VI. Corps on Bischofsburg via Ortelsburg; the XIII. on Allenstein; while the other two, followed in echelon to the left rear by the I. Corps, were sent against Scholtz (20th and 3rd Res. Div.), whose left was driven from Hohenstein. But already the two wings of the envelopment were being pre-
From the German point of view, although information was no doubt lacking as to the large undisclosed reserves moving in the "corridor," it must have been clear that the defeat of Rennenkampf would effectively answer any new threat of the S. by endangering the Grodno-Kovno artery. In the conditions of the moment this defeat could best be ensured by attacking his left wing, and in the first days of Sept. the VII. Army, with the corps from the W. were disposed accordingly on a long line from Preussisch-Eylau to E. of Wilensen; in order from left to right Guard Res., I. Res.; XI., XX., XVII., I. Corps and 3rd Res. Div. Von der Goltz with his own division and another made up from Unger's and Müllmann's forces (called 35th Res. Div.) watched the southern front on both sides of Mlava. The Königstiger force still held the Deime line. On his side Rennenkampf had already brought up two of his reserve divisions from the Niemen for the siege of Königstiger, and he now strengthened his left from both active and reserve formations assembled about Grodno. As had been the case at Tannenberg, the forces were numerically almost even. On neither side was any important condensation of force at particular points effected, and the resultant battle, known as the battle of the Masurian lakes, or of Angerburg, was practically "linear."

The idea pursued by Hindenburg was to press the Russian right, as far S. as Angerburg, with four corps, to break out of Lötzén (the key of the lakes, which had been kept throughout) with the XVII. Corps while the I. Corps and 3rd Res. Div. advanced from their Tannenberg positions eastward along the frontier railway. These 23 corps were intended to roll up the left of Rennenkampf and press northward, with an échelon to the right against the fresh enemy forces reported detaining about Grevevo. The battle began on Sept. 7 and on the 8th was general. But the lake barrier this time favoured the Russians. The German XVII. Corps made only slow progress in advancing from the pass of Lötzén, and most of the I. Corps was soon drawn north-eastward. The balance, however, passing S. of the lakes along the axis Johannisburg-Biala, made marked progress, and on the night of the 9th—10th Rennenkampf decided to take down his front by successive fractions from right to left, and retire into the Mariampol region whence he had come. The battle then became one of tactical incidents, with all the local vicissitudes of a general chase. At the end, thanks to the traditional rearguard aptitudes of the Russian soldier, Rennenkampf's army had flowed away to safety, leaving the bulk of the VIII. Army congested round Vladislavov and Eydtkühnen with the I. Corps E. of Vilkovishki and the 3rd Res. Div. at Suwalki. Goltz's southern cordon had meantime extended eastward as far as Margrabora.

The battle of the Masurian lakes freed E. Prussia, and the victors gleaned a harvest of some 30,000 prisoners in manifold combats amidst woods and lakes. But it was not a Tannenberg, and already events elsewhere were in progress which involved the VIII. Army in a general eastern front campaign.

The Galician Campaign of August-September 1914.—As has been said above, Conrad had determined to carry out the offensive in the region Lublin-Chelm, where the Russians were concentrated, though without definite assurances of cooperation from E. Prussia. In the offensive, the forces to be employed formed two armies—the IV. Army (Aufenberg), consisting initially of the II., VI., IX. and newly formed XVII. Corps, and four cavalry divisions; and (detainment area Varoslaw-Przemysl) the I. Army (Dankl), L., V., X. Corps and two cavalry divisions (detainment area middle and lower Samb.)

East of Lemberg it was intended to place two armies, the II. and III. But owing to the belief that the war crisis would be limited and localized as a campaign against Serbia, the II. Army was assembled initially on the Danube, and could only be brought N. by degrees. At the outset it was represented in Galicia only by the Army-group Köves (XII. Corps and some extra divisions S.E. of Lemberg and on the Dniester), but the IV. and VII. Corps were being disengaged from the Serbian front and sent up gradually. The III. Army (Brudermann) E. and N.E. of Lemberg consisted of the XI., III. and XIV. Corps.
EASTERN EUROPEAN FRONT CAMPAIGNS

and some other divisions, of which the XIV. Corps was presently taken to form the Army-group of Archduke Josef Ferdinand and placed N. of Lemberg to maintain liaison between the IV. and III. Armies, intervening as required by either.

On the left of the I. Army, along the N. side of the upper Vistula (i.e. in the Polish sector) an Army-group under von Kummer, formed of Landsturm troops, and to the left of Kummer, the German Landwehr Corps of Woyrsch, were to advance in the direction of Sandomir and Ivorangrod respectively, driving back such Russian mounted forces as remained in this region. These formed an échelon protecting the left rear of the I. Army, but were primarily intended to form a rallying-point for an insurrection in Poland. This hope was not realized, or realized only to a small extent, and the "Polish Legion" that was formed in fact consisted largely of Galician Poles.

The Archduke Friedrich was commander-in-chief, with Conrad as chief of staff and effective director of operations. The campaign which ensued constituted in reality a chain of battles and as such is described elsewhere. Here it need only be summarized very broadly. Apart from the movement of Kummer and Woyrsch, who started early, in order to be in position at the date of the general advance, the campaign opened on Aug. 20. Prior to that date, the Austrian cavalry divisions had made many attempts to ascertain the Russian movements in the "southern corridor" and the adjacent parts of Bessarabia, but without obtaining much information. The Russian masses were in fact still in the stage of rail transport, and their mounted troops, trained to fire action and favoured by the country, easily eluded the screen intact. The Austro-Hungarian offer of battle was therefore in its first stages carried out according to the a priori scheme.

The objective of the I. Army was Lublin, that of the IV. Chelm; they therefore aimed at the concentration centres of the IV. and V. Russian Armies respectively, and the conditions of this concentration led to a series of encounter battles in which the Austrian left was constantly écheloned forward, with the result on the other side that the Russian V. Army's tended to strike south-westward rather than southward, and so in turn exposed a flank to the Austro-Hungarian IV. Army. This Army, which depended for security on its right upon the Army-group (Josef Ferdinand), which was itself attracted now to the N. for intervention in Auffenberg's battle, now to the E. to protect Brudermann's exposed left. On the one side, therefore, an advance in échelon, on the other successive detrainments, produced a battle of marked day-to-day fluctuations. The I. Army in a series of combats collectively called the battle of Krasnik reached the line S. of Chodel–Borzechow–Tubrin by Aug. 26, against increasing Russian resistance especially on the left nearest Lublin, where it was found necessary to bring Kummer and Woyrsch E. of the Vistula in order to strengthen the forces aiming at that place while the right advanced to Krasnostav. On Dankl's left, meanwhile, Auffenberg was advancing into the area between the Wieprz and the Hucza, and on Aug. 26 the battle of Komarów began. In this, between Aug. 26 and Sept. 1 the Austrian IV. Army broke the Russian V. Army into two fractions, the more important of which, half-surrounded, only escaped through a maladroitness withdrawal of that part of the Austrian army which had seized its line of retreat. The withdrawal of the one Russian fraction to Chelm and the other to Hrubieszow on the Bug, with heavy losses, constituted a signal victory; and would have had great results but for events in Galicia.

There, in accordance with the prevailing doctrines and also in order to keep Russian influences as far as possible from the Ruthenian capital, Brudermann III. Army and Böh–Ermolli II. Army (in reality Army-group Kőves) had been sent forward to carry out an offensive defence, although in the one army Josef Ferdinand's group was limited in its range by its liaison task, and in the other the IV. and VII. Corps were still on their way to the theatre of war. This numerically weak offen-

1 In fact, it was wholly absorbed in the battle of Komarów.

sive encountered the Russian III. and VIII. Armies in full force—as has been mentioned above, these armies had been given priority in equipment and otherwise—and was brought to a standstill in the battle of Zloczów (Aug. 26–27) fought on the line upper Bug–Zlotá–Lipa. On Aug. 29–30 a new battle, defensive this time, was accepted and lost on the Vistula (battle of Przemyslany) and the III. Army fell back to Lemberg itself, which the supreme command thereupon decided to give up. It was evacuated on Sept. 2.

Thus Conrad was confronted with new problems. His left army (I., Kummer, Woyrsch) was already close upon Lublin, the victorious IV. Army pushing towards Chelm with its main body and Hrubieszow with its lesser half. In the region of Sokal and Rawa Ruska only cavalry activity had occurred, and Ruzsky's right wing was trending to the S.W. in the Lemberg direction. The beaten III. and II. Armies were assembled in good order on the strong line of the Grodeck lakes (near Wereszczyn), while no important attack had developed on the Dniestor. There were, substantially, three courses open—to pursue the northern offensive, trusting to distance and water to make interference with the right flank impossible during the necessary time; to take down the whole northern front and come back to the Vistula–San–Dniestor position; and to use the advantageous position of the IV. Army for a manœuvre on interior lines against Ruzsky's right flank. In principle, he preferred the first course, and as we have seen, he invited Hindenburg's coöperation in the still valid Sielcze scheme. But Hindenburg declined, as Rennenkampf had not yet been dealt with, and opposition in the front of the I. Army had visibly stiffened. The second alternative had obvious advantages and disadvantages; in the existing conditions, the disadvantages which had weighed heavily in peace-time—that E. Galicia was thereby abandoned—no longer applied since that region was now lost, and the preservation of the only-available armies of the Dual Monarchy was of the highest importance. Nevertheless, Conrad chose the manœuvre on interior lines, as the VIII. German army had done. It may be that Tannenberg contributed to the decision.

The germ of this idea appeared in the orders for Sept. 2, in which the IV. Army was ordered to suspend its offensive and change its front from N. to S. in readiness for a south-westward attack towards Lemberg, or for a south-eastward retreat towards the San. At the same time the lines of communication of each army were shifted westward, so that the hase of the system became the region between Cracow and the Carpathians. The effort of the I. Army to gain ground northward was not given up, so that in effect, at this date, the supreme command had not made up its mind. In the orders for Sept. 4, on the other hand, the choice was definitely made in favour of a IV. Army offensive in the Lemberg direction, though the I. Army, Kummer and Woyrsch, were still left with their mission unchanged.

On the 6th, the complicated manœuvre of the IV. Army was completed, but in its southward progress it had developed considerable opposition on the E. flank, while the W. and centre passing by Rawa Ruska and Niemirów met little or none. The result was that the army practically swung into line with the III. instead of striking from N. to S. against the assailant of that army. On the 7th, therefore, Conrad changed his plan again. The Austrian leader now proposed to take down the northern front by degrees, to use the IV. Army as a fixed pivot between Rawa Ruska and Magierów and to swing up the II. and III. Armies against Brussilov. This plan came to nothing. Russian pressure increased on the front of Woyrsch, Kummer, Dankl, and the Russian V. Army, beaten at Komarów, resumed the offensive against the group of divisions under Josef Ferdinan which had been left by the IV. Army to protect its rear. Finally, Ruzsky's right, augmented by a process of regrouping which had been going on at the same time as that of the Austro-Hungarians, emerged in great strength on and beyond Auffenberg's left, N. of Rawa Ruska. There was no surprise, as marked indications of such a move had been discovered in the southward advance of the northern army. But when the Russian V. Army, joining the general offensive, began to drive
into the weakly held gap between Dankl's right (Krasno-
sovice) and Auffenberg's left rear (group Josef Ferdinand about
Lasczów), Conrad gave up the battle altogether and ordered a
retreat to the line of the San and the Carpathians. The various
forces along the Dniester retreated to the Carpathians, the II.
Army to the region of Sambov, the III. to that of Przemysł, the IV.
to Yaraslav, and the I. with Kummer and Woyrsch to the lower
San (Sept. 11-13).

On this line, however, no stand could be made. Already on
the 14th the Russian IV. Army, strengthened from the assem-
bling IX., had been able to force a passage of the San near its
mouth. The Austrians thereupon resumed their retreat south-
westward (followed by a undefined time, before a Russian
force on that day standing on Sept. 22 on the line of the Visloka,
the Vislok and the Carpathians. Przemysł was left to be defended
by its garrison. On the 26th the retreat came to an end on the
line of the Dunajec-Tarnow-Gorlice-Usczie-Ruskie-Carpath-
ians. But at that date, the German IX. Army was beginning to
assemble in Upper Silesia. The eastern front had come into being.

The Vistula-San Campaign (October 1914).—In the last stages
of the Marne battle Moltke had been succeeded, in effective
direction of the German operations, by von Falkenhayn. Possi-
ble because he had had, and for a time continued to hold, the
office of war minister, certainly from judgment and temperament,
Falkenhayn was able to take the war towards the east on the lines
of the first. The war, after all, had become a war on two fronts
instead of two successive single-front campaigns, as had been
hoped, and it would have to be conducted accordingly. This
involved, first, a more intimate cooperation between the Ger-
man and the Austro-Hungarian forces than had existed
hitherto; secondly, the necessity of keeping the Austro-Hun-
garian army, in spite of its heterogeneous composition and
known deficiencies, in a fighting condition similar to that of
the German forces working with it; and, thirdly, constant recon-consideration of eastern plans, whether German or Austrian or joint, in
the light of the situation on the western front; but these three
were interdependent the first united operations clearly showed.

The immediate problem was to fulfill the second requirement
without neglecting the third. This meant, in concrete form,
the reestablishment of the Austro-Hungarian army without
bringing over forces from the west. At that moment—mid-
Sept.—the battles of the Alzne were developing northward into
Pierardy and Artos. The „race to the sea“ was in progress and
the chance of decisive victory in the W. had not been lost
on the Marne. On the other hand, it was clear that the Austro-
Hungarian army had not only lost Galicia but had suffered very
heavy losses of men and material stages extremely curtailed by its
experiences. The retreat to the Dunajec had on two occasions
come near to disaster—in the early stages when the IV. Army's
left flank was exposed and out of touch with the I. Army, and
in the later stages when strong Russian efforts were made to
drive the armies off their S.W. direction by enveloping the left
flank of Woyrsch and Kummer. After reviewing various alter-
natives offered by geography and the railways, he came to the
conclusion that to press the advance of the VIII. Army on Kovno-
Grodno, i.e. to pursue the victory of the Mazurian lakes, would
d not serve, and decided to form a „South Army“ in Upper
Silesia as a direct support to the Austrian left. At first it was
intended that this should be a small army, practically no more
than a reinforcement of Woyrsch, but within a few days Luden-
dorff's proposal to transfer the bulk of the VIII. Army to South
Poland, with its implication of a serious counter-offensive cam-
paign, was accepted. The object of Falkenhayn in agreeing
to this was, by enabling the Austro-Hungarian army to reassert
itself in the offensive, to gain time for achieving a decisive result
in the west. The theatre in which risks were taken was, as
before, E. Prussia. Hindenburg's victories had altered the
situation there, and a sort of pursuit could still be maintained
by a well-balanced force in the Carpathians. The possible reaction
set in and Rennenkampf came on again. Moreover, the barrier
of the lakes and the Angerpak was now being seriously fortified,
and it was to be expected that Rennenkampf could be brought
to a halt on that line if not in front of it. On the Małwa side,
no repetition of Samsonov's offensive seems to have been feared.
But as a precaution one of the 62 newly raised reserve corps was
sent to E. Prussia, and two more cavalry divisions were extric-
cated from the west. The forces of E. Prussia under von Schub-
bert retained the title VIII. Army. Those in South Poland were
designated the IX., under Hindenburg.

The Grand Duke Nicholas, meantime, was pursuing more and
more vigorously the idea which was first evidenced in the crea-
tion of the IX. Army behind Warsaw. This army had been
absorbed in the fighting against Dankl, but by now the more
distant active corps as well as numerous reserve divisions were
needed. They included several corps which had to be provided to
enable Rennenkampf's I. and X. Armies to check and drive off
the probable pursuit on the middle Niemen, and to reconstitute
the shattered II. Army on the Narov. But even with these
demands to be satisfied, enough remained for the constitution of
an offensive group between Warsaw and Ivangorod. With
this group he meant to transfer the centre of gravity to S.W.
Poland, making Warsaw—Czenstochowa and Ivangorod—Beuthen
the principal axes of his advance. Accordingly, in the last
days of Sept. and Oct. 1, the Russian army in front of the
Austrians began to be reduced. And a formidable mass—the
Austrian “gabelwurfer” for which the world waited—gathered behind
the middle Vistula, enabling the Austro-Hungarian army, retreating
with the advance S. of the upper Vistula, had advanced beyond
Kielce, Petrikov and Lodz.

The Austro-German offensive thus struck the Russians in the
act of regrouping. Its plan was— the German IX. Army and part
of the Austro-Hungarian I. Army, N. of the upper Vistula,
to advance, driving back all forces met with, to the line of the
Vistula above and below Ivangorod, and to form the pivot of
a sweep of the Austro-Hungarian IV. (Josef Ferdinand) and
III. (Boroevic) Armies which should advance to the San, relieve
Przemysł, and then strike northward and north-eastward.
The II. Army (Bohm Ermolli) in the Carpathians and the left
of the I. Army (Dankl) on the Vistula about Zawichost were to
conform to the movement as it developed. Danger of counter-
attack upon the extreme left of the IX. Army from the Warsaw
bridgehead was provided against partly by causing the various
frontier guards of Posen, Hohensalza and Thorn to advance into
Poland, partly by écheloning out a mixed force called Frommel's
corps—chiefly cavalry—on the middle Pilska.

Moving out from the concentration area in Upper Silesia
on Sept. 28, and joined on its right by the left of the Austrian
I. Army from Sept. 30, the German IX. Army reached the line
Klimontow (Austrian I. Army), Opatow (Woyrsch and XI.),
Groshe Guty, and the area between (XVIII.), W. of
Opoczno and S. of Raw (Frommel). At that date the Austro-
Hungarian I., IV. and III. Armies had also begun their advance;
and reached the Visloka, while in the Carpathians the II. Army
and Hoffmann's Corps to the E. of it began to dislodge the various
bodies of the Russian VII. Army that had established themselves
in and beyond the passes. Along the whole front only light
troops of the enemy were met, and the advance continued during
the following days. But, almost simultaneously, the Austrian
IV. and III. Armies were brought to a standstill on the San ban-
er and the gap of Chyrow which gave access to the Dniester.
Meanwhile, lighter forces, advancing north-westward, came into contact with the heavy
Russian forces now debouching from Warsaw.

This growing intensity of the fighting S. and S.W. of Warsaw
deflected the advance of the German IX. Army northward,
causeing a corresponding extension of front of the Austrian I.
Army, which now passed wholly to the N. of the Vistula, its
left centre facing Ivangorod. On Oct. 10, the battle was gen-

1 The III. Army—now commanded by the Bulgarian Radio
Dimitriev), minus several of its units, was employed in besieging
Przemysł; the VII. had come up from Bessarabia and taken over
the Dniester front from about Stryj eastward. Its designation
was shortly afterwards altered to that of "Dniester Group," but in 1915
a new VII. Army was formed in the same region.
eral along the whole front from Blonie W. of Warsaw, by Kal-
varya S. of that city, along the Vistula and the San to Przemyśl
(relieved on the 4th) and thence across the Chyrow gap to the
Carpathians. Here and there both sides sought to force the
water barrier. In most cases no foothold was obtained, but
where a bridge-head could be established, or where it existed as
at Warsaw and Ivangorod, effort was concentrated.

By the 14th the assembly of Russian forces about Warsaw
and Ivangorod was so great that no less than three army staffs
were required to direct operations—in order from right to left
the I. (brought down from Kovno region), the reconstituted II.
and the IV. (from the left of the Austro-Hungarian I. Army on
the left of this the V. while the III., VII. and VIII. (Dniester
Group) held the front of the San, Chyrow and the Dniester
foreground. The process continued on the following days;
the V. Army, taken out of the line S. of the Vistula, was put in
between the II. and IV., the IX. was brought up to Ivangorod,
and more and more Russian troops passed the bridge-heads,
while the thinned lines of both sides contended on the San-
Chyrow–Turka front without material changes, and the opposed
detachments of the Russian Dniester Group and Hoffmann
and Pflanzer-Baltin sought local battles on the various routes
between the mountains and the Dnieper delta.

On Oct. 17, Ludendorff, already warned of the strength of
the enemy's Warsaw armies by events and by a captured order,
advised Hindenburg to retreat. The want of success on the
Chyrow front indicated that the scheme for which the German
IX. Army had been brought to the Vistula had failed, and
the IX. Army and Dankl's I. Army were now exposed to the
convergent attack, from Warsaw, from Ivangorod, and from
Zawichost, of five hostile armies, while Josef Ferdinand, Boroe-
vic, Böhm Ermolli, and the forces eastward were pinned.

The retreat after a last attempt to gather a striking force on
the Pilsudz for a blow against the Russian II. and XV. Army—
made at the expense of thinning the front of the Austrians
before Ivangorod—set in on the 21st, and spread from left to right
as far as the Vistula above Zawichost. The San-Turka line,
on the other hand, continued to be held by the Austrians, fight-
ing being concentrated principally upon the right of the II.
Army, where a break-through was narrowly averted on the 27th.
During the next days, the lost ground was regained; and pro-
gress was made between the Carpathians and the Dnieper
by the smaller forces operating there. But on Nov. 2, operations
were suspended on the whole front S. of the upper Vistula.

During this period, the E. front of E. Prussia had been sub-
jected to attack, as had been expected. Renkenkampf, advanc-
ing from Kovno and from Ossowiec as well as frontally, had
pressed back the VIII. Army (von Schubert, later von François) to
Kibarty and to the W. of Lyck. François, sanguine in tem-
perament, defending his own corps district, inspired by a per-
sonal order from the Kaiser to protect E. Prussian territory, and
conscious that the work in the lake defences was incomplete,
was determined to hold his forward position to the last possible
moment. Falkenhayn, objective in mind and uneasy in spirit,
reinforced him with the new XXV. Res. Corps, which took
Lyck, and which was reduced by the Russians from the front. The
front then became quiet, for the Russians had no serious offen-
sive intention. Their I. Army was already on its way to War-
saw when the German counter-advance took place, and the X.
Army left to flank-guard the northern corridor was reduced in
strength to 13 divisions, as compared with some 47 in Poland
and 30 from Zawichost to Turka. On the Mlava front, held by
von Zastrow with a Landwehr Corps called the XVII. Res.,
all was quiet in the period of the Vistula–San operations.

The Campaign of Łódź–Cracow–Limanowa.—The retreat had
been foreseen in time for the German IX. Army to make elabo-
rate preparations for delaying the enemy's advance along the
south-western railway lines by which, evidently, his intention
was to reach Upper Silesia and the Moravian gap. In the course
of the retreat the demolitions planned as well as the evacuation
of stores and supplies, were carried out, if not completely, at
any rate sufficiently for their purpose. But both Hindenburg's
and Conrad's headquarters realized that they had now to deal
with the full effort of the enemy. The “steamroller,” after
breakages and delays, had started. By Oct. 31 the German
IX. Army had gone back to the line Szyrada–Szczerców, Novo
Radomsk, Włoszczowa, Chechiny, the Austro-Hungarian I.
Army to Kielce, Opatow, R. Opatowska. On Nov. 1–2 the
latter was driven back from the Opatowka line, necessitating
the withdrawal of the IV. and III. Armies from the San and the
abandonment of the offensives in progress on the E. of the
Stary Sambor region. A few days later the Russians had again
invested Przemyśl and were advancing to the Dunajec. The
central gravity, however, was in the S. of the Vistula.

The crisis brought out, in the three men who had to deal with it,
Conrad, Falkenhayn and Ludendorff, the characteristic
quality of each.

Conrad proposed to Falkenhayn that no less than 30 German
divisions should be brought over from the W. at once, bringing
Hindenburg's strength up to about 53 divisions. Forces in the
Carpathians and in E. Prussia were to be economized, and the
bulk of the Austro-Hungarian and German Armies were to seek
defensive victory in battle in Poland. Now that the Russians
had gathered, and gathered so far W., it would be possible to
fight without fear of their retreating into the less interior of their own country. In short, the war could now be
won in the E. It could also be lost, unless some such
decision were attempted, Conrad held that it would be necessary
in order to retreat to the Danube. Falkenhayn, on the other hand,
was becoming convinced—especially by the experience of Ypres,
that the war would be a protracted trial of endurance, and must
be handled on the principles adopted by Frederick the Great in
the latter part of the Seven Years' War, viz. a wary, economical
defensive, with offensive sorties on every favourable oppor-
tunity or necessary occasion, but no staking of all upon a throw.

If Conrad was the Lee of the Central Powers, Falkenhayn
was their Johnston. Had the Southern Confederacy possessed
a Grant, the parallel would be complete, for Ludendorff met
the problem as Grant would have met it, by a strategy that was
at once objective and grandiose. Hindenburg was now com-
mander-in-chief of the German eastern front, and his head-
quartermaster could deal with the situation as a whole. Ludendorff's
plan was to transfer the bulk of the IX. Army by the Silesian
railways to W. Prussia (Thorne–Hohenatal region), whence by
a sudden advance through the north-western part of Poland,
he could strike upon the right or right-rear of the enemy's sys-
tem. To reinforce the offensive mass, the E. front of E. Prussia
was to be stripped almost bare of troops and the country in
front of the lakes and the Angerapp deliberately evacuated and
broken up. The S. front of E. Prussia (Zastrow's and other
formations) was to participate in the offensive by advancing on
Plock, Ciechanov and Przasznysz, with the mission of flank-
guarding the main attack on the E. side of the Vistula, and of
keeping the Russian I. Army busy on the axis Mława–Ciechanow;
and to ensure that these forces should not be drawn away to the
E., they were placed directly under General Headquarters. To
fill the place of the IX. Army in S. Poland, Woyrsch's Land-
wehr was reinforced, and by agreement with Conrad, Böhm
Ermolli with the bulk of the Austro-Hungarian II. Army,
was brought on rail from the Carpathians to the upper Warta,
while to the left of Böhm the "Posen" and "Breslau" corps
of Ersatz and Landwehr were brought forward on the Kalisch–
Sieradz line. To prepare for the worst, arrangements were
made for destroying the mines of Upper Silesia. By all these
drastic measures, Ludendorff expected to obtain a partial suc-
cess that would suffice, without at present calling upon Falken-
hayn, to provide the mass of divisions asked for by Conrad.
At the moment at which the plan was put into effect, more was
scarcely possible. The continuance of the retreat, especially
on the front of the Austro-Hungarian I. Army, which was taking

1 Von François resigned his command in indignation and was re-
placed by von Below.

1 This was the second reserve of Posen. The first, as Bredow's
division, was already on the field.
the weight of the Grand Duke's attack on the line Kielce-R. Opatowka, brought the enemy ever nearer to Cracow and Upper Silesia, and the destruction of bridges and railways on the IX. Army front could only have a temporary effect. Moreover, new dangers threatened both the eastern and the southern fronts of E. Prussia.

On Nov. 5, the Austrian I. Army had retired behind the Nida, Zastrow's advanced forces were retiring on Mlawa, Below was preparing to meet a new thrust of the Russian X. Army (Sievers). On the 8th Ludendorff asked Falkenhayn for 6 to 8 more divisions as soon as possible, and for more later. The crisis, and with it the hope of decisive victory, was becoming more acute. On the 10th the regrouping was complete, except in the centre, where Böhm Ermolli was not yet on the scene. Here, cavalry alone held the country to the N. and N.E. of Kalisch. The Posen and Breslau Corps were beginning their advance from Kalisch and Kempen respectively. Woyrsch (Ldv. Corps, 1st Gd. Res. Div., 35 Res. Div.) was in front of Czestochowa; from Zarki to Wielun the Austro-Hungarian I. and IV. Armies had fallen back concentrically on Cracow, in front of which they now stood; the XI. Corps covered W. Galicia; the III. Army had taken over the front of Böhm as well as its own and stood on the line Virempna-Dukla Pass-Uszok Pass, and Pfanzer-Baltin, his offensive suspended, was at Vereces, Okormezo, S. of Detaltn, R. Pruth. But the offensive group (IX. Army under Gen.-Oberst von Mackensen) was ready—the XI. and XVII. Corps astride the Warta where it enters Germany, the XX. at Hohensalza, the I. Res., XXV. Res. and 3rd Gd. Div. between Hohensalza and Thorn.

At date the Grand Duke's Armies were thus disposed—X. on E. Prussian eastern front, I. (8 divisions) on E. Prussian S. front (Plock to Mlawa), with advanced troops approaching Soldau, Rypin and Lipno and one corps S. of the Vistula about Wolclawek; II. (6 divisions and a cavalry mass), W. of Lodz, advancing on Kalisch, with the II. Corps between Kutno and Leczyzka as a protective échelon; V. (8 divisions) near the Widawka river, cavalry approaching the Upper Warta; IV. (6 divisions) between the Plica and Jendzlejow, pointing towards Biechin; IX. (8 divisions) in the angle of the Nida and the Vistula; III. following up the Austro-Hungarian retreat towards and beyond the Dunajec, VIII. and Dniester Group on the Carpathian front; XI. (newly formed) besieging Przemysl.

On Nov. 11 the advance of the German IX. Army began. On the 12th at Wolclawek, parts of three corps quickly overwhelmed the corps of the Russian I. Army there, and drove it over the Vistula. The next phase was a concentric advance on the Russian II. Corps, right échelon of the II. Army, which held a position from Kutno to Leczyzka; out of this position it was driven with heavy losses on the 15th, losing at Leczyzka the gate between the Bzura and the Ner (Warta) waterlines. Then, while part of the German army pushed forward down the Vistula to intercept any assistance that might come from the I. Army, the XXV. Res. and XX. Corps from Kutno and Leczyzka, with the XVII. and XI. Corps from the Warta valley, advanced on Lodz, the manufacturing centre of Poland.

The battle of Lodz, which began on Nov. 17, is described elsewhere. In its intensity, its vicissitudes and its significance, it was the Ypres of the eastern front. In it took place the epic incident of the break-through, envelopment and final self-reeornts of E. XX. Res. Corps and 3rd Guard Division. No battle of the World War shows such varied, involved and difficult tactical situations. Here we are concerned with the results only. From the 19th the Posen Corps and Frommel's cavalry were actively engaged on the left of the XI. Corps, thus connecting the battle of Lodz with the fighting which went on along the line to Cracow, where the Austro-Hungarian I. and IV. Armies contended without defeat or victory against the thrust of the Russian IV. and IX. Armies. Further E., the Austro-Hungarian XI. Corps and III. Army engaged, equally without decisive results, the Russian III. and VIII. Armies. But Ludendorff had undeniably won a "Tellerfog," for the Russian onset on all parts of the line S. of the Lodz area was partly or wholly suspended in order to assemble all possible forces for the prevention of disaster on the right wing. Pressure was relaxed also on the two fronts of E. Prussia as the uncommitted reserves of the attack were taken away. In his regrouping the Grand Duke was successful; a continuous line of battle was formed by Dec. 9 from Nowa Wola, Lodz, X. Lwow, E. of Lodz, W. of Petrzkow, W. of Novo Radomsk, and so to the Cracow battle-field. But the cost had been heavy, and the Russians were unable, then or thereafter, to resume the tidal advance on Silesia and Moravia. With the formation of this long continuous line from N.W. of Warsaw to S. of Cracow began a new phase of the struggle, in which the battle of Lodz merges into the battle of Lwowicz, and that of Cracow develops, on its southern side, into the battle of Limanowa-Lapanow.

It has already been mentioned that Ludendorff had on Nov. 8 asked Falkenhayn for 6 to 8 divisions to be sent at once from the W. and more later. At that date Falkenhayn was still contemplating an attempt to revive the battle of Ypres, and had not reconciled himself to position warfare. On the 18th, before the decision had fallen at Lodz, Falkenhayn in agreeing to send 6 divisions had at the same time expressed his belief that it would even so be impossible to bring Russia to admit defeat, and that the outcome—certainly desirable in itself—would only be to relieve Austria-Hungary by the reconquest of the Vistula—San-Dniester line, and perhaps of Lemberg also. But a week later, under the influence of Mackensen's victory, he said that success in N. Poland might decide not only the Galician question but the whole war. He thought this might be achieved by building up yet another striking force E. of the Vistula, where the Russian I. Army was continually giving up divisions for the battle of Lodz. Ludendorff, on the contrary, saw no prospects in such a piecemeal building up of strength which the Russians could answer pari passu. Power and surprise combined, he held, were essential. At this moment, there were in Germany 9 new divisions under training, but the awful wastage of the lives and energy of their predecessors at Ypres had convinced Falkenhayn that it was necessary to avoid cutting short their training and to give them more experienced leaders before committing them to battle. Ludendorff, in spite of the achievements of the XXV. Res. Corps at Lodz, seems to have concurred in this view. Thus the reinforcement reduced itself to a gradual incoming of 8 divisions from the W. (II., III. Res., XIII. and XXIV. Res. Corps) which, with the I. from the now relieved E. Prussian front were all absorbed in the frontal battle about Lodz and Lwowicz, save one which was sent to assist the Austrian IV. Army S. of Cracow. The battle of Lwowicz began and continued as a front-to-front battle in which each side sought to condense enough force for a blow, now here and now there. It ended, in mid-December, with a general withdrawal of the Russian line to a winter-position, which ran along the line of the Rawka to Rawa, and thence southward, crossing the Plica E. of Tomaszew and following the upper course of that river, 5-15 km. E. of it, till near Jendzlejow it reached the Nida, to follow it to the upper Vistula.

South of Cracow, in a country of hills where manœuvre was possible and open flanks frequent, advance and counter-advance alternated during the month of December. In conformity to the general retirement of the Allied forces in October, the Austrian I. and IV. Armies had gathered about Cracow, and during November they had maintained their front against the Russian IX. Army (battle of Cracow). At the end of the month, however, the enemy had developed a strong attack S. of the Vistula, which reached the line Wylica-Sieprow-Drogini, threatened by turning the fortress from the S. to make the desired breach for passage into Moravia. This danger was averted by a regrouping of the Austrian IV. Army, which enabled an attack-force to be assembled on the right wing about Mzana Dolina and Dobra, almost in the mountains. On the 3rd this force attacked northward, bringing the Russians' advance at once to a stand-still, and forcing them to make new dispositions. The fighting was prolonged and heavy. On Dec. 8, forces of the Russian VIII. Army, condoned on the western flank of that army, be-
gian in turn to attack the flank of the Austrian attack-group, which had gained ground northward as far as Lapanow and Rajbrod. At Limanowa, the scene of this flank attack, three dismounted Austrian cavalry divisions had to meet the onslaught of more than an army corps. At the same time, the centre of the Russian III. Army farther N. assumed the offensive again, and threatened at Lapanow, to break the Austrian main body in two. But resistance at Limanowa continued till the Austro-Hungarian III. Army, defending the Carpathians with varying fortune, had managed to assemble a group on its left which struck in on the flank of the Russian forces about Limanowa. (Dec. 11.). Thereby the battle of Limanowa—Lapanow was decided. A last Russian force which was seeking to reach the flank of this Austrian counter-offensive was itself engaged in flank by other forces of the Austrian III. Army, and the Russians withdrew along the whole W. Galician front to R. Dunajec-Krzeszot-Krotno-Lisko (Dec. 14—16). A few days later the Russians launched a fresh offensive which in the battle of Jasio (Dec. 21—23) drove back the inner flanks of the Austrian III. and IV. Armies to the line Zaklicyn on Dunajec—Gorlice—Uscie—Kuske—Koalicza, and pressed the front of the former back to some places behind the Carpathian line. Here, and farther E., the operations were entering on the phase known as the Battle of the Carpathians, which will be dealt with later. But from Tilsit to Gorlice, the campaign of 1914 closed in stabilization.

At this period, according to Falkenhayn, the combatant strengths on both sides were: 105,000 Germans and 320,000 Russians E. of the lower Vistula (E. Prussian fronts); 525,000 Germans and Austrians and 847,000 Russians between the Lower and the Upper Vistula; 525,000 Austrians (including a German division), and 521,000 Russians between the Upper Vistula and the Rumanian frontier. In sum, 1,155,000 Germans and 1,688,000 Austrians (of whom 502,000 were German—Austrian).

Acknowledgments are due to General Y. Daukow for certain information as to the Russian plan of campaign and strategic deployment.

(C. F. A.)

III. CAMPAIGN OF JANUARY—SEPTEMBER, 1915

By the third week of December, 1914, the struggle in the central salient had died down to a trench-warfare contest, in which the remaining energy of the troops was devoted to consolidating gains made in preventing the opponent from doing so. The situation of Ypres was reproduced in that of the eastern front at the end of the battle of Löwicz. But there was the important difference that on both flanks there was still room to manoeuvre. On the N. flank, the region of Plock, Mława and Myszyniec was open, and the Russian army's position, in front of the Angerapp and the lakes, reached for the third time as the result of the battle of Kominten Heath (Nov. 13—16), rested its flanks on no very secure obstacles. On the S. flank, the line was continuous from Cracow to the Carpathians, but thence eastward the position was fluid. The Grand Duke, therefore, determined to assert his offensive will and power, and, confiding in the hardiness of his men, for whom winter was less terrible than for the enemy, began to group his forces with greater density on the flanks. The first signs of this tendency appeared in the counter-stroke of Jasio, which nullified the reverse of Limanowa—Lapanow and initiated the battles of the Carpathians. The second consequence was the reinforcement of the X. Army, and the re-formation, under a new army staff (XII.), of an offensive mass on the Narew.

At the outset, in the latter part of Dec. 1914, this new policy seems to have aimed at tactical results only, but in Jan. the offensives maturing on the outer flanks became evidently strategic. Interpreting the experience of the previous campaigns, the Russian headquarters could see not only the insecurity of their northern corridor, which must continue until E. Prussia had been cleared to the Vistula, and the similar but lesser risk to their left flank, but could also judge that the conquest of E. Prussia and the invasion of Hungary would be very heavy blows to the heart of the war-sentiment in Germany and Aust-Hungary. Reinforcements were constantly coming in, and it seemed that what the Russian headquarters chose to adopt as their plan they could impose upon the enemy. One factor, however, was already causing anxiety, that of munitions. Although the ammunition expenditure on the eastern front was on a much lower scale, both then and thereafter, than that in the W., yet even so it was far greater than had been foreseen; and Russia, with her low industrial development and her difficulties in communication with the outer world, was less well equipped than either her allies or her two opponents to meet the strain. Later, the shortage was to become operational and tragic; at present it was an additional argument for transferring operations to those parts of the line where trench warfare had not set in. It was not regarded as a reason for suspending the offensive, but rather for choosing for it those areas where conditions favoured human manœuvre-power.

On the other side, the problem of 1915 was, like those of 1914, viewed differently by the three men concerned, Falkenhayn, Conrad and Ludendorf. Falkenhayn. Conrad and Ludendorf. The first named, after a moment of enthusiasm in the Lodz period, had returned to his normal method of conducting the war as a war of endurance, with limitation of the particular acts of it. One of these limitations in the present instance was the necessity sooner or later of opening a way to Turkey by seizing at least part of Serbia. Another, and the principal, was the necessity of holding firm on the western front. German strategy was now paying the penalty for having doubled its fighting front there by bringing in Belgian territory. Throughout 1915, the year in which Russia was the principal theatre, just as in 1914 when it was only secondary, we find Falkenhayn working with extremely narrow margins of free strength. At a time when Germany alone possessed some 160 to 170 divisions, the adoption or rejection of operative schemes of the highest importance was made to depend on availability or otherwise of four, six or ten of them. Yet there was no remedy for this, short of a considerable surrender of occupied territory in the W.; and in the war of endurance, as conceived by the Falkenhayn school, occupied territory is an asset not to be sacrificed for the sake of a showy, but indecisive, tactical victory. The principle of working from situation to situation was, with Falkenhayn, fundamental, and in the winter of 1914—15 his projects in the east did not go beyond the formation of a German "South Army" under General von Linsingen to aid the Austrians in the Carpathian struggle. In this the motive was direct stiffening of the Russian front, and the German chief had to postpone sine die his Serbian project, to which he attached very great importance; but the condition of the Austro-Hungarian army in the bitter winter fighting of the Carpathians left him no alternative, especially as the prevention of a Russian break-through into Hungary was a condition precedent of any Danube operation.

Conrad von Hötzendorff, for his part, was sanguine as ever, and the plight of Przemysl—undergoing its second and more terrible siege—continually spurred him to activity. While with local counter-offensives, the growing Russian pressure on the Carpathian front, he proposed, first an offensive in the centre of the Polish salient on Radom (scarcely a promising direction), and then a resumption of the old scheme of an Austrian and Prussian rendezvous near Siedlce. Neither was accepted by Falkenhayn, and Conrad then proposed the direct relief of Przemysl by means of a great offensive from the Carpathian line. It was for this offensive and this purpose that the German South Army was formed and, later, Böh Mermoll's II. Army brought back from Poland. Substantially, then, Conrad, unlike Falkenhayn, was eager for battle as such. Unlike Falkenhayn, he had no manoeuvre—in the true sense of the word—to propose; that was in the given conditions practicable and worth the supreme effort.

At Field—Marshal von Hindenburg's headquarters, on the other hand, the idea of manoeuvre was always uppermost. Its basis was the fixed conviction that it was possible not merely to lame but to destroy Russia's fighting power on the field of battle.
To achieve this result against superior numbers, manœuvre was the only way, and by the term "manœuvre" Ludendorff understood the preparation and sudden delivery of a destructive blow by locally superior force upon that part of the enemy's system which was the key of the whole. In the present case, this key position, Ludendorff held, was the Russian X. Army in the foreground of the Masurian lakes. In this quarter, and also between Milava and Myszyniec, Russian offensives were maturing as early as mid-Jan., and in any case Hindenburg's headquarters had to consider the question of a preventive offensive in E. or W. Prussia or both. But the operative aim became higher as soon as it was known that Conrad meant to attempt the relief of Przemysl by winning through to the San and the Dniester. The four new army corps completing their training in Germany were asked for, for the purpose of a winter offensive which should not only anticipate that of the enemy, but also, in conjunction with Conrad's effort, "decide the whole war." These four corps (XXXVIII.–XL. Res.) were Falkenhayn's cherished reserve, with which he meant to carry any great crisis that might arise out of the "Winter Battle of Campania," then in progress, and himself to attempt a decisive offensive in France. From the contemplated blow in Prussia he expected no more than the temporary and local disablement of the enemy, so that he did not think it necessary to coordinate the effort closely in date or direction with Conrad's advance. Nevertheless, "with a heavy heart," as he says, he surrendered the four corps to the east, though at first—till the Campania crisis cleared in March—he reserved the right to withdraw them again. Actually, the XXI. Active Corps of Alase-Lorrainers was sent from the French front, the XXI. Res. Corps taking its place there; the other three, with the XXI., went to E. Prussia at the end of Jan., and constituted the new X. Army (General-Oberst von Eichhorn).

The two operations with which the campaign of 1915 began in the W. were not, in the strict sense, coordinated, though their combined effect, owing to geographical conditions, was expected to be the destruction, according to Ludendorff, or the prolonged paralysis according to Falkenhayn, of Russia's offensive power.

**The Carpathian Winter Battles.—**Owing to the relatively low development of Hungarian lateral railways—the Galician sectors were in the hands of the Russians—it was not feasible for Conrad to form a really important offensive mass in the eastern Carpathians and the Bukovina, as Hindenburg did in the region of the Masurian lakes, without great loss of time. The struggle therefore resolved itself into surgings of frontally-opposed tides, the one seeking to break into the Hungarian plain, the other to rescue Przemysl. Although, the lines being for the most part discontinuous, tactical and local outflanking efforts, for the time and place decisive, were constantly made by both sides, there was no systematic attempt at strategic envelopment on either front. At one moment indeed (Feb. 20), Pflanzer-Baltin's army group, victorious in Bukovina, sought to wheel in on the rear of the battle-field of the German South Army; and at a later stage the Russian Dniester forces were heavily reinforced for the purpose of driving Pflanzer-Baltin away and so gaining the flank of Linsingen. But in the main the opposed tides afforded each other and were broken, each in turn. In W. Galicia, the Russian offensive of Jaslo came to a standstill in the first days of January, and for the next three months nothing of importance took place W. of Gorlice. Here the Russian III. Army (Radko Dimitriev) and the Austro-Hungarian IV. Army (Archduke Joseph) were opposed. In the Carpathians, where Brussilov's VIII. Army was opposed by Boroevic's III. Army and by the left wing of the widespread Pflanzer-Baltin group, the year opened with the evacuation by the defenders of the important Uszok Pass, under a local threat of envelopment. The Dukla Pass and the adjacent mountain region had already been lost, and from the Uszok the withdrawal spread east to the

Volocz and Wyszok Passes. In the eastern Carpathians and Bukovina the Russian Dniester group (Webel) pushed back the light forces which Pflanzer-Baltin had in the foreground of the mountains, but in the last week of Jan. the arrival of the Austrian XIII. Corps from Serbia gave Pflanzer-Baltin enough forces to enable him on the 31st to begin the reconquest of the lost ground. Meanwhile the right and rear of the VIII. Arm. had held on, in spite of the loss of the Uszok and the Dukla Passes, and it was now reinfomed. After covering the assembly of the German South Army about Munkacs, this wing was to constitute the striking force of Conrad's offensive for the relief of Przemysl, the South Army (including Hofmann's Austrian Corps facing the Volocz Pass) following it in échelon on the right.

The offensive began on Jan. 23, and as usual in this part of the eastern theatre, met at first only light forces of the Russians. The whole Austrian line, from E. of the Dukla to the Wyszok Pass, moved forward, the left wing of Pflanzer-Baltin conforming. The Uszok, Volocz and Wyszok passes were retaken by the South Army, and Boroevic's striking force reached and passed the upper San (line Czermceza—Baligrod—Lutowiska—Borynia—Smerze) by Jan. 31. But the Russians had already answered by accelerating their projected offensive against the centre and left of Borocivit (front Mezőlaborcz—Konieczna) and especially southward and south-westward from the Dukla. From this point the battle was a contest of will-power and man-power. The inactive fronts were stripped of more and more divisions. Early in Feb. Böhlm Ermolli's headquarters returned from Poland to their old place on the right of the III. Army (front Lupkow Pass–Uszok Pass), and on the other side Letchitsky's IX. Army headquarters were withdrawn from the Nica for the Dniestre theatre. Between the end of January and the end of April the strength of the opposed forces in Poland west of the Vistula were approximately halved. In the event the Grand Duke Nicholas not only succeeded, during the first three weeks of Feb., in checking (and in forcing back somewhat) the Austrians on the Upper San, but considerably enlarged his gains S. and S.W. of the Dukla Pass, taking Mezőlaborcz and the Lupkow Pass, and penetrating the Laborez and Ondava valleys. On the other hand the German South Army made its way forward, very slowly, aste the Munkacs—Stryi railway.

Further E., the counter-offensive campaign of Pflanzer-Baltin, begun on Jan. 31, was successful in clearing all Bukovina and the Carpathian foreground as far as the Pruth on the right and the Dniester in the centre, but its left, attempting to inter-vene in the rear of Linsingen's opponents, was involved in heavy fighting about Krasna on the Lomnica, and in the last week of Feb. the heavy counter-attacks of the assembling Russian IX. Army drove the centre from its forward position on the Dniester. By mid-March, Pflanzer-Baltin had been forced back still farther to a line marked by the upper Lomnica—Solotvina (on the Bistrica)—Czernelica—Horodenka—Snyativ—Czernowitz, on which operations came to a standstill. These operations were however of secondary importance in which only some 1% of the whole forces of each side were concerned.

The real crisis, which culminated in March, was on the front between the upper San and the head of the Ondava valley, N.E. of the upper Barbelfurt (Bartha). As in Feb., the right of the Austrians sought to force a way to Przemysl—now in extremity—and the right of the Russians to enlarge the bridge-head in front of the Dukla and Lupkow Passes. The fighting was again intense, for the Austro-Hungarian II. Army had been reinforced for a last effort; but in the main its advance on Przemysl was definitely stopped. Meanwhile Brussilov's VIII. Army was forced out of the Dukla region made continuous, if slow, progress. The German South Army progressed along the railway to Tuchla, but at this stage of the battle its advance had not and could not have any great result, and its left was held up for weeks before the strong positions known as Zwiniin and Ostry, covering Koziova. Finally, on March 20, sure of the imminent surrender of Przemysl (which in fact fell on the 23rd) the Russians launched all along the front of the Austrian III. Army new attacks which, fed by troops released from the blockade of Przemysl, drove that
army back to the line S. of Zbroz—Kurma—Strzepko—S. of Wirova—Wola Michowa. At the same time Bähm's forces on the upper San front were compelled to fall back to the starting line of Jan., 23, whence they were withdrawn, in a state of exhaustion, to a line generally behind the mountain crest. The right, still in front of the recaptured Uzok Pass, was transferred to the control of the South Army.

Three weeks longer the battle lasted, but without material change, though both sides were 120,000 to 120,000 stronger in combatants than they had been in January. In the area of the Austrian III. Army two fresh German divisions, grouped as the "Bezirks-Corps" and "General's right flank" were sent to the rear of numerous Austrian line positions the Austrian II. Army held its own. The South Army maintained its ground also from N. of the Uzok Pass to Tuchla, and stormed at last the positions of the Zwinin (April 9) and Ostry (April 25) and Koziova. To the E., Pfanzer-Baltin's right wing and centre, reinforced by German mounted troops, regained its positions on the Diester and held off a new attack which Lechitsky mounted against its outer flank between Czernowitz and Uscbiebiskipe on the Diester. By April 20, however, the Battle of the Carpathians was at an end, after three months of continuous mountain fighting, in temperatures sometimes falling to 50° F.

The apparent effect of these battles was to give the Russians a more secure possession of a bridge-head S. and S.W. of the Dukla Pass which they could not use, and to waste the remaining war-energy of the Austro-Hungarian army in attempting to relieve a fortress which certainly contained fewer men than the number sacrificed in the attempt. But in reality the indirect consequences of the battle were of much greater importance than the direct. In the Carpathians, no less than in the Mazarin winter battle presently to be described, the Central Powers had managed to snatch the initiative before the Russian offensives had got under way, and thus put back the date and place of those offensives so far that the break-through into Hungary proved impossible. For the third time the "steam roller" had been brought to a standstill. Moreover it was showing signs of wear. Manpower had been unsparingly expended by the Russian command in its determination to break through; the trained officers and under-officers of peace-time were reduced to a skeleton, and the supply of munitions and even arms was becoming a very grave problem. In the majority of cases, it had been the Russians who attacked and the Austrians who defended the strong mountain passes and hill positions, and, though specific figures are not known, all the evidence available points to the Russian losses having been far greater than those of the Austrians and Germans. In sum, the Russians needed a pause even more than their opponents.

The Mazarin Winter Battle and the First Battle of Przasnysz.—The plan of campaign formed by Ludendorff for E. Prussia, as already mentioned, aimed higher than the simple preventive-offensive for which Falkenhayn had "lent" the four new army corps. His line of reasoning, differing from Falkenhayn's, was, and remained, this: the war will be decided by military victory in the W.; but this victory will not be possible till after the decisive defeat of Russia, because the degree of numerical and material superiority required for the double task of breaking through the strong trench-system of the W. and exploiting the break-through in an open-field campaign was not attainable till Germany could devote practically every battle-worthy man and gun she possessed to the western theatre. Meantime, nothing was gained and much lost by using up reserves in repetitions of the battle of Ypres. Whether, in Feb., 1915, the time was ripe for such a blow as Ludendorff contemplated is however more doubtful. Both on the Mlava—MyszyneC front and on the E. front of E. Prussia the Russians were well in advance of the natural barriers protecting the northern corridor. Victory W. and N. of those barriers could only lead to a limited exploitation unless the barriers could themselves be carried in the tactical pursuit. Victory on the barriers themselves, on the contrary, would give an unlimited field for strategic exploitation inside them. In the situation of Feb., 1915, then, an effort to inflict a completely disastrous defeat on the Russians required two successive efforts, or successive maxima in a continued effort; hence a double allotment of force would have to be made. A large part of the required divisions could have been found from the army reserves of the central salient, or by thinning the line itself there, had it not been for the formation of the German "South Army," which, raising the number of divisions absorbed in the Austro-Hungarian front from 1 to 5, left only limited possibilities of drawing on the IX. Army and Woyrsc, for the benefit of the E. Prussian Army, which ever since Nov. had been on a very low footing. Woyrsc and Mackensen were in fact able to provide only six free divisions. For the rest, if nothing could be spared from French operations (the right flank) and the German Army of the Carpathian attack, it would have been impossible to prevent a decisive Russian offensixe. Hence Falkenhayn's well-founded scepticism as to the scope of the E. Prussian offensive, and hence also Ludendorff's regret, after the event, at having parted with so much of his local reserves for the bolstering-up of a Carpathian attack.

The secret augmentation of the E. Prussian forces from the figure of 10 divisions (8 of which were Landwehr and Ersatz) in mid-Jan. to that of 24 in the first week of Feb. was itself no small task, and had it not been for a very fierce diversionary attack by the IX. Army at Bobolin, in the angle of Bzura and Rukwa, on Jan. 31—Feb. 2—memorable as the first occasion on which any German panzer were employed on a large scale—it is doubtful whether it would have been accomplished, for the assembly had to be made under cover of a thin screen of mounted troops, and by hypothesis the opponent himself was preparing to attack. The plan itself was comprehensive, and suggests that Ludendorff had not given up hope of being able to extract more divisions from Falkenhayn. It consisted in three main elements:—(1) the destruction, by means of breaking through and envelopment combined, of all enemy forces lying between Lyck and Tilsit, (2) the attempt to carry the Bohr line with a rush so as to break into the "corridor" south of Grodno, and (3) an advance on the Mlava—Willenberg front, in conjunction with (2), so as to bind the Russian I. Army while the X. was being destroyed and the Bohr forced.

The German forces were divided into three armies: the VIII. (Otto v. Below) of 7 divisions (including one of the new corps), which, after covering the whole eastern front during the assembly was to form an attack front on its right wing (Johannisburg); the X. (v. Eichhorn) of 7½ divisions, including the XXI. active and the other two new Reserve Corps assembled between the Niemen and the Lakes; and the Army Group Gall- witz, ten divisions, of which six came from central Poland holding the southern front from the Orzycc to the lower Vistula.

The scheme of the German offensive, though it was to be carried out over much the same ground as the September battle, differed considerably from the plan of that battle. The winter trench-line represented the halt of the Russians after the Rominen Heath battle, in front of the Lakes—Angerapp barrier. It ran N. to S. from the Schorellen Forest by Darckenhcn, E. of Lötzen to W. of Johannisburg, where it began to curve away to join the southern front. The right wing therefore presented to the Germans better chances of envelopment than Rennenkampf's right had shown in Sept., and it was on this flank that Ludendorff meant to make the chief effort. But the most significant difference was that it was now intended to treat the attack on the Russian S. flank as a break-through and not an envelopment problem. For this reason, not only was an attack-group formed behind Lake Spiridul but von Gallwitz, guarding the S.front, was to occupy the Russians on the Narow and prevent them from assembling large forces against the S. side of the VIII. Army attack. Moreover the attack was to aim at seizing crossings of the Bobr at and near Osowieck. Tactical cooperation in the encirclement of the Russian forces north of Lyck was the primary but by no means the principal task of the VIII. Army's attack-group. If the power and speed of the X. Army's blow from the N. proved as great as was hoped, the exact position of the anvil on which it struck the Russians was of secondary importance compared with the seizure of Osowieck and the Bobr by brusque attack in the Liège manner. On this, and on the progress made by the XX. Corps (Gallwitz's left) by Myszyneic on
Lomza, would depend the strategic, as against the tactical results of the whole enterprise.

The “Winter Battle of Masuria” therefore may be regarded; if not as the first great battle of the latter-day type, at any rate as in a transitional style. Although an open flank existed and was utilized to produce the tactical envelopment or “Can- nae” of pre-war theory, yet the effective victory was intended to be gained from a break-through, tactically difficult, but aimed in a strategically favourable direction.

The attack of the VIII. Army began on Feb. 7, that of the X. Army on Feb. 8, in the midst of snowstorms which, during the battle, changed to rain—the worst conditions for the carrying out of the scheme and notably so for the carriage of the troops along the marshes of the Bobr being frozen hard. In sum the X. Army drove the Russians southward without intermission from the first day. By the 10th the northern portion of the Russian line was being taken down with all speed, and by the 12th the German X. Army stood on a line from Ludwingow to Rominten Heath at right angles to the VIII. Plank guards were put out toward Pllwiszki and Mariampol against intercession from Kovno, but neither then nor later did anything more serious than threats by light forces develop on that side. Meantime, however, the VIII. Army’s attack (XL. Res. Corps and parts of the I. Corps) from Johannisburg Heath and Lotzen on Lyck was brought to a standstill in front of Lyck by the fierce resistance of the III. Siberian Corps, which not only suppressed the advance eastward, but led the German forces that were to the S. of it to swing north-eastward on Rajegrod so as to envelop the Lyck position. The expected Russian counter-attacks from Lomza and Osowiec proved too feeble—being absorbed chiefly by the advance of a division of the XX. Corps farther W.—to interfere seriously with this tactical manoeuvre. But therewithforward the Osowiec portion of Ludendorff’s scheme was doomed. The battle became the purely tactical “Cannae.” As such, it was brilliantly successful. By Feb. 14, Lyck had fallen and the VIII. and X. Armies had made good a semicircular position from Rajegrod, by Raczk and Seyny to the N.E. corner of Augustow forest. In the forest the Russians (no longer able, for want of routes, to withdraw with speed) fought with desperation to gain time for orderly withdrawal to Grodno, the one remaining avenue of escape. But by the 18th, forces of the XL. Res. Corps from Rajegrod reached the Bobr about Krasnymow, and, on the other wing, part of the XXI. Corps from E. of Seyny drove down at all risks, parallel with the Niemen and within range of the guns of Grotowo, to Lipsk, thus closing the ring round four Russian divisions left in this extraordinary situation, the German X. Army slowly completed the destruction of the encircled Russians, who resisted for several days and made fierce efforts to break the ring, while small German forces, fighting back to back with the encircling troops, held off relief attacks from Grotowo and the Bobr. Finally—but some days too late for the realization of Ludendorff’s plan—the remnant of the four divisions in the forest surrendered.

In all, this astonishing victory gave the Germans 110,000 prisoners, over 300 guns, and a vast quantity of stores which the Russians could ill spare.

Meanwhile, Ludendorff had attempted to extricate enough forces from the W. and N.W. portions of the ring to form the attack on Osowiec and the Bobr. He reconstituted the management of the mixed-up armies as best he could by putting all forces W. of Augustowo under Below (including the XX. Corps) and all engaged in and N. of the forest of Augustowo under Eichhorn. But most of the troops destined for this were involved in the forest battle, and the Osowiec groups had to be made up chiefly out of the troops that had been crowded out of the line as the wings converged. Of the XX. Corps only one division was available, and this had advanced no farther S.E. than Stawiski and Lipinski since it moved from its concentration area three weeks before. The other division was engaged on the Omulew river, and was connected to Lipinski by a thin screen of Landsturm. In sum, it was impossible with exhausted and scattered troops to force the now soliden marsh-valley of the Bobr or to reduce Osowiec. Hindenburg therefore ordered the attacks to be discontinued.

Moreover, the position of the X. Army, far ahead of regular supplies, had become untenable, and as soon as the battlefield had been cleared it began to withdraw, just in time to secure good conditions for meeting a Russian counter-offensive from Grodno and Olita. There the Grand Duke, “by stamping his foot on the ground”—as it seemed to his opponents—had called into being a new X. Army.

This counter-offensive penetrated through the Augustowo forest, almost to Augustowo, and, to the N. of the forest zone, it reached and passed Seyny and Simno (March 5–7). But, the wrong manner of exploitation of this new position by the German forces—i.e. miscalculating the promptness of the German decision to regroup on a rear line—the Simno force swung in to the S.E. toward Lodzdieje (March 8), exposed its own outer flank to counter-attack from Eichhorn’s left, which stood between Simno and Kalvarja, and on March 9 fell upon the flank and rear of the Russians, at the same time as the frontal defence in and north of the forest turned to counter-attack. The Russians thereupon withdrew behind the Niemen again. The German X. Army now returned to its prepared line Augustowo—Krassnopole—Kalvarja—Mariampol—Pllwiszki—Szaiki, and thrust hard for the S. and S.E. But the real crisis of the second half of Feb., which lasted till mid-March, lay not on the Niemen, but on the front of the new German VIII. Army and more particularly on that of Gallwitz. Here with his XII. Army (Plehve) the Grand Duke had all along intended to make the main effort of his Russian offensive, as geographically dictated; and the advances of Gallwitz and of the German XX. Corps, as diversions and flankguards for the Masurian battle, had merely put back the Russian preparations in time and place. Anger at the disaster to the X. Army, and fears for the safety of the “corridor” at its sensitive point N.E. of Osowiec, caused the Grand Duke to divert forces from the III. Army to form the new X. Army, but without affecting the mission of that army, which accordingly took the offensive against Gallwitz about the same time as the struggle in Augustowo forest came to an end. At the same date the attempts of the German VIII. Army against Osowiec and the Bobr line were dying out, and the division of the XX. Corps north of Lomza was pinned by heavy counter-attacks from that place, while the other division of that corps was making head on the Omulew against similar efforts from Ostrolanka, and the Landsturm screen between them was holding its ground with difficulty against other attacks from Novograd. The crisis, from the German point of view, reached its climax in mid-March, as Gallwitz’s Memoirs of 1915—published in English, 1926—show. In his memoirs, written four years after the event, satisfaction in the “Cannae” of Augustowo is almost completely smothered in the remembrance of anxieties, makeshift reinforcements, and critical decisions concerning the S. front. All energy on both sides was now focussed on this front.

In the winter of 1914–5, light forces of the Germans had been advanced, originally as an element of the battle of Lodz, a considerable distance S. of Strassburg and Mlava, and the reinforcement of these troops to the strength of an army group had taken place on this forward line. Gallwitz had then advanced, in conjunction with the Masurian offensive, deep into Ludendorff’s rear, threatening his concentration zone of the Russian XII. Army (Feb. 13). In a few days he had reached the line Plock—Raczoń—Przamszy. But by about the 24th, Plehve’s interrupted concentration was sufficiently near completion for him to advance. Pressing the front of Gallwitz on each main route, he developed his greatest strength in the Orzyc and Omulew valleys. In the latter, the division of the German XX. Corps above mentioned engaged the Russian advance in a series of combats which in the event were undecisive; but in the Orzyc region the Russian blow upon Przamszy succeeded in driving back three divisions under the command of the German VIII. Army, and only about the 24th did Gallwitz’s advance meet with more than a slight set-back. The whole centre and left of the German line then fell back, pursued by the Russians, to the line Radzonovo—Mlava—Chorzew. On and about this line fighting remained severe till about March 19, kept alive on the German side by successive reinfroc-
ments from the X. Army, and by assumption of responsibility for the Omlukh front by the VIII. Army, which enabled Gallwitz to group his forces more closely on the Chorzele and Milava fronts. The crisis died away in local attacks in the latter half of March. The Russians were becoming weak in munitions; the Germans continued weak in men. The last fluctuations of the battle brought the Germans from Chorzele close up to Przasnysz. Thus the E. Prussian offensive of the Russians closed, in the same way as the Carpathian offensive was soon to close, with little gain and great loss of leaders and of irreparable ammunition. The Germans, on the other hand, like the Austrians, had fallen back. The strategic results were thus, for both sides, negative, in spite of the accomplished "Cannae" in Masuria—its own exhausting effort.

**Intentions and Plans for the Summer Campaign.**—On both Prussian and Galician fronts a pause of some weeks was imposed by the weariness of both sides. The latter part of March and early April in the N., and the last half of April in the S. were devoted to discussion and formation of plans. At this stage the distribution of force was, according to an Austrian headquarters statement of April 20, as follows, in rifles and carbines:

East Poland: 165,000 Germans of X., VIII., and Gallwitz Armies, and 508,000 Russians of the X. and XII. Armies. Frontage 380 km.

**Central salient:** 245,000 Germans and Austrians of IX., Woyrsh, and Austro-Hungarian I. Armies, and 436,000 Russians of the I., II., V., and IV. Armies. Frontage 275 km.

**Upper Vistula to Beskidengebirge:** 198,000 Austrians (IV. Army) and 100,000 Russians (III. Army). Frontage 110 km.

**Carpathians and Bukovina:** 385,000 Austrians and Germans (III., IV., S. Army, Pflanzer-Baltin) and 496,000 Russians (VIII., XI., and IX. Armies). Frontage 375 km.

In sum, there were 1,001,000 Germans and Austrians and 1,540,000 Russians.

According to the distribution table given by Falkenhayn for the end of that month, 366,000 German combatants faced 640,000 Russians between the Baltic and the Vistula; 184,000 Germans and 54,000 Austrians, in all 238,000, were opposed to 407,000 Russians in the Polish salient; and 89,000 Germans and 610,000 Austrians, total 699,000, stood on the W. Galicia, Carpathian and Bukovina fronts against 720,000 Russians. In sum, 1,393,000 soldiers of the Central Powers to 1,757,000 Russians. The difference of pressure on the Austro-Hungarian armies is accounted for by the fact that artillery personnel is included in the second and not in the first sum: but whether taken separately or together, the figures throw a strong light on the state of the Russian army on the verge of the tremendous campaign of summer, 1915. It will be noticed that the total of 1,757,000 combatants is approximately the same as the mean monthly strength with the colours in peace (1,700,000). At this period no considerable forces were maintained in any but the eastern European theatre; so that, in effect, practically the whole of Russia's resources in men had been absorbed in maintaining the formations existing in peace and some 45 reserve divisions created on mobilization.

It will be noticed also that under the imperative needs created by the two-front war the German forces in the East had trebled, as compared with the strength at the time of the Masurian lakes battle in Sept., but that the Austro-Hungarian forces, though far above the nominal figure of Sept. 1914, were well below their mobilization figure. Hitherto, it must be remembered, the policy of "winning the war in the East" had not been accepted by Falkenhayn, and the German increased represents simply defensive and counter-attack requirements, and in particular the relief of pressure on the Austro-Hungarian armies. Correspondingly, German ideas and execution began from this date to predominate over Austrian. But no effective united command was ever created. German interferences in Austrian operations and operative methods, imperatively necessary to the common cause, but very often tactless, were constantly resented by Conrad and by most Austrian leaders; and moreover great divergencies of policy developed between the two Imperial Governments in respect of Poland, Italy, and the Balkans.

Falkenhayn neither then nor thereafter accepted the principle that a decision could be obtained in the East. But his ideas had undergone a change since he conceded the eight new divisions to the eastern theatre on loan. The French attempt to break through the Champagne lines had failed. A large number of German divisions were being reorganized on the basis of three infantry regiments instead of four, and the forces thus obtained were grouped in new handy divisions of veteran troops, which gave greater freedom in the play of reserves. He had abandoned, after detailed study, his plan, prospect of a break-through on the Albert–Aixwart front, and, at the same time, while Contra had refused to agree to his renewed proposal to force a way through Serbia for munitions for Turkey, though the peril of a Dardanelles break-through was becoming more and more evident. On the other hand, indices collected both on the Carpathian and Prussian fronts pointed to a growing shortage of material on the Russian side, as well as to a decrease of efficiency owing to losses in leaders and pre-war soldiers. Falkenhayn further thought it possible to keep both Italy and Rumanya neutral, almost for a long time. All things considered, he came to regard a very heavy blow on the Russian front as necessary, possible, and desirable; and on Contra's resuming, on April 7, the old scheme of combining blows from the lower San, and from the S. front of E. Prussia, with a rendezvous near Siedlice, he agreed, not indeed as to the plan, but as to the principle. It was still only a "sufficiently" heavy blow that he intended to deliver, but the limitation implied in the adverb was considerably relaxed. Eight divisions (Guard and X. Corps, XI. Res. Corps, and two of the new divisions) were to be brought over from the western front, this time simultaneously and for use as an army. Of this army (XI.) Mackensen was appointed chief, with Colonel v. Seeckt as his chief of staff, Prince Leopold of Bavaria succeeding Mackensen at the head of the IX. Army. To cover the withdrawal from the W., sharp local actions were initiated at different points on the trench-line. One of these, involving ten to more divisions, is known to history as the Second Battle or "gas attack" of Ypres.

The theatre of Mackensen's operations was to be the country between the upper Vistula and the mountains (Dunajce–Gorlice–Tarnow), where the front of contact was in much the same position as it had been at the end of the battle of Jaslo. It was held by the Russian III. Army (Rasiko Dimitriev) on the one side and the Austro-Hungarian IV. Army (Joseph Ferdinand) on the other, both being relatively weak. Suddenly, in the first week in May, a mass of eight first-class divisions, supported by the troops already on the front and by artillery on a scale never before seen in the East, had every prospect of breaking through. Falkenhayn took many precautions to secure his surprise, and in the main with success, although the Russians and their Allies were well aware that a blow was impending at some point of the eastern front. The troop trains were sent by roundabout routes, false rumours were circulated, and Conrad himself was not informed of Falkenhayn's decision till the movements of concentration had begun. Hindenburg, whose jurisdiction only extended to the left of Wayrsch's line, was instructed to make demonstrative attacks at different points. One of these, the raid of v. Laenestein's group into Courland, had an important sequel, and will be discussed later. The significance of the other two, an attack at Suwalki by the X. Army and a gas attack near Skierñiewicze by the IX. Army, was only momentary. In direction the attack was partly frontal, and it has been criticized for that reason. But a prime factor was the necessity of relieving the situation for the Austrians on the Carpathian front as soon as possible; and, besides in all probability compelling the Russians to retire in the southern part of the central salient, a drive N.E. and E. from the front Gorlice–Tarnow would make the Russian positions in the Carpathians untenable at least as far as the Lupkow pass inclusive. Falkenhayn went further, and proposed to involve the Russians even more thoroughly in mountain difficulties by retiring the right of the III., and the II. and South Armies. To this, however, Conrad would not agree; and Mackensen's blow lost part of its effect through this refusal.
The Dunajec-San Operation.—Reinforced by the Austrian VI. Corps already on the front, and placed in general charge of the Austrian IV. Army as well as of his own, Mackensen was himself subordinated to Conrad’s headquarters, though in fact no major decision could be taken without Falkenhayn’s agreement. On the Nida front the Austrian I. Army, and in the Beskidengebirge the Austrian III. Army, stood on the flanks of the two attack armies, and in case of success would be carried along as supports. On May 1 (see Dunajec-San, Battles of) Mackensen’s artillery preparation began. The scale of artillery and trench-mortar strength—hardly higher than that of a quiet sector in France in 1918—was, for the East and for 1915, overwhelming. At night, as a final diversion, an Austrian division crossed the Dunajec a little above its mouth and established two bridge-heads. On May 2 Mackensen’s attack was launched between Woynicas on the Dunajec and Malastov (S.—S.E. of Gorlice). The troops of Radko Dimitriev gave ground, fighting stubbornly. By the 6th they had retired with heavy losses beyond the Wisłoka; and the Austrian III. Army, taking up the attack on their rightward, on the region of Ulica or Duba Pass. By the 9th Mackensen had forced the Wisłoka; Boroczew was in the evacuated Lupkow Pass, and even Linsingen’s left was advancing. On the 11th, on the other flank, the Russian IV. Army evacuated the Nida position, pivoting on Kielce. Operations were fluid, and it was Falkenhayn’s and Conrad’s problem to maintain them so.

Falkenhayn’s intention was to ensure this by making the operation continue as a tactical one, with as little regrouping as possible outside the limits of the battle that was in being. For this reason he rejected a proposal of Conrad to reinforce, at Mackensen’s expense the Pflanzer-Baltin group (now called VII. Army), which by reason of its position might be enabled thereby to reach the rear of the Russian southern wing. He ignored the relief offensives started by his opponent against the front of Pflanzer-Baltin and elsewhere, and he even sought to utilize the attack upon Pflanzer-Baltin as a means of setting in motion the German South Army and the still stable portion of the Carpathian front, E. of the Lupkow Pass. But at first he had no intention that the effort should go in the slightest beyond its tactical limit, which he fixed as the San—Dniester barrier. Conrad agreed. Both leaders were anxious to dispense large forces for nothing against Serbia or Italy or Duba Pass. By the 9th Mackensen had forced the Wisłoka; Boroczew was in the evacuated Lupkow Pass, and even Linsingen’s left was advancing. On the 11th, on the other flank, the Russian IV. Army evacuated the Nida position, pivoting on Kielce. Operations were fluid, and it was Falkenhayn’s and Conrad’s problem to maintain them so.

As foreseen, the rush of the Gorlice offensive came to a stand on the San–Wisznia line. The Grand Duke had, under cover of his relief offensives, collected adequate forces on the III. Army front and was prepared to hold it firmly. By the 14th Mackensen had taken a total of 140,000 prisoners and more than 100 guns, and had reached the line Tarnobrzeg on Vistula (link with Opatowka line)—Nisko on San–Sieniawa (Austrian IV. Army); Sieniawa—Jaroslaw—Radymno (XI. Army); Magiera and Chyrow region (III. Army); Stary-Sambor (II. Army). But along the lower San, in the bridge-heads of Jaroslaw and Radymno and the fortress of Przemyśl, the Russians were ready to fight again, on the alert, in prepared positions, and had by demolitions of all sorts made the supply problem difficult for the Germans and Austrians. At that date Brusilov’s VIII. Army and Shcherbaachev’s XI. on its left were intact; Szaumy’s and the left of Linsingen’s were only beginning to advance; while Pflanzer-Baltin was on the defensive along the Pruth except at Kolomia where he still held a bridge-head. Moreover, Italy was on the point of declaring war (as she did on the 24th) and Rumania’s intentions were impenetrable. On the western front, the French and British had opened their relief offensives of May 9 (battles of Carency and Mervillers—Dardanelles) against the German military landward of the French naval attack, and the Turkish and Balkan problems, always obscure, had thereby become almost as well.

Nevertheless, during the fourth week of May, Falkenhayn finally determined to carry on the Galician offensive and even to extend it. According to Mackensen’s reports, that the shortage of munitions on the Russian side, already observed here and there, was general, and that it was possible in consequence to keep the offensive alive till it had secured a decision “sufficient for our purposes,” in Falkenhayn’s own words. Fresh troops were drawn from the West—in spite of the crisis north of Arms. Hindenburg was invited to press the advance of Woytsch’s army group—which had already begun on the 12th to move forward on the left of the Austrian I. Army and was in front of Radom by the 16th—to the Vistula below the San confluence. As in the Vistula–San operation of October 1914, the threat of turning the San line by Joselow was thought to be an effective means of weakening it against frontal attack. Ludendorff, however, deemed this operation to be impossible, in the offer of fresh divisions—his mind was already set upon a more grandiose scheme. Falkenhayn therewith gave the incoming divisions (2½ from France and 2 from Poland) to Mackensen, and on June 3 that general received instructions to push the XI. and IV. Armies over the San barrier, south of the Tanew, in cooperation with an eastern advance of the Austrian II. Army (now comprising what was left of the III. after Boroevich’s departure for Italy), which should “finally” beat the enemy still remaining south of the Dniester in front of the South and VII. Armies. Hindenburg was merely “to take any chance that offered itself anywhere.” It was held that in pushing forward the Armies of the San, the operation had already been brought to such a point of success that it was “impossible to delay the attack in order to establish a fortified position beyond the Vistula.”

In sum, then, the scheme was simply a prolongation eastward of the Gorlice–Tarnow effort by means of a fresh engagement of reserves. No new operative idea was involved. But the decision to continue the battle was in itself an operative decision of the first importance, and, in view of the general war situation, a very bold one.

Mackensen meanwhile, partly urged by his own fighting spirit, partly compelled by Russian counter-attacks, had been involved in constant fighting on and for the San line. The Austrian IV. Army was strained to the utmost in holding to the positions it had gained on the middle San (below Sieniawa) and in front of the line Nisko–Tarnobrzeg (or “San angle position”) which joined Radko Dimitriev’s front to that of Evert on the Opatowka. The right of the XI. Army was similarly held up by the Russian positions about the Radymno bridge-head, and Przemyśl interposed a formidable obstacle between that army and the advancing Puhallo group (the relic of the Austrian III. Army, which included also the German Beskidenskorps). But the left of the XI. Army stormed the Jaroslaw bridge-head and, crossing into the Lubaczowka valley, pressed to the right rear of the Radymno bridge-head farther up the San. On May 24 a general assault carried this line, and the Russian centre, its right still holding the “San angle” position and the San below Sieniawa, fell back to the line of the Wisznia, the Grodok lakes, and the Wereszyca. Practically at the same time, the right of the XI. Army, Puhallo, and the left of the II. Army closed upon Przemyśl from the N., W., and S.; after severe fighting the fortress fell on June 3, as described under PRZEMYŚL. Further E., the right of Böhm-Ermolli’s and the South Army, advancing in the last ten days of May, reached the line Wilkło Bloto (“great marsh”) on the Dniester—E. of Drohobycz—S. of Stryj-Dolina, making connexion at Jasien with the left of the VII. Army, which was holding, still with success, the Pruth line.

The Russians, however, falling as were their resources, reacted powerfully. The Grand Duke’s instructions were that “for political reasons, it is imperative to hold” the Opatowka–San–Grodok line “at all costs,” and he carried them out by a series of heavy counter-strokes. First on the lower San against the Austrian IV. Army, then on the Pruth against Pflanzer Baltin, and lastly against Linsingen on the Stryj front, offensives on a large scale were delivered in the latter half of May. Of the first operation 25,000 prisoners were drawn from an army at Odessa which was to have co-operated in the attack on Constantinople. Even Woytsch’s advance, far away on the Kielce–Radom railway, was opposed by stubborn defence and sharp local counter-attacks. But in the last resort the Grand Duke’s forces were inadequate for prolonged defence. The long exposed flank of the northern corridor compelled him to keep fairly large forces inactive on the Narow, the Bobr, and the Niemen; and the Lauenstein operation in Courland (described below) made a continual drain on his northern resources. But above
all, the failure of munitions led to enormous losses, both in counter-attacks and in rearguard operations. By June 16 the Russians had lost, in the battles of Gorlice-Tarnow, the San, Strzyj and the Pruth, no less than 392,000 in prisoners alone, besides 304 guns. The last acts of this phase were the forcing of the Grodek lines by Mackensen's two armies on June 16-19 (see Lemberg, Battles Round, Section II.) and the successful two-fronted battles of Lisingen's South Army against Strzyj and Drohobytsz, in which his left, facing north, held off the counter-attacks of the Russian XI Army, while his right, by intervening in the flank of Pflanzer-Baltin's opponents (IX. Army, Eberhard) and bringing them back to Lemberg and Drohobytsz, made it possible for Mackensen to be evacuated to Drohobytsz, while the Russian attempt to enter the Pruth corridor was defeated, after the Russian troops had been repelled by the Fifth Army and the Eighth Army. (see Lemberg, Battles Round, Section II.)

The Bug and the Narew Campaigns.—Although the Russian retirement in E. Galicia was not, as Conrad imagined for a moment after the fall of Lemberg on June 22, a retreat in dissolution, it was definitively a retreat on the largest scale. Once the gap between the San and Dniester had been forced, neither was tenable by the defence. Very soon, therefore, the Russians on the Dniester were taking down their line from right to left, to re-form on the positions offered by one or another of the N.-S. tributaries of that river. From the San, the Tanev and the region of Rawa Ruska, the retreat took a northerly direction and thus there came up again the same possibilities, risks and alternatives for the Austrian offensive as those of Aug. and early Sept. 1914. The conditions were, however, partly changed. The Russians and Austrians alike had lost most of their peace-trained leaders and their offensive energy. Instead of the general clash of an encounter battle, it was now a case of retreat and of a follow-up, upon which delay was imposed by the necessity of restoring demolished communications, and caution by the risk of counter-attack striking the pursuit at a weak spot as it opened out fan-wise towards Lublin-Chelm and towards Sokal. Such a counter-attack did in fact bring the German XI Army into momentary peril between July 7 and July 12.

The prospect of a slow advance of indefinite depth made it imperative for Falkenhayn and Conrad, and especially for the rear, to consider the position. Hitherto the German leader had proceeded from one limited objective to another, all along the same general direction. Now—at the beginning of July—the choice had to be made between initiating a far larger operation and calling a halt to consolidate gains.

There were in reality two decisions to be made, one of principle and one of detail. Apart from the danger of a continuous retreat and thus of a continuous weakening, Falkenhayn's opinion was, fundamentally, unchanged, and he foresaw new dangers in France owing to the impending appearance there of 12 British new army divisions, considered as heralding an attack. But deciding, on the evidence, that the great French offensive would not take place till Sept., and relieved of fears for the Italian front—impressed also, without doubt, by the repeated counter-strokes of the Russians—he decided on June 28 to initiate a new eastern offensive effort.

The second decision, as to the form and direction of this effort, was more difficult and controversial. Apart from Conrad's proposal, made once again, to strike from two directions against Siedlce, there were two schemes under consideration. One was from Ludendorff on behalf of Hindenburg; the other from von Seeckt, representing Mackensen. In the sequel, Falkenhayn accepted the latter, with additions of his own.

In Section I. of this article, mention was made of the geographical barriers, both flank and transverse, of the "northern corridor," and it was noted that the tendency of the latter was to turn southward in their upper courses, so that a series of gateways existed along the inner flank of the corridor. Seeckt's proposal, first made as early as June 15, was to wheel the two Mackensen armies sharply northward, pivoting at about the mouth of the San, to the line Ivanozorod-Wlodawa, with, as flank-guard against dangers from the Luck direction, the Austrian II Army, which should advance, in echelon from the left, towards Vladimir Volynsky, E. of the Bug. Only the South Army and the VII Army would remain to drive the Russians remaining S. of Brody out of E. Galicia. The Austrian I Army on the other side of the Vistula was to conform by pushing the enemy back to about Josefov, and, itself crossing there, to come into line to the S.E. of Ivangoord, thereby allowing Mackensen (L, IV., and XI. Armies and Beskidenkorps) to congest on his right wing and drive forward on the Bug, with on his right, beyond the river, a deep échelon which could pull out and outflank the enemy's left wherever it was found. To this scheme it was open to Falkenhayn to add a similar enveloping element on the northern flank.

But, in accepting the plan, Falkenhayn and Conrad modified it considerably. The situation in E. Galicia did not seem to them to justify the plunge of the II. Army southwest on Vladivostok and Volhynsky. They therefore reserved this army, as heretofore, for operations in the Brody direction, and instead withdrew the I. Army from the central salient—Woyresch extending, in place of it, to the Vistula—and reconstituted it about Rawa Ruska with orders to line the Bug as a flank guard in proportion as Mackensen progressed. It was during this regrouping that the Russian counter-attack of July 7, above mentioned, was delivered. A serious objection to Seeckt's scheme was, in Falkenhayn's eyes and probably in Conrad's also, the fact that the II. Army would have become involved in the marbles of the Turkish Reich and in the Galicia salient, while Mackensen could and incidentally, Ludendorff considered the difficulty of this country to be exaggerated, and Falkenhayn admitted after the event that this was so. In any case much would have depended upon the scale of the operations E. of the Bug, and this was just the unknown factor in the problem.

Falkenhayn therefore limited the Mackensen operation to the area between the Vistula and the Bug, thus turning some, but not all, of the transverse barriers by their inner gates. Reckoning upon obstinacy in the command and slowness of the machinery of his opponent, he considered that it would suffice to come in upon the rear of the Russian centre during its presumed evacuation of the central salient, at some point between Siedlce and Brest-Litovsk. But he was aware that the centre of gravity of the whole Russian line now lay opposite Mackensen, who would be called upon to make a purely frontal advance through country that was destitute of railways and would certainly be devastated. He therefore intended to deliver an additional blow from the other wing generally in the same direction; that is, to reinforce Gallwitz to such strength as would enable him to force, in succession, the Russian XII. Army's Przasnyz lines and the New Austrian N. Army's villages of Volhynsky. Both Seeckt and Conrad expected the maximum result that was possible, and with a time-limit set by the forthcoming French offensive in Champagne and by the Bulgarian peasants' harvest.

Ludendorff, on the other hand, aimed at the "annihilation" of the Russian armies and thereby the certainty of winning the war. He argued that Mackensen's movement on the left of the Bug would be a slow frontal drive; that a Gallwitz offensive toward the Narew would be brought to a standstill, or at the least reduced to the condition of Mackensen's, very little beyond the Narew; that Byelostok could not be reached with certainty by an offensive from the VIII. Army front (Oswiecim), as had been projected in the Masurian campaign, though he and Falkenhayn were agreed as to this being, ideally, the decisive point; that Kovno and Grodno effectively held the middle-Niemen line and that, in effect, the only practicable envelopment was one which, starting from the N. of Kovno, swept round and invested that fortress and swung in by Vilna toward Moldoechno and Minsk. The cross-barrier of the Vilya, and that alone, was sufficiently far back from the present Russian front to ensure the cutting-off of the entire Russian army in Poland, Poland and southern Lithuania. To complete the "Canace," he proposed that the Mackensen group of armies should place its centre of gravity on, and even E. of, the Bug, as laid down in Seeckt's original plan.

To understand the significance of this proposal and the arguments for and against it, it is necessary to realize the new position of affairs on the extreme left of Hindenburg's front. At the close of the Masurian winter operations the X. Army...
leaned to the left on the lower Niemen, rather east of Tilsit. In March there had been some advances and retreats on both sides but no substantial change in the situation. A raid on Memel, beyond the left flank of Eichhorn’s Army, by a small body of Russian militia from Libau (who were expelled after doing some damage) was the only incident of importance. Of the Niemen till, in mid-April, Hindenburg received orders to deliver feint attacks in order to divert attention from the forthcoming Gorlice offensive. He chose, for this purpose, the region N.E. of Tilsit, and assembled a mobile group of infantry and cavalry divisions under General von Luttwitz. In this quarter the Russians had only a small force and the advance could be carried out in three separate columns, thus covering an enormous front. In all, 3 infantry and 3 cavalry divisions were sent out on April 27, by Memel toward the Vindava, by Taurogene on Shavli (Schaulen, Szawle), and by Yurburg on Sredniki and the Dubliss a line. A small raiding body, in conjunction with light naval forces, took possession of Libau early in May.

Lauenstein’s movement was unexpected, and his left column penetrated to Mitau before the reaction set in. The others made good Shavli and the line of the Dubliss, and during May and June a series of fierce battles on a small scale took place all along this line. The Russians brought up considerable reinforcements under the V. Army staff, and the first object of Lauenstein’s enterprise thus attained marked success. But, like other wide extensions of front in the war, as soon as serious infantry fighting opened, manœuvre began to call upon reserve resources for its maintenance. Two infantry and 2 cavalry divisions were added to the German force, which became the “Army of the Niemen” under Otto von Below, Scholtz succeeding this officer as the head of the VIII. Army. Thus, at the end of June, when the plan of future operations was being settled, the ground was prepared for the manœuvre advocated by Ludendorff. From Shavli, with flank of the Russian army and the line of the Dubliss, the Niemen army could, after being made sufficiently strong to defeat the Russian V. Army assembled in front of it, turn Kovno and reach the Vilya line long before the Russians in retreat from Western Poland could do so. On the other hand, so grave a peril would clearly bring into existence a new Russian army of relief in the Riga–Dvinsk–Petrograd region, and this army would make short work of a few flank-guard divisions facing Riga, Jakobstad and Dvinsk. One necessary condition of Ludendorff’s plan, therefore, was heavy reinforcement of the Niemen army; another the reduction of Kovno, so as to clear a direct and safe line of communications Isterburg–Vilna and to bring the X. Army into action E. of the Niemen. From Falkenhayn’s point of view, however, the eccentricity of the whole manœuvre was its gravest drawback. He doubted whether so distant an operation would affect the situation of Mackensen, but especially whether it would not become just that plunge into the unlimited interior of Russia which, with his time-limit fixed, he dreaded above all. Operations N. and E. of Kovno were permissible, in his opinion, only for hunting down an army already in dissolution, not as a preliminary to the battle that was to bring about the dissolution of the Niemen army.

Such, in sum, were the elements of a controversy between Falkenhayn and Ludendorff, which in the course of the summer created a serious breach between the Supreme Command and the commander-in-chief East, and undoubtedly handicapped the operations, for Falkenhayn never swerved from his intention to close down the campaign as soon as an “adequate” result had been achieved, and Ludendorff on his side returned to the charge at every opportunity, with the result that the few available reserves were handled without singleness of purpose.

The Ludendorff plan, first proposed as early as June 7, was discussed fully at a conference on July 2, in the presence of the Emperor William, who, bound by the practice of the German army either to follow the counsels of his sole and responsible adviser or to dismiss him, chose the former course. It was decided therefore that Mackensen, after completing his wheel-up, should advance with all possible energy against his immediate opponents between the Vistula and the Bug, with the reconstituted Austrian I. Army protecting his right flank by making good the line of the upper Bug as he advanced; and that Gallwitz’s army group, reinforced, should break through at Przasnyz and on the Narew. When Gallwitz’s operation, with its immediate relief to Mackensen, should have been completed, then Falkenhayn was prepared to allow an extension of the offensive to the middle Niemen region.

On Mackensen’s front the wheel-up was completed in the midst of a heavy Russian counter-attack, and the advance that was to follow was involved in great difficulties from the outset. His three armies were driven back to the right, the Austrian IV. and the German XI. and Bug Armies (Ludendorff, who had been forced under Linsingen)—had not moved appreciably when Gallwitz’s attack was delivered. The Russians had massed considerable forces to deny access to the inner gates of the corridor, and under cover of their activity had already begun the evacuation of the central salient. There all the old line had been already given up S. of Inowlodz on the Plica, and, on Mackensen’s intention becoming evident, the retreat was continued to the line of the Vistula itself, where, however, the foreground of Ivanograd and, especially, the great entrenched positions west of Warsaw continued to be held in force. The German IX. and Woyrsch Armies, instead of following this line, now constituted as a group of armies under Prince Leopold (probably in order to give Falkenhayn a force independent of both Hindenburg and Conrad), had been weakened and could do little more than follow up, boldly on the right but very cautiously on the left where the Warsaw positions and Novogorgevsk imposed respect.

When Woyrsch reached the region of Ivanograd (July 21) so little progress had been made on the Mackensen front that Conrad proposed that Woyrsch should cross the Vistula above that fortress, so as to intervene in rear of Joseph Ferdinand’s opponents. This movement, which would have thrown the axis of the operations to the left of the IX. Army to the south of the middle Bug and put an end to all hopes of cutting off the Warsaw group of the enemy, was opposed by Falkenhayn and also by Mackensen, and Woyrsch received orders to cross the Vistula below Ivanograd, as he did on the night of July 28–29 near Muciejowce. The IX. Army meanwhile felt its way forward to the Warsaw lines and the S. front of Novogorgevsk.

Before any of these movements were under way—largely indeed with the intention of helping them to get under way—the Gallwitz group, reinforced from the central salient by 4 divisions to a strength of 37, on July 13–15, he operated its offensive on July 13–16 by breaking through the Russian XII. Army’s trench-lines at and west of Przasnyz (see Narew, Battles of the). On the night of the 17th Gallwitz stood within range of Ostrolenka on the left and the N. defences of Novogorgevsk on the right. But a new and more severe effort was needed for the forcing of the Narew line itself. Russian counter-attack forces arrived in time, and it was only on Aug. 8—more than 3 weeks after the offensive began—that the Gallwitz group, now styled XII. Army, had made good a line E. of the river defined by Serock–Wyszkow on the Bug–E. of the Ostrow–R. Ruz, the last named being occupied by the right of Scholtz’s VIII. Army which had advanced in sympathy. The right of the German XII. Army meantime, W. of the Narew and facing S., was holding its own, not without considerable difficulty, against repeated counter-attacks issuing from the Novogorgevsk defences, where the Grand Duke maintained large mobile forces up to the eleventh hour—and indeed beyond it.

In these 3 weeks Mackensen’s right, the Bug Army, had been engaged (see Brest-Litovsk, Battles of) by the Russian XIII. Army, at the halt on almost every line of E.–W. streams available. It had fought on the line Grabowice–Gubieszow from July 10–21, on that of Chelm–Annonopol from the 21st to the 31st, and along the Uchkeria river and at Sawin in the first days of August. The XI. Army, with better conditions, had advanced first astride and then east of the Huczwa, and by Aug. 6 had reached Lubartow–Sawin; while Joseph Ferdinand had—without the suggested flanking assistance from Woyrsch—reached the
line Novo Alexandrovsky-Ulabortow. In the centre Woyrsch had extended his Muciejowice bridgehead and was passing all his forces over the Vistula for the advance on Siedlce-Lukow, and under this threat the Russians had entirely evacuated the left of the Vistula. Warsaw fell on the 9th, though the German IX Army was unable to force the river—there a kilometre broad—until the 8th. Ivangorod was evacuated on the 6th. Thus the German front had assumed a still more pronounced N.E. direction than at the beginning of the Mackensen manœuvre; owing to its battle and route conditions, Linsingen's Army was back instead of forward of the alignment, and the Russians had retreated southward in order to allow an advance by the Liwcz, the Bystriecka and, facing Mackensen, the middle Wispya, the Swinka and the Ucherva. The Austrian I Army, occupied principally with flank-guarding Linsingen along the Bug, had advanced its right to Vladimir Volhynsky but no farther. On the other flank of the Russian retreat Gallwitz was firmly held for the time being. In other words the Russians—handled with great skill by General Alexeiev, commander-in-chief of the N.W. front, were successfully effecting their retreat to that line (Kovno-Grodno-Bрест-Литовск.—W. of Kovel-Luck-Dubno) which had been already in peace-time regarded as the line of safety for deployment. In territory, they had abandoned no more than they would have been prepared to give up gratuitously in their pre-war concentration scheme.

But this in itself was, after a year of warfare, a confession of defeat. The enormous losses of that year in men and material—losses such that the great army of peace-time with all its resources had practically ceased to exist and the stocks of arms no longer sufficed to equip even the men in action, let alone new formations, with rifles—left no doubt that as a dominant factor in the war Russia was out of the reckoning. In the light of after events, the decision to continue the struggle after the loss of the Soły line in June is seen to be the first step to the Russian Revolutions. Yet, on purely military grounds, it was justifiable on the assumption that the French effort to break through the Champagne front would succeed. Only this confidence in victory in September, indeed, can explain the stagnation on the Western front from April to August (broken only by the May battle in Artois), enabling Falkenhayn to withdraw some 12 divisions for the Eastern operations.

By August it was evident that the chances of cutting off any considerable force of the Russians in the Kielce region was at an end, and again there came up on the German side the controversy between Falkenhayn and Ludendorff as to what the operations were intended to achieve. Falkenhayn held firmly to the view that the Russian army must be beaten before any wide enveloping movement was undertaken to surround its débris. Writing after the war, he maintained the same opinion, only reproaching himself with not having compelled G.H.Q. East to give Gallwitz 20 divisions instead of 14. And certainly, if prisoners and booty were considered, he had in fact inflicted what by all military standards was a "sufficient" or "decisive" blow—for by the middle of August the Russian losses in prisoners alone had reached the figure of 750,000 since May 1, nearly 50% of their combatant strength as it had been at the end of April. But the time-limit was close at hand, and the withdrawals of forces to France and Serbia, delayed as long as possible, had now to be begun. The weeks remaining must, according to Falkenhayn, be devoted to inflicting as much additional loss on the Russians as was possible by frontal pressure coupled with flank attacks on the middle Niemen and east of the Bug, i.e. in the immediate vicinity of the frontal fighting, and possibly raids by light forces on the communications behind Kovno and Brest-Litovsk. At a suitable date the operation would be closed down, and the best lines of defence taken up as a winter front. Ludendorff, on the contrary, considered that the actual annihilation of the Russian armies was the only "sufficiently, decisive result" that would give freedom of action in the West, and with renewed insistence—which went as far as a personal appeal by the Field-Marshal to the Kaiser—demanded the reinforcement of his left (Niemen army) with a view to quick swooping down on Vilna and Molodechno and the closing of the "corridor." The axis Orany-Lida, originally suggested, was now too near for the required effect, but the principle was the same, and the movement would originate from a more favourable situation of the Niemen army than that existing in June. Preparations for the attack on Kovno by the X. Army were already well advanced, and Ludendorff considered that even at this stage complete success would be possible.

At this period the fighting on the Corssawa-Schali-Dubissa line, backed by a renewed drive in favour of the German Niemen army, the Russian V. Army receiving little or no further reinforcements when Mackensen's and Gallwitz's attacks developed. Below was progressing beyond the line named in each of the three directions Mitau-Riga, Ponevisheev-Dvinsk, Keidamy-Willkomir, and about Aug. 1 his various columns, totalizing about 71 inf. and 53 cavalry divisions, were approximately on the line River Aa-R. Musha-E. of Ponevishe-E. of Keidamy. To the southwest, the German X. and Russian X. Armies were still making war in the same fashion as in March, the Germans based on the Suwalki-Schali lines, and the Russians on their new Grodno fortifications, making periodical thrusts in the region between. But the last important Russian thrust was delivered early in May, as a "relief offensive" toward Schali; and the German reaction became a methodical advance toward Kovno and Olita, which at the time here considered brought their left almost up to their opponent's stronghold. Behind the German advanced line preparations had been made for the siege of Kovno, an essential part of the scheme which Ludendorff still advocated.

The Final Phase.—It was evident that the scheme of bringing Below and Eichhorn down upon Vilna and Molodechno, and capturing Kovno in time, would call for the reinforcement of either or both, and, on this ground principally, Falkenhayn preferred to continue the campaign on the same lines as before, though a little later he conceded to Hindenburg freedom to dispose as he chose of the forces in his own area and to Mackensen freedom to pass to the E. of the Bug. Conrad, meantime, was planning an operation in East Galicia with the II., South and VII. Armies.

Thus the last phase of the tremendous campaign consists of 4 parts: (a) the frontal drive of (right to left) the Bug Army, the XL., Woyrsch, IX., XII. and VII., (b) the attack on the north flank, and the rear of the German X., and Niemen Armies, (c) the N.E. sward of the Bug Army and the A.-H. I. Army, and (d) the autumn campaign in E. Galicia. All these were carried out without any great regrouping or reinforcement, and, indeed, as regards (a) the forces concerned, were gradually reduced in order to form the army for the Serbian front and to increase the reserve in France. In the case of the operations in E. Galicia, the Russians followed a clear purpose and the parts of their efforts were co-ordinated. But elsewhere, under the tremendous pressure of the row of hostile armies stretching from Lomza to Wlodawa and Vladimir Volhynsky, the German general policy was that of gaining time at the expense of ground and of avoiding envelopment at all costs, and the day-to-day situations were met as best they could be. On the German and Austrian side the offensive energy of the troops was beginning to approach its limit, except as regards troops N. of Grodno, so that it may be said that the allied left and the Russian left alone retained the capacity for fresh achievement, while the rest were wearing each other out at an increasing rate.

The central campaign, between the Bore and the Bug, may best be summarized by recording the battlefields of each of the German armies in succession.

Protected on its right by the Austrian I. Army, the Bug Army fought and won the battles of the Ucherva (Aug. 7-12) and of Wlodawa (Aug. 13-17), and in concert with the XI. Army continued its advance northward along the Bug against Brest-Litovsk. Meantime, the crossing of the Bug was authorized in so far as concerned the establishment of bridgeheads; and in carrying out orders with this object the German subordinate
leaders became involved in fighting E. of Wlodawa, which inevitably formed the starting-point of an offensive against the eastern communications of Brest-Litovsk. By Aug. 21, then, the greater part of the Bug Army was engaged on the line of the Kapajowska from its mouth to Switiaz lake inclusive, well inside the region of the great marshes; the remainder (Beskidokorns only), still west of the Bug, was nearing the outworks of Brest.

To the left of the Bug Army the XI, already being reduced for the forthcoming German campaign (for the conduct of which its staff was presently withdrawn), moved forward correspondingly against the W. of Brest. On Aug. 10 its left had reached Janow on the Bug below the fortress, while the Beskidokorns stood at Koden on the same river above it. To the left of the XI Army, again, the Austrian IV Army at that date lined the Bug between Janow and Niemirow; and beyond Joseph Ferdinand, already N. of the river, was Prince Leopold with Woyrsch’s and his own armies, which, as soon as they had debouched from Ivanogrod and Warsaw, had made rapid progress, as the Russian centre retreated at the fastest possible pace to escape, while Gallwitz and Mackensen were still being held off.

The German IX. and Woyrsch Armies stood, on Aug. 10, N. of Niemirow, facing the line of the Pulwa and the Nurzec on which the Russians were preparing to make a stand.

Meantime Gallwitz, in his bridgehead position in the angle of the Bug and Narew, had overcome the Russian counterattacks, but not before their purpose of keeping open the railways and roads for the retreat of the Warsaw and Ivanogord forces had been achieved. The battles of Ostrow (Aug. 8-10) and Tschishew-Sambrow (Aug. 11-12) and the advance in the direction of Bielisk which ensued were thus similar in character to the operations of the IX. and Woyrsch’s Armies, viz.: a direct pursuit where an envelopment had been hoped for. At the date of Aug. 18-19, Gallwitz stood between the Nurzec and the upper Narew, facing Biala, where the Russians were prepared.

The rightmost troops of the XII. Army, viz. those which in the battle of the Narew were facing south against counter-attacks from Novogorievsk and the strong points of the lower Bug, had now been combined with the leftmost troops of the IX. Army for the siege of Novogorievsk, in an army group under von Beseler, the captor of Antwerp; and the siege, pressed with energy, was nearing its close. On the 20th the place, with a large garrison, surrendered. On Gallwitz’s other flank, the right of the VIII. Army had conformed to his advance and was taking the direction of Byelostok; its centre had mastered Lomza and Wisznia on Aug. 10; and its left was again, as in Feb., battering Osowiec, which fell to the superheavy artillery on the 22nd. Kovno, as will be seen, had already fallen on the 18th, to the attack of the German X. Army.

Throughout these pursuit operations large numbers of prisoners continued to be taken by the Germans, and the Russian fortress artillery swelled enormously the total of captured guns. At Novogorievsk some 85,000 men and 700 guns were taken. Shortly it was to be the turn of Brest-Litovsk and Grodno, though these places were not defended after the withdrawal of the battle-lines outside them.

The later stages of the frontal pursuit may be very briefly dealt with. The general direction of the Woyrsch, IX. and XII. Armies was eastward. From Aug. 10-24 Woyrsch and the IX. Army were engaged in mastering the Pulwa–Nurzec line, on which the Russians delayed their opponents long enough to cover the evacuation of Brest-Litovsk against interference from the X. Army. On the 25th the X. Army moved in and took these two armies in a fresh series of combats in and about the “primenal forest” of Byelovitsa. Meantime the XI. and (till its withdrawal) the Austrian IV. Armies, with the Beskidokorns of the Bug Army, had attacked Brest-Litovsk concentrically from the W. and S., and the last Russian rearguards had been driven out of the evacuated stronghold on the 26th. The Germans and Austrians then continued the pursuit eastward, where the operations of the Bug Army and the Austrian I. Army (presently to be described) came into line with theirs in the early part of Sept. The XII. Army drove the Russians from the Biedalski positions on the 26th, from the Svislocz river a few days later, and from the Naumka–Werekzya line on Sept. 4, at which date the IX. Army and Woyrsch had at last debouched from the Byelovitsa forest towards the Jasiolda river.

In general, the effort of the Bug, XI., IV., Woyrsch and IX. Armies in the earlier stages of pursuit had tended to crowd the Russians into the area around Brest-Litovsk, and at a certain stage in this process the Bug Army had been authorized to push through the marshes of the Gumbas Don to open the line of communications Brest-Litovsk-Kobrīn–Pinsk. At the same time the Austrian I. Army about Vladimir Volhynskyi advanced to Kovel, and thence eastward (see Autumn Campaign in East Galicia p. 907) while from Kovel its cavalry worked up through the marshes northward to join the swinging right wing of the Bug Army. But that army, although it drove the retreating and diminishing forces of its opponent N.E. from the Kapajowska to Kobrin, was unable to reach that point before the Russians evacuating Brest-Litovsk had flowed past it. The Russian rearguard stood to fight on a line E.N.W.-S.E. through Kobrin, but, the Austro-German Cavalry Corps of General von Heydebreck from Kovel arriving on their flank, they soon fell back to the oblique line of the Dnieper–Bug canal, where they were temporarily secure against all but frontal pressure. Thus in this quarter too the pursuit became a direct one. The Russians were driven by the Bug Army and by what remained of the Austrian XI. and Austro-Hungarian IV. Armies—the whole now commanded by Linsingen—out of the canal lines in the battle of Horodec (Aug. 31–Sept. 1) and out of the defences of Drohibition–Chomske (Sept. 4–6). But Linsingen’s offensive, more and more hampered by poor communications, came to an end with the occupation of Pinsk on Sept. 16, and positions were taken up here which remained unchanged till the end of the war.

With the almost simultaneous capture of Brest-Litovsk, Bielisk, and Grodno (the last named fell to the German VIII. Army on Sept. 2–3), the Germans obtained possession of that line across the northern corridor which had usually been regarded as the Russian stabilization line. Falkenhayn, however, took full advantage of the shortening of front which resulted from the directions taken by his armies, and then at last Ludendorff’s scheme came into play.

Such an operation as Ludendorff contemplated, or at least one from the middle Niemen, Falkenhayn had been willing to agree to from the first; and as the occasion approached he relaxed his hold on Hindenburg’s dispositions, stipulating only for the observance of his general directions and for the release of certain divisions for the West. In practice he approved the attack on Kovno. Ludendorff promptly took advantage of this, and the intended wheel-in upon the rear of the “corridor” was already in progress before the fall of Grodno and Brest-Litovsk. On Aug. 8 the X. Army was able to begin the siege of Kovno. Ten days later the fortress was in its hands—even earlier than at Novogorievsk, Osowiec, and Brest-Litovsk. On condition of strengthening either the Niemen army or the left of the X., therefore, Ludendorff’s plan had become feasible, if feasible at all, while masses of the enemy were still south of Brest-Litovsk, on the Pulwa and the Nurzec, about Bielisk and Byelostok and Grodno. At that date, Aug. 18, the Niemen army had pushed its left columns close up to the Riga–Üxküll bridgehead on the Dvina, and to Friedrichstadt on that river, whence its centre and right ran southward along the Jara and Sventa to the north side of Kovno. It was still very strong in cavalry, but since it had now been driven into the area, surviving through the devastated areas to the South.

Nevertheless, no serious advance was made to the westward from Kovno for more than a week, and even then part of the X. Army swerved full to the south against Olita to open an advance in the direction of Orany, and also to help the VIII. Army in cutting off Grodno, now a pronounced salient. At this late stage Ludendorff himself had doubts of the efficacy of the westward movement, and for a moment contemplated taking the direction favoured by Falkenhayn, viz.: Orany, Lida, Baranovichi. Not only was this the shortest route to the enemy’s
EASTERN EUROPEAN FRONT CAMPAIGNS

heart—the shortest, that is, as measured by the time necessary for concentrations and for rebuilding routes—but it offered hopes of driving a large mass of the enemy into the marsh region round Slonim, where the avenue of escape was narrowest (whereas at the latitude of Vilna—Molodechno the corridor broadens out considerably). However, he chose, in the end, to follow the current scheme of operations, as offering "the golden prize" of the enemy at a price, though admittedly that prize might escape him. On the 28th, therefore, with the expressed or implied consent of Falkenhayn, the X. Army was ordered forward on Vilna, with centre of gravity on the north wing, north of the Vilya. Reinforcements were collected from the troops lately besieging Novogeorgievsk and from the VIII. Army, which, after the fall of Grodno, would evidently be crowded out of the line. The Niemen army was directed to press up to the Dvina bridgeheads and, especially, up to Dvinsk, to cooperate with its left wing in the operations of the X. Army north of the Vilya, and to prepare a mass of cavalry to break through the thin line of the Russian Army by an enemy sortie or destroy the railways at Molodechno and Minsk.

The last great battle of the campaign, known as that of Vilna—Molodechno, began after the Grodno episode had been closed on Sept. 9. At that date Linsingen was advancing on Pinsk, Woyrsch and Prince Leopold driving the enemy slowly from one river-line to the next, over the Jasiolda, in the direction of Slonim; and Gallwitz and the remnant of the VIII. Army were pressing slowly forward up the Niemen in the same direction. The Niemen army was, by its activity between Riga and Dvinsk and the Dvina, driving back the enemy slowly and bringing along with it its usual steady train of Russian forces which were coming up from the Baltic provinces. From Wilkomir, north of the Vilya, to Orany, the X. Army engaged the very heavy forces that the Russians had collected for the last effort to hold the flank of their corridor—the final act of command of the Grand Duke Nicholas before the Tsar took over the control from his able hands. The German offensive progressed slowly, like all offensives against the Russian flank in this campaign, but after some days it was judged that the forces on the Dvina and amongst the Dvinsk lakes had obtained sufficient security for the left flank, and on Sept. 11 the German cavalry diversion had been turned back west of Novo Sventiansy and made for Sventiansy and Molodechno. On Sept. 14 the horsemen reached and broke the Vilna—Molodechno line at Smorgon. At Wilejka and farther north at Glubokoye they cut the vital Lida—Plotsk line. A party even reached the Minsk—Orsha line at Smolowice.

This last crisis was also the most dramatic. The first wave of cavalry was followed by others till about seven divisions were collected about Wilejka, Smorgon and Molodechno. But, recovering from their first surprise, the Russians quickly sent troops from Vilna and from Minsk, as well as from the southeast of Dvinsk, to clear their intercepted lines of retreat. These had to be recovered at all costs, for, while the forces retiring before Gallwitz, Leopold and Woyrsch still had the lines focused on Baranoviči at their disposal, these could not help the northern masses, and it was in the north, towards Vilna, that the centre of gravity lay.

Thus a race to build up forces about Smorgon, Molodechno and Wilejka set in. The Russians, having the better communications and consequently the larger forces, won it. They drove back the German cavalry, after a continuous skirmish of five days, to the west of Smorgon and the northwest of Wilejka. Two days later the first infantry divisions arrived on the German side from the left of the X. Army. The détour of these troops along the north bank of the bending Vilya had enabled the Russians, moving on the shorter line, to reopen their line of communications; and, with this, the battle of Vilna became, like the battles farther south, a slow frontal drive. Thereupon Falkenhayn ordered operations to be broken off and more divisions to be withdrawn for other theatres, and fixed in general the line to be taken up as a winter line. The concluding operations of the campaign, mostly completed in early October, consisted in the methodical advance of all armies to this line, which, so far as the Hindenburg, Leopold, and Linsingen groups were concerned, ran from Tuckum, on the Gulf of Riga, past the south side of Riga and parallel to the Dvina to Novo Alexandrovsk, and thence southward by Lake Drivyaty and Lake Naroch, Smorgon, Krewo and Baranoviči to Pinsk, south of which point Linsingen's right came into touch with the left of the Austrian operations in East Galicia.

In the Russian Campaign in East Galicia.—In East Galicia the pursuit of the Russian VIII. and IX. Armies, after the Grodek—Lemberg break-through in June, had been left by Conrad and Falkenhayn to the Austrian II. Army, the German-Austrian South Army, and to Pflanzer-Baltin. Although the first impressions of the victors in that battle had been that the Russian armies remaining in East Galicia were incapable of more than retreat and rearguard fighting for a long time to come, in fact it cost the Austrians and Germans much fighting and manoeuvring to establish themselves on the line of the upper Bug and the Zlota Lipa; and Pflanzer-Baltin was at one time subjected to a heavy counter-attack by General Lechitsky's Army, for in this quarter the Russians had an ample supply of reinforcements in their Odessa army. Towards the end of July, however, the fighting in Galicia died down.

Towards the end of August, as a part of the same final offensive act which produced the battle of Vilna—Molodechno in the other flank, Conrad initiated a campaign which was intended to confirm the separation of the northern and southern groups of the enemy and to clear the latter out of Austro-Rumanian territory definitively. The thinness of the defensive cordon in the west, boldly revealed by the lack of counter-measures on the part of the Russians, and the approach of the large Puhlowski's I. Army on and beyond Vladimir Volhynsky, and the advance of Heydebreck's Cavalry Corps across the swamps and forests to Linsingen's Drohičyn battlefield, led the Austrian command to make its effort on the north side of the Lemberg—Brody watershed. Profiting by the general shortness of the line between the Bug and Vistula, Conrad withdrew the Archduke Joseph Ferdinand and the IV. Army from the Brest-Litovsk field of operations in the last few days of August, concurrently with the withdrawal, mentioned p. 906, of the German XI. Army for Serbia. During the gradual withdrawal of the IV. Army, Puhlowski began his offensive from the line Vladimir—Volhynsky—Kovel in a south-easterly direction.

The fighting which followed is described in the article ROVNO, BATTLE OF. The incoming of the Austrian IV. Army on Puhlallo's left, on the one side, and the arrival of reinforcements for Ivanov's VIII., XI. and IX. Armies, on the other, led to the battle spreading along the whole front from the Priepet to the Pruth. In sum, the Austrians, after advancing from Kovel to the rivers Goryn and Putlivka N.W. of Roivno, and from the Zlota Lipa to the Galician Sereth, were checked and driven back by a counter-attack group formed by Brussilov's VIII. Army in the region of Rajalovka. The rest of the Russian front taking up the movement, the Austrians were driven back from the Sereth to the Strypa, and from the Horyn—Stubiel line to the upper Styr and Stokhid, while the centre held practically all its gains. From the fourth week of September the battle, after some further fluctuations on the left, became a stabilized trench-warfare conflict which dragged on till mid-November, when both sides settled down in their winter lines. These ran from the Priepet along the Styr and the Kormin and thence past Dubno to Zborow and so along the Strypa. From the Strypa mouth to the Sereth mouth, the Austrians retained positions north of the Dniest, and from that point Pflanzer-Baltin's front substantially followed the frontier to Rumanian territory E. of Cernovitz. Thenceforward up to the opening of the great Russian offensive in 1916 the only important operations which took place in East Galicia were the relief offensive known as the "New Year battle" (see STRYPRA—CZERNOWITZ) initiated by the Russians in the hope, which was not realized, of calling off Austrian troops from Montenegro, and the Russian capture of the Dniestir bridgehead of Ucleszko on March 19—a diverting attack in aid of the spring offensive of the north.

( C. F. A.)
IV. RUSSIAN FRONT, 1916-17

Operations in Russia and East Galicia, 1916 and 1917.—About the end of 1915 and the beginning of 1916 the rival belligerents in the World War were confronted with the necessity of making vital decisions. For the Central Powers and their allies the past months had been rich in results. In the Balkan Peninsula Bulgaria’s entry into the alliance, and the conquest of Serbia and Macedonia, had opened the way to Constantinople and Asia Minor. The Allied army in the East had tried in vain at Salonika to bring about a change in the state of affairs. The Entente troops had been withdrawn from Gallipoli. Even the bloody battle in East Galicia and on the Bessarabian frontier at the New Year had had no effect upon the general situation. Against Italy, and in the French theatre of war, the armies of the Central Powers had successfully maintained their position. The chief of the Austro-Hungarian General Staff, Gen. Conrad von Hützendorf, proposed to the Emperor the situation in the Balkans as far as possible. Rumania must be forced to give up her ambiguous attitude by an ultimatum, supported by the presence in South Hungary of a powerful force of troops. Montenegro and at least the north and centre of Albania must be occupied by the Central Powers. These measures having been taken, an offensive, prepared in the meantime, on Salonika would end the campaign in the Balkans. But the chief of the German General Staff, Gen. von Falkenhayn, had since late autumn, 1915, remained with his plans in the West in the French theatre of war. He pronounced against an offensive at Salonika on several grounds, and his view of the political future of the Central Powers from the peace conference’s standpoint could not be waived aside. The German Gen. von Seeckt also upheld Falkenhayn in this, on the strength of a conference with the Bulgarian Army Command. While the plan of an attack on Salonika was rejected, in this manner, pressure on Rumania was now likewise deemed unnecessary, since the military successes of the Central Powers had meanwhile caused a more conciliatory attitude at Bucharest.

As regards the Austro-Hungarian Army Command’s plans for dealing with Montenegro and Albania, Falkenhayn tried to postpone these indefinitely. But Conrad clung to his point and carried out his intentions, more or less against the will of his German colleagues, whereupon a most acute personal quarrel broke out between the two generals, lasting nearly a month.

This quarrel, in the course of which Gen. Conrad had the satisfaction of seeing his troops take the Lovchen (Lovčen) and subdue Montenegro, obviously laid no promising foundation for their common decisions in the future.

The idea of bringing about a decision in the war by a campaign against Kiev or Odessa in the spring of 1916 seems to have engaged political rather than military circles in Vienna and Berlin. In the latter the Russian operations in 1915 only strengthened the old conviction that the Russian armies—thanks to the illimitable area of operations and the skill of the Russian leaders in retreat—would always slip their heads out of the noose again, and that any further advance of the Central Powers towards the east could only result in an inconvenient extension of the front. The war, according to the view of both the General Staffs, could only be won against the western opponents. Conrad proposed a combined offensive against Italy. An annihilating blow delivered against this enemy would have been not only in accord with his personal feelings and those of his armies, but was worthy of consideration on many other important grounds. The increased effect in the Italian front was increased for the Austro-Hungarians by every new defensive battle; the Italian menace to Trieste became more intolerable week by week. On the other hand, Italy was easier to overthrow than France—or England, for that matter; and, as often before in history, the fate of the Rhine might be decided in the plain of the Po. Falkenhayn did not refute these arguments; but he was doubtful whether, in the first place, it would be possible to force Italy to break with the Entente, in view of her dependence on England, and, in the second, whether even if, contrary to expectations, Italy’s overthrow should be brought about, the Western Powers would take the loss of this Ally so very much to heart. Falkenhayn was convinced that the decisive campaign could be fought only in the French theatre of war. Conrad held to the other solution, but declared himself willing to place a few particularly good fighting corps at the disposal of the German Higher Command for use in France. This offer was declined by Falkenhayn, both on military grounds and as a matter of prestige. He proposed as an alternative that his allies should take over, in addition to the 400 km. of front which they were defending between the Bessarabian Pruth and the Pripet (Przyłę) against the Russians, a further portion of the Lithuanian front stretching towards the north. In this way it would become possible to set free more German troops for the attack on Verdun. But Gen. Conrad could not bring himself to accept this purely passive rôle, and the result of this difference of opinion was that the two empires of central Europe divided their forces, the one proceeding to the attack in France, the other to the Vitamin mountains.

The Eastern Front in March 1916.—For the execution of these attacks, forces that had been set free in the Balkans were brought up and others from the Russian theatre. The German eastern troops were, between Oct. 1915 and Feb. 1916, reduced from 56 to 45 or 47 inf. divs., not to mention the exchange of other fighting troops for less serviceable units. Heavy artillerу and technical supplies were also withdrawn and sent to France, but these could be adequately replaced, thanks to the mechanical power of German industry.

The Austro-Hungarian eastern front in March 1916 was so organized as to leave 40 divs. less than at the close of the frontal October campaign in 1915. To balance this, however, a series of regts. and batts. were brought up from other divs., so that the Austro-Hungarian eastern armies gave up, in all, 120 batts. for the attack on Italy. The drafts for the infantry in this fighting force were supplied mostly from home at regular intervals, the drafting reserve being overfilled owing to the slight losses entailed by the war of positions. Out of this superfluity of men the regts. formed 5th and 6th Batt. Thus there could be no question of numerical weakening on the Austro-Hungarian eastern front. Far more heavily weighed the fact that the best and most reliable troops had been picked for the Italian attack, including nearly all the German-Austrians and a great proportion of the Magyars. The eastern armies were seriously weakened thereby on the moral side; and the militia-like character, which the Austro-Hungarian army had begun to take on in the Carpathian battles in the spring of 1915, now became particularly apparent in the east. Still more severely felt was the withdrawal of the whole of the heaviest artillery, and a considerable portion of the medium-heavy, to the Italian theatre, and the considerably smaller share of technical supplies which had been assigned to the eastern front when these were divided.

In the beginning of March there were about 40 Austro-Hungarian and 46 German divs. on the Russian front. Of these, 42 German and 2 Austro-Hungarian hold the front (Pinsk) between Riga and the Pripet and were under the German Higher Command; the other half of the fighting forces, in the south portion of the front, was under the orders of the Austro-Hungarian Army Higher Command (Teschen). Each section had a breadth of 400 km. The Austro-Hungarian divs. were on an average 14 batts. strong, the Germans only nine. The inferior rifle-shooting of the Germans was abundantly compensated by their superior equipment in artillery and fighting material of all sorts. The entire rifle strength of the forces of the Czecho-Slovak army on the Russian front amounted at this time to rather more than a million. It would be safe to estimate the Russian front at double that strength. The Russian Higher Command, controlled since autumn 1915 nominally by the Tsar but actually by his chief-of-staff, Gen. Alekseev, could draw on its drafting reserve to the fullest extent. In the spring of 1916 the regiments, in spite of the gigantic losses suffered in the last campaign, had been replenished for some time. Immediately behind the army front were enormous masses of reserves, and all the recruiting depots were full. Half of the world’s munition factories were straining to supply equipment for the Tsar’s armies. A number of En-
tent officers were instructing Russians in the western methods of attack. Along with all this the greatest efforts were made to raise the soldiers’ moral.

By March 1916 about 130 inf. divs. and 40 cav. divs. stood on the Russian front, the inf. divs. consisting of 16 batts.—almost double the number of the German. This did not include the draft formations standing in readiness immediately behind the fighting reserve. The rifle strength of the front might safely be estimated at 2½ millions. Her allies might well hope that Russia, in spite of her defeat in 1915, would come up to expectations in the general offensive planned for the summer.

**Battle of Lake Narocz** (Narocz)—July 18–29 1916.—The German troops under Von der Grels, in Feb. 1916 brought the Russians into action earlier than was expected. Like Italy, who was now making her fifth attack on the Isonzo, the empire of the Tsar was expected to lose no time in doing its utmost for the relief of France. Russia had already transferred her centre of gravity to the area N. of the Pripet before this demand reached the Higher Command. On this section, that is, opposite the German front, were 80 out of 130 Russian divisions. Since the beginning of March Hindenburg’s general staff (Kovno) had located a concentration of Russian troops at Smorgon, Dvinsk (Dünaburg) and Jakobstadt. On the other hand, the attack of the II. Russian Army under Gen. Smirnov on both sides of the Narocz lake on March 18 took the Germans somewhat by surprise. After a preliminary bombardment, such as had not yet been seen on the eastern front, this army flung itself upon the German XXI. Army Corps commanded by Gen. von Hutier. It was assumed from orders of the supreme commander of the Russian west front (Gen. Ewirth), which were captured by the Germans, that the Russians meant more by this attack than a mere relief offensive. While Gen. Litvinov’s I. and Gen. Pfeive’s V. Armies were holding the weak German forces occupying the trenches at Waidz, Dvinsk, and Jakobstadt, Smirnov was to force a way through in the direction of Vilna—Kovno and then to wheel northwards and so drive the German wing to the sea.

The “Narocz Offensive” led at first to considerable successes for the Russians. The attack delivered between the Narocz and Wiszniew lakes by Gen. Balujiev with 4 army corps pressed the weak German forces backwards some miles between March 18 and 21. Though the groups attacking farther to the N. were not so fortunate, the Russians might yet hope for success. Then, to the rescue of the Germans, came a sudden thaw. This, indeed, increased the difficulty of bringing up the reserves which they had scattered so painfully, but incomparably worse was the plight of the attackers in this melting of snow and ice. Their second and culminating attack on March 26, according to the German reports, was choked literally “in mud and blood.” Towards the end of March the Russian spring offensive of 1916 died away, without ever getting beyond the local success on Lake Narocz. Their losses were estimated by the Germans at 150,000 men, while the Germans sacrificed not more than 15,000.

On April 28 1916 the troops of the German X. Army under Gen. von Eichhorn snatched from the Russians the greater part of that tract of country which they had captured during the March battles in the confined area of Lake Narocz. **The Luck (Lutsk) Campaign, Summer of 1916.**—At the conference held on March 18 1916 the Allies had fixed July 1 for the opening of the great general offensive on all fronts. For this the Russian Supreme Command was now making ready. By the end of May all their preparations pointed to the probability of their decisive attack again being made N. of the Pripet marshes, and again on the German front. Of the 130 Russian divs., comprising over 21 million rifles, as to which the Austro-Hungarian and the German intelligence service had accurate reports, 74 to 77—or less than two-thirds—were in the northern section. On the side of the Central Powers there were at the same time on the eastern front 83 inf. divs. and about 20 cav. divs., each cav. div. counting almost as many rifles as one regt. of inf., and often fewer. Altogether these amounted to 600,000 fighting men for the Germans and the same number for the Austro-Hungarians. The distribution of forces was the same as in the beginning of March.

In the middle of May the Austro-Hungarian offensive against Italy had started, meeting at the beginning with great success. Once more the Russians were faced with the necessity of relieving their hard-pressed allies, and at least preventing any further transference of Austro-Hungarian fighting forces to the Italian front. Now the preparations for the Russian attack were not yet complete. Also it was evident that active relief to the Italians could only ensue from an attack, not on the German, but on the Austro-Hungarian eastern front—that is, between Finsk and the Bessarabian Pruth. The Russian Supreme Command therefore decided to refrain from any major operation to the east prematurely before July 1. In the end, however, they had to yield to the pressure of the Allies. Gen. Brussilov, supreme commander of the Russian “south-west front,” with the Quartermaster-General, Gen. Dietrich, as the real source of energy at his side, received the order to advance to the attack from Rovno down to Bessarabia. The very first assault, made with attack groups that had been got together at haphazard, brought Brussilov great and unexpected success on both wings in the battles of Luck and Ocna, although the defenders were strongly fortified and situated as regards numbers. Therupon the Russian Supreme Command decided to refrain from the great attack on the German front altogether and transfer the centre of gravity of their operations to the southern section. The advances on the Russian side during the next three months, at Riga, Jakobstadt, Dvinsk, Smorgon and Lake Narocz, were therefore undertaken only at odd moments, without any successes worth mentioning, and must be treated simply as demonstrations. But meanwhile Brussilov had snatched from the Central Powers large portions of Volynia and East Galicia and the Bukovina.

**Battles of Baranowitch (Baranovichi).**—On the other hand, the objective of the Russian Supreme Command in the three battles at Baranovichi had a close connection with the operations at Luck. In the first battle, on June 13 and 14 1916, the attacks led by Gens. Ragosa and Lesch failed completely. Gen. Woyrsch maintained the upper hand over the Russian grenadiers with his Silesian Landwehr. The Germans lost 150 men, the Russians 7,000. In the second battle, on July 2–14, the Russians put in 16 of their divs. against the 2½ German and 2 Austro-Hungarian divs. holding the section Gorodishche (Horodyszcze)—Baranovichi. The Russian main blow fell on the Austro-Hungarian XII. Corps under Gen. von Henriquez, and forced it back to the second position. German battalions were hastily scraped together to reinforce their hard-pressed allies. There were critical hours and critical days. But on the last two days of the battle the greater part of the ground captured by the Russians was torn from them again. East of Baranovichi Gen. Ragosa’s troops were fated to achieve only unimportant local successes. The defenders lost—in dead, wounded and missing—180 officers and 8,000 men; the attacking Russians many times this number.

For the third time the battle of Baranovichi blazed forth on July 25 1916, this time as an introduction to the great Russian general attack N.W. of Luck. Once more the Russians flung themselves against the Gorodishche section, but were driven back by the Germans after a fierce three days’ fight.

**Operations in the Summer of 1916.**—The Russian offensive in the beginning of June 1916 brought the attention of the Central Powers with a jerk to the eastern front, where all at once the situation had become extraordinarily tense, and the anxiety became all the greater with the reflection that the results in the other theatres of war had not come up to their expectations. The Verdun undertaking had cost the Germans heavy sacrifices without making them masters of the fortress, and it was but a small consolation to know that the French had bled even more than they. On the Somme an English-French attacking force of prodigious size and fighting strength was massing itself. In the Venetian mountains at Asiago, the Austro-Hungarian corps, though it was still attacking, had lost much of its momentum since May 25. A pause in the fighting at the end of that month
In the eastern front—in Falkenhayn's words—"to look after itself" was, it may be assumed, only theoretically discussed. Neither did such resolutions come under consideration, either then or later, as those executed in 1914 by the Central Powers when they shooed off the enemy by one mighty move backwards and thus again to the Russian front. The scarcity of food alone, under which the peoples of the Central Powers were already beginning to suffer heavily, made it imperative to cling to every foot of fruitful soil in Volhynia or East Galicia at all costs. On the other hand, the situation was so grave on all other fronts that for the moment any assistance proposed for the eastern front must be of a modest order. The commanders of the armies fighting against Russia indeed attempted, even within their own areas, to keep their forces together for use as units rather than to use them to fill up gaps. Gen. von Linsingen, for example, made frequent efforts in the area of his field armies to concentrate strong forces for counter-attack. But the strength of these attack groups, in most cases, very soon exhausted itself against the numerical superiority of the enemy. Similar attempts were made several times in East Galicia and also in the Carpathians. Mention should be made in this connexion of a plan formed in the beginning of July 1916 to form a XII. Army out of the German and Austro-Hungarian troops in East Galicia and to attack with it on both sides of the Dniester. This idea certainly promised success; but the divs. selected for the purpose were, in view of the new increase of the Russian attacks, in most cases diverted to some particular danger-spot on the wide-ranging defence front; and the construction of the XII. Army, together with the task to be entrusted to it, had to be given up. There was nothing for it but to persist in the method practised since the middle of June, and contest every inch of ground in dogged local defence-battles. And even this mode of warfare was conditional on a considerable expenditure of force. Between the beginning of June and the end of Aug. about 17 German divs. had to be brought over from France and 8 to 10 Austro-Hungarian divs. from Italy. In addition, the front to the N. of the Pripet transferred a large portion of its regts. and divs. to the southern sector receiving in exchange only worn-out troops.

Since the beginning of July 1916 the Russians had also drawn strong forces from Eupatorin's and Ewerth's fronts to add them to Brussilov's. Finally, at the beginning of Sept. the area S. of the Pripet, with 71 divs., had 20 divs. more than the northern sector. The attacks during the summer offensive of 1916 cost the Russians enormous bloodshed. Great as were the results, the sacrifices far outweighed them. The Russian Supreme Command remained true to the methods practised in the Carpathians. It is quite impossible to point to any great conception underlying the operations of the Russian Command in these battles. They worked on purely local considerations and prospects, and often did not even make use of these, as for instance immediately after the first great blows delivered at Luck, when they gave their opponents time to close a gap of 50 km. which had been made. More than once did the Russian Supreme Command let slip an opportunity of a mortal blow. The great crisis on the eastern front, lasting several months, reacted strongly on the relations between the armies of the Central Powers. The Austro-Hungarian troops had, from the very first Russian attacks, shown considerably less power of resistance than the German. The Austro-Hungarian armies fighting at Luck and Ocna had, within a few days, left a quarter of a million prisoners in the enemy's hands. Even in peace-time the conditions in the polyglot Dual Monarchy were less favourable by far than those in the German Empire for a display of military power, and the unexpectedly long duration of the war increased the difficulties enormously. It should also be remembered that in the first year of the war the Austro-Hungarian military forces had had a considerably larger drain on their men than the German. At the end of 1915 only a small remnant of the forces deployed at the beginning of the war was left at the front. The rest were dead, wounded or prisoners. In the quiet period before the Russian summer offensive of 1916 the training of the drafting reserve was certainly better organized than in the first year, when recruits had on occasion to be sent to the front after a month's training. But between the young, systematically trained peace-time forces, full of heroic self-sacrifice, with which the Austro-Hungarian forces engaged on the first campaign years, some of them physically and morally unsound to begin with and many of them far too old, there could be no comparison. This was particularly the case with a considerable proportion of the Slav and Rumanian forces, on whom the great national crisis could not act as a spur but rather as the reverse, as was not infrequently proved. Under these difficult conditions the lack of good regular officers was most keenly felt. The flower of these had been left on the battle-fields of 1914.

In consequence of the internal weakening of the Austro-Hungarian army in the east—which was not noticeable in the field—the 3rd Austro-Hungarian army, commanded by Gen. Mackensen, was ordered to its "hereditary enemy," Italy. A rule was made that on every point of the battle-front where the Russians were using great pressure German units should be flung in. In this way, from the beginning of July, the whole Austro-Hungarian section was interspersed with German troops. This system of "stay-boning," as it was sarcastically called, naturally brought with it a powerful increase of German influence in the combined army. It also happened that the Austrian leading provoked frequent criticism on the part of the German commanders. Immediately after the first Russian assault at Luck, for instance, the commander of the 1st Austro-Hungarian Army, Archduke Joseph Ferdinand, was relieved of his command on the explicit demand of the German General Staff. Added to this, between the new commander and his Austrian subordinate commanders intermediate posts were interposed and filled by German generals, who alone exercised direct power of command over the troops. As the number of German forces on the Austro-Hungarian front increased, the ambition of the Germans to get the principal commands into their own hands became more and more evident. Immediately after the beginning of the Russian offensive, the army commanded by the German Gen. Linsingen, which began on the Pripet, was extended to the boundary of Galicia. At the same time Falkenhayn proposed to entrust Field-Marshal Mackensen, who was in Bulgaria, with the supreme command of all the allied troops fighting S. of the Pripet. Conrad von Hützendorff was opposed to this arrangement, but offered to confer on Mackensen the command of a group of armies in East Galicia. This Falkenhayn declined.

In July Falkenhayn made the proposal to recall Field-Marshal Hindenburg from Kovno and appoint him supreme commander between the Pripet and the Dniester. To this plan Conrad agreed, though without seeing any particular meaning in it. As a matter of fact Falkenhayn's proposal was made more on personal than on practical grounds. The chief of the German General Staff had from the start few friends but many enemies. Since the failure of the attack on Verdun, Emperor William had begun to be besieged with complaints against the man who had his particular confidence. The Imperial Chancellor also urged that Falkenhayn should be replaced by Hindenburg, with a vigour quite unusual with him. The summer battle made the situation more acute. A depression fell over Germany, the army lost faith in the Supreme Command, and louder and louder became the clamour for Hindenburg.

Falkenhayn, though realizing that his relations with Hindenburg and Ludendorff had been somewhat strained for more than a year past, felt obliged to fall in with the general opinion. He therefore proposed—assuredly more or less against his inward conviction—that Hindenburg should receive the appointment alluded to, that of supreme commander from the Pripet to the
Dniester. This he followed up a few days later, under pressure from all sides, by offering to place the Field-Marshal in command of the whole eastern front from the Baltic Sea to the Carpathians. For some such urgent command there was urgent need on military grounds. Indeed the proposal had received a passing consideration in Nov. 1914, when the Archduke Frederick was to have held the command with Ludendorff as his chief-of-staff. But Conrad was opposed to this solution, arguing that the Russian assaults were not to be stopped by new commanders but by strong battalions, that the non-German peoples and troops of the Austro-Hungarian Monarchy would regard any too conspicuous manifestation of German influence as a burdensome tutelage, and finally that in the southern section of the eastern front, so many specifically Austrian interests were at stake—in particular with respect to the Carpathians—that this section ought not to be withdrawn from the immediate influence of the Austro-Hungarian Higher Command. But, however worthy of consideration Conrad's objections may have been, it is only human to suppose that personal grievances also played their part. The solution proposed by Falkenhayn was tantamount to making a clean sweep of the Austrian General Staff from the command of the war in the east. Yet, the leader of the Austro-Hungarian army was practically alone in his opinion. Even in those Viennese circles most jealously concerned, so far as Austria was concerned, never was there a pressing demand to have the question of the command straightened out on German lines, since Conrad's leadership no longer inspired full confidence. In principle the old Emperor, Francis Joseph, agreed also. Emperor William, for his part, proposed a compromise to his allies. Hindenburg was certainly to have supreme command from the Baltic Sea to Lemberg, by far the greater portion of the eastern front, but the southern portion on both sides of the Dniester and in the Carpathians was to be placed under the command of the Austrian heir-apparent, Archduke Charles Francis Joseph, who later became emperor. The Archduke was to be the direct successor of the Chief of Command of the XII. Army, and now, since this army had not come into being, was temporarily commanding a group of armies on both sides of the Dniester. To protect German interests the German Gen. von Seeckt, formerly Mackensen's chief-of-staff, would be attached to the Archduke. This solution was accepted by the Austrians and acted upon in the beginning of Aug. 1916. It was the prelude to the establishment of a Supreme War Command (Oberste Kriegsleitung) over all fronts.

The impulse to create a general supreme command of this nature, to apply to all parts of the Eastern Front, and at the same time to create a Central Staff in Germany was agreement. Germany was agreeable to the proposal, which also gained ground rapidly in Vienna's political circles, but here again it was Conrad who, in defiance of his superior commander, Archduke Frederick, sharply opposed the idea, even threatening to resign. Emperor Francis Joseph's personal intervention alone was able to overcome this opposition. On Sept. 16 1916 the agreement on the Oberste Kriegsleitung was signed in the German headquarters at Pless in Prussian Silesia. According to these arrangements, shortly after acknowledged as binding by the Bulgarian and the Imperial Ottoman Army Commands, the German Kaiser became responsible for the higher leading of operations in general without disturbing the relations between the allied sovereigns and their fighting forces. The Kaiser was assisted by the chief of the General Staff of the German armies in the field, who before every important decision was to consult the chiefs of the allied General Staffs and, as far as possible, bring them to an agreement. This done, the German chief of the General Staff would issue orders, binding on all, in the name of the Oberste Kriegsleitung. In order to meet Conrad's particular misgiving the German Kaiser bound himself, in a special supplementary note which was kept secret from Sofia and Constantinople, that the integrity of Austria-Hungary should be as carefully protected as that of Germany.

The institution of the Oberste Kriegsleitung was undoubtedly an advance on the method of dealing with each case as it arose, which had been practised since the beginning of the war. But the undertaking, set on foot with such difficulty, still lacked one thing to complete it—the creation of a common political and domestic policy. This was never achieved. On the contrary, the forces involved in these matters fell further and further apart the longer the war lasted, particularly after the change of Government in Austria-Hungary. To make matters worse, when the young Emperor Charles took over the Austro-Hungarian command, alterations were made in the most important part of the agreement in consideration of his position as sovereign, so that in the end the old methods employed in the first two years of the war came back into use.

The New German Supreme War Command (Oberste Kriegsleitung).—The agreement on the Supreme War Command had been signed on the part of the Germans by Field-Marshal von Hindenburg as new Chief of the General Staff. On Aug. 29 1916 Falkenhayn had left the Supreme Command. It had long been only a question of when the Kaiser would be forced to yield to the storm raised by Falkenhayn's criticisms; the immediate cause of his dismissal was Rumania's declaration of war on Austria-Hungary on Aug. 27 1916. Up to the last hour, in spite of the well-founded warnings of Austria-Hungary, Falkenhayn had been unable to believe that Rumania was on the point of coming in, and had perpetually reassured the Kaiser to that effect. When the event happened the Kaiser was thunderstruck, and Falkenhayn's fall followed. The German nation, and its allies greeted the new men, Hindenburg and Ludendorff, with the utmost confidence.

The first task to fall upon the new command was the organization of the Rumanian campaign (see next section). Meanwhile the defensive battle against Russia had to be carried on. This constantly flamed up again along the whole front from Luck to the Carpathians till the end of Oct., although the Russian attacks had fallen off in strength and determination, and no more successes worth mentioning were gained by them. The relief offensive, too, which the Russians undertook between Nov. 28 and Dec. 13 1916 in the wooded Carpathians against Koves' and Arz's armies, to relieve Rumania, hard pressed in Wallachia, was without results and could save neither Bucharest nor Focsani. Neither did success attend the Russian surprise attack on Jan. 23 1917 on the Aa at Riga, great as were the prospects of success on the first day. The German position was indeed rushed, but the defenders' reserves, brought up in haste, restored the situation.

The enormous drain on Russia's forces in the summer, and the difficulties of her interior political situation, had sapped the rear guard of her army. The armies of the Central Powers and their allies had come through their difficult career of 1915 and the beginning of 1916, so now they experienced a great relief in the east.

The Russian Revolution.—The Austro-Hungarian chief of the General Staff, Conrad, who since Nov. 11 1916 had been a field-marshal, was once more proposing to take the opportunity of attacking Italy. The attack was to begin in the spring of 1917 and was to be carried out by an equal division of Austro-Hungarian and German forces. But the new German Oberste Kriegsleitung in the middle of Jan. rejected the plan for the time being. Then, on the 13th, the submarine war, begun in Feb. 1917, to bring their enemy to his knees, Gen. von der Goltz, who had succeeded Conrad as chief of the Austro-Hungarian General Staff in March 1917, received the decision of German Headquarters with unqualified approval. The Russian Revolution, which broke out in the middle of March, was extraordinarily favourable to the military situation of the Central Powers. It could not, of course, be seen as yet whether Russia's armies would permanently withdraw from the list of enemies, which now included America. But for the moment the clash was so enormous that it must be months before the Russian High Command could consider offensive operations. The Central Powers now left nothing untried that could hasten the process of disorganization among their enemies. This purpose was above all to be served by an extensive peace propaganda, which was to be carried to the Russian trenches—though Ludendorff's consent
to this step had not been easy to obtain. Meanwhile the war fell practically fast asleep, as was natural. On April 4, 1917, the troops under Prince Leopold of Bavaria, who had taken over the eastern front between Riga and the Carpathians from Hindenburg in the autumn of the previous year, captured the small Russian bridgehead, Stochod, at Tobol in Polyezic, by a coup de main, on which occasion the Russians gave themselves up as prisoners in swarms. On the political circles of the Imperial Powers this action produced a most disturbing impression, and the troops were now ordered to suspend all hostilities against the Russians unless they should provoke them.

In preparing the line to be taken with regard to propaganda in the trenches, the Austro-Hungarian Government would have liked to impose other than the Petrograd catch-words, "Peace without annexation or indemnity" and "the right of nations to self-determination." But the dominating influence of the German Supreme War Command, which was not prepared to give up its Balkan aspirations in a hurry, prevented this. Nevertheless it was hoped, especially when the Workmen’s and Soldiers’ Councils became a stronger political factor in Petrograd in the beginning of May, that a way might be found to force Kerensky’s Government to agree to an armistice and consent to open peace negotiations. This hope was to prove deceptive. When at last an envoy from Berlin arrived in Petrograd promising peace beyond the Russian trenches to Gen. Dragomirov, commander of one of the armies on the north front, he was met with an absolutely unequivocal refusal. Meanwhile, at numerous points of the front, a local truce had been declared. But in June a remarkable change was noticeable on the Russian side. Kerensky, relying on Gen. Brussilov and numerous Entente military missions, succeeded gradually in converting a considerable portion of the army to the idea of carrying on with the war to make the world "safe for democracy," and in restoring their fighting spirit.

**Battle in Galicia and the Bukovina, Summer of 1917.**—By the end of July the Army Commands of the Central Empire had reason enough to count upon a revival of the war in the east. Indeed, the Russian Supreme Command, apart from the concentration of troops at Riga, Dvinsk and Kriewe 1 in the Courland-Lithuanian section, had assembled two powerful attack groups in East Galicia. The one, a division strong, stood N.E. of Brzezany opposite the Austro-Hungarian II. Army (Böhme-Ermolli); the other, 15 inf. and 2 cavi. divs. strong, was piling itself up adjacent to the first and opposite the German Southern Army under Gen. von Bothmer. 2 These powerful attack-masses were charged to overthow the enemy and to take Lemberg.

The Army Higher Commands of the Central Powers did not look on idly at the Russian preparations for attack. By June 27 the German Emperor, in concert with the Austro-Hungarian General Staff and Prince Leopold of Bavaria, was ready with the order to counter-attack in case of a Russian attack in East Galicia, and to throw back the enemy beyond the frontier of the Austrian Empire. Besides the allied troops already on the spot, 5 divs. could be brought up from the west and 3 to 4 divs. from that section of the eastern front which was not threatened.

**Battle of Brzezany, July 1-6.**—The anticipated Russian attack was launched on July 1, 1917 on the Volkswagen line of the Western Powers had supplied their Russian allies with artillery munitions and war supplies of all sorts in abundance. The battle of Brzezany lasted six days with only slight interruption. The Russians made only slight gains in fighting the German Southern Army E. and S. of Brzezany, and these were for the most part wrested from them again. N.E. of Brzezany, in the village of Konuichy, they were more successful. Here they had brought into the fight a Czechoslovak brigade against Austrian battalions of Slavonic speech, large sections of which surrendered, with the result that the Austro-Hungarian line was driven back some 4 or 5 km. on a front of 10 km. On the evening of the second day of the battle however, the Russian blow was counteracted by the German troops. Since, to the immediate N. of the battle-field and N.W. of Zborów, the first echelons of the German divs. rolling up for the counter-attack had arrived, and the Russian attack had now lost its force, Prince Leopold of Bavaria now supposed the danger to be averted.

Far more unpleasant was the effect upon the command of the heavy set-back to the Austro-Hungarian III. Army under Gen. von Terszynszky at Stanislaw only a few days later. Here Gen. Kornilov, the ambitious commander of the Russian VIII. Army, had advanced to the attack at 7 a.m. with an attack-group thrown together anyhow. On the following day he had ordered his forces to withdraw, from the enemy’s position—the Jutrena Gora height dominating Stanislaw. Terszynszky hoped at first to have to withdraw the north wing only, but the Russians pushed the Austro-Hungarian regiments back so vigorously that by July 17 the whole of the III. Army had to be withdrawn behind the Lomnica. The town of Styrj, and the East Galician petroleum district, Drohobycz-Borysław, in the possession of which the continuance of the submarine war very largely depended, were in the utmost danger, and Prince Leopold of Bavaria was forced to let 3 inf. and 1 cav. divs. of the units rolling up for the counter-attack on Zborów, the III. Army.

When the Russians again attacked at Kalisz and made progress there, Prince Leopold and his chief of the General Staff, Col. Hoffmann, were confronted with the difficulty of deciding whether in the given case the counter-blow at Zborów, already being prepared, should be given up, and help sent in haste to the sore-pressed Gen. von Terszynszky. The Prince resolved to adhere to the original plan. He proved to be right. The attacks of Kornilov’s troops lost their sting as rapidly as those delivered at Brzezany by the Russian VII. Army. Aided by German reinforcements, Gen. Kritiek, who relieved Terszynszky in the command of the III. Army, was able by the 16th to prove his forces’ newly established powers of resistance in counter-attacks at Kalisz.

Meanwhile, between the upper Sereth and the railway line between Lemberg and Tarnopol, immediately W. of Zborów, 8 inf. divs. (including the I. and II. Guard Divs.) and one combined cavalry div. were deployed for the counter-blow along 25 km. of front behind the divisions of position. The German Gen. von Eben was in command on the battle-field. The intention was on the first day to make a hole in an easterly direction in the south wing of the Russian VIII. Army which stood opposite, and then to wheel to the S.E. and grip the massed remnants of the VII. Army, standing on either side of Brzezany, in the N. flank and in rear.

**The Battle of Zborów.**—This idea underlying the battle of Zborów (July 19-26, 1917) was carried out according to plan. Early on the 19th the German and Austro-Hungarian forces drove the Russians from the Zlota Gora height, N. of Zborów, under the eyes of Prince Leopold of Bavaria. Simultaneously the German Guard, reinforced by a line division, broke through the Russian front immediately S. of the Sereth. Only in places did the Russians offer resistance. Their retreat frequently degenerated into precipitate flight. While the Guard Div. in the following days drove the blow on Tarnopol, the III. Army pushed forward from the 2nd line pressed after in a S.E. direction. The Russian masses at Brzezany were soon swept into the general retreat. By the 22nd the German Southern Army was able to take up the pursuit, also from the N. wing. On the 23rd the III. Army followed S. of the Dniester, and was able on the next day, after several shifts, to push out to beyond its old positions at Stanislaw. On the 25th the German Guard took Tarnopol in presence of the German Emperor, and on the 26th the heights to the E. of it, thus assuring an adequate protection to the S.E. blow by the other allied forces. The S. wing of the II. Army was already beyond Trembowla, and the Southern Army beyond Buczacz. They had rapidly broken the Russian resistance.

A few days after the defeat of Zborów the Russian command passed out of Brussilov’s hands into those of Kornilov. The
Russian General Staff reports of those days give a tragic picture of the condition of the VII. Army and the S. wing of the VIII. Army at that time. It was clearly out of the question to maintain a hold on East Galician soil in this area. The decision was therefore made at Mohiliev to withdraw the VII. Army and those parts of the VIII. Army pursued by the enemy behind the river Zhishen on the frontier.

**Capture of Czernowitz by the Austrians.**—More cheering were the reports received by the Russian Supreme Command from the VIII. Army now commanded by Cheremissov, which was retiring S. of the Dniester. This army could, with some hope of success, be charged to hold Czernowitz and as much as possible of the Bukovina. Further relief was expected from the results of the Russian-Rumanian attack in the valley of the upper Susita in Rumania, which had commenced on July 23 and was accompanied by demonstrations along the whole Transylvanian east front. This attack had really succeeded by July 27 in forcing back the numerically very weak defenders to a not inconsiderable distance. But the fate of the Bukovina was nevertheless sealed. Between the Dniester and the Carpathians Cheremissov’s troops several times put up a good resistance; in fact, the Austro-Hungarian III. and VII. Armies (the latter under Gen. von Köves) had even to deliver counter-blows. But on the morning of Aug. 3 1917 the Russians, threatened on the N. and the S., had to surrender Czernowitz, and soon to retire from the Bukovina into the frontier area. The Austro-Hungarian III. Army pursued between the Pruth and the Dniester and the VII. S. of the Bukovina.

East Galicia had also been swept clean of the Russians, apart from the area N.E. of Tarnopol which had remained untouched by the offensive. Advanced detachments of the German Southern Army had set foot on Russian soil on the middle and lower Zbrucz. But here the soldierly characteristics of the Russian people, which had survived even the unnerving influence of the revolution, came to the fore again. The Russians not only cleared the E. bank of the Zbrucz, but roused themselves in an amazing manner to renewed resistance E. of Czernowitz and in the southern part of the Bukovina. It was undoubtedly to their advantage to cut the army in its rear, but the enemy had come dangerously far away from his railways. The Austro-Hungarian III. Army at Czernowitz for instance was 120 km. removed from its main detaining station lying W. of Stanislau. This was particularly serious in view of the meagre means of transport supplied to the Austro-Hungarian troops. Had the armies been crossing a less fertile area the pace of the offensive must soon have slowed down very considerably. As it was the troops could subsist largely on the resources of the country and the rich booty left behind by the Russians. But now, on the frontiers of East Galicia and the Bukovina, the advance of the Imperial forces was arrested.

**The Battle of Marasesti (Marasheșt).**—For some weeks past the Allied Higher Commands had been considering the idea of combining with the East Galicia offensive an attack on the Rumanians in Moldavia, which should drive them behind the Pruth, thus gaining a particularly useful defence section in which troops could be economized. Accordingly, on Aug. 6 1917 Mackensen advanced to the offensive against the Rumanians N. of Focshani. The battle of Marasesti ended unfortunately for the forces of the Central Powers. In view of this, and of the difficulty of obtaining fresh drafts in the Bukovina, the Central Powers abandoned the idea of occupying Moldavia for the present, and dropped it completely when, at the end of Aug. and the beginning of Sept., the Isonzo battle led to the combined Oct. offensive against Italy. Ludendorff lays stress, in his memoirs, on his own reluctance to give up the Romanian campaign.

In the Bukovina and on the Transylvanian-Rumanian front minor operations lasted until the middle of September. Local attacks and counter-assaults were distributed on both sides. Then gradually the fighting died down.

**German Capture of Riga.**—Meanwhile, in the extreme N., the Germans had won a fresh victory over the Russians. During the second half of Aug. they had been quietly preparing to capture Riga. By order of Gen. von Hutier, supreme commander of the German VIII. Army, 6 divs. were placed in readiness for crossing the Dvina opposite Uxküll, to the S.E. of Riga. Other forces were to follow. Altogether there were 14 divs. available for the undertaking, including the Guard and other units brought from East Galicia.

The crossing at Uxküll was carried out most punctually on Sept. 27. By now 3 bridges had been built. The German XII. Army (Parški), 20 inf. divs. strong, made only a slight resistance, and by the 2nd had evacuated all the positions S. of Riga. On the following day the 2nd Guard Div. and the 1st Res. Div. were able to enter the ancient Baltic trading-centre, the one from the east, the other from the west. The Russians now evacuated the whole N. bank of the Dvina up to beyond Friedrichstadt. On the 4th the German infantry reached Hinzenberg railway station, 40 km. N.E. of Riga. The permanent position was now formed along a line drawn from Uxküll to Hinzenberg and thence westwards to the sea. Only the German cavalry now pursued the enemy, who first came to a stand 20 to 40 km. E. and N. of the German line.

The occupation of Riga needed to be supplemented for the Germans by the capture of the Baltic islands, Ösel, Moon and Dagö, and this was duly achieved in the middle of October. For the first time in the war, on the side of the Central Powers, the navy was present in some strength to assist in the operations of the land army. The landing corps consisted of the German 42nd Inf. Div. and the Cycle Bde., and was commanded by Gen. von Kuchen. The spot selected for the landing was Tagga Bay on the N.W. corner of Ösel Island. While Adml. Erhard Schmidt’s German squadron penetrated through the Domesnäs straits, after silencing the coast batteries, the torpedo boats went round Ösel in a northerly direction, in order to bring their guns to bear on the mole connecting Ösel with Moon and to cut off the retreat of the Russian troops on Ösel. From the N. they were to press on into the Moon sub. On Oct. 13 the German troops landed in Tagga Bay. The enemy, about one div. strong, tried to effect their escape, some southwards to the Sworbe Peninsula, others over the mole to the island of Moon. By evening on Oct. 16 the whole of Ösel was in possession of Gen. Kuchen. Ten thousand Russians were taken prisoners, among them one divisional and three brigade staffs. On the 18th Lt.-Gen. von Estoffi, commander of the mole, occupied the island of Moon, and on the 21st Dagö had also been taken by the Germans. In the waters of Moon it came to fighting engagements between German and Russian ships, in the course of which the Russian battleship “Slava” was set on fire.

**The Armistice.**—On Nov. 7 the Bolshevist Revolution broke out in Russia. On Nov. 9 the congress of the “Workmen’s and Soldiers’ Council,” meeting at Petrograd, issued its proclamation of peace “to all.” In vain did Kerensky and Kornilov attempt to give matters a different turn. An army corps sent by them against Petrograd on Nov. 12 was defeated at Tsarskoye Selo. On the 20th the Council of People’s Commissaries gave instructions to the new Russian Supreme Commander, Dukhonin, to offer an armistice to all the belligerents. As Dukhonin hesitated to carry out the order he was replaced by Ensign Krylenko. On Nov. 28 the troops of the Imperial forces on the eastern front intercepted a wireless message in which Lenin and Trotsky invited the earliest possible preliminary arrangements for the armistice and peace negotiations. On Dec. 2 the armistice negotiations between the Imperial forces and Russia were begun at Brest-Litovsk, at Prince Leopold of Bavaria’s headquarters. The only questions which caused serious difficulty were that of the Baltic islands, which the Russians wished the Germans to evacuate at least in part, and that of the transference of German troops to the west. On the first point the Germans refused to give way; on the second they compromised. After a formal 10 days’ truce had been agreed to on Dec. 5 and the armistice had set in on the Rumanian front on the roth, the cessation of hostilities for one month on all the Russian fronts against the Central Powers was declared on Dec. 15. On Dec. 22 the peace negotiations of Brest-Litovsk began. (E. G.-H.)
Operations in Transylvania and Rumania, 1916-7.—After the unexpectedly great results of the Russian summer offensive under Brussilov in 1916 the conviction gained ground in Rumania that the moment had now come for her intervention on the side of the Entente Powers. In accordance with the policy pursued since the Balkan Wars of 1912-3 of harvesting from international quarrels the greatest practicable advantage with the least possible sacrifice, Rumania now hoped to be able to realize the desire, cherished by the entire nation, for the enlargement of the kingdom by the incorporation of the districts of Austria-Hungary inhabited by her nationals.

The Austro-Hungarian Supreme Command had foreseen most clearly the intervention of Rumania, while at German Headquarters the danger did not appear so imminent; and the Hungarian Government—fearing unrest among their own population and in the hope of not destroying the last chances of maintaining peace with Rumania—avoided taking in the threatened frontier districts the measures necessary in the event of war breaking out. Thus it happened that Transylvania was quite inadequately defended from the military point of view against the Rumanian attack, and the enemy was hardly prepared at all as a theatre of war. On account of the pressure of troops for all effective units on the Russian and Italian fronts, the Austro-Hungarian Supreme Command could transfer to Transylvania in the beginning of Aug., only the seriously reduced 61st Div., the 51st Honved Div., and the 82nd Inf. Regt., troops for which an urgently needed rest had been intended. The 11th Honved Cav. Div., disentrained in Transylvania, was at once constituted the southern wing of the VII. Army. The removal of the war-worn 30th Honved Div. began in the last days of Aug. 1916. In addition there were in Transylvania, at the end of Aug., 8 newly formed batts., 2 Landsturm batts., 10 communication batts., 3 mining batts., (armed coal-miners from Petrozsény), 9 “alarm” batts. (march batts. not yet fully trained), about 5,000 frontier police, 3 Landsturm squadrons and 9 field batteries, which were formed into newly created larger units whose formation was, with many changes, only completed in Oct. 1916. All the troops above mentioned, in the areas between the Hungarian frontier of the Bukovina and the Danube at Orsova, were from Aug. 13 onwards under the newly created Austro-Hungarian I. Army headquarters, under Gen. Arz von Strassenburg, at Klausenburg (Kolozsvár).

Preparations were also made for the thorough destruction in the passes, of the roads and railways leading to Rumania. At the end of July a convention was concluded at Pless between the German, Austro-Hungarian and Bulgarian Army Commands for common action in case of hostile Rumanian intervention, and to this Turkey shortly afterwards became a party. The plan of campaign was laid down in its main outlines and the contingents to be provided by the separate States agreed upon. The Germans allotted 5 to 6 inf. and 1 to 2 cav. divs., which, however, the German Supreme Command in expectation of coming events did not yet wish to place in reserve in Transylvania, as they would certainly be missed at critical points on the other battle- fronts. They therefore timed themselves in the time being to sending German construction troops to strengthen the existing railway lines in Transylvania, S.E. Hungary and northern Rumania for the advance of larger bodies of troops. The German detachment under Kaufmann, already placed in northern Bulgaria with a view to the creation of a German-Bulgar-Turkish army on the Dobruja frontier, was reinforced, and had heavy artillery, mine-throwers and flying formations.

Bulgaria placed on the Dobruja frontier the III. Army, commanded by Gen. von Toshev, consisting of the 1st, 4th and 13th of the 6th Inf. Divs., 1 cav. div., the garrison of Varna, and a part of the Kaufmann detachment, while the Danube was guarded from Tekija (opposite Orsova) to the mouth of the Vid by the Bulgarian 12th Inf. Div., and from there eastwards as far as Ruschuk by the German Kaufmann detachment. At Sistova there was a heavy Austro-Hungarian bridging train with its complement of men, some heavy batteries, and the Austro-Hungarian Danube flotilla. The supreme command over all the troops in Bulgaria for operations against Rumania was exercised by Mackensen, with headquarters at Tirnovo.

It was considered most probable that Rumania, when she struck, would begin by invading Transylvania, in order to gain possession of the country and to use it as a base from which completely to shatter the Carpathian front, which the Austro-Hungarians, as it was, were only maintaining with difficulty, while comparatively weak forces only would be employed against Bulgaria. On this assumption it was proposed to surprise and overrun the Rumanian positions in the Dobruja with the German-Bulgarian-Turkish forces, in order to penetrate to the narrowest part of the district between the Danube and the Black Sea. The strongest possible forces would then be collected, and held ready at Sistova, where the heavy Danube bridging train was already placed, for a forward push in the direction of Bucharest. In Transylvania the Austro-Hungarian forces were to hold up the Rumanians in the mountains on the frontier if possible, but at all events to establish the positions on the rivers Maros and the Little Kukullo (Kleine Koken), until the attacking troops being concentrated meanwhile could be matched up. These, and Mackensen’s troops to be held ready at Sistova, would then proceed to the reconquest of Transylvania and the overthrow of Rumania. In this case the unusual happened, and the actual operations in their main lines were successfully executed as had been proposed in the discussion of war plans at Pless.

Rumania had pushed forward her mobilization, and by continuously reinforcing the troops on the Transylvanian border had nearly completely their concentration that operations could begin immediately on the declaration of war, which was handed in at 9 p.m. on Aug. 27. It was intended first to conquer Transylvania. For this purpose strong forces were to push forward from the E. over the mountains on the frontier, and advance westwards through the valleys of the Kukullo, the N. Kukullo and the Maros. The calculations included a simultaneous push forward of the Russian front adjoining on the N., whose advance would be greatly facilitated by the offensive of the Rumanian army S. of the chain of the Carpathians stretching from Hungary into the Bukovina. The forces which penetrated the Transylvanian southern front were then to advance by means of positions in the nature of bridgeheads, and to join the forces of the main offensive from the E. as these advanced.

On the Rumanian side expectation of an easy victory prevailed. In conformity with the plan of operations there was a concentric advance. The I. Army (Gen. Culcer), with about 45 inf. divs. and 3 cav. bdes., and a stronger group on the E., advanced through the Roter Tschämp pass on Hermannstadt (Nagy Szeben), and with a weak group on the W. over the Vulk and Szurdak passes in the line Petrozsény–Hátzeg (Hateg). The Orsova group (about one rohensdorf div.), on the Danube the left bank and the rear communications of the portions of the I. Army in Transylvania, attacked any advance from the Banat. The II. Army (Gen. Grániceanu), with about 4 divs. and 4 cav. bdes., operated from the Törzberg to the Oltz pass through all the defiles leading into the Kronstadt (Brasov) basin and the Hâromszék. The IV., or Northern Army (Gen. Presan), with about 4 divs. and 1 cav. bde., operated N. of the II. Army and in connexion with the Russian Carpathian front through the Úz, Gyîmes, Békás and Tölgyes passes into the basins of the Cîsk and the Gyergyő. The III. Army (Gen. Averscuk), with about 4 inf. divs. and a cav. bde., faced Bulgaria in the Dobruja front in strong well-situated positions, and was to maintain the defensive. On the stretch of the Danube from Turn Severin to the mouth of the Alt stood protecting troops, one div. strong. In the district S. of Bucharest the Rumanians assembled a group of several res. divs. and other new formations for disposition as reserves.

The Rumanian Invasion.—The Rumanians crossed the frontier on the night of Aug. 27-28 over all the passes into
Transylvania, driving back the weak Austro-Hungarian defence troops in numerous small engagements, not without suffering appreciable losses at many points. The Rumanian advance was substantially delayed by the destruction of roads and bridges effected by the Austro-Hungarian frontier troops, and especially by the bad roads of the mountain country.

By Sept. 3 the Rumanian Orsova group reached the lower course of the Cerna, and the western group of the I. Army occupied the important coal area between Urlîkány and Petroșeni and had driven back the ineffective Landstorm and miners’ battalions of the 144th Inf. Bde. over the saddle of Merisor. The eastern section of the I. Army, which had penetrated by the Roter Turm Pass, occupied positions S. of Hermannstadt, without attempting to take the town though it was garrisoned only by a weak Landstorm detachment. They were plainly apprehensive that by occupying Hermannstadt they would have to extend their bridgehead-like formation beyond capacity.

The II. Rumanian Army deployed cautiously in Burgenland and in the Háromszék, allowing their columns to close up, and receiving fresh reenforcements. The IV. Army forced their way, in continuous fighting touch with the 61st Inf. Div., through the narrow mountain valleys, and on Sept. 3 their advanced troops reached the eastern edges of the basins of the Gyergyó and the Cisk. Meanwhile the first troops sent by the Central Powers were rolling up towards Transylvania. Gen. von Arz was instructed not to use the forces assembling on both army wings to strengthen the covering troops with them as they arrived, but first to concentrate them and hold them ready for wider action. In view of the expected continuation of the Rumanian advance he directed the 30th Honved Inf. Div. and what eventually, after many changes, became the 89th Inf. Div., to the district half-way between Szász Régén (Reghina-Sas) and Klausenburg (Kolozsvár); the 187th Inf. Div. and 3 German cav. regts. of the 3rd Cav. Div. were to be disentrenched at Matiss Ilye; the 1st Austro-Hungarian Cav. Div. S. of this place between Hâțaszig (Hateg) and Karansebes; the 1st Royal Hungarian Landstorm Hussar Bde. at Tóvás. The first of the two German General Commands to arrive, Lt.-Gen. von Morgen, took over the command of the 61st and 71st Inf. Divs., the 1st Landstorm Hussar Bde., the newly arrived 30th Honved Inf. Div. and the 89th Inf. Div., while under Lt.-Gen. von Staab were placed the 51st Honved Inf. Div., the 187th Inf. Div., the 1st Cav. Div. and the 3rd Cav. Div., together with the covering troops at Hermannstadt, Hâțaszig and Mehadia. The very slow progress of the Rumanians made it possible for the incoming divs. of the Austro-Hungarian army to move forward their disentrenchment stations. Accordingly the following disentrenchment arrangements were made: the 39th Honved Inf. Div. at Szász Régén, the 89th Inf. Div. at Marosújvár, the 1st Cav. Div. at Takácsh; only 1100 men were to offer resistance to the Rumanians (the Schmettow Cav. Corps) at Mediasch and Elisabethstadt, the 187th Inf. Div. at Piski with a regt. intended for Hermannstadt at Alvine.

Since the Rumanian group pushing northwards over Petroșeni might endanger the transport of further reenforcements on the Maros Valley railway, the bulk of the 187th Inf. Div. was directed against Merisor, in order, in conjunction with the Austro-Hungarian 144th Inf. Bde., and strengthened by the 3 first arriving German Jäger batts. of the Alpine Corps, to throw back the Rumanian Mountain Corps over the frontier; and this task was accomplished between Sept. 14 and 22.

The Schmettow Cav. Corps, linking up on the E. with the 51st Honved Inf. Div. standing directly N. of Hermannstadt, was posted on the heights N. of the Alt as far as Fogaras (Făgăraș). The Alpine Corps, which was only one div. strong but consisted of excellent troops, equipped for mountain warfare, was disentrained with the main body at Mühlbach. The German 76th Res. Div., which was on its way, was to be assembled at Karlsburg (Gyula Fehérvár). The Austro-Hungarian 143rd Inf. Bde., which had been stationed at Hermannstadt, was moved behind the N. wing of the I. Army, and thence formed into the 72nd Inf. Div. These measures, taken by the I. Army Command, on the one hand averted the menace to the Maros Valley railway at Piski, and on the other established the operative basis on which the battle of Hermannstadt was afterwards fought.

Bulgarian Offensive in the Dobruja.—Meanwhile events of far-reaching importance took place in the Dobruja. On Sept. 1 the III. Bulgarian Army crossed the Rumanian-Bulgarian frontier. The aim of the operation was the conquest of the Dobruja. After the capture of the bridge-heads of Turcucia and Silistra the advance was to be made by the Cernavoda—Constanța railway to the narrowest part of the territory lying between the Danube and the Black Sea. The fortress of Turcucia consisted of a girdle of 15 forts on the S. bank of the Danube, which were connected by strongly built field positions. While very great care had been bestowed on the technical development of the place during the 3 years of preparation, the armament consisting of only about 100 guns, including the field artillery, was inadequate. Artillery fire against Turcucia began on Sept. 3; in the comprehensive attacks following on Sept. 4-5 and carried out by the 4th and sections of the 1st Bulgarian Inf. Divs. and the German detachment under Hammerstein, the bridge-head was stormed. The capture of this place by a coup de main was an admirable feat of arms. Only a very small portion of the garrison of the place, the 15th and 17th Rumanian Inf. Divs., which suffered heavy and bloody losses, escaped. Many soldiers were drowned in trying to swim the Danube, across which there remained no bridge. Twenty-one thousand men and 400 officers, including 3 brigade commanders, together with the whole armament, were captured.

While the remainder of the Bulgarian 1st Inf. Div. pushed forward by Akkarynyar and the 1st Cav. Div. by Kurtun, the 2nd Bde. of the 6th Inf. Div. and the garrison of Varna attacked the Rumanian 10th Div. on the plateau N. of Dobric (Hagi-Oglu) on Sept. 4 and threw them back northwards.

In contrast to Turcucia the bridge-head of Silistra was in a state of unpreparedness. It fell on Sept. 9 into the hands of the cavalry of the 1st Div. after a short bombardment directed against the Rumanian cavalry.

While the Bulgarian III. Army was pressing forward successfully on the whole front, the retreating Rumanians were reinforced by the Russian Expeditionary Corps under Lt.-Gen. Zajanczewski, which consisted of the XLVII Corps with 3, and later 4, inf. divs., among them the 1st Serbian Div. (formed from Austro-Hungarian deserters) and the VI. Cav. Corps. The Bulgarian III. Army put their main weight in the advance in the space between the Danube and the Dobrich-Medziđie (Hagi-Oglu-Megilia) line, while E. of the railway on the right wing only sections of the 1st Cav. Div. drawn from the centre of the army front operated.

On Sept. 15 the Rumanian-Russian fighting forces, which had been reinforced by the troops on the line Lake Márkeans–Teke Seres–Karajli–Kara Omer–Mangalia, were attacked by the Bulgars and compelled to retreat along the whole line. The III. Rumanian Army, reinforced by hurriedly-brought-up Russian and Rumanian units, prepared to fight again on the position Rasova–Copadin–Toprai Sari–Urtukio, which immediately protected the Cernavoda—Constanța railway and had been partially prepared in time of peace. The attacks executed by the Bulgarians on Sept. 19-20 did not penetrate the line this time. Instead, the III. Bulgarian Army Command were compelled to withdraw their troops some kilometres, to wait for the bringing up of munitions and the arrival of sections of the Bulgarian 17th Div. and the VI. Turkish Corps (25th and 15th Divs.). But the counter-attacks undertaken by the Rumanian eastern wing on Sept. 22 were repulsed by the recently arrived 25th Turkish Div., and the Bulgarian-Turkish front was again established on the line N. of Amuzacia.

In the Dobruja generally operations for the time being came to a standstill.

The Liberation of Transylvania.—In Transylvania the IV. Rumanian Army advanced from the basins of the Gyergyó and the Cisk through the Maros valley, then over the Gorgény and Hargita mountains, and continuously pressed back the 61st
Inf. Div., subsequently reinforced by the 1st Landsturm Cav. Bde. It was feared that it would all too quickly reach the inner region of Transylvania, with its excellent communications. In that case it would threaten the rear of the 71st Inf. Div. which occupied positions on the W. bank of the Alt (Oltu) between Fogaras and Reps, and farther N.E. to Homorod and Okland, at the weak angle where the front of the I. Army from a direction W. to E. bent sharply from S. to N. Generally, too, it would deprive the covering troops of the possibility of protecting according to plan the picked attacking troops coming up to the front. The commander of the east front, Lt.-Gen. von Morgan, therefore, planned to make a surprise attack on the Rumanian IV. Army on its emergence from the Görgény and Hargita mountains, using for the purpose the concentrated strength of newly arrived units. He proposed to attack either from the area N. of Szász Régen (Keghina-Sas) southwards or from the upper course of the Great and Little Kukilö valley in a N. E. direction, and by pressing on the Rumanian communications to prepare an annihilating defeat for them. This plan, however, was not approved in higher quarters; it was determined merely to strengthen the E. front by hurrying up the Austro-Hungarian 72nd Inf. Div., and a more active conduct of the defence was recommended. Both Supreme Army Commands adhered to the original plan of concentration and to the idea of striking first at the inactive enemy S. of Hermannstadt.

Before daybreak on Sept. 23 the Rumanian II. Army crossed the Alt between Fogaras and Reps in several columns, for the most part with the help of bridges or ferries transported, and advanced farther N. from Borăț, through Homorod–Okland–Drausa towards Katzendorf. In order to make a mobile defence possible the 71st Inf. Div. had left only weak covering troops (about 3,000 rifles) on the 60-km. front, placing the main force in readiness in the district Petek-Mehburg. The weak defence naturally had to give ground before the far superior weight of the Rumanian attacking columns. But in the afternoon the main force of the div. made a surprise attack, advancing southwards through Filos and struck the 6th Inf. Div., marching as the most northern column of the II. Army, in flank and rear. The surprise and confusion of the Rumanians were so great that the II. Army, which had only just crossed the Alt, ceased to advance, and remained inactive for a week.

The Rumanian IV. Army, on the other hand, continued to advance steadily, thereby compelling the command of the I. Army to support the Landsturm Cav. Bde. by 4 newly formed Bosno-Hercegovinian inf. batts., which really belonged to the unit of the 71st Inf. Div. In addition the 39th Honved Inf. Div., N.E. of Maros Vásárhely, was pushed up to the front; the 80th Inf. Div. was advanced to Maros Vásárhely, and an inf. bde. of the 37th Honved Inf. Div., coming up without armament, was placed in conjunction with the 1. W. of Szász Régen. The newly arrived Austro-Hungarian VI. Corps Command took over the command of the N. wing (72nd Inf. Div., half the 61st Inf. Div. and half the 37th Honved Inf. Div.), while the I. Res. Corps Command retained command of the Landsturm Hussar Bde., the 39th Honved Inf. Div., the 71st Inf. Div., supported by the 10th Mountain Bde. of the 61st Inf. Div., and the 80th Inf. Div.

At the end of Sept. the IV. Rumanian Army in the N., with the reinforced 14th Div., had reached Déva in the Maros valley and Kauza in the Görgény valley, and with sections of the 8th Div., was already pressing at Khebd on the Kukilö position. With the reinforced 7th Div. the west of Székely-Keresztur was reached, where the 19th Mountain Bde., already much weakened, could only defend itself with difficulty against the overwhelming pressure, while the 71st Inf. Div. on their left wing had definitely to give way.

On the evening of Sept. 17 Gen. Erich von Falkenhayn, with the staff of the newly formed German IX. Army, arrived at Déva, and took over the command of Gen. von Staab's troops, and of all the reinforcements coming into this district. His command was in conjunction with the I. W. of Szász Régen. The enemy out of Transylvania, and for this purpose, while masking the Vulkan and Szurduk passes, to surround the enemy posted at Hermannstadt, with a double ring, and beat him. Gen. von Falkenhayn first ordered Lt.-Gen. Sunkel, commanding the 187th Inf. Div. in the neighbourhood of Petroşeni, who was about to push the Rumanians back to the frontier passes, after reaching the time to send all the troops he could spare from his div. and the Alpine Corps towards Hermannstadt; he ordered the assembly of the 187th Inf. Div. at Reussmarkt, of the Alpine Corps at Sinna, and the disentainment of the 76th Res. Div. at Markt-Schelken. Finding by a reconnaissance in the direction of the Roter Turm Pass that the road was practicable for mountain troops without wheeled transport, he decided to direct the Alpine Corps by way of Cindrelu and Prezbe towards the Roter Turm, in order to hinder the retreat of the Rumanians by this route, while the 187th Inf. Div., the 31st Honved Inf. Div., the 76th Res. Inf. Div., and sections of the Schmettow Cav. Corps, were to attack W. and E. of Hermannstadt in the direction of the northern outlet of the pass. This was not indeed a double encirclement of the enemy, as had been ordered by the Supreme Command, for which the forces of the eastern wing, where only a few squadrons could be made available, were insufficient. It was, however, a far-reaching enveloping movement against the one passable rearward communication of the enemy, in cooperation with an energetic attack on the front, of which the object was to destroy the group composed of the 2nd and 17th Rumanian Inf. Divs., under Gen. Popovici commanding the I. Corps.

On Sept. 22 Gen. Popovici attacked, but only attained success south-west of Cornaticlu against the extremely thinly held positions of the 77th Cav. Bde. of the 1st div., being everywhere else completely repulsed. The expected continuation of the Rumanian attack on Sept. 23 did not take place, and it was possible to issue orders for the projected battle. By Sept. 25 the XXXIX. Res. Corps with the 187th Inf. Div. were able to be assembled at the foot of the mountains S.W. of Hermannstadt, the 31st Honved Inf. Div. to the N.W., and the 76th Res. Inf. Div. to the N.E. of the town, while the Alpine Corps was to be within a day's march of the Roter Turm Pass. The general attack in the direction of the pass was to begin on Sept. 26; the Alpine Corps was to endeavour to reach the E. side of the pass in order there also to block the bridle-tracks leading over the mountains. The Schmettow Cav. Corps might, in the event of further pressure by the enemy, give way with its right wing, but with its centre on the Alt and its left wing towards Fogaras it was to hold its ground obstinately, and, in addition, if the operations proceeded according to plan, to arrange to push forward from the N.E. over the river towards the entrance of the pass. The I. Army Command was asked, as soon as possible, to take the 85th Inf. Div. in readiness at Schäßburg (Segesvár).

The Rumanians standing at Hermannstadt did not interurbivis further efforts towards the W. The IV. Army, on the other hand, the 11th Rumanian Div. stationed at the Szurduk Pass attacked again on Sept. 25, and regained possession of Petroşeni. The 144th Inf. Bde., reinforced by two German battalions and two batteries, held the heights N. of the place. The IX. Army Command did not contemplate further reinforcement, but the unattached staff (i.e. without troops) of the German 31st Infantry Div. was sent there, under the direction of which were placed the 144th Inf. Bde. and the Austro-Hungarian 2nd Mountain Bde., which had arrived on the 28th; and with these forces the Rumanian attack was again compelled to give up the extremely valuable coal basin.

The Battle of Hermannstadt (Nagy Szczen).—On Sept. 26, favoured by beautiful autumn weather, the attack began, and it continued with undiminished violence against the obstinate defence of the Rumanians until the evening of Sept. 28. It ran, on the whole, the course intended by Gen. Falkenhayn.

The Alpine Corps had already reached Roter Turm, Riu Vadulin and Câneşti with their advanced troops on the road to the pass, early in the forenoon of Sept. 26. The Rumanians indeed now thoroughly realized the magnitude of the danger which thus threatened them, and decided the most violent counterattacks from N. and S. against the detachments of the Alpine
Corps. These troops might be temporarily pushed back at one point or another, but the road over the pass now lay continuously under German fire, which inflicted heavy losses on the Rumanian columns still attempting to break through. The Alpine Corps, however, did not succeed in reaching the E. bank of the Alt, and sections of the Rumanians were thus able to escape the threatened encirclement, and to cross the western spur of the Alt to the river banks.

The three divs. of the XXXIX. Res. Corps made a concentric attack between Orlat—Hermannstadt and the heights on the E. of it. It was only with difficulty that they at first gained ground, and not till Sept. 28 did they succeed in breaking the Rumanian resistance; but then, in consequence of the heroic endurance of the Alpine Corps, which made both escape and the bringing up of reinforcements from the S. impossible, the Rumanian defeat became a complete collapse. This collapse was precipitated when on Sept. 27 the 3rd Cav. Div. had succeeded, with two regts. of light horse, in crossing the Alt and narrowing S.W. of Porumbacu the circle of fire round the Rumanians, while the 18th Hussar Regt. of the 3rd Cav. Div. at Chertisjora secured the front towards the E., whence there had been since Sept. 27 increasing indications of an advance by the Rumanian II. Army. As the bringing up of reinforcements through the Roter Turm Pass from the S. failed, the Rumanian Command was compelled to set the II. Army on the march towards Hermannstadt to relieve the seriously threatened group under Gen. Popovici. The II. Rumanian Army executed their movements slowly and with difficulty, and since an advance on the shortest line in the Alt valley from the N. over Fagaras from the Agnethehn-Heddendorf district might easily have been threatened on the flank, the Rumanian Army Command thought themselves first compelled to secure freedom of movement N. of the Alt river. The sections of the 71st Inf. Div. in the forward positions were therefore first pressed back, and then the 6th Cav. Bde. of the 1st Cav. Div. standing N. of Klein Schenk were thrown back westwards. Meanwhile, the Austro-Hungarian I. Army Command had sent from Schässburg to Heddendorf the greater part of the 89th Inf. Div., one infantry regt. and one light field-howitzter detachment going off by rail as army reserve to Salzburg (N. of Hermannstadt). Pushing between the 71st Inf. Div. and the Cav. Corps, they made on Sept. 28 a successful attack in a southerly direction, and so put the brake on the advance of the Rumanian troops N. of the Alt. The I. Army of Gen. Arz had to withdraw steady westwards under the superior weight of the IV. Rumanian Army, and as the seriously weakened 19th Landsturm Mountain Bde. especially had great difficulty in withstanding the continued Rumanian attacks in the direction of Schässburg, the I. Army Command considered it necessary to withdraw the 71st Inf. Div. to the Little Kukillo (Kokel). Gen. Falkenhayn urgently dissuaded them from this move, as it would expose his eastern flank to an unbearable threat. He also expressed his doubt as to the ability of the I. Army, when once it had been pressed back behind the line of the Maros and the Little Kukillo, to maintain that position permanently with its present forces. Thereupon the withdrawal of the southern wing of the I. Army was delayed.

On the afternoon of Sept. 28 the Rumanians again attacked the 1st Cav. Div. N. of the Alt, and pressed them back to the heights E. of the Haarbach; the reserve, not required at Hermannstadt, was hastily sent with heavy motor wagons through the Haarbach valley to the aid of the heavily engaged Schmettow Corps. On the Fagaras Mountains, however, on the flanks of the Rumanians in the Fether Tarm Pass was sealed, the attacking troops of the XXXIX. Res. Corps ceasing to meet with serious resistance in the early morning of Sept. 29. Those who were not able to escape through the forests over the mountains fell a sacrifice to the inexorable onslaught. The bulk of the Rumanian I. Army was destroyed. Three thousand prisoners—a relatively small number—were taken, but the whole of the artillery and the whole train fell into the hands of the victors.

It was now necessary rapidly to take new decisions for fighting the II. Rumanian Army, the threat of whose approach was imminent. In accordance with the instructions received, the IX. Army was to gather all its strength, and to deliver an enveloping attack from the S. against the southern wing of Rumanian main forces pushed forward W. of Fagaras. Falkenhayn intended to relieve the Alpine Corps for this purpose by the 51st Honved Inf. Div., to assemble the 76th and 187th Inf. Divs. on the heights of Sanyval on both sides of the Alt, and then to push forward in an eastern sweep to strike the Rumanian forces in the Fagaras mountains being assigned to the Alpine Corps. But the rapid and violent push of the Rumanians in the space between the Haarbach and the Alt on Sept. 29 entailed changes in the plan of operations. The relief of the Alpine Corps had to be given up, as involving too much time; instead, the 51st Honved Inf. Div. and the 76th Res. Div. were to reach as rapidly as possible the Alt valley S. and N. of Avrigu and the 187th Inf. Div. Cornaticiu in the Haarbach valley. The seriously weakened Cavalry Corps was to attack itself for the forward movement to the N. wing of the 187th Inf. Div. of the I. Army, the 90th Inf. Div. and the strongest possible sections of the 71st Inf. Div., under the command of Lt.-Gen. von Morgen, were asked to attack in the direction of Bekoken. The beginning of the attack was proposed for Oct. 1.

To the surprise of their enemy the Rumanians did not continue the attack N. of the Alt on Sept. 30, but withdrew a little from the Cavalry Corps. With this object they attacked S. of the Alt and drove back the 18th Hussar Regt. westwards of Chertisjora. The weariness of the troops and the almost impassable state of the roads, owing to the rain which had set in, delayed the forward movements, and it was agreed to begin the attack on Oct. 2. The Rumanians did not take advantage of the loss of time this entailed on the German-Austrian side, but entrenched themselves in the positions they had reached.

The unification of the command in Transylvania was established by placing the Austro-Hungarian I. Army from Oct. 1 under the operative control of Falkenhayn.

On Oct. 2 began the advance of the XXXIX. Res. Corps, the Schmettow Cav. Corps and the I. Res. Corps. South of the Alt the Rumanians offered no resistance, but retreated according to plan before the German advanced troops. North of the Alt, after strong forces had been brought up by way of Gross Schenk in a westerly direction, the advance also began. The 89th Inf. Div. attacked in the direction of Bekoken, and at first obtained a great success, but was thrown back to its point of departure by a Rumanian counter-attack. The 71st Inf. Div. had not been able to join in this attack because its artillery was not yet in position on account of the softness of the chalky roads after rain. Lt.-Gen. von Morgen thought the situation of these two divs. so endangered that he intended to withdraw them as far as the sector Henndorf-Jakobsdorf. On Oct. 3, however, this idea was abandoned, as the enemy themselves had withdrawn eastwards. Owing to this movement touch with the Rumanians became extremely loose, which made it exceedingly difficult for the Austro-German Command to discover the measures taken by them.

On their side the Rumanians had obviously abandoned as early as Oct. 2 the idea of continuing the offensive. Impressed by the annihilating defeat at Hermannstadt and recognizing the impossibility of attacking in a tactically unfavourable situation the IX. Army, rapidly advanced eastwards, they had decided to withdraw betimes in order to defend the frontier passes. In order to secure the time necessary for the threading of the marching columns into the passes of the Geisterwald, the Harlten and the Görgény mountains, the Rumanians undertook a series of forward pushes: on Oct. 1 S. of the Alt, and on Oct. 2 against the 89th Inf. Div. Against the I. Army these attacks continued until Oct. 5, and during them the Rumanians, especially on Oct. 3, obtained a fresh success against the 19th Landsturm Mountaun Bde. and the Landsturm Husars.

Though the IX. Army Command could not yet fully discern the intentions of the enemy, the puzzling behaviour of their opponents seemed no reason for delay, and the advance was therefore pushed forward with the utmost speed. The 3 divs. of
Eastern European Front Campaigns

Lt.-Gen. Staabs were taken into the space S. of the Alt, the 1st Res. Corps was to reach the passages over the Alt at Comana and Héviz, while the Cav. Corps was to reach the N. wing of the IX. Army.

The Battle in the Geisertwald.—The Rumanians retired on the whole E. front, without being brought into action by the pursuing troops of the Austro-Hungarian 1st Army and the German 6th Army. It was only after dusk on Oct. 4 that the XXXIX. Res. Corps was able to bring the Rumanians to a stand on the western slope of the Geisertwald in a prepared position behind the Sinca brook. The corps were ordered to attack early on Oct. 5, while the 76th Res. Div. was to advance along the high road to Volkány, the 51st Honved Inf. Div. to Vledény, and the 187th Inf. Div. over the mountains, enveloping the enemy on the N., in the direction of Kirzba. The 8th Mountain Bde., just arrived at Hermannstadt, was ordered to follow the XXXIX. Res. Corps with which in the Alt valley. It was intended to allow them to advance W. of the Königstein towards the Tarnow–Câmpolung.

Morning mists and the time taken by the enveloping movement of the 187th Inf. Div. in roadless mountain country delayed the beginning of the attack on Oct. 5. In order to lose no time Lt.-Gen. von Staabs ordered the 76th Res. Div. and the 51st Honved Inf. Div. to attack alone in the forenoon; they soon captured the Rumanian positions, the Rumanian 4th and 3rd Inf. Divs. suffering heavy and bloody losses in their violent counter-attacks. But when the enveloping movement of the 187th Inf. Div. became effective the Rumanians began their retreat. The Kronstadt band with the utmost haste, at the cost of a great part of their artillery. Close upon them followed the victorious divs. of Gen. von Staabs. Meanwhile the advance guard of the 85th Inf. Div. had reached Comana on Oct. 5, after, by quick action, succeeding in putting out the fire which the Rumanians had set to the bridge. After a still pursuing action the 71st Inf. Div. took Reps, but, N. of Héviz, met with strong resistance from the enemy which was only broken down on the morning of the 6th. The 89th Inf. Div. which had been brought up here, was marched through Héviz in front of the 71st and directed over the Bogat saddle towards Földvár. The 9th Corps’ Cav. Corps had assigned to the task of throwing back the 2nd Rumanian Cav. Div. over the line Mehbburg–Pálos. But the Rumanian Horse escaped attack by a hasty retreat towards the N.E., and established temporarily contact in the Upper Alt valley between the two Rumanian armies, which were diverging more and more.

The Battle of Kronstadt (Brașov).—On Oct. 6 the divs. of the XXXIX. and I. Res. Corps in their marching lines sought to reach the western outlets of the defiles of the Burgenland. The attack on the 3rd, 4th and 6th Divs. of the Rumanian II. Army, closed together around Kronstadt and entangled with one another during the retreat, was fixed for Oct. 7. The 76th Res. Div. was to reach the Törzburg Pass by way of Tohanuin–Törzburg. Kronstadt was the goal fixed for the 54th Honved Inf. Div., advancing by Feketehalom, while the 187th Inf. Div., attacking to the N. of it, was to wheel inwards, its flank protected from the N.E. in order to envelop Kronstadt and the entrance to the pass S.E. of it. On Oct. 7 the 85th Inf. Div. was to reach Földvár and the 71st Inf. Div. Miklosvár. Of the Cav. Corps the 3rd German Cav. Div. was to push forward through Baró towards Mikosjafa, to hinder Rumanian movement through the Alt valley, while the Cav. Div., pressing forward towards Szt. Egyházas–Olahfalu, was to clear the rear sections of the Rumanian troops still on the Szekely–Udvardely–Cîşkerda road.

On the early morning of Oct. 7 the vanguard of the 76th Res. Div. emerging from the mountains at Tohanuin was caught by the Rumanian artillery fire, and could penetrate no farther. The main body had therefore to make a wide détour by Zerneste against the Rumanian left flank, and a pause was made for the arrival of the heavy artillery. Thus this div. could make no further progress on the 7th. But the 51st Honved Inf. Div. and the 187th Inf. Div. rapidly approached Kronstadt, meeting, however, with violent resistance from the Rumanians on the N. and W. sides of the town, so that it was not until evening that the vanguard of the 187th succeeded in penetrating into the northern part of the town, where an obstinate street fight raged all night. Next morning the 51st Honved Inf. Div. also won their way in and stormed the heights S. of the town.

In consequence of the enveloping movement through Zerneste and the threat exercised by the 8th Mountain Bde. approaching W. of the Königstein it became possible for the 76th Res. Div. on Oct. 8 to seize Törzburg and the heights on either side of it, together with the entrance to the Törzburg Pass. The advance against the pass was continued, and, in addition, a detachment was pushed forward through the Klein Weidenbach valley towards the Tömös Pass in order to bar the Rumanian retreat here. Although this div. failed to reach the road, its appearance in threatening proximity caused a panic-like flight of the troops and transport hastening southwards.

Meanwhile the Rumanians tried to hold up the German advance N. of Kronstadt, and, with reenforcements hurrying up partly by rail from Sepsi–Szt. György, delivered violent counter-attacks against the E. wing of the 187th Inf. Div., standing at Szentpéter, which was hard pressed till the attack of the 89th Inf. Div. from the N. struck the Rumanians unawares.

Early on Oct. 9 the victory of the IX. Army was complete. The beaten troops of the 3rd, 4th and 6th Rumanian Divs. retreated hurriedly through the passes, so that, supported by the 10th, 21st and 22nd Inf. Divs. brought up for the purpose, they might undertake the defence of their country against the pursuing German and Austro-Hungarian divs. in fortified positions on the frontier prepared during peace.

Gen. von Falkenhayn in his pursuit tried to cross the mountains simultaneously with the Rumanians, and by a fresh distribution of his army, the I. Res. Corps with the 76th Res. Div. and the 8th Mountain Bde. attacked over the Törzburg Pass in the direction of Câmpolung. Through the encircling movement of the 8th Mountain Bde. the pass was soon successfully opened, and the 22nd Inf. Div. which had arrived to support the seriously exhausted Rumanian 4th Inf. Div. was repulsed. But the attack of the I. Res. Corps was held up by the strongly fortified positions N. of Câmpolung.

The XXXIX. Res. Corps had orders to push forward through the Tömös Pass with the 51st Honved Inf. Div., and through the Altschann Pass with the 187th Inf. Div. towards the line Sinaia–Isorele. The 51st Div. did indeed succeed in storming the summit of the pass, but could not penetrate the 21st and 10th Rumanian Inf. Divs. in their strongly constructed positions. The 187th Div. had a similar experience against the Rumanian 3rd Inf. Division.

The 89th Inf. Div. had to attack through the Tatarhavas and Bodza passes. After reaching the basin lying S. of the frontier, it was held up by the main body of the Rumanian 6th Inf. Div. and by separate regts. of the 3rd, 15th and 22nd Inf. Divisions.

As the German Supreme Command urgently demanded that the strongest possible infantry and cavalry forces should be directed towards Ocna, to control the communications from there northwards by rail, road and telegraph, the 71st Inf. Div. was put under the command of Gen. Count Schmettow, commanding the Cav. Corps, who led the div. in forced marches to the Otojz Pass. On the summit of the pass the div. overran a position held by the Rumanian and Cav. Div. and forced their way over the frontier. Recognising their peril the Rumanians and sections of the 7th, 8th and the newly formed 15th Inf. Divs., and after long engagements with many vicissitudes prevented the 71st Inf. Div. from reaching its goal.

The 3rd Cav. Div. assembled first in the basin of Kezdiúsváróhely, where the 1st Cav. Div., which had pursued the Rumanian 7th Inf. Div. up to the Uz Pass, had also been brought up. As the employment of cavalry on the route by way of Ocna into Moldavia had become impossible, the 1st Cav. Div. established communication in the forest-clad mountains, with their lack of roads, between the 89th and the 71st Inf. Divs. The three regts.
arrangement of the commands, was moved from East Galicia to Grosswardein, as from Oct. 13, and the German IX. and Austro-Hungarian I., VII. and III. Armies were placed under him.

The Conquest of the Dobruja and of Wallachia.—After the battle of Kronstadt the Rumanians were entirely reduced to the defensive. On the Transylvanian front they limited their activities to attempts to win back the lost frontier heights commanding important roads of invasion. The Rumanian Army Command also tried to induce the Russians to relieve the Rumanian troops in the Dobruja and on the Transylvanian E. front in order to set free forces for the defence of Wallachia. On Oct. 1 the Danubian forces on Oct. 7 had crossed the river at Rahova (S. of Bucharest) with a div., and had temporarily gained a firm footing. German and Bulgarian troops, rapidly assembled, compelled the Rumanians to return to the N. bank, the latter suffering severe losses, as the Austro-Hungarian Danube monitors had shot to pieces the Rumanian pontoon bridge. Rumanian forward pushes against the Bulgarian III. Army brought no success. On Oct. 19 an attack by Gen. Tosheov's Army (Bulgarian 1st, 4th, 6th Divs., and sections of the 12th Inf. Div., 1st Cav. Div., Turkish VI. Corps, with the 15th and 25th Inf. Divs., German 217th Inf. Div.), broke through Rumanian lines to the N. of Vama-Vața and crossed the opposing army far over the Cernavoda-Constanta railway, Rumania thereby losing her only rail connexion with the sea.

While the bulk of the Bulgarian III. Army followed only as far as the line Lake Tasaul–Bazanlia–heights of Kualni–Dânube S. of Topal, and settled themselves for the defence on this shortest line between the Danube and the sea, the reinforced cav. div. pursued the retiring Rumanians and Russians as far as the line Saruri–Sârighol–Ducușeni. Gradually the Russians again slowly pushed forward southward against the new position of the Bulgarian III. Army. The Rumanian troops were withdrawn in Nov. from the Dobruja into Wallachia. Of the Russians there were in the Dobruja the VI. Cav. Corps, the XLVII. and IV. Siberian Corps, with 6 inf. divs. and 1 cav. div. in all, which were placed under the command of the newly formed Russian Danube Army (Gen. Sakharov).

In the new defensive position of the Bulgarian III. Army, which was by this time under the command of Gen. Neresov, there remained the 4th and the combined 6th Inf. Divs., then the 1st Cav. Div. The Turkish VI. Corps stood for the time being at Medzidile in reserve. The other troops in the Dobruja and in Wallachia, together with the expected Turkish 26th Div., were collected in the district around Sistova, and were placed in readiness for crossing the Danube as the new Danube Army under the command of Gen. Kosch.

On the Transylvanian S. front the obstinate struggle for the passes was continued. The I. Res. Corps succeeded in reaching a point just N. of Câmpolung after the arrival of the 12th Bavarian Inf. Div. and with the assistance of the enveloping movement in the mountains of the 8th Mountain Bde. on the W. wing. At that point irruption into the basin of Câmpolung was barred by a new strongly constructed position in which the newly brought-up Rumanian 12th Inf. Div., in addition to the 22nd Inf. Div., offered the most obstinate resistance.

At the Roter Turm Pass Lt.-Gen. von Kraft intended to force an exit from the mountains by enveloping on two sides, with the 2nd Mountain Bde. eastwards with the 10th Mountain Bde. westwards, and the Alpine Corps in the centre. The attack began on Oct. 16. After easy initial successes the weather broke on Oct. 18, and this circumstance, together with hastily executed Rumanian counter-attacks, prevented complete success.

South of Petrosenî the group of Lt.-Gen. Kneusel, with the 11th Bavarian Inf. Div., the 144th Inf. Bde., and the 6th Cav. Div., began the attack in numerous columns through the Szurdok and Vulkov passes and over the heights to the west. In spite of the fall of snow the advance began on Oct. 23.

News had been received that, under pressure of the preceding attack by Kraft's group and the I. Res. Corps, the Rumanians had deflected against these reinforcements which had been sent up, and that it would therefore be easier to break through. At first,
indeed, complete success attended the attacks of the Kneszel group. The troops, forcing back the Rumanian 11th Inf. Div., had worked their way to the foot of the mountains N. of Târgu Jiu, and were to fight their way out to the plain on Oct. 27. At this point, however, a counter-attack by the hurriedly summoned Rumanian 21st and 22nd Inf. Bdes., and a regt. of the 1st and 3rd Inf. Divs., struck the W. wing. After losing many in prisoners and guns the German detachments had again to withdraw to the frontier heights, whither the Rumanians pursued them only with skirmishing detachments. In spite of the defeat he had suffered Falkenhayn held fast to the idea of a break-through by way of Târgu Jiu, and directed the newly arriving troops (41st and 109th Inf. Divs. and 7th Cav. Div.) to Petroșeni. After the experience just gained the most thorough preparations were to be made for this operation, which was to begin on Nov. 11. Lt.-Gen. Kühne of the L.V. Res. Corps being chosen for the command of this strengthened group.

Urged by the Rumanian Army Command, the Russians relieved the Rumanian troops facing the Austro-Hungarian I. Army, beginning from the N., and pushed the southern boundary of their IX. Army in the middle of Nov. to a point just N. of the Gyimes Pass. Simultaneously with the III. Cav. Corps and the XXXVI. Corps, they attacked in this new sector the Austro-Hungarian XXII. Corps on Nov. 6. In expectation of this Russian push forward the Army from the command had placed in reserve 3rd Ukrainian Cav. Corps (3rd and 4th Cav. Divs.) in the district Olah-Toplica-Gyergyó-Sz. Miklós, the 18th Bavarian Inf. Div. brought southwards from the VII. Army in the district around Csík-Szereda, and the bulk of the 8th Bavarian Res. Div. at Kézvivarsahely. The Russian forward movement obtained small successes on both sides of the Tőlgys and Békás Pass. After the bringing up of the 10th Bavarian Inf. Div. and the 3rd Cav. Div. the situation was once more restored.

In the Ojtoz Pass also, where the 71st Inf. Div. and the 1st Cav. Div. were once more placed under the I. Army from Oct. 27 to 29, the Danube valley, the Rumanians, partly mixed with Russian units, attacked on Nov. 5 without obtaining noteworthy successes.

**The break-through at Târgu Jiu.**—According to plan, the attack of the group of Lt.-Gen. Kühne began on Nov. 11 S. of the Szurdok and Vukan passes. They were to force their way into the Wallachian plain before the approach of winter made mountain operations impossible. Simultaneous attacks on all the other passes of the Transylvanian S. front and at Orsova were to distract the attention of the Rumanians and divert their reinforcements from the principal theatre of attack, an invasion which was successfully accomplished.

Protected by the 41st Inf. Div. on the W., with the 100th and 301st Inf. Divs. of the river Schyl, on the W. flank by sections of the 6th Cav. Div. and the 9th Regt. of the Hungarian Landsturm, the troops fought their way out of the mountains in an obstinate struggle lasting from Nov. 11 to 14, and on Nov. 15 reached Târgu Jiu. The Rumanian 11th Inf. Div., seriously weakened, retired to the heights S. of the town, where it again gave battle with rapidly brought up new forces of about the strength of two divisions. In the Kühne group the Schmettov Cav. Corps (6th and 7th Cav. Divs.) was brought along the road over the pass and placed on the W. wing for the envelopment of the enemy; the 11th Bavarian Inf. Div., hitherto in reserve, was placed on the front E. of Târgu Jiu, while the 301st Inf. Div. acted as covering troops on the east.

On Nov. 16 the Kühne group attacked once more. On Nov. 17 the Rumanians, in spite of the most courageous defence, were decisively beaten. The road into Wallachia lay open. The pursuit was undertaken without delay. With the right wing (6th Cav. Div. and behind that the 41st) in the Jiu valley through Craiova, the centre (109th and 11th Inf. Divs.) towards Slătina, and the left wing (301st Inf. Div.) in the direction of Drăgășani, the group swerved eastwards and made rapidly for the Alt. On Nov. 21, Craiova, the capital of Wallachia, was reached. The rapidly attacking vanguard of the 6th Cav. Div. succeeded on the 23rd in seizing the bridge E. of Caracal, which had remained undamaged, over which the main body of this division on Nov. 24 and the 7th Cav. Div. on the 25th crossed the Alt, in order to push on against the Vede sector.

The Rumanians, repulsed from Târgu Jiu (11th and 17th Inf. Divs. and parts of other divs.) placed themselves after the destruction of the bridges on the E. bank of the Alt between Slătina and Dragasani, in order to bar at this point an advance by Lt.-Gen. Kühne's troops. Farther N. too, opposite the group of Lt.-Gen. von Kraft, the Rumanians had evacuated the W. bank of the Alt, so that the German troops were able to occupy Rimnik Valcea on Nov. 25. The attempts of the 41st and 11th Bav. Inf. Divs. on Nov. 25 and 26 to cross the Alt at Slătina failed, in spite of the support of some squadrons of the 7th Cav. Div., which had already come into action from a S.E. direction. The 109th Inf. Div. was placed in support of the Cav. Corps by way of Caracala, and was soon followed by the 11th Bav. Inf. Div. and the 115th Inf. Division.

In consequence of the rapid break-through at Târgu Jiu the retreat of the Rumanian Orsova group, 3 regts. of the 1st Inf. Div. with artillery, was cut off. Held in front by violent attacks on the part of the group of Col. Szívó, they were shut in on the rear by detachments of the Kühne group. In a series of engagements in which at one time they threatened the rear communications of the Kühne group, this Rumanian group went down almost completely; the troops on the eastern bank of the Alt, they laid down their arms before their pursuers on Dec. 6. Ten thousand men and 40 guns fell into the hands of the much weaker Szívó group.

In front of the group of Lt.-Gen. von Kraft, reinforced by the newly arrived 216th Inf. Div., the Rumanians also could not hold their own on the E. bank of the Alt in spite of the participation of the 7th and parts of the 8th Inf. Divs.; they retreated as far as Curteel d'Arges and behind the Topologia sector, where they offered a temporary resistance.

The I. and XXXIX. Res. Corps (under which latter the 89th Inf. Div. in the Buzdza Pass had been placed) maintained undiminished pressure on the Rumanian groups opposed to them.

With the aim of building up a further reserve of the army front, the 17th Inf. Div. was relieved by the approaching Austro-Hungarian 24th Inf. Div., and placed in readiness in the Hâromszék. The Ojtoz group now under the command of Gen. von Gerok, of the XXIV. Res. Corps, was on Nov. 12 again placed under the IX. Army Command. On the E. front the Russians continued the relief of the Rumanians as far as the road over the Ojtoz Pass.

**Crossing of the Danube Army at Sisova.**—On the side of the Central Army Command now thought the moment had arrived for the Danube Army to position at Sisova to cross the Danube and push forward towards Bucharest, in order, in conjunction with the approaching IX. Army, to effect the complete conquest of Wallachia. The Danube Army consisted of the 217th German Inf. Div., the 1st and 12th Bulgarian Inf. Divs., the combined Cav. Div. of Maj.-Gen. Goltz, German and Bulgarian Landsturm troops, German and Austro-Hungarian heavy artillery, the 26th Turkish Inf. Div. and Austro-Hungarian pioneer formations. At 4 a.m. on Nov. 23, favoured by thick mist, and supported by the Austro-Hungarian Danube monitors and the German motor boats formerly transported across the river of the 217th Inf. Div., unnoticed by the enemy, was successfully accomplished without delays. Zimnicu was occupied. Then the 1st Bulgarian Inf. Div. and the Landsturm formations crossed; the resistance of Rumanian detachments brought up was rapidly conquered.

On Nov. 24 the bridge-head was widened, and the construction of a pontoon bridge by the Austro-Hungarian pioneer group of Maj.-Gen. Gaugl was begun, and finished in the afternoon of Nov. 25 at 6 o'clock. The remaining troops were now brought over the bridge in unbroken sequence, and the advance was begun: on the left wing the cav. divs. towards Alesandri, on its right the 217th Inf. Div., then the 12th and 1st Bulgarian Inf. Divs. The Turkish 26th Inf. Div. followed as Army Reserve behind the left wing. Rapidly advancing, and quickly
breaking the resistance of the Rumanian 18th Inf. Div. and the 1st and 2nd Cav. Divs. sent against them, the heads of the columns had already on Dec. 1 reached the Argeșu, S.W. of Bucharest. But in this hurried forward movement the Danube Army, after establishing only slight contact by means of cavalry at Roși de Vede, again lost touch with the main body of the IX. Army, held up on the Alt sector; their left flank lay open.

Battle of the Argeșu.—The Rumanians recognized the opportunity offered them of falling on the rashly advanced Danube Army. They endeavored, with their I. Army, to keep the Kuhne and Kraft groups as far to the W. as possible, and also made violent frontal attacks across the Argeșu on the isolated Danube Army, and on Dec. 2 from the N.W., completely encircling the left wing of the Danube Army, with the Rumanian 1st Cav. Div., then parts of the 2nd, 4th, and 15th Inf. Divs. The Danube Army was thus placed in an extremely critical position. Rapidly brought-up Landsturm battalions, a few pioneer companies and the 26th Turkish Inf. Div., advancing in the second line, compelled a pause in the Rumanian enveloping movement. The Rumanian manoeuvre, which only failed of success because it was not met with the necessary energy, was coincident with violent pushes carried out by the Russians on the Carpathian front, from the Tartar Pass southwards to the Oțoș Pass and on the Dobruja front, and also with attacks by Gen. Sarrail's Army on the Salonika front, by which it was hoped to relieve the hard-pressed Rumanian Army and to snatch from the Central Powers the advantage developing in this area. Yet all efforts were in vain.

The right wing of the IX. Army, which had been placed from Nov. 30 under the army group command of Field-Marshal von Mackensen, was brought up with the utmost haste. The 109th Inf. Div., advancing northward on Nov. 27 and 28 on the E. bank of the Alt, had at last succeeded in compelling the Rumanian I. Army to abandon the Alt sector. The 41st and 301st Inf. Divs. could then cross the river at Slatina. The pursuit towards the E. was conducted in the following groups: along the projected Craiova-Bucharest railway the 11th Bavarian Inf. Div.; behind that the 11th Inf. Div.; N. of the Bavarians the 106th, 41st and 301st Inf. Divs. The Schmettow Cav. Corps had rained in advance of the right wing. Thus the IX. Army approached the seriously threatened left wing of the Danube Army. On Dec. 2 parts of the Cav. Corps, and on Dec. 3 the 11th Bavarian and 109th Inf. Divs., swarming southwards, were able to participate in the battle. The Rumanians, now themselves enveloped, turned back with heavy losses to Bucharest. For the Danube Army the crisis was over.

While on Dec. 2 and 3 the main body of the Schmettow Cav. Corps and the 109th Inf. Div. covered the road to Bucharest, Lt.-Gen. von KRAFT at the same time, with the 216th, 73rd and 301st Inf. Divs., struck the remnant of the Rumanian I. Army on the middle course of the Argeșu, and pushed forward with the Alpine Corps and the 2nd Mountain Bde. towards the Tirgoviște, which, after the capture of Câmpulung, the I. Res. Corps was also approaching.

Attacks by the just arrived Russian 40th Inf. Div. and the 8th Cav. Div. on Dec. 4 and 5 against the Bulgarians on the S. wing of the Danube Army gave no results. The violent attacks delivered by the Russians against the Austro-Hungarian Army and against the Bugar-Turkish Dobruja front in the beginning of Dec. were also continuously repulsed.

The Capture of Bucharest.—On the evening of Dec. 5, after successful engagements, the Danube Army stood E. of the Argeșu, and on Dec. 6 retook 2nd and 3rd forts N. of the town as far as the Prâhova valley. Since it was doubtful whether Bucharest would be defended as a fortress, heavy artillery and all the means of attack were placed ready to hasten its capture. In the night of Dec. 5-6 cavalry of the Schmettow Corps rode up towards the N.W. front, and found the works blown up and ungarrisoned. The Rumanians evacuated their capital almost without fighting. On the night of Dec. 6 the troops of the Danube Army and parts of the S. wing of the IX. Army entered Bucharest, while on the same day Falkenhayn's N. wing captured Ploesci, and with it the important petroleum area, where English hands had previously rendered the boring apparatus useless for a considerable length of time. Two days later, as the result of rapid enveloping movements carried out by Lt.-Gen. Morgen's group, the 4th Rumanian Div., left stranded in the mountains, were surrounded in the district N. of Ploesci, and were taken prisoners. The road to the S. now also lay open to Lt.-Gen. Staab's group. The 51st Honved Inf. Div. was able to occupy Sinaia.
itary mission undertook to reorganize the army, and to give it a thorough education based on the principles of the conduct of modern warfare. This task it had finished by the summer.

The Battles N. of Focsani in the Summer of 1917.—In the spring of 1917 events took place of the most far-reaching significance for the conduct of the war in the East: the deposition of the Tsar, the outbreak of the revolution in Russia and the beginning of the collapse of the Russian army. As on all parts of the eastern front, so in Rumania, the Russian infantry had no more desire for fighting; the Russian artillery, left to carry on alone, were threatened by the infantry; indeed it came to a situation in which the Russian infantry was inferior to the enemy in both arms. It is true that with difficulty that the numerous officers of the Western Powers distributed among the higher commands could prevent the collapse of the eastern front. The fighting value of the Russians did indeed improve at the time of the Kerensky offensive of June 1917, but the improvement was not a lasting one. The Rumanian troops remained untouched by all these happenings. Indeed it seemed as if Rumania’s fighting strength increased in proportion as her ally became less reliable.

In the second half of July the reorganized Rumanian I. Army was ordered to advance to the Russian IV. Army, through the weak front of the 218th Inf. Div. and the 1st Cav. Div. and threw them far beyond Soveja back into the mountains, the wing division of the IX. Army being thereby surrounded on the N. and N.W. by the Russian VIII. Corps. Even though there was little need to fear Rumanian advance against Kézdvásárhely in the rear of the I. Army, on account of the width and impassable nature of the mountains, there was all the more danger that, after the capture of the Mt. Odobeshi (Odobești), the whole front of the IX. Army, which covered the advance into the basin of the IV. and VI. Divs. by Gen. Kosch, might be rolled up from the north. This was obviously the intention of the Rumanians, but the troops in carrying out the operation did not strike hard enough. Precious time was thereby lost. On account of the want of roads direct support of the 218th Inf. Div. was hardly possible. It was only slowly that one regiment of the 117th Inf. Div., and then half the 37th Honved Inf. Div., which had been set free from the N. wing of the I. Army, could be brought up. The 217th Inf. Div. was supported by single regiments and battalions of 5 different divs. of the IX. Army, and the attack was thus barred.

In the counter-operation planned by the Central Powers it was intended to take up again the original plan of penetrating far into Moldavia. For this purpose the IX. Army was to conduct the main attack from Focșani W. of the Sereth in the direction of Ajudu Nuou, and simultaneously to cover this attack by the construction of a bridge-head on the E. bank of the Sereth in the direction of Tecuci. A second push was to be delivered by the Gerok group from the Ojtoz valley on Onești. By this means the Rumanian II. Army, which had already driven back the Russian troops of the Soveja, was to be cut off.

Engagements North of Focșani and South of Ocna.—For the attack which was to start from Focșani the following were placed in readiness under the command of Lt.-Gen. von Morgen (I. Res. Corps): the 12th Bavarian Inf. Div., 76th Res. Inf. Div., and the 80th Inf. Div., to be followed in second line by the 216th Inf. Div. As army reserve there stood at Focșani the 212th and 115th Inf. Divs. On Aug. 6 the attack began, and had indeed desired success on the first day in a N.W. direction. The attempt to cross to the E. bank of the Sereth, however, failed.

The Russian Corps which were attacked (the VII. and behind that the XXX.) put up a surprisingly obstinate defence. It was only after throwing in the army reserves that the German I. Res. Corps succeeded in outflanking the Susita sector. Moreover, the 5th and 9th Rumanian Divs. of the Rumanian I. Army also came forward to face the attacking Germans, and caused considerable delay, especially at Marasesti (Marashești), by their violent, deeply éléchoné counter-attacks.

On Aug. 10 the VIII. Corps with 3 (partly combined) divs. reinforced the attack of the Gerok group on both sides of the Ojtoz valley. They attacked the Rumanian IV. Corps (6th and 7th Inf. Divs.), and gained ground as far as just S. of Ocna and Grozesci. But on account of the obstinate resistance of the Rumanians the objective, Onești, could not be reached.

Left of the I. Res. Corps the XVIII. Res. Corps, reinforced by the Alpine Corps, once more in action, had meanwhile joined in the attack with their left wing, and after heavy engagements had taken Pancu N. of the Susita. On Aug. 15 the S. wing of the Gerok group (218th Inf. Div. and sections of the 17th Infantry, half the 37th Honved Inf. Div. and the 8th Mountain Bde.) and the 217th Inf. Div., standing on the left wing of the XVIII. Res. Corps, also joined the attack and slowly drove the Rumanians out of the basin of the Soveja. A bridge-head on the W. bank of the Sereth threatening the German flank, held by the Rumanian 5th Div., was stormed by the 216th Inf. Div. of the I. Res. Corps on Aug. 14, severe losses being inflicted on the Rumanians. The further attempts of the I. Res. Corps, under which was placed the newly arrived 13th Riffle Div., to advance over the line Marasesti–Panciu, failed through Russian and Rumanian counter-attacks.

In consequence of the events in East Galicia and in the Bukovyna, where the Russians were driven back to the old boundary of the Empire, a regrouping of troops and new distribution of the armies in Moldavia was effected. The troops of the Russian IV. Army were withdrawn to the N. to the VII. Corps, and the Russian IV. Army Command took over from the IX. Army Command the sector on the Transylvanian E. front as far as the Sănic valley. The Rumanian I. Army also took over the sector held earlier by the Russian I. Army, so that the two Rumanian armies now stood side by side.

On Aug. 28 the XVIII. Res. Corps, with the 216th Inf. Div. and the Alpine Corps, attacked from the line Panciu–N. edge of the Mt. Odobești in a N.W. direction, to gain the upper course of the Susita. After stubborn engagements lasting for many days against the Rumanian II. Corps, Jrescu and the heights S. of the Susita were captured, upon which practically the old line, as it stood before the Rumanian attack, was reached. On Sept. 3 attacks from the German side were again suspended.

At the beginning of Sept. the Rumanians with the IV. Corps conducted a series of violent attacks against the advanced positions of the VIII. Corps, especially against the 225th Inf. Div., standing just S. of Ocna, but they were bloodily repulsed.

In consequence of the events in East Galicia and in this unsuccessful enterprise, the troops which could be spared (the Alpine Corps, the 13th Riffle Div., the 117th Inf. Div. and much heavy artillery) were withdrawn for transfer to other theatres of war. The remaining units again went into permanent positions. On the Rumanian side the fruitless attacks ceased. They had suffered heavy losses in killed and wounded, and important loss in prisoners and material. The newly formed Rumanian divs., instructed by the French, had succeeded in defending their country from complete conquest. The battle of Marasesti, as it was called by the Rumanians, is the most famous page of the Rumanian Army in the World War.

Armistice of Focșani.—On Dec. 5 the commander-in-chief of the Russian S.W. front, Gen. Gritscherbach, asked for an armistice. On Dec. 7 the negotiations began at Focșani under the presidency of Lt.-Gen. von Morgen; representatives of all the participating armies took part, and they were concluded on Dec. 10.

(R. K.)
EASTMAN—ECONOMIC ENTOMOLOGY

EASTMAN, GEORGE (1854— ), American inventor and philanthropist, was born at Waterville, N.Y., July 12 1854. He was educated at Rochester and early became interested in photography. In 1880 he began to manufacture dry plates and four years later produced the first practicable roll film. In 1888 he invented the "kodak." In 1892 he gave $250,000 toward University's endowment. To its school of music he has given $3,500,000 and to its medical school $4,000,000 (1920). In 1920 it became known that he had given at various times large sums to the Massachusetts Institute of Technology, amounting to $11,000,000.

EBERT, FRIEDRICH (1871— ), first president of the Reich or German Federated Republic, was born Feb. 4 1871 at Heidelberg, Germany. Ebert's parents have followed the lead of Cape Colony and the West Indies, and have found the entomologist a necessary officer on the staff of the agricultural department. The entomologist appointed from the United Kingdom to such work took up his duties at the close of 1899; now a number leave England yearly to replace the vacancies or to fill new posts in the agricultural departments of the Dominions and the colonies of the Empire. A third factor, and one that will increase in importance, has been the immensely increased facilities for the rapid transport of plants and pests from one country to another, and also the increased desire to obtain the new varieties of tropical crops produced by the economic botanists of the tropical agricultural stations. Formerly the Royal Botanic Gardens, Kew, were the British centre of plant distribution, and while Kew was the home of many introduced scale insects, few pests were distributed apart from these; but the new varieties of cane from Java and the West Indies, the cotton seed from Egypt, Cambodia, Australia, the mango seed from the East, the rubber plants that circulated over the tropics, the countless shipments of tropical plants, have been the means of introducing pests to new countries, where, freed from the control of nature by means of natural enemies, they have bred and multiplied to their full extent and so constituted a very serious menace to cultivation. Experience has also shown that the new applied entomology is as practical a science as any other upon which the practice of agriculture depends. This was not always the case, and the amateur entomologist, whose interests were primarily confined to collections and nomenclature, did not impress the practical farmer as able to help him in his fight against enemies; this phase (from Great Britain and India notably) has not wholly passed, but it has so largely given place to the practical entomologist whose object is to eliminate the pest and thereby also the loss, that the entomologist is now recognized as necessary. A final factor is the growing recognition of the value of "team work," that is, of the cooperation of the plant breeder, plant physiologist, mycologist, bacteriologist, and "soil condition" expert, in tackling problems of plant hygiene, and their demand for the collaboration also of the entomologist able to deal with that aspect of the problem. Many insect problems are cases solely of gross damage by feeding insects; but many are tangled up with other disease phenomena, and in many cases an insect is the transmitter from plant to plant of virulent disease organisms. It will be evident that the older type of entomologist, whose interest in the insect ended with its classification and the enumeration of the symptoms under which it was known in the literature, must be replaced by the more widely trained man capable of collaborating in these complicated problems.

Training.—In 1900 there were few facilities for training outside of the colleges and experiment stations of the United States, and the entomologist selected for responsible work in the colonies was required to have taken a degree in zoology and to have an amateur knowledge of entomology as then understood. Even in 1910, the English universities provided no better training, and the groundwork of a very thorough education in comparative anatomy and zoology was regarded as the one essential upon which could be laid a small amount of...
entomological knowledge. A single British college established in 1911 a fuller course of specialized training, and has since provided a four-year course, designed to teach not only entomology but also so much of allied subjects as to enable the entomologist to collaborate readily and intelligently with his colleagues in plant physiology, plant breeding, mycology, bacteriology; it embraces some training in all these; it is divorced from zoology and the comparative anatomy of animals, except in so far as there are necessary to a wide comprehension of biological questions, and it provides a full and complete training in all aspects of applied entomology; further, a feature is the inclusion of research on some problem of applied entomology as part of the actual training, so that the trained student has had some experience of the kind of problem he will spend his life solving. Progress in this direction was being slowly made up to 1921 at other teaching institutions in Great Britain, but it contrasted poorly with the progress made in the United States in the provision of full facilities for training at many colleges and experiment stations. The problem of economic entomology in England had been to escape from the dominion of the zoologist; the problem in America had been to incorporate sufficient science and to escape the anti-academic demands of the "practical man," to whom science as such did not appeal. It is probably true to say that both countries err, the English in being still too academic, the Americans in being too practical and too little sympathetic with the value of the "scientific" method of thought. This question was discussed at the Conference of Agricultural Entomologists arranged by the Colonial Office in England in June 1920, and while this Conference did not reach any definite conclusion, feeling was general that the ideal training was a groundwork of general horticultural or agricultural science, with the special training of the entomologist thereafter, and this is very nearly a mean between the present training of the Imperial College in London and that of most of the American colleges. The total number of entomologists required for science in the British Empire was not in 1921 sufficient to justify the provision of facilities for training at a number of universities, and it was possible that the establishment of tropical agricultural colleges might lessen the need of facilities in Great Britain, while the providing better training for tropical problems. Careers in entomology had become far wider in 1921 than they were in 1900; in 1910 there was no official entomologist employed in England. The entomologist attached to the Ministry of Agriculture was in 1921 stationed at Harpenden, where he was in close touch with the Phytopathological Institute, with several entomologists employed upon research, and a beginning had been made with the appointment of local entomologists, each to advise a small group of countries and to work on the staff of the institutes designed to assist the progress of agriculture and horticulture. There are entomologists attached to the departments of almost every British colony, and the Dominions of Canada and South Africa maintain larger departments with considerable staffs. India was in 1921 still provided only with a small number of entomologists attached to some of the provincial governments, and had a small teaching and publishing section, not directly concerned with the checking of insect pests, at the Agricultural Research Institute. The most complete economic entomology department in India was that of the Madras Government, but entomologists were attached also to the agricultural departments of the Punjab, United Provinces, Bihar and Orissa, and Burma. A recent phase in the development of this country is the increasing utilization of entomologists by companies engaged in the cultivation of tea, rubber, sugar-cane and similar products, or by associations of such companies. The Indian Tea Assn., the United Planters' Assn. of South India, the Colonial Sugar Co., and similar organizations in Malaya, Fiji, Jamaica, etc., maintain scientific staffs usually with entomologists, and there are considerable developments probable, now that the commercial community is realizing that economic entomology can be a sound, practical affair, and not an amateur scientific business of naming insects. In the United States, the development of entomology as a career for trained men has probably reached its limit; as the conditions of agriculture stabilize themselves, as the proportion of each crop becomes fixed, so the immense incidence of crop pests characteristic of America will diminish, and it is now probable that the main concern of the entomologist in that continent will be to safeguard the industry against the incursion of fresh pests from abroad. European entomologists have been developing very much as described above. Before the revolution in Russia, there had been an immense impetus to the development of entomology in that vast country; in France and Italy the entomologist is now being increasingly utilized, and while in Germany the subject had been neglected, since the war the Association of Economic Entomologists has stimulated the development of practical applied entomology. In Japan the development of the subject has come with the increase in scientific departments, and especially with the immensely valuable results derived from research on the silkworm-rearing industry.

Control of Pests. The principles on which it is sought to control and check insect outbreaks developed very markedly during 1912-20 from "artificial control" based upon direct remedies and insecticides, to "natural control" based upon an understanding of the factors that produce outbreaks of pests and action arising from that knowledge. The first essential is a really intimate knowledge of the pest itself, its habits in all its stages, its senses and sense organs, its (almost) daily ways in the most minute particulars. It is now recognized that this must be carried to a degree of detail not contemplated before, and that upon the intimacy of this knowledge depends the success of any direct method, it being not sufficient to know that eggs are laid in such a way, in such number, at such a time, that the larvae moult so many times, feed in such and such a way and pupate, that the pupa takes a certain time, and then the adult emerges to mate, lays eggs and dies. An instance may be taken from the Codlin moth, whose larva hibernates in the winter in shelter; the full-grown larva leaves the fruit, crawls about, and for shelter will get under a flake of bark, spin a light cocoon and there remain. Will it do this on the trunk and branches, on the north (exposed) or the south (sunny) side, must the bark be dead or alive, will it pre-
by which man's artificial cultivation of crops disturbs the delicate balance of life, and produces those fluctuations or "waves" of insect abundance which the entomologist recognizes as pest outbreaks that he has to deal with. If he can he has to trace to their origin these waves of increase, and the modern science of entomology is to do this as far as possible. The problem is the simple one of determining if the insect is an introduced one; if it is, it has probably been introduced without the natural enemies that checked its original home; and it is due to the work of an Englishman, R. C. L. Perkins, that this principle was applied in the Sandwich Is. against the insect so seriously destructive to the sugar-cane, the Cane-leaf-hopper (Perkinsiella saccharicidia). Its natural home is Australia. Study of the insect there showed it to be kept in check by a variety of insects, some of which were industry. In the Sandwich Is., eventually reducing the insect to the status of an ordinary insect, not a pest. This principle has been followed in other cases, notably the Fluted Scale of Orange (Teaca purchasi), the Gipsy Moth in the United States (Porthetria dispar), the Brown-tail Moth (Eupterctis chrysorrhoea) in the United States, the Sugar-cane Cockchafer of Mauritius (Phyllalus Smithii); it is the natural principle to proceed upon in the case of introduced insects and it has been developed especially in the United States, which owes to importation so many of its principal pests.

In other cases the disturbance and consequent occurrence of pests due to violent alteration in the proportions of the crops grown. Where there has been, as in England, a fairly uniform mixed cultivation of many crops over a long period, a balance of life has been established as under natural conditions; but where the variations in supply cause fluctuations in prices and large areas are put under other crops, this balance is disturbed, and there are waves of insect pests; naturally this manifests itself far more quickly under tropical conditions, where there are several broods of an insect a year, than under temperate conditions, where there is only one brood a year with the longer period, and it is partly this factor which makes for the very great loss from pests in that climate.

Having obtained any data as to the factors producing an outbreak, it is to be seen whether there is any way of quickly restoring the balance of life, or of so modifying cultural practice as to avoid the outbreak, and it is to be seen that the entomologists' attention is specially directed. The nature of the rotation of crops, the time of sowing, the use of early or late maturing varieties, these are important points; a further point is on what food plants or under what conditions the insect spends the time when the crop is not on the ground or is not fresh, which might in some cases make means very definite the value of the old maxim of clean cultivation, of growing only crops, with nothing on the land besides—no weeds, no alternative food plants, no "volunteer" plants. This is particularly the case with permanent cultivation such as fruit or such tropical crops as tea, coffee, cocoa, rubber and the like.

A point of great interest, which has as yet been scarcely touched, is that of "immunity," whether natural or induced. The discovery that American vine stocks were immune to Phylloxera, since they had always been exposed to it in America, whence Phylloxera came, did much to save the European vine industry; there are stocks of apple which are strictly immune to the root forms of woolly aphis (Schizoneura lanigera); vigorous plants growing under good conditions are frequently "im- mune" to attacks of such sucking insects as Leaf-hoppers (Jassidae), Scale Insects (Coccidae), Psyllidae and White Fly (Aleurodes). This question is far more developed in the case of Fungi (e.g. rust in wheat) than in that of insects; but it is a question which has come more definitely to the front during the past few years. It is not at present possible to induce immunity, but it may soon be possible to do so.

The fourth point in the entomologists' plan is that of the utilization of direct remedies, such as insecticides, fumigants, and soil insecticides. There was a considerable modification in opinion during 1920-21, and but for the large propaganda insecticide firms, the use of these artificial methods would have considerably declined. In the actual practice of spraying there have been few improvements and no radical changes. The arsenates, nicotine, lime, sulphur, soaps, these are still the principal insecticides; heavy oil emulsions have replaced paraffin, and the present tendency is to seek further shield for new and more powerful substances. There have been little systematic investigation, and there are only differences in detail in the use of insecticides and spraying-machines.

A feature of the development of the subject has been the broadening of knowledge among farmers, fruit-growers and even the general public, particularly in the United States, but also in Europe. In England, publicity and propaganda campaigns have been mainly concerned with the house fly, and there is still great ignorance about other pests; but this is passing with the increase of nature-study and the greater development of natural-history societies in schools.

Legislation.—Experience of the value of legislation in regard to the formerly great stress laid on the value of quarantine, the very definite simplification of the laws and enactments relating to insect pests, and a conference of delegates of 26 nations in Feb. 1914 at Rome formulated the Rome convention, which still further simplifies the principle governing the regulation of plant traffic from country to country. Almost every country now seeks to protect itself against new pests by introducing quarantine regulations, and if a country has such a pest as a destructive agent it can prevent the importation of it; this has been done by prohibiting the import of plants from a specified locality, of specified plants, of anything likely to cause disease, of insects, or of packing with infested articles; so, for instance, a sugar-growing country prohibits the importation of cane, and also, perhaps, of all plants from an area in which a virulent insect pest is active.

An alternative is to permit importation under conditions; ports of entry must be designated, and only such cargo as are certified as free from pests may be landed. If this is done plants imported may be limited to special times, or must be in new packages, or only in postal packets. The most general condition is inspection on arrival, by a competent officer, who may order their removal, removing the pest, or the plant is refused as infected. On arrival, this being done usually with hydrocyanic-acid gas generated from potassium cyanide and sulphuric acid, the amount used being about 2 oz. cyanide per 100 cub. ft. space for half an hour. As many cases, these plants must be kept under supervision by a Government botanist until it is certain that they had no disease. The objection was that the plant was diseased, the disease was brought into the country and whatever the supervision of the botanist, might get loose and spread; an alternative to quarantine was following up; the importer notified the arrival of his consignment, the exact state of the plants, and he was visited at intervals in order to destroy them if any disease developed.

A more recent principle is that of admitting plants without delay if they were accompanied by a certificate that they had been inspected, and if officially certified as free from pests. The importing country, and were declared free of pests scheduled by the importing country, or that they had been grown in an area declared free of the scheduled pest. The latter applied particularly to Phylloxera of vine; the former applies to the schedule of pests drawn up in each country, and this is the principle accepted by the Rome convention of 1914. Each country is to draw up a schedule of pests which are not epidemic in that country but which are recognized pests, and any country sending plants will have an adequate service of trained inspectors to give certificates that either the nursery sending the plants, or the actual consignment, is free of the pest. If a pest is declared so that "Phylloxera" may not be brought in, this is not the whole pest, but "Phylloxera" of which there are many species, so that the consenting countries bound themselves to create this, and this has to some extent been done in Great Britain, France, Italy, Holland, Belgium. The United States refused even to discuss the question, and has adopted drastic inspection and certificates of freedom from pests, but experience has shown it that few certificates are reliable and it is not willing to receive consignments from any country whose control has been small, not really of established value (e.g. those of Holland are accepted).

A further difficulty is that plants may come from countries not able to give certificates, e.g. Tibet, and these plants are very liable to disease. Further, in case of wrong arrival, an effort has been made to enable such plants to be grown under quarantine when imported by a firm of established reputation in Great Britain, France, Italy, Holland, Belgium. The United States refused even to discuss the question, and has adopted drastic inspection and certificates of freedom from pests, but experience has shown it that few certificates are reliable and it is not willing to receive consignments from any country whose control has been small, not really of established value (e.g. those of Holland are accepted).

Internal legislation, prescribing action on the part of growers, has made progress during recent years, and has been very much simplified. In Great Britain the sale-of-diseased-plants order of 1921 puts a penalty on the sale of "substantially attacked"
by a number of common insects and fungi. The actual enforcement of the order generally would require the services of thousands of officials, and would be impossible, but it is designed to give powers to the Ministry of Agriculture to proceed against any nurseries notorious for distributing diseased plants, and also to enable the Ministry to act freely in case of a new pest being introduced.

In America and the British Dominions such legislation is common. It prohibits the possession of diseased plants, the sale of infested plants, the sale of plants from an infested area, the removal from declared areas of plants, cases, bags, packages, etc. and also the presence of infected persons; it is often aimed entirely at nurseries and seeks to control the distribution of plants; nurseries must be registered, must be inspected at fixed intervals, must send out certificates of inspection with all consignments, and may, if infected with a prohibited pest, be quarantined; and therefore the usual provisions as to entry, to prescribing remedies, to penalties for non-compliance. The treatments of infested plants by the owner or by the State are prescribed, or the destruction, isolation or confiscation of infested plants. Further provisions are to compel destruction of insect breeding-places, and to prohibit the planting in infested land or within a certain distance of infested land.

In many countries, as in Great Britain, the occupier of land has to notify the occurrence of any of the scheduled pests to the Ministry of Agriculture and in some tropical countries there is a specific prohibition of the practice of driving locusts to one's neighbour's land. The tendency is to rely less on legislation and penalties, and to move more towards education and reason. The spirit which enabled a Government to close all schools, courts, places of business, etc., while a single pest was present focuses the entire country in only the least civilized areas of the earth, and the campaign against pests is carried on by propaganda, education and the arousing of public spirit.

**Cotton.**—The importance of insect attacks as factors in the growth of crops varies from the case of cotton, where the insect is a dominant factor, equal in value to soil and climate, to that of rubber, where as yet scarcely any serious insect pest has arisen, certainly none equivalent to the fungid diseases that exist only in the least civilized areas of the earth, and the campaign against pests is carried on by propaganda, education and the arousing of public spirit.

Cotton was formerly produced mainly in the southern United States. There the bollworm was the chief pest, causing loss that now averages some $2,600,000 a year but in 1898 the Boll Weevil appeared in Texas, and in 1905 Dr. L. O. Howard, Chief of the Entomological Bureau of the United States Department of Agriculture, wrote:—"The Mexican Cotton Boll Weevil has the unique record of developing in less than 20 years from an obscure species to undoubtedly one of the most important economically in the world. There was a hope that the increase in cotton in the United States would keep pace with the world's demands; now the weevil has rendered this impossible." The damage is now averaged at about $5,000,000 annually. But there is worse to come. Another pest has been known in India since 1844; this is the Pink Bollworm which reached Egypt between 1913 and 1916. There they had already had another bollworm but by 1917 the Pink Bollworm was destroying on the average 7½% of the crop, causing a loss of $8,000,000 a year, and this pest reached Turkey in 1920. At the time of the establishment of the U.S. Department of Agriculture it was established there in 1921, and in a few years it seems likely to destroy 2,000,000 bales, worth, say, $60,000,000.

Nor are these the only pests of first-rate importance. In India the Cane Borer, a pest which attacks sugar-cane and cotton, has destroyed an area of 29,000,000 acres of cotton in the Punjab and Sind, and it was known in 1921 only in India, Egypt, the United States and East Africa.

The chief cotton-producing countries are listed here with the pests they have; what if the pests spread to all? The output is that of 1917:

**Ecuador** (see 8,010).—The population of Ecuador was not altered much during the period 1910-20. Immigration was very slight. No census had been taken. In 1920, an official estimate gave the pop. as 1,500,000.

**Government.**—In a message to Congress in 1914 President Plaza G. raised the question whether or not presidential government in Ecuador had met the test of experience. Upon that subject he held conferences with the members of a special committee of the Chamber of Deputies and hoped that, as a result of those conferences, a joint resolution would be adopted by both Houses of Congress to draw up a project for the reform of the constitution of 1906. The Senate, however, did not favour this action. President Plaza G. again mentioned the urgent need of constitutional reform in his message to Congress of Aug. 10, 1915. Upon the following day he addressed a special message to Congress proposing the political reorganization of Ecuador by the introduction of the parliamentary system. Annexed to his message were certain proposed amendments of Ecuador's fundamental law which were framed to accomplish this end.
These, however, were not accepted by Congress. On June 28, 1917, President Baquerizo M. promulgated a decree regulating the traffic in cacao. In the Inter-American Peace Conference of 1910, the government decided to be charged with internal administration, municipalities, police, prisons, houses of correction, public works, railways, sanitation, concessions, and with government of the province of Oriente and the Galápagos Islands. The Minister of Foreign Relations was to have direction of international affairs, consuls, post-offices, telegraphs, telephones, immigration, and colonization. The Minister of Public Instruction was to be charged with public instruction, statistics and civil registry, fine arts, theatres, charity, justice, religion, agriculture, improvements and national forests. The Ministry of Finance was to supervise the administration of the national resources, taxes, public credit, the administration of national property, commerce, public lands and trade marks. The Minister of War and the Navy was to control the regular army, reserves, war vessels and lighthouses. By a decree of Sept. 22, 1910, the control of the province of Oriente and the Galápagos Islands was transferred to the Minister of Foreign Relations.

Communications.—In recent years measures were taken by the national Government for the improvement of roads, most of which were merely trails or bridle-paths. Some internal traffic was carried on by mule, by gondolas on the banks of the rivers and the branches of the Amazon. The most important railway was the Guayaquil and Quito, opened to traffic in 1908. To shorten the route between the capital and the Government planned a railway between San Juan Chico and Riobamba. Other railways were projected, and in some cases partly completed. A contract was signed whereby a railway was to be built from Quito to Ibarra, thence to Balcarce, and from there to Santa Elena. These lines were projected and construction was begun on a section of the roadbed near Ibarra in Aug. 1917. Construction was begun also on a railway between Ambato and Curaray in Jan. 1913. By June 1918, the section between Ambato and Polobio was practically completed, enabling in 1914 work was begun on a railway between Huigra and Cuenca. After some preliminary surveys had been made the Government decided to begin work on a railway between the highland and the coast. The line from Quito to Salas, and another was being constructed in 1920 between Bahía de Guayaquil and Guayaquil. During a large portion of the year 1920 Ecuador was almost isolated from the world by sea, for, because of the prevalence of the bubonic plague and of yellow fever at Guayaquil, that port was avoided by large vessels. In April 1914, a radio station was officially opened at Guayaquil, the wireless communication was established with a small station at Manta. Sanitation.—Sanitary work was begun seriously when, in Dec. 1913, a contract was signed between the Ecuadorian Government and the Rockefeller Foundation, for the establishment of an instalment of a modern water system. A yellow-fever commission of the Rockefeller Foundation made a scientific study of Guayaquil in 1916. A fight against the fever was, however, postponed because of the appearance of a new strain of stegomyia Col. G.D. proposed a scientific attack upon the aegyopis mosquito in Ecuador. So successful was this campaign that, on May 27, 1920, the director-general of public health at Guayaquil issued a statement that yellow fever had been eradicated from that city as well as from the towns in the provinces of Guyas, Los Ríos, and El Oro, where it had been endemic.

Foreign Commerce.—There was some fluctuation in the imports and exports from 1910 to 1918, but not much increase. Figures compiled by the Pan-American Union show that in 1913, the imports of Ecuador amounted to $8,835,689 U.S. currency; and that her exports in that year amounted to $15,789,367. In 1918 her imports increased to $11,115,000, while her exports came to $18,360,741, in both cases a decrease. Her import and export trade with the United States has grown greatly at the expense of trade with European countries. In 1919 her exports to the United States amounted to $2,817,754; in 1918 they aggregated $2,632,761. In 1917 her total export trade of $15,789,367 her exports to the United States came to $3,532,728, while in 1918 they amounted to $10,292,150. Among the principal items sold to the United States in 1918 were coconut (other than silk), food-stuffs, hardware, machinery, paper, and perfumes; while her most important exports were cacao, ivory nuts, Panama hats, coffee, gold and wool. In the navy of Ecuador was composed of a destroyer, a cruiser, a coastal guard vessel, a submarine, a launch, and a tender, with a small personnel. The territory of the republic had been divided into eight districts, each of which was in charge of army officers. A general staff was in control of the regulars, made up of 10 battalions of infantry, two squadrons of cavalry, three regiments of artillery and a company of engineers. The regular army including officers, numbered 5,200.

Education.—Although by a law of Ecuador primary education was free and attendance compulsory, the percentage of illiteracy was high. In 1914 and 1915, succeeded by Dr. Francisco Azpilcueta, there were 8,778 students. In addition there were schools for professional or technical training: normal schools, a school of agriculture, schools of mines, schools of trades, and other. A more popular type of education was being developed at the University of Quito, and at the national colleges attended by 1,778 students. In 1916 and 1917 decrees were issued reorganizing the curricula of normal schools, of the school of arts and trades at Quito, and of the national military academy. In 1917 the President decreed the establishment at Quito of a museum of archaeology and of a national gallery of painting and sculpture. Higher education is carried on in universities at Cuenca, Guayaquil and Quito. The central university of Ecuador at Quito is in the hands of the college of doctors of the faculty of law. The younger universities at Guayaquil and Cuenca have colleges of law, medicine and pharmacy.

Finance.—In Ecuador's budget for 1914 the revenues and the expenditure were balanced at 20,226,794.85 sucre. Revenues from import duties which were estimated at 10,883,055.02 sucre came only to 7,707,191.26 sucre. The end of the year left the Government with a deficit of 3,357,907.86 sucre. This deficit would have been larger but for a 4% income tax imposed on the postmortem of some payments. In 1915, partly because of the decrease in import revenues due to the World War, Ecuador had to borrow 20,000,000 sucre from local sources. Dr. Guillermo Vaca, Minister of Finance, decreed on April 1916, a domestic debt amounted to 34,001,651.04 sucre, while her foreign debt came to 18,923,508.10 sucre, making the total debt $2,025,159.14 sucre. Of the domestic debt 131,547.27 sucre and of the foreign debt 601,154.41 sucre were interest unpaid. The minister stated that up to Dec. 31, 1917, the service of the foreign debt in interest and amortization was in arrears 10,710,276.55 sucre, because of the decrease in revenues.

History.—Gen. Eloy Alfaro's term as president expired Aug. 10, 1918. On Aug. 11, however, he resigned the presidency and his resignation was accepted by Congress two days later. Emilio Estrada, who was elected in Jan. 1911, was inaugurated Aug. 31, but died Dec. 21 following. Dr. Carlos Freile Z., president of the Senate, who had served as chief executive upon the resignation of Alfaro, again assumed executive authority which he exercised until March 3, 1912. Meantime a revolt, having as its object the overthrow of the legal Government and the establishment of Gen. Alfaro as supreme magistrate, was quelled. That leader was taken out of the penitentiary at Quito by the infuriated populace and killed in Jan. 1912. Acting-President Freile, a half-brother of Gen. Eloy Alfaro, Marin, speaker of the Chamber of Deputies, who exercised presidential authority from March 6 to Aug. 10, when Dr. Alfredo Baquerizo M., president of the Senate, took the reins of power and served as president until Aug. 31, 1912. Upon that day, as the result of a special election held in April, Gen. Leonidas Plaza G. was inaugurated as president for his second term. He selected Alfredo Baquerizo M. as his Minister for Foreign Affairs, who was succeeded by R. H. Elizalde. The first years of his administration were stormy, being marked by revolts and civil war. Even after a troublesome insurgency in the Oriente province, Carlos Costas Tarqui, an official of the government soldiers in Feb. 1915, his followers were loath to lay down their arms. In elections held in Jan. 1916, Alfredo Baquerizo M., a Liberal, was elected president: he was inaugurated on Aug. 31. Various steps were taken by the President and Congress to lessen the economic and fiscal strain due to the World War. Embarrassing disputes arose between Ecuador and the Guayaquil & Quito Railway Co. about the execution of their engagements. On Aug. 31, 1920, Dr. José L. Tamayo was inaugurated as president for the term to Sept. 1, 1921.
should be appointed to place marks along that line where natural boundaries were not sufficient and to make such minor reciprocal compensations of territory as might be necessary to fix the boundary exactly. That commission began the delimitation of the Colombian-Ecuadorian frontier line about a year later, and it completed the task by July 1919.

The World War.—On Aug. 17, 1914, the Ecuadorian Government issued a decree announcing that it would observe the strictest neutrality in the World War and stating that it would adhere to the Hague Convention of 1907 and to the general principles of international law. Soon afterwards France and England complained that Ecuador had permitted violations of neutrality, allowing German war vessels to use the Galápagos Is. as a naval base. On Nov. 21 1914, Minister Elizalde issued a justification circular to American chancelleries about the neutrality of his Government. Seven days later President Plaza G. issued a decree containing certain regulations that were to be observed by all neutral vessels reaching Ecuador. In Oct. 1917, when the ex-German minister to Peru, von Perl, who was also representative of his Government to Ecuador, expressed his intention to proceed to Lima to the meeting of the Triple Entente, it was informed by the Ecuadorian minister at Lima that his reception by Ecuador would be incompatible with the principles of American solidarity. On Dec. 8 following, the Minister of Foreign Relations sent cablergrams to Ecuadorian legations stating that Ecuador had severed relations with Germany. As a party to the Treaty of Peace with Germany, Ecuador had the opportunity of becoming a member of the League of Nations. At the instance of its committee on foreign relations, on Nov. 1 1920 the Ecuadorian Senate postponed action on the League until the next meeting of Congress.

The number of municipal wards has been increased from 16 to 23 and the number of members of the town council from 50 to 71—three representatives of each ward in addition to the two ex officio members, the mayor and the commissioner of the police. The four Leith wards form the parliamentary division of Leith, and the four new suburban wards are in the northern division of Midlothian and Peebles. The powers of the board of trustees under the Edinburgh School Board Act of 1866 and 1867, the Edinburgh and Leith corporations gas commissioners are now exercised by the town council. The total valuation, as extended, is £4,696,504.

Upon the inauguration of the first Edinburgh Tramway Co., for £50,000, and the transfer took place in July 1919, at the expiry of the company’s lease. The work of replacing the system of cable cars was begun in 1919. A tramway extension to South queensferry and Port Edgar was sanctioned by the town council in 1917. The most important addition to the public parks was the establishment of the Zoological Society of Scotland, in conjunction with the town council, of a zoological park at Corstorphine hill, which was opened in July 1914. The site, which extends to 74 ac., was purchased by the town council and freed to the society. About 27 ac. have been laid out in a manner designed to give expression to the latest ideas about the acclimatization and exhibition of wild animals, and to show the inmates living under conditions which invite them to display their natural instincts and habitats. The park contains a large and well arranged collection, and is then completely termed "Zoo." Large corporation markets and slaughter-houses were opened in 1910, and in March 1914 the Easter Fair, bequeathed to the city by the loco. 1858 by Miss Johnstone, was reopened.

Additions to the large number of public memorials in the city include a Black Watch memorial (1910), a statue of Dr. Guthrie (1910), a life-size statue of Thomas Carlyle (by Boehm) presented to the National gallery by Lord Rosebery in 1916, and a Gladstone memorial (1917). In 1913, Lord Rosebery presented to the city the historic house in the Lawnmarket known as Lady Stair’s house; and in Oct. 1921 the birthplace of James D. Thomson, 8. Howard Place, was purchased as a memorial by the R. L. Stewarts, the King and Queen dedicated the new chapel of the Order of the Thistle, in St. Giles’ cathedral. The new Freemasons’ hall was opened in the same year. The western entrance of St. Mary’s church (carrying out the original plan of Sir Gilbert Scott) were completed and dedicated in 1915 and 1917. Recons’uctions of the national museum of antiquities and of the national portrait gallery were made in progress in 1920, and a scheme for a national war memorial was provided for the utilization of this purpose for Edinburgh castle, which was to be covered as barracks.

Royal residence at Holyrood has emphasized the social position of Edinburgh as the capital of Scotland, and its importance as an administrative centre tended rather to increase than to diminish, as new government departments were established. Its commercial importance has likewise increased, and the Scottish banks and insurance companies and the North British Railway Co., upon the continuation of its traditional position as the chief centre for the administration of Scottish landed estates and property, are of equal importance. One of the features of the high courts, Edinburgh firms of writers and Chartered accountants are entrusted with a large proportion of Scottish legal and administrative work.

During the World War the proximity of Edinburgh to Queensferry and Port Edgar and the great battle cruiser and destroyer base in the Firth of Forth gave it strategic importance in the naval campaign, and its position depends on the protection of the Scottish banks and insurance companies and of the North British Railway Co., upon the continuation of its traditional position as the chief centre for the administration of Scottish landed estates and property, are of equal importance. One of the features of the high courts, Edinburgh firms of writers and Chartered accountants are entrusted with a large proportion of Scottish legal and administrative work.

EDINBURGH—EDMONTON

EDMONTON, Canada (see 8.946), first established as a trading post by the Hudson Bay Co. in 1795, remained little more than a village until 1901. Since then its growth has been rapid, and in 1920 it had a pop. of 17,700. It is the terminus of the Calgary and Edmonton branch of the Canadian Pacific Railway. The city council consists of a mayor and 10 aldermen elected from the city at large—the mayor for one year and aldermen for two—and the mayor and two commissioners act as a board for administration. There is also an elected board of public school trustees, and another elected board of trustees for the separate (Roman Catholic) schools. The Supreme Court sits at Edmonton several times a year. Edmonton

*These figures indicate the volume and page number of the previous article.
is the chief educational centre of the province, and besides the university of Alberta has a branch of the Normal school, Alberta College, Westminster Ladies' College and a Presbyterian college.

Edmonton has extensive live-stock, dairy, milling and packing industries. There are 9 coal mines within the city limits and 24 on the outskirts, giving a yearly output of 1,680,000 tons. Gold, silver and oil are also found in the neighbourhood.

EDMUNDS, GEORGE FRANKLIN (1858-1910), American lawyer and political leader (see 8.949), died in Pasadena, Cal., Feb. 27, 1910.

EDUCATION (see 8.951).-In the sections on Education, in the articles on various countries, mention is made of the progress made there during 1910-20. Here a general account is given of progress in the United Kingdom and the United States.

(1) UNITED KINGDOM

The first two decades in the 20th century opened a new era in the history of education in the United Kingdom. In England and Wales the Act of 1902 not only combined in a national system of elementary education both voluntary and state schools, but laid a wider foundation for a national system of secondary education. It was an Act which represented the spirit of compromise. It gave a new expression in one most important group of institutions to the English genius of harmonizing diverse elements within the State. At the same time the Act marked a great experiment in local government, by transferring the responsibilities for education, elementary and secondary, from the ad hoc school boards in England and Wales to the municipal and county councils, and bringing education thereby into closer relations with the other sides of civic policy.

It is necessary to the understanding of the development of English education between 1910 and 1920 to keep in view this fundamental change at the beginning of the century. For during these first 10 years the system of education was taking on a new character, which reflects a wider conception of education. The school becomes more publicly recognized as a great centre of social influence. Provision is made by statute to secure in necessitous cases that school children shall be properly fed. Inspection of the health of school children becomes a responsibility of the local education authorities. Increased attention is directed to the special problems of physically and mentally defective children. The care also for the leisure hours of the child and the provision of play centres become part of school life; and the creation of juvenile employment organizations, in connexion with the school, express the continuity of the elementary school with the after life and care of the child. Side by side with these developments there can also be observed a remarkable growth of corporate life amongst school children themselves, and of voluntary organization of social workers, anxious to help in the ways of the juvenile community. It is not too much to say that a broader human outlook marks English and Welsh elementary education in the first 20 years of the 20th century. And this is no less true of education in Scotland.

Meanwhile, a deeper sense of the need for secondary and continuation education was also awakened. The growth in the number and variety of continuation classes under the local education authorities, the rise of the Workers' Educational Assn. and of the university tutorial classes system are all signs of the new order in education. What this means in progress can only be realized by looking backward and reflecting how modern is the growth of the system of English public education. When the mind follows the story of education in England from 1831, when first smouldering efforts made by Parliament for public education, the opening decades of the 19th century stand out above all as calling into consciousness a deeper and wider idea of national public education.

The second decade of the 20th century marks in a very peculiar degree the continuation and working out of the movements which had manifested themselves in the preceding 10 years. The great Act of 1918, with the corresponding Education (Scotland) Act, extended and deepened the work of the 1902 Act in England and Wales and of the 1908 Act in Scotland. The principles of organization and the ideas of the relationships between the school and society, developed in the legislation and administration of the period 1907 to 1910, were being progressively carried out in the years immediately following. But the second decade of the 20th century is broken and deeply affected by the years of war. In these 10 years three periods may be distinguished. The first from 1910 to the outbreak of war in 1914; the second from 1914 to the Armistice period in 1918; and the third from 1918 onwards, the opening of the period of reconstruction and reaction. The first period, from 1910 to 1914, was marked by the steady progress of the new order. The sectarian controversy which raged for several years again subsided; a wider and deeper conception of educational relationships was growing steadily with a more general acknowledgment of the truth, that national education in England must combine a wide variety of opinions and a large freedom of curriculum. There was a new spirit of tolerance. The administrative authorities, central and local, had set themselves seriously to carry forward the extension upwards of the educational structure on the basis of the 1902 settlement. These are years of steady progress and widening outlook.

The second period is that of four years of war, a period in which there was much less check to the continuous work of school education than might have been expected. But necessarily the schools suffered by reason of the war. The young male teachers went off on service, many school buildings were required for military and emergency purposes, the restrictions as to the employment of children were relaxed. Yet the war gave a new impulse to school life. Examples of service and sacrifice were present to the mind. There was a strain and seriousness which affected both teachers and scholars, and gradually, too, there came to the nation a fresh realization of the value of education in developing individual and national life. Already in the early years of the war expression was given to the demand for a wider and fuller system of national education, and steps were taken for the systematic consideration of the problem of "continuation education" and later of "adult education." Before the conclusion of hostilities the Departmental Committee on "Juvenile Education in Relation to Employment after the War" had presented its report and the Minister for Education had framed, and Parliament approved, a measure which ranks with the great Acts of 1870 and 1902. Moreover the army itself had become a great school or university and the experiments carried out with the forces at home and overseas in adult education were fruitful in stimulating new ideas as regards the scope and method of national education and in directing attention to the place which education should have in the life of men engaged in the military and naval services.

The third period from the Armistice onwards, presents, in less than three years, marked contrasts. In the first enthusiasm for reconstruction there was a vigorous forward movement with the view of bringing into operation as rapidly as possible the provisions of the 1918 Acts. It was more than a period of reconstruction; it was a time of new national ideals. The army, the civil service, and the public library organization in the years immediately preceding the war was being linked more closely than before with the educational system. It must also be remembered that already before the war a stronger national spirit had been evinced itself in education in the several parts of the United Kingdom. England, Wales, Scotland, Ireland, each was shaping on its own lines its national system, and the comparison of the development in the several states is rich in instruction for the student of mod-
ern education. But while there has been an increasing measure of administrative devotion in education the main lines of progress are common to all parts of Great Britain, though to a less extent to Ireland. England, which had been in the past more backward in its general education provision of elementary and secondary education than Scotland or Wales, has perhaps shown a greater advance during these years than any other part of the United Kingdom, and has not only led the movement for an obligation in the form of continuous education to the age of 18, but has opened a wider vision of adult civic education and culture.

Education in England—When the position of education in England was reviewed at the opening of the second decade of the 20th century, it could be seen that the system established by the Act of 1902 had become firmly established. That Act had done three noteworthy things. First, it had abolished the school boards and transferred their powers as regards education to the county and municipal councils. Secondly, it brought the voluntary elementary schools under the local education authority and assisted them by support from local rates, while leaving them a partial measure of control in management. Thirdly, it had given the new local education authorities power to provide for schemes of secondary education and to levy rates for this purpose. Since 1902 there had been no important change in the constitutional machinery of the educational system in England. The Act of 1918 in England called into being no new order of local education authorities, as had been done by the corresponding Act in Scotland. In 1921 there were in England nearly three hundred local education authorities, with powers of making schemes and levying rates, standing in direct relation to the Board of Education, whereas in Scotland the number of local education authorities had by the Education Act (Scotland), 1918, been reduced to under 40. The consolidating movement had, therefore, progressed much further in Scotland than in England.

As regards elementary education, already in 1910 the system in England had become well established. Attendance at school was required up to the age of 13, and by the Act of 1918 it was obligatory on all up to the age of 14. The average attendance has varied from 86% to 89%. Apart from the normal period of the war there has been a gradual diminution in granting of exemptions from school, and the Act of 1918 abolishes whole or partial exemption under 14 years. There has been little change in the number of public elementary schools in England. In 1903 there were 18,887, and in 1919-20 their number was 19,070. But there has been a considerable change since the Act of 1902 in the number of council and voluntary schools respectively. Since 1903 the number of voluntary schools has fallen from 13,438 to 11,635, whereas the council schools have increased in number from 5,049 to 7,433 in 1920. The total average attendance of pupils in public elementary schools in England, in 1920, was 4,795,672. In respect of the provision of teachers the period also shows relatively little change, but gradual improvement. The number of teachers, per 1,000 pupils in average attendance, in 1910-11, was 36-9, of whom 19-01 were certificated, 8-10 were uncertificated, and 2-89 other adult teachers. In 1919-20 the number of teachers per 1,000 scholars was 30-4, of whom 21-8 were certificated, 6-3 uncertificated, and 2-3 other adult teachers. In certain other matters, however, there had been very marked advance. In the years 1907-10 steps had been taken to secure to the local education authorities in England and Wales powers to establish medical inspection, to provide meals for school children where this was considered desirable, and to organize information in cooperation with the labour exchanges for the guidance of children as to the choice of employment. The Act of 1918 had also been extended for the purpose of dealing with the mentally and physically deficient and a much wider recognition was secured for "after care" work among school children. A wider conception of the school and its responsibilities was thus steadily emerging. The Act of 1918 has carried the movement forward and has converted these powers of local education authorities into a duty to look after the health and physical condition of the children in public elementary schools. A system of school health services providing not only medical inspection, but also treatment, is now well on the road to accomplishment. Again, as regards the physically and mentally defective and epileptic children, the Act of 1918 requires that the local education authorities shall ascertain what children in their areas are thus afflicted and shall make provision for their education. It is also worthy of note that the Act of 1918 lays particular emphasis on the great importance of healthy recreation. The Act enables local education authorities, with the approval of the Board of Education, to supply, or maintain, or aid (a) holiday or school camps—especially for young persons attending continuation schools, (b) centres and equipment for physical training, playing fields, school swimming-baths, (c) other facilities for social and physical training in the day and evening. A very large proportion of the proposals already submitted have been concerned with holiday and school camps. In this connexion it may be noted that the 1918 Act especially encourages local education authorities to avail themselves of voluntary services, particularly in the development of the recreative side of school life, and the work of the Juvenile Organizations Committee in promoting healthy recreation is a sign of the new spirit which is now steadily pervading the educational system. Thus with the great development in State action, the sphere of volutary action is also increasing. The ideal education policy requires voluntary and state agencies acting in close cooperation.

Secondary education in England presents a very different situation. It might almost be said that, until the opening of the 20th century, there was no national system of secondary education in England. The number of secondary schools, apart from the residential public schools and the old grammar schools, were few and the gateway from the elementary schools was very narrow. But the Report of the Royal Commission on Secondary Education in 1895, the Education Act of 1902, and the Regulations for Secondary Education in 1907, are stages in the foundation work of a new order, and during 1910-20 considerable progress was achieved in building up the framework of a national system of secondary education. The great public schools and grammar schools which have been so distinguished a feature of English higher education retain their independence and their well-deserved prestige. Like the ancient residential universities of Oxford and Cambridge, their position has been strengthened rather than weakened by the growth of new institutions. But the public schools (as the term is understood in England, meaning Eton, Harrow, and so forth) can only supply education to a very limited number and at a high cost, while there is a steadily increasing demand that there shall be easy provision of secondary education for all children who are willing and able to avail themselves of it. By 1911 there were 862 secondary schools on the Board of Education grant list, with 141,000 pupils; in 1920 there were 1,621 schools, with 282,005 pupils. There were also in 1911-12 secondary schools recognized as efficient but not on the grant-earning list, with over 17,000 pupils—while in 1920 there were 201 of these schools with 36,771 pupils. In the case of the schools on the grant list normally 25% of the places must be free; the actual proportion was considerably higher.

In considering however such figures of secondary education a caution is necessary. By far the greater number of pupils attending these schools are under 16 years of age. In the session 1919-20, out of the total of 283,005 pupils in the secondary schools 83,386 were under 12 years of age, 177,088 were of 12 and under 16 years, while only 20,631 were 16 years of age and over. Thus for all except a very small percentage, secondary education ends before 16 years of age. When it is recalled that there are close to 7 million children in England and Wales 12 years of age and under, that the number leaving the elementary schools each year must be close on 600,000, it is evident how restricted the national provision of secondary education still remains. This in itself emphasizes the importance of the step taken in 1918 to provide obligatory continuation education. It is the case that in England the demand for secondary education has considerably exceeded the supply, but it is also true that the pressure of economic circumstances and the tradition of getting to work early will prevent a very large number of children in the elementary schools from
continuing or desiring to continue as full-time secondary school pupils. For the immediate future, therefore, a general system of continuation schools is the best hope of imparting the benefits of higher education to the majority of young people.

Already for many years local education authorities have been providing increased facilities for evening students—especially in technical and manual instruction. The circumstances of the war, however, stimulated greatly the public sense of the value of a much more complete system of continuation education, and brought into relief the defects of this side of educational organization when compared with the system of continuation education in Germany. Accordingly in 1916 the Minister of Education (Mr. Arthur Henderson) appointed a Departmental Committee on Juvenile Education in relation to Employment after the War. This committee submitted in its final report, in 1917, recommendations which the then Minister of Education (Mr. H. A. L. Fisher) largely embodied in a bill. Modified in certain particulars, this bill became the Education Act of 1918.

The Education Act of 1918 is, however, much more than a measure establishing an obligatory system of continuation education. It affects the whole scheme of elementary, secondary, and continuation education. It aims at the establishment of a “national system of public education available for all persons capable of profiting thereby,” and local education authorities have, under the first section of the Act, been called upon to prepare schemes setting out the provisions which they have made and propose to make towards this great end. The Act makes important specific changes in respect of elementary education, including the provision of “nursery” schools for children between 2 and 5 years, the raising of the compulsory school age to 14, with power to the local education authority, by by-law, to extend the compulsory age to 15, the abolition of part-time attendance, the provision of central schools and special classes of more advanced and more practical instruction for the older and more intelligent children in the elementary schools, and it emphasizes the social welfare side of education.

In respect of secondary education, the Act requires local education authorities to cooperate in providing for the purposes of Part II of the Education Act of 1902 (i.e. higher education), particularly in respect of (1) the preparation of children for further education in schools other than elementary, and their transference at suitable ages to such schools, and (2) the supply and training of teachers. Also the very important duties and powers with reference to provision for medical inspection and treatment of children in elementary schools are extended by the Act to secondary and continuation schools. The Act removes the limitation, under section 2 of the Education Act of 1902, on the amount to be raised by the council of a county out of rates for the purpose of education other than elementary. The Act of 1918 is not a continuation of the Education Act of 1902 and does much to complete the educational ladder.

But important as are these provisions, the main feature of the Act of 1918 is the institution of a compulsory system of part-time continuation education after the close of the elementary school period. “Young persons,” between the ages of 14 and 18, are required to attend a continuation school for 320 hours a year—unless able to claim exemption under the Act. This is the cardinal fact of the new Act. For the first period of seven years compulsory attendance applies only to pupils between the ages of 14 and 16 years and a local education committee may reduce the number of hours’ attendance to 280—modifications which give time to the authorities to make provision of schools and teachers whereby to meet the new situation. Owing, however, to contingencies, mainly financial, the operations of the Act have to a considerable extent been postponed. But these difficulties are temporary, and the experience of a national system of part-time work and part-time education will presently begin to furnish instructive evidence on the value of secondary education and continuation education respectively. It is a matter which merits the most careful observation in the next period.

In connexion with this very important subject it should be stated that in the session 1918-9, 125,000 students were in attendance at technical and special schools in England, while the number attending evening schools, chiefly under the local education authorities, exceeded 465,000. Attention should also be directed to the very notable and encouraging growth of classes under the Workers’ Educational Association and the university tutorial classes. England has been the home of this development, which is one of the most significant and encouraging signs of the times. In 1918-9 there were 87 one-year classes organized by the Workers’ Educational Association and 132 tutorial classes which are three-year courses. In 1919-20, the number of one-year courses had increased to 159 and of three-year courses to 182. These classes have been concerned mainly with economic history and theory, political and social science, history, literature, and in some cases philosophy. Summer schools are now held at many of the universities, for students from the tutorial classes. The growth of this movement has been shown by the activities of the Royal Commission on University Education in Wales." In their report this committee, while recognizing the valuable work
achieved by the Welsh Central Board, drew attention to the fact that the system of secondary education as it has developed in Wales has, owing to the division of authority, provided an organization which “is more elastic and less adaptable than that of England to the new demands likely to be made upon it by the Act of 1918.” They therefore recommend that the Welsh Intermediate Act, which being a “temporary” act has been periodically renewed, should be allowed to lapse, and that the intermediate schools and the municipal secondary schools should be brought under one local county education authority which should make provision for a completely co-ordinated scheme of secondary education within its area, and that a National Council of Education for Wales, representative of the Welsh universities and of the education authorities in Wales, should be set up under the Ministry of Education to which wide powers should be devolved in relation to the whole field of education, elementary, secondary and university. The aim is thus to provide in Wales a national educational authority more complete in its scope, and more representative in its constitution, than exists at present in any part of the United Kingdom. Meanwhile, as in England and in Scotland, there has been in Wales, especially since the war, a marked increase in the demand for higher education. The proportion of scholars who pass from the elementary to the secondary schools has, in nine years, risen from 35% to 45%. The further problem of the relation between the secondary schools and the university of Wales has received particular attention from the Royal Commission on University Education in Wales, and a scheme has been recommended whereby the county authorities shall assume greater responsibilities towards and receive increased representation in the National University, so that elementary, secondary and university education may be three closely related parts of one common system. The object in view is that no child on the ground of lack of means may be debarred from receiving the very highest education the nation can supply. Wales is thus in a most interesting and progressive stage of development towards a complete national scheme of democratic education. The growth of Welsh education is reflected in the great increase in the estimates of educational expenditure. In the year 1921–2 the estimates of net expenditure on elementary education in Wales amount to £4,999,804, while the estimates for higher education are stated at £846,716. Thus in Wales, elementary and secondary including continuation education already claim £5,845,000. So also in England the latest corresponding estimates (1921–2) provide for a net expenditure of £5,846,816 on elementary education and of £1,622,015 on higher education—the total figures for elementary education thus exceeding 77 millions. When the expenditure on elementary education is considered it is seen that considerably increased sums will be required for continuation education, and for further extension of university education, it will be seen how great and growing is the recognition of the service of education in England and Wales.

*Education in Scotland.*—The progress of education in Scotland in the period 1910–20 is in many respects similar to that which has been seen in England and in Wales. There was no Act for Scotland corresponding to the English Act of 1902, because conditions were different and at that time, as now, the local education authorities in Scotland were considerably in advance of those in England, particularly as regards financing and controlling secondary education. Scotland also did not follow the example of England by transferring the control of education from the school boards to her county and municipal councils. But at the close of 1908 the Education (Scotland) Act was passed, which can properly be regarded as marking an important stage in the development of Scottish education. For while it made no fundamental change in the educational system of Scotland the Act enlarged the powers and duties of local education authorities, and laid the foundations for the even greater Act of 1918.

In the history of education in Scotland, more than in any other part of the United Kingdom, there may be seen a steady development of the national system along clearly marked lines, and the Act of 1908 and, later, that of 1918 illustrate this character. First, the idea of separate ad hoc local educational authorities has been maintained and Scottish education thus continues to present an interesting comparison with the system in England established since 1902. But while the school board system was maintained in Scotland until 1918 the need of larger areas has steadily made itself felt, and in the Act of 1908 powers were given to school boards to combine for various purposes. This immediately took effect and in the report of the Scottish Education Department for the year 1910–1 it is stated that 13 unions of school boards have already been effected by voluntary arrangement, or by order of the Department. It was pointed out, however, in the same report that it was difficult whether this policy of combination of school boards could be carried very far, and that, however active individual school boards might be within their own areas, it is clear that the educational functions which transcend the sphere of the ordinary school board. This is particularly the case in respect of secondary education, where for effective work authorities controlling wider areas are necessary. The Act of 1918 carries out the work of enlarging areas and consolidating local organization, which had been thus tentatively advanced by the earlier Act of 1908. Secondly, as in England and Wales, there has been a continuous movement of transferring voluntary schools to the control of the statutory local education authorities. Such schools have not been so many or so important in Scotland as in England, but there has been a growing appreciation of the value of a national system which leaves room for a variety of type and which recognizes the place of the denominational school within the national system. The Act of 1908 assisted the transfer of voluntary schools to the school boards, and the completion of this movement has been secured under the Act of 1918. Thirdly, there has been a steadily widening conception of the educational duties of local authorities. The Act of 1908 enabled school boards to make provision, either by themselves or in combination with other school boards, for the supply of meals to pupils attending school within their district, to provide conveyance and travelling expenses in order to help children in outlying districts to attend school, to extend information to the employment open to children on leaving school, and to make provision for the maintenance and education of physically or mentally defective children. It gave powers also to school boards to secure medical inspection and supervision of children attending school. A special Act of 1913 added medical treatment to medical inspection, and the Act of 1918 made such duties obligatory on the local education authorities. Fourthly, there has been a consistent policy of building up a complete national system, not only of primary and secondary education but of continuation education, and of increased facilities of university or other special and higher training. When the Act of 1908 was passed provision for the extension of the system of continuation schools above the age of 14 years, requiring school boards to make suitable provision for such schools, and it thus prepared the way for a universal system of continuation education.

In two other respects also the Act of 1908 made a notable contribution to the better organization of Scottish education. It made provision for a national system of pensions and superannuation of teachers, and it consolidated and simplified the financial arrangements for the control and distribution of State grants by the constitution of the Education (Scotland) Fund.

The Education (Scotland) Act, 1918, which in many respects corresponds to the Education Act for England and Wales of the same year, may be regarded as the most important measure relating to education in Scotland since 1870. In one sense the Act only carries out developments which had been making themselves evident even before and especially after 1908. But the new stage marks the transition from tentative and partial efforts to that in which a wider envisagement of the whole field of national education is realized. A new order of local education authorities is called into being, in order to carry forward the work of developing the larger policy. In place of the 945 school boards in 1908, the Act of 1918 made provision for the establishment of 115 local education authorities. This has been made possible by making legislation, which had previously been possible only in limited areas, now applicable to the whole of Scotland, and by providing for a national system of local education authorities with a value of 1918. The Act of 1908 made provision for the establishment of a national system of local education authorities, and the Act of 1918 provided for the establishment of these authorities, which are now set up under the system of proportional representation, known as the transferable vote. To these local and county education authorities are
committed the powers of determining and controlling the whole system of primary, secondary and continuation education within their respective areas. To aid them in their work a system of school district management committees has been provided, each county being left to determine the number of such committees within its area. At the same time a representative National Council for Education has been constituted under the Act with the view of advising the Scottish Department of Education—an important step in bringing the central administrative organization into more direct touch with a representative body. Locally, this provision has been made for the establishment of advisory councils, which may stimulate on the one hand public opinion and on the other assist the local education authorities on special questions, particularly such as relate to economic and industrial conditions. The value of such local councils has yet to be proved, but the step taken is significant of the desire to bring the administrative system both centrally and locally as closely as possible into touch with public opinion.

In considering the great change which the Act of 1918 has made in the representative machinery of Scottish education, it may be well to point out that the working of the new machinery of government has not been without its difficulties. These have arisen partly from doubt whether the Act has not gone too far in abolishing the local school boards and in constituting in their place county authorities with school management committees, which latter bodies frequently are concerned with an area larger than that of the former school board. The school management committees are selected in a variety of ways, but they do not have behind them the simple strength and influence of popular election. The measure of the success or failure of this step will be found in the extent to which local interest in educational matters is sustained or weakened. That statutory bodies, exercising wide powers and controlling larger areas, were necessary does not admit of doubt, but the sweeping away of the local school boards may be found to have removed the most effective agency of stimulating local interest in education. The problem of securing the best form of representative machinery to deal with modern educational problems is a matter of very great importance, and its solution is yet by no means reached. For that reason the variety of experience presented in the United Kingdom is of peculiar interest. It may be added that, at the election for the new local education authorities in Scotland under the Act of 1918, only some 35 per cent. of the electorate voted, and close attention has been paid to the matter both in Parliament and at Westminster. The important fact is, that whereas the Act is a disappointing fact, and indicates the need, even in Scotland, of stimulating local interest in education. Another important constitutional aspect of the Act of 1918 was the change made in respect of financial administration. The Education (Scotland) Fund, as established under the Act of 1908, is by the Act of 1918 so regulated that the distribution of grants will give to the local education authorities greater discretion and flexibility in the expenditure of the moneys entrusted to them by Parliament. Instead of earmarking particular grants for particular services, the earning powers and claims of the local education authority as a whole are assessed by the Department of Education, and great latitude is allowed to the authorities in the disbursements of the sums, provision, however, being required for the maintenance of secondary education. There has resulted thereby a simplification of finance and an increase in the responsibilities of local education authorities. Apart from these important changes in the representative system and in financial administration the chief features of the Act are the raising of the full-time school age to 15 years and the requirement of obligatory continuation education up to 18 years of age. For the period of three years from the passing of this Act, the compulsory stage for continuation education is limited to 16 years, whereas in England seven years of age before the full policy of the Act can take place. The 1918 Act carried out to its logical conclusion a development which had been steadily advancing for many years throughout Scotland. Under the Act of 1908 it was lawful for school boards with the consent of the Scottish Department to make a by-law, requiring attendance up to the age of 16 at continuation classes. Already in the session of 1913-14, before the war interrupted normal develop-
The Scottish educational system is thus, to-day, strong and progressive and it maintains its distinctive independence. But it is a striking evidence of the way in which autonomy tends to follow similar lines of development, that at no time has there been so much in common between English, Welsh and Scottish education as at the present day. Left free, each system develops its own peculiar spirit and traditions, but it also tends to assimilate itself to the standard of other progressive systems.

Education in Ireland.—The system of education in Ireland has undergone no such marked development as was seen in England and in Scotland during the years 1919-20. Educational progress in one part of the United Kingdom must always be affected by the other parts, and in the development and steps that have been taken in Ireland as in other parts of the United Kingdom to make better provision for medical inspection, for the care of physically and mentally defective children, and for attending to the feeding of school children. But the condition of affairs has remained far from satisfactory in both primary and secondary education, and this is even more the case as regards continuation education.

In Ireland the control of education is divided between three public departments. The Commissioners of National Education deal with primary education, the Intermediate Board with secondary education, and the Department of Agriculture and Technical Instruction, with agricultural and technical education.

To a limited extent coordination is secured between the several departments, and the Consultative Committee of Education, on which all three departments are represented, is an evidence of this. But the autonomy of the several departments remains the outstanding fact. Education undoubtedly suffers from this division of control, and from time to time the question has been considered of uniting the various boards of educational administration in one system. In Nov. 1910 a comprehensive Education (Ireland) Bill was introduced by the Chief Secretary for Ireland, which among other things proposed to set up a single Department of Education in Ireland, but it failed to become law. In the past the educational problem has been constantly overshadowed by political considerations and no effective step has yet been made towards that unity of direction and completeness of supervision which can only be secured either by a single department or by the closest cooperation and harmony between the separate departments. The difficulties and disabilities arising out of division are further accentuated by the widely different systems represented by the three boards. The Commissioners of National Education who are responsible for the position of primary education in Ireland, and who, therefore, have by far the greatest task placed upon them, represent a centralized and bureaucratic system of administration such as cannot be paralleled in any other part of the United Kingdom. As primary and secondary education are not matters which have been handed over, as in England and Wales, to the local county and municipal authorities or to local education ad hoc authorities as in Scotland, the local control rests with the school management of the individual school and the local attendance committees. It follows, so far as primary and intermediate or secondary education are concerned, that there are no local rates. The financial resources required for this most important part of national education have, therefore, to depend upon moneys voted by Parliament, or upon the yield of endowments, contributions, and school fees.

The result of this is that, so far as primary and intermediate education in Ireland are concerned, the financial position is most unsatisfactory. The resources for the maintenance, and still more for the improvement, of national education are very inadequate, and the old order has continued to exist at a time when great measures of educational advancement are being carried out in the other parts of the United Kingdom. The day has passed when grants from a central department, supplemented by voluntary contributions, can be equal to the burden of a national system of education, and Ireland is constantly suffering from the fact that she has not faced the responsibility of establishing a system of local education authorities, and of charging the local rates with a share of the burden of primary and intermediate education. The problem in Ireland is complicated by the denominational character of the schools and by the strong element of clerical control in local educational matters. But, if education is to advance, local and lay control must share the burden of responsibility, and developments in England, Wales and Scotland prove that alike the central Department of Administration and the local authorities can find a place in the national system for denominational schools. Until the people of Ireland locally and directly show their zeal for education by securing the establishment of local educational authorities with powers to tax, Irish elementary and secondary education cannot keep pace with the progress which is being made in the sister countries. The question of financial autonomy is so fundamental that it must always be viewed, as during the past ten years the difficulties of the present system of primary and secondary education have been making themselves increasingly felt. In 1923 a Viceregal Committee of Inquiry into Primary Education was appointed to report upon the system of inspection of primary schools, the relations between teachers and inspectors, and the system of promotion of teachers in national schools, and both the evidence and the report illustrate how difficult is the problem of encouraging and remunerating teachers, and of giving scope for educational development where there are no local representative authorities and where promotion depends upon the report of inspectors and the decision of the National Board. Alike in Scotland, England, and Wales experience has proved how necessary it is to have wide areas and to link education closely with the interests of the community. In Irish primary education, the absence of local representative authorities controlling large areas with a wide range of schools accounts for much of the present stagnation of education, and places upon the Central National Board the increasingly onerous task of a bureaucratic system. Nor can it be said that there is any effective parliamentary control over Irish primary education. The system is thus constitutionally weak and fails to stimulate and curate the local interest and national public opinion in the vital question of education.

What is true of primary education in Ireland is also true in respect of intermediate education, though owing to the much more limited number of schools the problem is less acute. One of the most serious aspects, however, of Irish education remains the very inadequate provision which is made for secondary education, other than agricultural and technical education. The supply of schools, and the financial provisions for such as exist, fall far short of what modern Ireland should have. In Ireland, as in Great Britain, there is an increasing demand for higher education and with the change in the value of money the situation of the secondary schools is especially precarious. In their report for the year 1920 the Intermediate Education Board commented severely on the fact that the grants in aid of Irish secondary education from the Treasury are considerably less than the proper share which should have been allocated for this purpose when compared with the grants in England, Wales, and Scotland, and they conclude their report with the grave words "... remembering also the scanty funds with which our admittedly successful efforts were achieved, it is difficult for us at this juncture—when the whole edifice of secondary education in Ireland is topping to disaster—to refer to these matters in language of hope and restraint. Of one thing, however, we feel quite certain, and that is, that if something is not done immediately to place Irish secondary education in the position of financial equality with that of Great Britain, it is impossible to see how the complete disrupion of the system can be avoided." In one respect improvement has been made in recent years in the work of the Intermediate Education Board, by the belated establishment of a system of local inspection. The Intermediate Education Board has been in the past too much a central examining body rather than an educational department, and even with the limited step which has now been taken to secure supervision of the intermediate schools and their inspection by the Local Education Authority the control is largely exercised through the medium of written examinations. Thus both in respect of primary and intermediate education, Ireland has presented a very unprogressive form of organization and even with the improvements made in recent years, the system remains very
far from satisfactory. There is no part of Irish public administration in which reconstruction is more vital or more urgent. According to the Commissioners of National Education in 1918–9, the average number of pupils on the rolls of the 8,802 primary schools in Ireland was 705,553, and the average attendance 488,831—or 68.6%. The highest average yearly attendance in the past ten years has been 72.6 per cent. These figures are in themselves eloquent as to the very backward state of Irish primary education. The State expenditure on Irish primary education amounted in 1918–9 to £2,375,572. In respect of secondary education, 386 schools in Ireland received the Intermediate Education Board in 1920, the total number of pupils between 12 and 19 years of age in these schools being 27,250. The number of pupils between the ages of 14 and 19 years, who presented themselves for examination under the Intermediate Board, was 11,948, of whom 6,002 passed. The grants to intermediate or secondary schools from the statutory funds and the parliamentary grants of the Intermediate Board amounted in 1920 to rather less than £142,000.

The third department responsible for a part of Irish education is the Department of Agriculture and Technical Instruction, and at the same time the Agricultural and Technical education of the land can claim to have a system which is worthy of comparison with that of any modern state. The importance of the system established in respect of agriculture and technical instruction lies not simply in the merit of the education provided in the schools and colleges under the Department’s supervision, but in the improved representative relationships between central and local authorities provided by the constitution of the Department. The Agriculture and Technical Instruction Act of 1859 provided for the appointment of local statutory committees of the county councils and municipal councils of Ireland to deal with the subjects of agriculture and technical instruction, including the raising of local rates for these purposes. It also brought about the establishment of a central Council of Agriculture, consisting in respect of two-thirds of its membership of representatives of county councils, the remaining third being nominated by the Department. At the same time provision was made for the appointment of a Board of Agriculture chosen in respect of two-thirds of its membership from the Council of Agriculture, the remaining third being nominated by the Department, and of a Board of Technical Instruction representing chiefly in this field of agricultural and technical instruction the central and local authorities concerned in technical education. Important functions and powers were given to these bodies of shaping the policy and the administration of the Central Department. The result of this representative machinery has been a closer harmony between central and local authorities than has been secured in any other field of public administration in the United Kingdom, and the great progress which has been made in Ireland in the two decades of the 20th century, both in agricultural education and technical instruction is in no small measure due to the admirable constitutional organization which was laid by the founders of the Department. The close relationships between central and local authorities have, even in a difficult period of national affairs, led to increased interest in the progress both of agriculture and of technical instruction, and no part of government in Ireland has succeeded in so fully associating the people with the work of administration and in educating public opinion and eliciting local financial support. The work which thus centres round the Irish Department of Agriculture and Technical Instruction has exercised a great influence on modern Ireland. It has given a much needed impetus and direction to science teaching and research, to agricultural study and investigation, to manual training and craftsmanship, to commercial and industrial subjects in relation to the economic conditions of the country and to domestic economy and public health education—all of which are peculiarly vital to a community in which education has suffered from a too narrow and bare curriculum. But it has done more, and has suggested, by experience, the possibilities of a much wider re-establishment of Irish education in which all parts will be brought into closer relation one with the other and strengthened by association with central and local representative committees. In the year 1918–9 the grants made out of the parliamentary vote to technical schools and classes of science and art amounted to £114,210—while a further expenditure on technical instruction, amounting to £59,867, was made out of endowment funds. In addition to these sums the sum contributed from local rates amounted to £36,518. The number of students attending technical schools and classes was 37,241, and the number of students recognized for grants in connexion with technical instruction in day secondary schools was 14,822.

Conclusions.—Looking back over the period from 1912–22 and comparing the state of the profession and the school life at the present time, the advance in the technical education of Ireland, in the improved relative position of technical instruction, in the methods of training and discipline, in the facilities for the training of teachers, and in the equipment of the schools, is so marked that the improvements which have taken place will be recognized as the most striking and important developments in the training of teachers since the establishment of the technical schools in the late 19th century. The achievements are many and varied, and it is impossible in this limited space to deal with them in any detail. The following account of the progress of technical education in Ireland must be succinct; but it must not be forgotten that there are numerous local councils, local authorities, and voluntary societies which have co-operated in this great work, and that the results of their efforts are very great. The fundamental conditions in Ireland are of an educational character, and it is to the education of the Irish people that future development must be attributed. It is the duty of all who have any concern for the future of the country to watch the progress of education, to encourage those who are in the field, and to support the work of the Department in the present and future. (W.G.S.A.)

(2) United States

Each state in the American Union has its own system of education, which includes elementary and secondary schools, and, in all except the states of the extreme north-east, state Institutions of higher learning. All of the 48 states have enacted compulsory school laws, but in the details, standards, and in the enforcement of them, they vary widely. School attendance is (1921) generally required of children between the ages of 8 and 14 or 16 during from 6 to 8 months in the year, and many states further require attendance upon part-time or evening classes by those who have not acquired a prescribed minimum of education or who can not adequately speak, read and write the English language. The National Government, through Congress in 1916, notably reinforced the compulsory school laws of the states by an enactment prohibiting the shipment, in interstate commerce, of any articles in the manufacture of which children under 14 have been employed. In place of the almost universal requirement of eight years in the elementary school and a nearly uniform curriculum, there is manifest a tendency to group together as a "junior high school" the seventh, eighth and ninth grades, which otherwise would constitute the last two years of the elementary school and the first year of the secondary school. The purpose of the rearrangement is to facilitate departmental teaching, to free the
child from the rigid grade system of promotion, by which a failure in one subject necessitates the repetition of the whole year's work, to permit earlier a choice of courses and thereby prepare the pupil for greater accomplishment in his chosen field during the later high-school years. The public secondary schools have grown by leaps and bounds in numbers and resources. Their enrollment doubled in the 10 years 1908-18 and between the years 1918 and 1920 there was a proportionate increase. They are no longer essentially stepping stones to college; they represent the continuation of the common schools, and their function is to complete the formal education of that vast majority which will never enter institutions of higher learning.

**Colleges and Universities.**—Throughout the country, but especially in the west and middle west, so-called "junior colleges" are becoming numerous. The term is somewhat a misnomer. Some of these institutions are derived from small, non-tax-supported colleges which, finding themselves financially unable to continue satisfactorily the full four-year course, limit themselves to two years, and others, more significantly, from the upward extension of the vigorous public high schools. This type not only brings the opportunity for higher education within the reach of many who could not leave the immediate vicinity of their homes, but also reacts favourably on the pupils and teachers of the secondary schools from which it grew. The college remains the most characteristic feature of educational development in the United States. In 1920 there were enrolled more than 250,000 college students. Entrance requirements have become less rigid, as indicated by the recommendation of the conservative Association of New England Colleges that its members adopt "a system of tests for admission in which a certificate shall be taken for the quantity, and examination shall be held in a limited number of subjects for the quality, of school work." The curriculum covers a very wide range of subjects, but experience has shown that it is wise to permit the student to exercise untrammeled freedom in the choice of his studies, and most colleges now limit the selection of courses in such manner as to prevent too great concentration and too great dispersion as well. The universities, though not more numerous, have in recent years grown stronger. Their graduate departments, better manned, attract more students. In this respect the development of the state-supported institutions has been remarkable. A few years ago only three had achieved distinction in this field; by 1921, 12 had qualified for membership in the Association of American Universities, and constituted one-half of its members. The enrollment of graduate students in all universities was in 1916 11,215; in 1920 it was upwards of 16,000. So great has become the demand among women for higher education that the colleges exclusively for women are no longer able to provide in the rapidly increasing number of applicants for admission. Bryn Mawr, Vassar, Wellesley, Smith and Mt. Holyoke have been forced to establish waiting lists. The doors of the universities for the most part stand open to women upon an equal footing with men. By 1920, 44% of the students, graduate and undergraduate, enrolled in the universities, colleges and technological schools, were women, and it may confidently be predicted that they will soon outnumber the men. The general admission of women to courses in medicine removes practically the last barrier discriminating between the sexes.

**Professional Education.**—Schools for professional training have grown rapidly. Whereas a century ago professional education comprised little more than preparation for the ministry, it now includes theology, medicine, law, the new profession of engineering, and two offshoots of medicine, dentistry and veterinary medicine. Pharmacy and nursing are sometimes regarded as professions because a specialized education is prescribed for those who would practise them.

**Theology.**—The colleges first founded in what is now the United States, Harvard, William and Mary, and Yale, were established to train men for the Christian ministry. As the colleges have developed into universities the original aim has been merged into the broader purpose of providing liberal education for all, while influential schools of theology have grown up, for the most part, as strictly denominational institutions independent of the universities. During recent years the content of the curriculum and methods of teaching have been revised. Formal theology is emphasized less, a first-hand knowledge of human relationships more; Hebrew is not always obligatory, while the results of literary and historical criticism are fully discussed. Freedom of thought in some institutions has completely liberalized the training and greatly modified the traditional theology. During the years 1870-95 the number of theological students increased more rapidly than the general population. During the next 25 years the figures show marked fluctuations, but for the period as a whole neither student enrollment nor the number of graduates kept pace with the increase in population.

**Medicine.**—The medical schools of the United States have shown a remarkable growth. Among the leading medical schools of the country is Harvard, whose medical school, founded in 1782, is the oldest in the United States. It was in the 19th century that the second great era of medical education began, with the establishment of new medical schools, the rapid development of physiology, pathology, embryology, chemistry and hygiene, and the introduction of the scientific method into the practice of medicine. It was not until the latter part of the 19th century that the medical profession began to realize the necessity of a scientific basis for practice, and the development of the medical schools was rapid. In 1870-95 the number of medical schools increased from 16 to 109, and the number of medical graduates increased from 1,371 to 11,600. In 1919-21 the number of medical schools in the United States was 150, and the number of medical graduates was 25,000. The medical schools of the United States are now among the most important institutions of higher education. They provide a scientific basis for the practice of medicine, and their graduates are the leaders in the field of medical science and medicine. They are the only schools in the United States where the study of medicine is a four-year course, and they have developed a scientific method of teaching and research that is the basis of modern medicine.

**Law.**—The legal education in the United States began in a kind of apprenticeship, an intimate personal relationship with a practising lawyer. The increasing complexity of legal machinery and the resulting specialization on the part of legal practitioners rendered it impossible for a student to gain a complete education in a single office. Schools were therefore established offering systematic courses of lectures, and attendance on such schools, in addition to a clerkship in a law office, is now required for admission to the bar. The length of the law course has been increased from one to two and from two to three years and the curriculum correspondingly enriched. In some instances the student is permitted a choice of electives. Most schools have adopted the "case method" of teaching, which consists in presenting to the student the records of selected cases. These records he analyzes, and from them deduces the legal principles involved. Lectures and moot courts are also employed. The minimum of preliminary training required for admission to a recognized law school is the completion of the four-year secondary
school courses, but many of the universities demand in addition two years or more of college work. In 1921 the number of law students was more than 27,000, an increase of nearly 20% over the pre-war figures.

Engineering.—The beginnings of American technological training were made, not in the long-established colleges, but in a group of special schools, independently founded, such as the Massachusetts Institute of Technology in Boston and Stevens Institute in Hoboken, N.J. Later the universities took up engineering education with avidity, built up elaborate departments and offered the greatest variety of courses. Another type of technical school is the state college of "Agriculture and Mechanic Arts," supported by land grants from the Federal Government. Engineering schools require of applicants for admission the completion of the four-year secondary school course. Instruction is largely by means of laboratory courses. The university of Cincinnati has gone a step further and perfected an arrangement by which students spend half their time outside the college, actually employed in some form of engineering work; periods of two weeks of study alternate with like periods of practice in a shop. The degree of Bachelor of Science, with or without specification of the branch studied, is commonly conferred after four years of work. Those of Civil Engineer, Mining Engineer, and so forth, are awarded for undergraduate work by some schools in place of the B.Sc.; by others reserved for more advanced study.

Dentistry.—Since 1900 there has been increasing uniformity among dental schools until in 1921 all recognized schools required for admission at least the completion of a four-year secondary school course, and gave four full years of professional training. It was even proposed that beginning in 1926 the entrance requirement for dental schools be raised to include two years of college work. The growing appreciation of the value of dentistry is indicated by the increase in the ratio of the number of dentists to the total population. In 1860 this ratio was 12 for 100,000; in 1910 it was 43; in 1920, 56.

Veterinary Medicine.—In this, as in other professions, there has come a realization of the necessity for a solid foundation of general education on which to base special training. The accepted standard in 1921 was the completion of a four-year secondary school course and three years in a college of veterinary medicine. In 1900 13 schools enrolled 362 students and graduated 100 veterinarians. In 1916 the numbers had increased to 22 schools, 3,065 students and 759 graduates. The war brought about a great reduction in the number of those choosing veterinary medicine as a career. In 1921 the number of veterinary school students declined to 14 and the student enrolment to 859.

University Extension.—Under this head are grouped all those activities of institutions of higher learning which are carried on for the benefit of people unable, through lack of time or training, to matriculate in the regular college or university courses, but who still desire some form of higher education, and this extension of facilities is designed to include in its scope persons many years older than the ordinary undergraduate. Originally no more than a series of public lectures on topics of literary, historical or scientific interest, this extra-mural teaching has extended its range, filled its methods, and multiplied its activity of college; it has become, in some instances at least, an important function of the university. The spirit of service to the community which it embodies was expressed by the late President Van Hise in these words:—"So far as the university of Wisconsin is concerned, we propose to take up any line of educational work within the state for which the university is the best fitted instrument," and again, "It is my ideal of a state university that it should be a beneficent influence to every citizen of the state." In such a programme the whole realm of human knowledge is included, from sewing to Sanskrit and from plumbing to philosophy. Summer sessions, of from six to eight weeks' duration, provide valuable opportunities for those, chiefly teachers and students, whose work allows a long vacation. Varying standards prevail in the summer schools; in not a few the amount and quality of the work render it acceptable as part of the requirement for a degree. The university of Chicago has made its summer session the full equivalent of one of the winter terms and operates on a four-quarter schedule. 'Teaching by mail is another method employed by some universities to widen their spheres of influence. Extension teaching is also carried on by local boards of education, especially in large cities. Much of it takes the form of part-time classes for children who have left school prematurely and for immigrants who lack command of the English language. Private enterprise outside of academic circles has contributed to extension teaching along two distinct lines. The Chautauqua Assembly is the prototype of the summer school, and has exerted a very wide influence through the thousands who each year attend its courses. Quite different in scope, but not less valuable, is the kind of work done by other institutions which provide opportunities and incentives for continuous and serious study as well as lecture courses and concerts having a wider appeal. Perhaps the most valuable extension teaching is that which reaches into the home, bringing to the mother such information as will aid her in solving her manifold and peculiar problems. The U.S. Government prepares and distributes upon request a comprehensive series of pamphlets containing instruction regarding the selection and preparation of food, infant feeding, child hygiene and many other subjects. Whenever possible, nurses and women trained in the household arts visit the homes and, by personal directions and demonstration, often succeed in promoting the welfare of the family where print alone would fail. Intellectual development is stimulated by courses of home reading. The recognition of the importance of home influences as factors in the child's success at school has led to the formation of "parent-teacher associations," from which the teachers gain a knowledge of the home environment of their pupils and the parents learn how best to cooperate in the education of their children.

Vocational Training.—This term denotes training of less than college grade, designed to fit the individual to earn a livelihood. It was in the beginning of the manual training movement that the phrase was first employed, as far as 1886, but except for a few isolated experiments it is a development of the 20th century. Phases in the progress toward an understanding of the problem have been:—(1) attention was focussed on "misfits"; based on what might be called a "niche" theory of society, the problem was stated as that of finding the particular place or station in life that exists somewhere for each individual; (2) it was held to be the duty of society to regard with earnest concern and in some way to aid those that are defective; (3) then came the idea that the schools might prevent individual and perhaps unusual types from being spoiled in the making; (4) next came the idea that each of the individuals may have a training; and (5) finally has come a recognition of the necessity for an educational survey of the community in order to determine what opportunities are already available and what its industrial needs really are. The so-called Smith-Hughes Act passed by Congress in 1917, authorized appropriations which will aggregate $7,000,000 a year for promoting, in cooperation with the states, special training in schools designed to meet the needs of those who are preparing to enter agriculture or industry; provision is also made for training teachers for this work by industrial or commercial corporations and by the co-operative effort of the schools and the corporations. The teaching of domestic science was begun in the schools of France, and its development in the U.S. was begun in 1898. The desirability of such training for every young girl has led to the inclusion of one or more courses in home economics in the curriculum of every girls' high school and also in the middle grades of the better-organized elementary schools.

Agricultural Education,—Training for agricultural pursuits, more than any other branch of education, has been fostered by the Federal Government. Its development manifests several stages, each characterized by a different method. The land grants of 1862 led to the establishment of state colleges of "Agriculture and Mechanic Arts," which, however, for a generation at least, were predominantly schools of engineering. In 1887 Congress authorized subsidies to agricultural experiment stations under state control, a policy the wisdom of which was quickly demonstrated. In a few years these stations accumulated a wealth of exact knowledge relating to farm problems which
EDWARD, PRINCE OF WALES

would have been of inestimable value if it could have been applied.

Then came the development of agricultural extension education employing agencies such as lectures, bulletins, correspondence courses, reading courses, farmers' institutes, short courses at agricultural schools, travelling libraries, educational trains, demonstration farms, educational exhibits at fairs and moving pictures. This phase culminated in the Smith-Lever Act of 1914, which appropriated more than $4,000,000 annually to be apportioned among the states for agricultural extension work. Such activity, being a great demand for teachers and farm demonstrators, reacted beneficially upon the agricultural colleges.

Meanwhile another tendency was becoming manifest. The science of farming was being taught in the secondary schools. This plan possessed so many obvious advantages and showed such satisfactory results, that during the decade following 1910 it was widely adopted. In 1920 1,797 public secondary schools, with an enrolment of 27,755 pupils, provided vocational instruction in agriculture. In most schools the boy or girl is required to carry out, under supervision, some definite enterprise such as the cultivation of a small plot, the raising of pigs or poultry or the cultivation of a miniature dairy. A detailed record of achievement, including a financial statement, is required and affords a basis for grading pupils' work.

Certain private corporations, not directly engaged in teaching, have influenced education in the United States. The General Education Board, incorporated by Congress in 1903, has employed the funds at its disposal in assisting institutions of higher learning throughout the country, and in the southern states it has also promoted the development of the secondary schools and the teaching of agriculture. Recently it has entered the field of medical education. The Carnegie Foundation for the Advancement of Teaching, incorporated in 1906, starting with a permanent endowment of $5,000,000, has been led into the field of investigations and surveys. The published reports of its findings have contributed in large measure to educational progress. The Russell Sage Foundation performs similar service.

Statistics.—The magnitude of educational work may be indicated by figures from the report of the Commissioner of Education for the year 1918. The total enrolment of pupils amounted to 23,433,726, and the estimated total cost $1,089,034,803, making the average outlay $45 per pupil enrolled and $10 the cost per capita of the whole population. Teachers and supervising officers numbered 769,703, of whom 25% were men. The bureau reported 670 colleges and universities, with an enrolment of 355,151. For the public schools of elementary and secondary grade the following figures were given:

- Number of pupils: 20,852,516
- Average number of days schools open: 160.7
- Number of male teachers: 109,854
- Number of female teachers: 545,515
- Number of school-houses: 276,827
- Average annual salary of teachers: $765
- Value of all school property: $1,083,658,818
- Income from permanent funds and rents: $21,517,040
- Income from local taxes: $380,610,400
- Income from state taxes: $101,505,857
- Income from other sources: $334,820,885
- Expenditure for sites, building and equipment: $19,682,944
- Expenditure for salaries: $130,477,090
- Expenditure for other purposes: $206,119,685
- Expenditure per capita of whole population: $7.26
- Expenditure per pupil in attendance: $49.12
- Expenditure per pupil per day: $0.97

(A. S. D.; N. M. B.)

EDWARD (Edward Albert Christian George Andrew Patrick David), Prince of Wales (1894- ), eldest son of King George V. and Queen Mary, was born June 23 1894, at White Lodge, Richmond Park, and baptized in the Campus of Westminster Abbey on Aug. 27, 1894, by the Archbishop of Canterbury. In 1902, Mr. H. P. Hansell was appointed his tutor, and remained with him from that time until Aug. 1914. During 1902-7 the Prince was prepared for the navy, and in the spring of 1907 he entered Osborne, where he remained for two years before going on to the Royal Naval College at Dartmouth. During his time at Osborne, Capt. E. Alexander-Sinclair and A. H. Christian were in command, and Capt. T. D. L. Napier and H. Evan-Thomas at Dartmouth. On June 24 1910 he was confirmed in the private chapel at Windsor Castle. While still a cadet at Dartmouth he performed his first public duty on March 29 1911, by presenting to the mayor and corporation of that town the silver oar which they held formerly as a symbol of the rights associated with the Bailiwick of the Water of Dartmouth. At the close of his Dartmouth training in June 1911 he was invested as a Knight of the Garter, and on July 13 1911 he was created Prince of Wales and Earl of Chester. He was shortly afterwards invested as Prince of Wales in Carnarvon Castle, of which Lloyd George was at that time constable, and on this occasion for the first time an English prince addressed the Welsh people in their own tongue. Shortly after this event the Prince became a midshipman, and was appointed to H.M.S. "Hindustan," in which ship he served for three months under Capt. Henry Campbell. The months which followed this cruise were spent quietly at Sandringham in preparing for Oxford, but during the spring of 1912 the Prince spent five months in Paris as the guest of the Marquis de Breteuil, during which period he was coached by M. Maurice Resollet in the language and history of the country. In Oct. 1912 the Prince, accompanied by Mr. Hansell and Maj. the Hon. William Cadogan (roth Hussars), who had recently been appointed his equerry, became a freshman at Magdalen College, Oxford. During his time at Oxford the Prince entered heartily into the corporate life of his college and the college athletic amusements of the undergraduates. The Prince resided in college rooms, dined in hall or at one of the university clubs, and mixed freely with his fellow undergraduates. Some of his vacations he spent in European travel, visiting Germany twice, in 1912 and 1913, and Denmark and Norway in 1914. The Prince's university career was ended by the outbreak of the World War in Aug. 1914 on the eve of his third year. On Aug. 7 he was gazetted 2nd lieutenant in the Grenadier Guards, and on the 11th he joined the 1st battalion at Warley Barracks, Essex.

In Nov. 1914 the Prince, who had been appointed aide-de-camp to Sir John French, arrived in France and took up his new duties at British G.H.Q. at St. Omer. During the next 18 months he served with the Expeditionary Force in Flanders and in France in various parts of the line, being first attached to the 2nd division under Maj.-Gen. Horne, to the I. Corps under Maj.-Gen. Sir Frederick Siborne, and later to the Guards division under Maj.-Gen. the Earl of Cavan. In March 1916 he was appointed to the staff of the G.O.C. the Mediterranean Expeditionary Force, and proceeded to once to Egypt. He took the opportunity of seeing the troops in various parts of the line on this front, and also went as far south as Khartum. On his return journey he paid a visit to the Italian headquarters at Udine, and by the middle of June had returned to the British armies in France. He was then attached to the XIV. Corps (Lord Cavan) in Flanders and France, taking part in the battles of the Somme and Passchendaele, and subsequently proceeded with this corps, in Oct. 1917, to the Italian front, where he remained till Aug. 1918. In May 1918 the Prince paid a semi-official visit to Rome. The Prince then returned to France and was attached to the Canadian Corps, with whom he was serving at the time of the Armistice. He was attached to the Australian Corps in Belgium till the beginning of 1919, after which he visited the Army of Occupation on the Rhine, spending a few days with the New Zealand division, and paying a short visit to General Pershing at the American headquarters at Coblenz.

On his return to England at the end of Feb. 1919 the Prince almost immediately took up a number of public duties which had of necessity been deferred during the war, and on May 29 was admitted to the freedom of the City of London. On Aug. 5 1919 he left Portsmouth in H.M.S. "Renown" for Newfoundland and Canada, first setting foot on Canadian soil on Aug. 15 at St. John, New Brunswick. His tour extended through the entire Dominion from E. to W., and five days after reaching Victoria on Sept. 23 the return journey began by a slightly
different route. The Canadian tour ended at Ottawa, and on Nov. 10 the Prince left for Washington to pay a short official visit to the President of the United States. New York was subsequently visited, and after a long series of official engagements, the Prince sailed for Halifax, where he bade good-bye to Canada, and reached Portsmouth on Dec. 1.

After a short stay in England the Prince sailed again in H.M.S. "Renown," on March 16 1920, for New Zealand and Australia. The first port of call was Barbados, and then, passing through the Panama Canal, short visits were paid to San Diego (Cal.), Honolulu and Fiji, Auckland being reached on April 24 after a voyage of 14,000 miles. A month was spent in New Zealand, visiting all parts of the North and South Is., and on May 26 the Prince landed at Melbourne. During his stay in Australia he visited all states of the Commonwealth, and eventually sailed from Sydney harbour on Aug. 19. On the return journey stops were made at Fiji, Samoa, Honolulu and Acapulco, and, after passing once again through the Panama Canal, three weeks were spent in the West Indies. The last port of call was Bermuda, and H.M.S. "Renown" eventually reached Portsmouth on Oct. 11 1920. The Prince received a magnificent reception on his arrival in London, and, as had been done on his return from Canada and the United States, the conclusion of his world-tour was celebrated by the King and Queen at a banquet at Buckingham Palace, and the Prince was shortly afterwards entertained by the Lord Mayor at the Guildhall, where he gave an account of his travels.

After a brief holiday, spent for the greater part in the hunting-field, he entered upon a period of official duties which lasted until Christmas 1920. During this period, the first six months of 1921 H.R.H. was occupied chiefly in London, but found time to visit, among other places, Oxford, Cambridge, Glasgow and the Clyde; his Duchy of Cornwall property in Devon, Cornwall and the Scilly Is.; Cardiff, Newport and Bristol. On June 23 1921 the Prince spent part of his 27th birthday with 1,000 East End children who were entertained by the Fresh Air Fund in Epping Forest. On Oct. 26 he sailed in the "Renown" on a State visit to India.

EDWARDS, GEORGE (1852-1915), English theatrical manager, was born in Ireland Oct. 8 1852. He was educated for the army but deviated into theatrical business and became manager successively to Michael Gunn at the Theatre Royal, Dublin, and to D'Oyly Carte at the Savoy theatre, London. In 1885 he joined John Hollingshead at the Gaiety theatre, London, and the next year took over the sole management of that theatre, which he ran with striking success up to the time of his death. He also built and managed Daly's theatre, was managing director of the Empire theatre and at different times acted as manager, or producer, at a number of other London theatres. Incidentally he was well known as an owner of racehorses. He died in London Oct. 9 1915, never having quite recovered from the effects of confinement in Germany, where he was interned on the outbreak of the war.

EDWARDS, ALFRED GEORGE (1858-1929), first Archbishop of Wales, was born at Llanymawddwy Nov. 2 1858, and was educated at Jesus College, Oxford. He was ordained curate of Llandinat, Carmarthen, in 1874, and became warden and master of the college, Llandovery, in 1875; holding this position until 1885, when he accepted the living of Carmarthen. In 1886 he became bishop of St. Asaph. In 1920, after the disestablishment of the Welsh Church, of which measure he had been one of the most active opponents, he was created Archbishop of Wales, and was enthroned by the Archbishop of Canterbury at St. Asaph cathedral June 1.

Amongst his publications may be mentioned The Church in Wales (1888); Common-Sense Patriotism (1894); and Landmarks in Welsh Church History (1912).

EDWARDS, ENOCH (1852-1912), British Labour politician, was born at Talk-o'-the Hill, Staffs., April 10 1852. He was the son of a pitman, and worked as a boy in a coal-mine. In 1870 he became treasurer of the North Staffordshire Miners' Association and was elected secretary to the same body in 1877. In 1884 he went to Burslem, where he became a member of the school board and town council in 1886, and later he became alderman and mayor. In 1886 he became president of the Midland Miners' Association; he was later president of the Miners' Federation of Great Britain and a member of the Staffordshire county council. He was elected to Parliament in the Labour interest as member for Hanley in 1892. He died at Southport June 28 1912.

EDWARDS, JOHN PASSMORE (1862-1939), English newspaper proprietor and philanthropist, was born at Blackwater, Corn., in 1824, the son of a carpenter, and was mainly self-educated. In 1844 he became London representative in Manchester of the Sentinel, an anti-Corn Law weekly newspaper. A year later he went to London and began lecturing, together with the practice of journalism, starting several small periodicals which in succession failed, until in 1862 he bought the Building News, which by 1866 had made a handsome profit. In 1876 he bought the London halfpenny evening newspaper, the Echo and controlled it for 20 years. He was an ardent peace advocate, and supported a number of humanitarian and philanthropic objects, endowing various libraries and other institutions which bore his name, notably the settlement in Tavistock Place, Bloomsbury, now called, in memory of Mrs. Humphry Ward, the Mary Ward Settlement. He also founded a Passmore Edwards scholarship at Oxford for the conjoint study of English and classical literature. He published privately an autobiography, A Few Footprints (2nd ed. 1906). He died in London April 22 1911.

EGGLESTON, GEORGE CARY (1839-1917), American journalist and author (see 1879), died in New York April 14 1917.

EGYPT (see 9.21).—Turkish suzerainty over Egypt was formally abolished in Dec. 1914 when a British protectorate was proclaimed, while the acquisition of Tripoli and Cyrenaica by Italy and the establishment of Palestine as a separate state under a British mandate cut Egypt off from all territorial connexion with the Turkish Empire.1

Population.—At the census of March 1917, the inhabitants numbered 12,750,918, as contrasted with 11,287,350 in 1907, an increase of 12-0% (compared with an increase of 14.9% for 1897-1907). The number of foreigners in the country in 1917 was 238,651, a figure which owing to war conditions did not represent the normal foreign population. While the area of Egypt is some 350,000 sq. m., the cultivated and settled area—the Nile valley and delta—covers only 12,226 sq. m., and in this restricted area the inhabitants in 1917 exceeded 1,000 per sq. m. The number of nomads and semi-nomads was estimated at 422,263. The pop. of the chief towns in 1917 was: Cairo, 790,039; Alexandria, 444,617; Port Said (including Ismailla), 91,000; Tanta, 74,105; Mansura, 49,238. Classified by religions there were in Egypt in 1917: Moslems, 11,658,148; Copts, 854,778; other Christians, 155,168; Jews, 50,581, and "others." 213,243. On July 1 1919 the pop. was calculated at 12,878.

General Economic Conditions.—By 1911 the State finances had recovered from the effect of the economic crisis of 1907—a crisis due to over-speculation and extravagance following a period of much prosperity. But at the opening of 1914 the liabilities left over from 1907 still weighed heavily on private finance. The outbreak of the World War in Aug. 1914, just when the cotton crop was about to be harvested, threatened once more to place Egypt in a critical financial position.

1 The question as to how far Egyptian territory extended along the Mediterranean W. of the Nile was settled in 1911. The Italians upon declaring war on Turkey in that year proclaimed a blockade of the coast as far S. as Ras el Kanai, thus reviving the Turkish claim as to the limits of Cyrenaica. The British Government on behalf of Egypt protested, maintaining that, as both Turkey and Italy had been notified in the Egyptian territory of Cyrenaica, Egypt, 150 m. W. of Ras el Kanai, in this contention Italy acquiesced and the frontier between Italian territory (Cyrenaica) and Egypt was fixed at the head of the Gulf of Sollum, the small strip of coast being termed the "shoal." Egypt. The British Government further announced that inland they regarded the oasis of Jarabub as part of Egypt. In 1919, however, it was agreed to transfer Jarabub to the Italian sphere (see senussi and Senussites).
Egypt in great economic difficulties. The price of cotton fell by a third and a panic was averted only by drastic measures taken by the Government. As part of these measures a general moratorium was proclaimed and an emergency currency obtained by making the notes of the National Bank of Egypt temporarily legal tender and irredeemable. But cotton, stimulated by war demands, had again risen to pre-war prices by the end of 1915, and this, together with forced economy and the large sums spent by the army stationed in the country, restored the situation. Taking the country as a whole a new period of prosperity set in, chiefly due to the soaring price of cotton—which in April 1920 was almost ten times its value in 1913. During the war exports greatly exceeded imports in value, and, deprived of normal means of employing capital in the country itself, the Egyptians sought foreign investments, putting their money to a large extent into British war securities. It was calculated that between Aug. 1914 and April 1920, as much as £150,000,000 had been invested abroad. Yet at the same time Egypt (apart from the public debt) was still a debtor to foreign countries for a still larger sum, chiefly loans on mortgage and capital invested in industrial, transport and other companies. But the wave of prosperity—which depended on an unhealthy extent on the inflated price of cotton—was accompanied by very real distress among the fellahin (peasantry). The great increase in the cost of living acted upon this class (who form 62% of the pop.) with extreme severity, and their plight was accentuated by the natural tendency to extend the area under cotton cultivation at the expense of the area under cereals. The poorer classes in the big towns were even more affected than the fellahin; in Cairo in 1920 the cost of living was thrice as high as in the beginning of 1914. An attempt by the authorities to fix maximum prices was found to do rather more harm than good. The Government was reduced to seeing that certain staple articles of food—chiefly wheat, flour and maize—were supplied at reasonably cheap prices. Wheat had to be imported for this purpose and sold at prices involving a loss.

As one result of the increased cost of living there was a general demand for higher wages and improved conditions, and labour organizations resembling trade unions made their appearance. Many strikes occurred, some of long duration and some political, rather than economic. A Labour Disputes Conciliation Board, established in Aug. 1919, did much good work in regulating questions of pay and conditions of work for patients, etc.

The year crop in the price of cotton during the first half of 1920 naturally affected Egypt, and 1921 proved a year of considerable stringency. The restriction in the purchasing power of the community was a reflex of the fall in cotton. The price of Egyptian cotton (sakel) on the Liverpool market was 84·50d. in April 1920 and 17·75d. in April 1921. The fall came too late to affect the trade returns of 1920, which were the highest recorded. The figures were largely delusive, as they were mainly the result of higher prices and not of increased production.

To a certain extent the poorer fellahin enjoyed advantages which protected them against the worst effects of bad harvests and low prices. By a law of 1912, passed at the instance of Lord Kitchener, holdings up to five feddans2 were secured from distrain for debt, and as native owners of land of five feddans or less numbered at the 1917 census over 1,500,000, or about one-tenth of the total population, the benefit of the Five Feddans law was very appreciable. Moreover, the peasantry could obtain loans from the Agricultural Bank at the fixed rate of 8% interest.

Agriculture, Mining and Trade.—The Egyptian Government, especially under Mr. Leake's administration, displayed an increased interest in the subject of agriculture. Kitchener, a keen and practical agriculturist, transformed it into a Ministry of Agriculture. Cotton maintained its position as the mainstay of Egyptian prosperity. The crop of 1910 rea\n
1 1912 a law was passed for the protection of birds useful to agriculture. Many of these birds, such as the bull-billed heron (egret), had been almost exterminated. The new law proved effective and these birds again multiplied.

2 One feddan = 1·098 acres.

941

and tobacco (£3,184,000). Much of the coal imported in 1919 and 1920 came from South Africa and Australia.

Alexandria is the principal centre of trade, taking normally over 90% of the total. Its share in 1913 was 91.8%. In that year Port Said had 4.4%, and Suez laid out 4.8%. War conditions most likely the Port Said (and Suez) to obtain, temporarily, a much larger share—25%—of the trade, but in 1919 Port Said had dropped to 18% of imports and under 4% of exports. In that year Alexandria took 87.9% of the trade.

The following table of the trade of Alexandria for 1913 and 1919, showing the chief importing and exporting countries, may be taken as showing the economic relations of Egypt to a whole. The following notable features of the table are the entry of Japan into the Egyptian market and the increasing competition of the United States. Japan first appeared as a customer in 1916.

(Values in round numbers of £E1,000.)

The share of the United Kingdom and of British possessions in the import trade of Egypt as a whole was 32.6% in 1913 and 22.8% in 1919. In the last-named year the United States came next with 6.1% of imports, being followed by Italy, France, and Greece. In 1913 the United Kingdom took 43.2% of exports, Germany 24.6%, Austria 4.9% and the United States 7.9%. The British share of the exports in 1919 was 54.3% that of the United States 22% and of France 7.7%. The increase of United States' trade was largely due to the demand for cotton; of 1919 to the U.K. 85.3%, compared with 42% taken with the U.K. and 10% by France.

The value of merchandise in transit during 1920 was £E13,000,000 as compared with £E1,000,000 in 1913. It consisted mostly of coal and petroleum and passed largely through Port Said. Re-export trade (entrepôt), to which the geographical situation of Alexandria is peculiarly favourable, was valued at £E2,500,000 in 1920 compared with £E500,000 in 1919, and consisted mainly in the export of textiles, metal goods, kerosene, oil and fuel and vegetable oils to adjacent countries of the Levant, notably Syria and Palestine.

Shipping.—The tonnage of ships entering Alexandria in 1911 was 40,000. The British share was being reduced in favor of the French, next with 10%. In 1913 the tonnage was 3,718,000, a figure nearly maintained in 1914. During the World War the commercial tonnage greatly dwindled and in 1918 was 735,000 tons, of which 527,000 tons were German. The British passenger services were completely disorganized and this traffic was in 1919 almost wholly absorbed by Italian companies, notably the Lloyd Triestino (formerly Austrian Lucania). In 1919 the average number of passengers on the Suez Canal steamers including warships and all vessels on military service, the shipping figures for 1918—Alexandria, Port Said, Suez and all minor ports combined were: Steamers entered, 2,108; tonnage, 5,350,000; ships cleared, 2,160; tonnage, 5,180,000. Vessels entered, 412; tonnage, 20,000; cleared, 403; tonnage, 25,000.

War and post-war developments included the establishment of regular lines of cargo steamers by Japan, Norway, and the United States. Trade with the United States was still, however, maintained mainly by British ships.

Railways, Telegraphs, etc.—In 1915-6 the Egyptian railway system was extended and connected the new line between Ismailia and Qantara with the Suez Canal line. The line was built (originally for military purposes) across the Sinai Peninsula parallel to the coast, and was later continued to Jerusalem and Haifa. A steel swing-bridge over the Suez Canal at Qantara, connecting the Ismailia end of the new line, was built in 1912. The construction between Cairo and Jerusalem was begun in 1913, but did not reach the line at El'Atf to Alexandria. It is open to navigation throughout the year and has wharflage at Gabbari (the Alexandria goods station). In 1919 the building of short lines to give the Delta towns better access to Alexandria and Port Said was under consideration.

Wireless telegraph stations were erected at Cairo and Assuit and a line laid out between the two stations. They are not yet completed, and the line has not yet been leased, and may not have been leased, to any private company which served as stations on the trans-African route. In April 1916, a Ministry of Communications was formed, which took over control of railways, telegraphs, telephones, the post-office, ports and lights, etc., for the purpose of war service. The telegraph offices have been recently purchased by the State from a private company.

Irrigation.—The task of raising the Assuan dam was completed in 1912. The so-called regularisation of the Nile, a work which was about 1850—having suddenly collapsed in Dec. 1909, a new regulator had been built by Messrs Aird & Co. by July 1910, in time for the Nile floods. In 1912 extensive works for improving the irrigation and drainage of the Delta were under way, their completion was delayed by the financial stringency caused by the outbreak of the World War.

In 1916 the Egyptian Government in conjunction with the Sudan Government began investigations for new irrigation works on a large scale. The work for two years included the construction of a dam at Gebel Aulia, near Khartum, with a storage capacity double that of the Assuan dam, and of a large new canal near Hamadi on the Upper Nile. The object defined by Lord Allenby in 1920 was to permit the perennial cultivation of the remaining waste or basin areas of Egypt, amounting to some 1,000,000 ac. which are now uncultivated, and 1,200,000 ac. which until second irrigation and higher education there were no great developments during 1910-20, and no effective steps were taken to fund the proposed State university. Much injury to education caused by war conditions, for persons studying law, were among the students in many higher and secondary schools in March 1916.

Finance.—The revenue in 1911 was £E16,795,000, exceeding that of 1910 by £E87,000, and that of 1907 (the highest figure previously recorded) by £E111,000, or 11%. The expenditure in 1911 was £E7,820,000. During 1913 the Domains loan was extinguished and the profit on the working of the domains became available for general purposes. The revenue had increased to £E17,368,000 by 1913 and expenditure to £E17,388,000. The effect of the outburst of the World War was seriously to contract revenue and to necessitate great economies and the finding of new sources of income. The accounts for 1914-5 showed a deficiency of £E1,406,000. The recovery in the price of cotton and the expenditure of the British army stationed in Egypt, however, enabled the Finance Ministry to show a surplus of £E1,165,000. By 1919-20 the revenue had risen to £E18,707,000 in 1919-20 and the expenditure was £E18,091,000. On April 1, 1920 the general reserve fund stood at £E15,576,000. Meanwhile, in 1917-8, the Egyptian Government had taken over charges amounting to about £E3,000,000 incurred by the Egyptian Expeditionary Force. This gave a total of £E3,000,000 (March 31), framed when cotton was at its highest price and trade increasing, was estimated to balance at a slightly higher price of £E40,000,000. During the year the great fall in the price of cotton occurred, with a general contraction of trade, while food subsidies and emergency purchases of coal were a great drain on the revenues. The year closed with a deficit of £E1,000,000 in the general revenue account, which in 1921 was reduced to £E3,000,000. The budget for 1921-2 was framed to meet the altered economic position. Revenue was estimated at £E36,701,000, and expenditure at £E39,000,000 with a draft on the general reserve fund to balance accounts.

The public debt stood on Dec. 31 1919 at £95,299,000 sterling, of which £5,382,000 was held by the Government and £86,917,000 was in the hands of the public. Interest on the debt was £2,356,000.
Administration.—In 1913 the two legislative bodies, the General Assembly and the Legislative Council, were replaced by a single body called the Legislative Assembly consisting of (1) Cabinet ministers; (2) 60 elected members; and (3) 17 members nominated to represent minorities. Members were to hold their seats for six years, one-third being elected every two years. The Legislative Assembly met in 1913 and had a somewhat stormy session. In 1914 martial law was proclaimed and there were no further sittings of the Assembly.

On the proclamation of the British protectorate (Dec. 4, 1914) a High Commissioner replaced the British consul and agent-general. The then ruler, the Khedive Abbas Hilmi, was deposed and his cousin Husein Kamel, a son of the Khedive Ismail, was placed on the throne with the title of sultan; on his death his brother Ahmed Fuad Pasha became sultan (Oct. 9, 1917). The capitations continued in force pending the elaboration of measures which satisfied foreign Powers that under a new judicial system the interests of their subjects would be safeguarded. (See below, History.)

The most useful records of the finances, administration and social and economic condition of Egypt are the Reports of the British Agent of Boutrous Pasha, annual from London down to 1913. In 1920 appeared a Report from the High Commissioner covering the period of 1914–9, a report to which the present writer is indebted. Detailed information is given in annual reports of the various Egyptian ministries, and in the official reports of the Copts see S. H. Leader, The Modern Sons of the Pharaohs (1918). See also M. S. Briggs, Through Egypt in War Time (1918). (F. R. C.)

Political History 1909–21

The Pre-war Period.—The policy of entrusting the Egyptians with a larger administrative responsibility was initiated under Sir Eldon Gorst, who succeeded Lord Cromer as British Agent and Consul-General in 1907. Considerable success attended the extension of ampler powers to provincial councils, which in 1909 took over the direction of the irrigation and education of their territory. A sufficient period of time did not elapse before his premature death in 1911 to give the experiment a fair trial, and the new policy, which was generally interpreted in Egypt as an attempt to conciliate opposition by concession, rather stimulated than discouraged Nationalist agitation. In Feb. 1910 Boutrous Ghali Pasha, the first Copt to attain the rank of Premier, was assassinated by a young Egyptian of the Nationalist party, which proclaimed the murderer a patriot and provoked demonstrations during his trial. Their influence had affected the General Assembly, which displayed its anglophobia by rejecting a proposal to extend the existing Constitution of the Copts; after its expiry in 1968. The British Agent was compelled to recommend drastic measures to stop anti-British manifestations and Sheikh 'Abd el 'Aziz Shawish, the moving spirit behind them, was expelled from Egyptian territory. It is significant that he established his residence in Berlin. Mohammed Said Pasha became Prime Minister and Husuf Saba Pasha, hitherto Director-General of Posts, joined the Cabinet. A long-felt want was supplied in 1910 by the creation of an Agricultural Department under the Minister of Public Works. After the murder of Boutrous Pasha the tension between Copts and Moslems increased and a Coptic Council was established at Assiut in 1911. The Assemblies drew up a memorandum preferring complaints of unfair treatment which the British Agent was unable to regard as justified. Sir Eldon Gorst, who had long been in failing health, requested to be relieved of his functions early in July 1911 and a few days afterwards he died. His long and intimate knowledge of the country lends special importance to his final report for 1910, in which he recognized that the Legislative Council and General Assembly had become instruments of agitation against the occupying Power and that the new policy had failed.

It might be open to question how far it would generally be opportune to appoint a former servant of the Egyptian Government to be representative of Great Britain in Egypt. An exception was, however, certainly justifiable in the case of Lord Kitchener, who had, moreover, been employed for many years elsewhere and who enjoyed exceptional prestige. He arrived in Egypt at the end of Sept. 1911. A fortnight later the Italian landing in Tripoli took a declaration of war with Turkey. Egypt was at once declared neutral. H. M. Government contended on behalf of Egypt the claim of Italy to blockade the coast up to a point 100 m. E. of Sollum, that post, which was occupied by an Egyptian force, being regarded as the limit of her western frontier. In spite of a general feeling of sympathy with a Moslem belligerent, intensified by geographical proximity and racial kinship, the Egyptian people displayed self-control, and neutrality was strictly observed. But the Libyan War had the effect of stimulating the patriotic sentiment which is largely a patriotism of Islam. The anarchical conspiracy displayed by the murder of Boutrous Pasha was again revealed in July 1912, when a plot was detected to murder the Khedive, Lord Kitchener and the Prime Minister.

Lord Kitchener’s energies were first devoted to the needs of the Egyptian peasantry. A law was introduced exempting small holdings up to 5·15 ac. from distraint for debt, while usurious money-lending at more than 9% was made punishable by fine and imprisonment. Boards of local magistrates were instituted to summarily decide trivial cases and avoid costly suits. Steps were taken to preserve the bird life so necessary to keep down cotton pests. Thanks to his efforts the cotton crop, which had been in a bad state, was in 1912 one of the best on record, and the crops of many other products also became conspicuous in the fields. A representative international cotton congress was summoned to meet at the end of 1912. In that year Mohammed Said lost the services of Sa‘d Zaghlul Pasha, his Minister of Justice, who subsequently became the leader of the Nationalists. But his administration was strengthened in 1913 by the formation of two new ministries, those of Waqifs (see 17,413) and Agriculture. Tension with the Khedive, however, led to his resignation in 1914. He was succeeded by Husein Rushdi Pasha, who remained in office throughout the period of the World War.

The Legislative Assembly.—The first measure of Lord Kitchener’s administration was a revision of the Organic Law of 1883 and the institution of a Legislative Assembly on a broader electoral basis than that of the old Legislative Council and General Assembly. Under the previous system the villages appointed representatives by manhood suffrage to elect provincial councils. The provincial councils returned 14 members from their own body to represent the provinces in the Legislative Council, to which 12 more were nominated by the Khedive. The council of 26, with the ministers and 46 other delegates elected by the village representatives, constituted the General Assembly. All laws and decrees before approval had to be submitted to the Legislative Council, which could invite information, submit petitions and criticize the budget. The General Assembly, with similar powers of discussion and criticism, met at rarer intervals. Its concurrence was necessary for any measures involving fresh taxation, but it had no power to initiate legislation. There was no justification for the existence of two bodies performing practically the same functions, and the inclusion of members of the provincial councils, whose duties were entirely different, was an anomaly. A single Legislative Assembly was now substituted for these two bodies, with considerably extended powers, including that of initiating measures on its own responsibility. It was made incumbent on the Government to justify persistence in legislation disapproved by the majority, and machinery was also introduced enabling the Government to directly consult the electors in regard to proposals rejected by the Assembly. The electorate was based on the old register, with the addition of all newly qualified voters, and numbered some two millions. Electors were divided into groups of 50, which returned delegates to carry the vote of each group to the poll.

Three weeks elapsed between the choice of delegates and the final elections. The first Assembly consisted of 49 landowners, 2 lawyers, 3 religious dignitaries and one engineer. The president and one vice-president were appointed by the Government. As elective vice-president Sa‘d Zaghlul Pasha, who was already hailed by the opposition press as the champion of
Egyptian liberty, was chosen by an overwhelming majority. He led a bitter attack against Mohammed Said and indirectly against the British Agency in the early debates. The hostility of the new Assembly received encouragement from the Khedive, who now acted in complete understanding with the Nationalists.

**Egypt during the War.**—On the outbreak of the World War in 1914, and the change that was made in the status of Egypt, the sitting of the Assembly were suspended, and the term of its mandate expired without their having been renewed. Lord Kitchener was absent from Egypt on leave when Great Britain entered the war, and he never returned there, his services being demanded at home, where he was appointed War Minster. On Oct. 1, 1914, enemy subjects were ordered by the G.O.C. in chief, Sir John Maxwell, to register themselves, and German or Austro-Hungarian male subjects of military age, or under suspicion, were deported to Malta. A proclamation of Nov. 2 placed Egypt under martial law. This enabled administrative measures to be enforced without reference to the Legislative Assembly and, where foreign subjects were concerned, without the elaborate procedure for obtaining the consent of foreign Powers. A further proclamation on Nov. 6 notifying a state of war with Turkey, which was not supported by any movement in Egypt itself. Volunteer labour battalions were also raised, which played an important part in the conduct of the war. From 1917 onwards, an Egyptian force, enrolled under the Frontier District Administration with British officers, maintained security and suppressed contraband in the Arabian and Libyan desert zone, hitherto patrolled by the coast-guards.

As the Egyptians were nominally subjects of the Sultan the entry of Turkey into the World War as the enemy of the occupying Power created an intolerable situation which demanded immediate settlement. Turkish suzerainty might have been determined by the annexation of Egypt to the British Empire. But it was decided, rather to proceed along existing lines and to place Egypt under British protection. By a proclamation issued Dec. 18, the Secretary of State for Foreign Affairs gave notice that, "in view of the state of war arising out of the action of Turkey, Egypt is placed under the protection of His Majesty, and will henceforth constitute a British protectorate under His Majesty's Government, and will be treated as a British province. In the case of Turkey's suzerainty over Egypt is thus terminated and His Majesty's Government will adopt all measures necessary for the defence of Egypt and protect its inhabitants and interests." A second proclamation issued the following day announced the deposition of the Khedive, Abbas Hilmi, who was in Constantinople, on the ground of his adherence to the King's enemies, and the acceptance of the succession by his uncle Prince Hussein Kamel, who was henceforth to bear the title of Sultan of Egypt. The arbitrary and corrupt methods of the deposed Khedive had rendered him generally unpopular with Egyptians, who had also little reason to regret the severance of the last link with Turkey. At the same time Musulman feeling could not be indifferent to the danger which threatened the caliphate, and German agents had freely promised the eventual liberation of Egypt from British control after the victory which they confidently predicted. Sultan Hussein's position was therefore no easy one, in spite of the personal respect which he commanded.

**Sir H. McMahon, High Commissioner.**—The new status of Egypt was nevertheless introduced without disturbance, if without enthusiasm, under the direction of Sir Milne Cheatham as acting High Commissioner, pending the arrival early in 1915 of Sir Henry McMahon, who had been selected for the post. The British representative now took over the direction of foreign affairs and the Egyptian minister disappeared.

The complete failure of the Turkish attack on the Canal had its effect on public opinion, and as time went on the Sultan's personal popularity increased. On the other hand, the Russian retreat, the failure of the Dardanelles attack and the final withdrawal produced some reaction and confirmed the general impression of German invincibility. In April and again in July 1915 attempts were made on the life of the Sultan. In justice to the Egyptians, however, it should be recorded that, whatever anticipations had been raised among them as to the outcome of the war, they bore with patience and goodwill the unwelcome disabilities which it entailed, and paid Great Britain under obligations both moral and financial. Requisitions of cereals and of live stock, the control imposed on the price of cotton, recruiting for the labour and the camel transport corps, without which the Palestine campaign could not have been brought to a successful conclusion, and finally the assumption by the Egyptian Government of the whole liability for expenditure on services connected with the war, held over in a suspense account which reached £5,000,000, constituted a British obligation for which too little credit was given.

**Nationalist Propaganda.**—The war had entailed the recall of a great number of British officials from Egypt for service elsewhere, and not only was much abusive action by uncontrolled local agents attributed to British pressure, but a free field was taken for pro-Government propaganda, which was ever-increasingly active as the generation died out which had experienced the pre-war régime. Nationalist sentiment, legitimate and worthy of sympathy in itself, might have assumed a moderate and healthy form had it not from the first received an anti-British impulse from rivalries and jealousies among the Western Powers, making use of the indeterminate position of Great Britain as a serviceable political weapon. The situation was considerably modified by the Anglo-French understanding of 1904. But the Nationalist movement founded by the late Mustafa Kemal and fanned by Sheikh Shawish and others had assumed a definitely anti-British colour, which the ex-Khedin had at one time exploited for his own personal ends. The members of a disaffected civil service, who regarded the presence of an ever-growing number of British officials in the higher posts as a bar to their promotion and interest, swelled the ranks of the Nationalists, reinforced by the students, who felt that their prospect of obtaining State employment, to qualify for which they had often made real sacrifices, was diminished by the competition of the foreigners. The lawyers, a very numerous class, who anticipated that the protectorate would entail a modification of the judicial system prejudicial to them, took advantage of the opportunity to demonstrate the members of all the professional classes. Not only had British officials increased in a manner which seemed disproportionate to the expanding activities of the departments and hardly consistent with the principle of training Egyptians to manage their own affairs, but, in contradiction of that very principle, they had tended to absorb administrative functions and not merely to advise. With increasing numbers they had become a community living their own lives, wholly aloof from the Egyptians and the other foreign communities, and with this loss of contact their influence and moral control had weakened. Finally, the war between Great Britain and Turkey, the cost of the caliphate, had emphasized the latent but always present impatience of the Moslem under Christian rule. The strength which the Nationalist movement continued to acquire during the earlier and middle phases of the war does not seem to have been sufficiently realized.

**Sir R. Wingate, High Commissioner.**—In Dec. 1916 Gen. Sir Reginald Wingate, who had filled the posts of Sirdar of the Egyptian army and Governor-General of the Sudan since Dec. 1899, was called to Cairo as High Commissioner in succession to Sir Henry McMahon. The health of Sultan Hussein, which had for some time caused anxiety, did not improve and it became urgent to settle the question of succession, left in abeyance in 1914. Prince Kamel ed Din, his only son, who had married the sister of the ex-Khedin, finally declared the position of heir-apparent, which was then offered to Prince Ahmad Fuad, the sixth son of the Khedive Isma'il. He had been educated at Turin, where he passed through the military school.
Sultan Hussein died Oct. 9 1917. The removal from the scene of a ruler remarkable for his character, public spirit and thorough knowledge of his own country was a misfortune for Egypt. Certain modifications in the Ministry, in which it was proposed to include Sa'd Zaghlul Pasha, were considered after the accession of the new Sultan. But eventually only one resignation took place, Fathi Pasha, Minister of War, being replaced by Ziwar Pasha, the Governor of Cairo. But the discussions engaged in made it clear that the Prime Minister intended on the conclusion of peace to raise the question of autonomy and the ratification of Egypt's relations with Great Britain by convention.

After-war Plans.—As the World War drew to a close the principles formulated by the President of the United States, to which Great Britain and her Allies subscribed, had a far-reaching and even a decisive effect on educated opinion in Egypt. The numerous declarations of British statesmen, disclaiming any intention of permanently occupying the country, were insistently recalled, and the aspirations of the Egyptians to govern themselves were represented as having received international sanction through the acceptance of the principle of self-determination. Such sentiments were by no means confined to the discontented and the ambitious, who in the furtherance of their political aims would even have welcomed a German victory. Moderate opinion also adopted the view that the attitude of Egypt during the war and the sacrifices made by her people justified a claim for special consideration and that the time had come to reconsider the relations between their country and Great Britain. When in Nov. 1918 an Anglo-French declaration was published announcing that the policy of the Allies in the East contemplated the complete enfranchisement of the peoples so long oppressed by Turkish rule and the "institution of national Governments and administrations deriving their authority from the initiative and free choice of the local populations," Egyptians felt their title to manage their own affairs to be as good as that of Syria and Mesopotamia. They, moreover, regarded their own country with its progressive organization and western methods as far ahead in development of Arabia, where an independent kingdom had already been established. At the moment when concrete expression was being given to these sentiments certain other factors combined to excite public opinion. Early in 1918 a commission had been appointed to consider the presidency of the Prime Minister to consider the future organization of the Legislative Assembly in Egypt. Sir W. Bruntyate, the Judicial Adviser, who, during the long illness and after the death of Lord Edward Cecil also acted as Financial Adviser, was requested by the commission to prepare a basis for discussion and to consider the question of the participation in legislation of the foreign colonies, in view of an eventual abolition of the Capitulations. Another commission had already for some months been discussing the judicial reforms which such a measure would entail, and an impression which gained ground that in any new courts replacing the mixed tribunals the English language and legal procedure would predominate had confirmed the hostility of the legal profession in Egypt. The memorandum regarding the Legislative Assembly was submitted to the Prime Minister in Nov. 1918. Though only intended as a basis for confidential discussion its contents became known and were regarded as having the approval of H.M. Government. The project was interpreted as restricting the Assembly to consultative functions while all legislative power was to be vested in a Senate, in which the members officially appointed with a group of elected foreigners would constitute a majority. Its divulgation raised great and permanent protest within Egypt and formed the basis of reports of representatives of Egypt at the conference. After-war Plans.

Aspirations for Autonomy.—A Nationalist committee was formed at the end of 1918, under the chairmanship of Zaghlul Pasha, who now definitely became the leader of the party. On Nov. 13 he paid a visit to the High Commissioner and expressed the desire to go to London to put forward a programme of complete autonomy, a proposal which was rejected as calculated to serve no good object. At the same time the Prime Minister, with the approval of the Sultan, proposed that he should himself proceed to London with the Minister of Education, Adli Pasha Yeghen, to discuss the affairs of Egypt, urging that, as the Peace Conference would give official sanction to the protectorate, its nature could not be left indeterminate. Sir R. Wingate appealed for their reception with some insistence. But as the Foreign Secretary and other Ministers were shortly leaving for the Peace Conference and would be unable to devote sufficient time and attention to the problem of Egyptian internal reform, they were invited to defer their visit until the moment be opportune. The real urgency of the issue and the danger involved in postponing its consideration appear still not to have been fully appreciated. Rushdi Pasha together with Adli Pasha then tendered their resignations. Every effort was made to induce the two ministers to remain in office and an approximate date was eventually suggested for the visit. But the ministerial crisis was still unsolved when in the middle of Jan. Sir R. Wingate was summoned to London to report personally on Egyptian affairs. He pressed for the immediate reception of the ministers and the withdrawal of restrictions on the movement of Nationalist leaders. The contents of the Nationalists, to whom many of the moderates had rallied, were now receiving so much general support in the country that the ministers were only disposed to repair to London provided similar facilities were accorded to Zaghlul and his colleagues. As the latter were now openly engaged in a campaign aiming at the severance of all connexion between Egypt and Great Britain, their reception by the Foreign Office could not be entertained. On the other hand the invitation to the ministers was renewed. Rushdi Pasha, however, adhered to his resignation, which was accepted.

Meanwhile documents addressed to the Foreign representatives and residents in Egypt announced that a delegation of 12 members, under the presidency of Sa'd Zaghlul, had been formed to lay before other countries the legitimate aspirations of Egypt. On March 3 this delegation forwarded to the Sultan, who had declined to receive them, a petition which, though drafted with all the forms of oriental courtesy, maintained the nullity of the protectorate and was clearly designed to intimidate His Highness and to prevent the formation of a new Government. Vigorous action was therefore taken without delay. On March 8 Zaghlul Pasha and three of his principal adherents were arrested and deported the following day to Malta.

Disturbances in Tanta.—The assertion of authority revealed the gravity of the internal situation. Anti-British demonstrations by the students in Cairo rendered military intervention necessary. On March 12 there were serious disturbances at Tanta and during the following days similar outbreaks occurred in the Delta provinces, characterized by looting and attacks on British soldiers and civilians. Railway lines were simultaneously torn up in different places, in accordance, it would appear, with a plan originally prepared for a rising had the Turkish attempt to cross the Canal proved successful. On the 16th Cairo was isolated by the severance of railway and telegraph communication both with the Delta and with Upper Egypt, where foreign colonies were besieged in the quarter where they had taken refuge. On the 18th the fanaticism roused by the reports of unscrupulous agitators led to the brutal murder and mutilation at Deirn station of a British inspector of prisons, two officers and five of other ranks. Mobile columns had been dispatched with all possible expedition to the disturbed areas and by March 26 the main lines of communication were restored, the danger points were in military occupation and the situation well in hand. But it required the employment of considerable forces and an ultimate resort to armed force to suppress the movements of representatives. The Egyptian was further bloodshed. The leaders had probably never contemplated such a serious upheaval and were alarmed at a situation which had passed beyond their control. But the Nationalist committee, which continued to sit after the deportation of Zaghlul Pasha, cannot escape responsibility for the effects of their propaganda. During these and subsequent manifestations the Egyptian police in the great cities carried out their duties in an exemplary manner. The army, with the exception of a few units, was in the
Sudan, which remained entirely unaffected by events in Egypt. The extent and influence of the Nationalist organization appear to have been underestimated, and the British authorities evidently did not anticipate that within a week after the deportation of the leaders the anti-British agitation would develop into a national movement, supported by elements from every class, including the Copts, many of whom were no doubt prompted by prudential considerations to proclaim their solidarity with the Mussulman. That the fellahin, a pacific peasantry which had derived the greatest benefits from the British occupation, should have been so readily led by agitation to commit acts of savage violence had occasioned some surprise.

The movement among the fellahin was only of a very partial character, and generally restricted to the neighbourhood of large centres. At the same time several factors had by the end of 1918 combined to create a spirit of discontent and some loss of confidence in the British administration, which was made responsible for all the grievances experienced during the war. Recruiting for the labour and camel transport corps was in its earlier and really voluntary stage not unpopular, as the good wages paid were a boon to the poorer people, who enlisted again and again on the termination of their engagements. But when the voluntary system ceased to produce a sufficient number of men administrative pressure was exercised and the local officials took advantage of the absence of control. Unscrupulous Omdas in many cases abused their position, accepting bribes for exemptions and sending their enemies to serve under methods resembling those of the press-gang, while alleging British pressure as their excuse. In spite of the good prices paid, the requisition of domestic animals pressed hardly on the small farmers, who had to part with their only means of transport. Still more resented was the requisition of cereals and the manner in which it was enforced. Requisition rates ranged lower than market rates, which tempted local officials to collect larger amounts than they were required to furnish in order to sell the balance at the higher price, while cultivators who grew no wheat had to buy their quota at the market rate and sell at requisition rates. The process of verification and repayment was inevitably slow and opened the door to abuses. Collections for British Red Cross Funds, intended to be purely voluntary, were enforced by officials seeking to acquire merit for the amounts realized in their districts, and were often regarded by the ignorant fellah as a contribution imposed upon him to the British war-chest. The prices of food, clothing and fuel rose to an unprecedented degree during the war, and the average wages of the labouring class became inadequate to meet the enhanced cost of living and supply the necessaries of life. Meanwhile the fortunate producer of cotton and the privileged foreigner were seen to be accumulating fortunes. The discontent thus engendered among the poorer peasantry created a favourable field for the agitator, who proclaimed that the removal of the British occupation would ensure prosperity.

Lord Allenby’s Regime.—Lord Allenby, the C.-in-C. in Egypt, who had left for Paris on March 12, 1919, was directed to return at once as special High Commissioner during the absence of Sir R. Wingate, with instructions to restore law and order and “to administer in all matters as may be required by the necessity of maintaining the King’s Protectorate on an equitable basis.” The situation now passed from one of active to one of passive resistance. A general strike was maintained for only a few days, but students, lawyers and a large number of public officials declined to resume their activities. Lord Allenby had instructed his officers of conscription and, notwithstanding the dangerous interpretation to which these words were sometimes repeatedly given, the removal of the embargo on the free movement of Egyptians was approved. This entitled the liberation of Zaghlul and his associates interned at Malta, who left for Paris, where their arrival almost coincided with President Wilson’s recognition of the British protectorate. Their efforts to obtain a hearing at the Peace Conference were disappointed. Punitive measures for the outrages perpetrated during the outbreak inevitably tended to maintain embitterment.

On April 9 Rushdi Pasha reconstituted a Ministry with Adli Pasha as Minister of the Interior. An additional Ministry to take charge of all communications was now instituted. But the life of the new Government was ephemeral and, having failed to terminate the official strike while deprecating intervention by the High Commissioner, Rushdi once more resigned on the 21st. A stern proclamation by Lord Allenby, acting as C.-in-C. under powers of martial law, which announced that all officials not returning to duty forthwith would be struck off the lists, had the desired effect.

Appointment of the Milner Mission.—H.M.’s Government now decided to send to Egypt a mission, under the chairmanship of Lord Milner, “to inquire into the causes of the recent disorders, and to report on the existing situation in the country and the form of the constitution which, under the protectorate, will be best calculated to promote its peace and prosperity, the progressive development of self-governing institutions, and the protection of foreign interests. Such were the terms of reference eventually drawn up. It would have been well if such a commission could have proceeded at once, while the impression of repressive measures was still strong, before the Nationalist movement had completed its organization, had exploited industrial unrest and extended throughout the country a propaganda which now received open encouragement from sections of the Arab university of El Azhar. But circumstances rendered its departure impossible before the autumn. A month after Rushdi’s resignation, Mohammed Said Pasha (Prime Minister 1910–3) formed a new Ministry, in spite of the opposition which was henceforth to be anticipated to any combination from the Nationalists. Certain changes were also regarded as opportune in the British personnel. Sir Paul Harvey, who had resigned the position of Financial Adviser during Lord Kitchener’s administration, returned. Sir W. Brunyate, who had acted in that capacity since the death of Lord Edward Cecil, also resigned his position as Judicial Adviser. Mr. Douglas Dunlop, Adviser to the Minister of Education, whose department had been much attacked, was replaced by Mr. R. S. Patterson, the Director-General of Accounts, as was Mr. Haines, the Adviser to the Interior, by Brig.-Gen. Sir G. F. Clayton, chief political officer to the Egyptian Force. A period of drift now ensued during which, though conditions appeared outwardly calm, the Nationalists continued to be active and to advocate a boycott of the Mission.

Among the arguments used to discredit the British administration much capital was made among the small landowners by the allegation of an intention to curtail the water-supply of Egypt in favour of the Anglo-Egyptian Sudan. A project had been adopted for the construction of barrages at Gebel Aulia and Sennar on the White and Blue Niles respectively. The former was designed to create a reservoir which would enable the remaining waste lands of Egypt, some 1,000,000 ac., to be cultivated, while extending perennial irrigation to some 1,200,000 more, now under basin cultivation, and therefore restricted to one crop in each year. The Blue Nile dam to be constructed near Sennar contemplated the raising of the river to a level necessary to feed a great canal which would irrigate the triangle south of Khartoum known as the Gezira, approximately equal in area to the Egyptian Delta, and suitable for raising cotton. The unfortunate attacks made by Sir W. Willock and Col. Kennedy on Sir Murdoch Macdonald, Adviser to the Ministry of Public Works, which were shown by the report of the eminent irrigation experts serving on the Nile Projects Commission to be unfounded, did much to encourage these misrepresentations. The present Government, who, on the advice of having falsified figures to justify his proposals rendered inevitable a prosecution for criminal libel which ended in conviction.

The proposal to boycott the Milner Mission gained strength from the protest of the Prime Minister against its arrival before the signature of peace with Turkey, and his resignation which followed. Wahba Pasha, who had acted as Minister of Finance in the last two Cabinets, consented with no little courage to preside over a Ministry of Affairs.
Reception of the Mission.—The special mission to Egypt was thus composed: Viscount Milner (chairman), Sir J. Renneill Rodd, Gen. Sir John Maxwell, Brig.-Gen. Sir Owen Thomas, Sir Cecil Hurst, and Mr. J. A. Spender, with A. T. Loyd and E. M. B. Ingram as secretaries. The mission arrived in Egypt on Dec. 7 1919. Every possible measure had been taken for its security in view of the attitude of organized antagonism which was at once openly manifested by strikes and street demonstrations in which even the Cairene ladies emerged from their seclusion to take part. Every effort was made to prevent Egyptians of note from coming into contact with the mission and those who did so were denounced in the local press. The headquarters of the mission were watched by pickets and the movements of individual members carefully followed, even into the provinces, with a view to preventing any contact with the people. Serious riots at Tanta followed a visit to that city, where military intervention became necessary.

During their stay in Cairo there was a series of attacks on British soldiers and no less than three attempts were made to assassinate Egyptian ministers by bomb-throwing. Soon after the departure of the commission the chiefs of El Azhar University identified themselves with the Nationalists by a manifesto addressed to the High Commissioner, setting forth the claims of Egypt to complete independence and demanding the withdrawal of the British. A somewhat similar declaration signed by six princes of the khalifal family was sent in a letter to Lord Milner and simultaneously published in the press. The denunciation of the protectorate was the prevailing note.

The general hostility displayed was to some extent mitigated by a declaration issued on Dec. 29, in which the real aims of the mission were clearly stated. The belief that its object was to deprive Egypt of rights hitherto possessed was declared to be without foundation, and free expression of all opinion without limit to the field of discussion was invited. But the relations of the mission with the Egyptians were confined to informal discussion and conversations with individuals. These as time went on became so general that its members were able to thoroughly ascertain the current feeling of the country. A visit was paid by the mission to Alexandria, where its members were enabled to hear the views of the French, Italian and Greek as well as of the British Chamber of Commerce. An exhaustive inquiry was made into the working of every public department. The principal British officials were consulted as well as the leading members of the non-official British community. Sir Cecil Hurst devoted a great part of his time to an investigation of the judicial system and the reforms which would become necessary to meet new conditions. Sir John Maxwell and Sir Owen Thomas also visited the Sudan. Before the departure of the mission in March 1920 a large volume of material had been collected, and certain propositions, on which remarkable unanimity was displayed, were provisionally drafted with a view to the preparation of a final report in England. While there had been no means of ascertaining how far a settlement on the lines contemplated would meet and gain general support in Egypt, it was clear that on certain points the commission had obtained agreement were at one, and a solution on the basis of mutual agreement was obviously preferable to an imposed arrangement.

Milner-Zaghlul Agreement.—An opportunity presented itself in April, largely through the good offices of Adli Pasha, of which advantage was taken, to enter into relations with the Egyptian Delegation in Paris, who were now disposed to meet the mission in England. Meanwhile Wahba Pasha, whose health no longer permitted him to stand the strain of office, resigned on May 19 and was succeeded as Prime Minister by Tewfik Nessim Pasha. Zaghlul and seven other delegates reached London on June 7 1920. Friendly relations were established with them and, after deliberations which extended to the middle of August, the general lines of an eventual settlement were drafted. But Zaghlul and his friends were not prepared to commit themselves to acceptance without reference to their supporters in Egypt, and four members of the delegation accordingly returned to Cairo with a memorandum outlining the bases on which an agreement might subsequently be framed. This memorandum, which came to be known as the Milner-Zaghlul Agreement, was in general accordance with the conclusions adopted by the mission in Egypt, though it went somewhat further, especially as regards the right of Egypt to foreign representation. A letter handed to Adli Pasha together with the memorandum made it clear that the latter had no reference to the Sudan, which lay outside the scope of the suggested agreement.

The proposition contained in the memorandum may be summarized as follows:—

In order to establish the independence of Egypt on a secure and lasting basis it is necessary to define precisely the relations between Great Britain and Egypt and to modify the privileges and immunities enjoyed by the British High Commissioner and other accredited representatives of the Governments should contemplate:—

a Treaty of Alliance between Great Britain and Egypt under which Great Britain will recognize the independence of Egypt as a constitutional monarchy with representative institutions, and Egypt will confer upon Great Britain the rights necessary to safeguard her special interests and to enable her to give foreign Powers guarantees which will secure relinquishment of certain properties and responsibility for legislatures in the Egyptian territory, and Egypt will, in case of war, render Great Britain all assistance in her power within her own borders. This Treaty of Alliance will be signed with the British High Commissioner and will be extended to foreign countries, and in absence of an accredited representative confirmative interests to the British representative; Egypt will not adopt an attitude inconsistent with the alliance, or enter into any agreements with foreign Powers that would prejudice the position of her representatives, having influence, and Egypt will confer on Great Britain the right to maintain a military force on Egyptian soil for the protection of her Imperial communications; Egypt will appoint, with concurrence of H.M. Government, a British high commissioner, who shall be the one of the commissioners of debt and be generally available for consultation; Egypt will similarly appoint a British officer in Ministry of Justice, with access to minister, to have cognizance of all matters affecting foreigners and be available for consultation regarding maintenance of law and order; Egypt will recognize right of Great Britain to intervene in case of legislation operating inequitably against foreigners, or any infringement of the rights mentioned above; Egypt will have a special method of settlement for disputes with other foreign representatives; engagements of British or other foreign officials and officers may be terminated by either party within two years after the Treaty comes into force, with pension or compensation to be thereafter determined.

Further provisions contemplate:—approval by a Constituent Assembly of the Treaty, which would only come into force after foreign Powers have agreed to close their consular courts; a new organic statute securing ministerial responsibility to legislatures, religious toleration and protection of rights of foreigners; conclusion by Great Britain of agreements with capitulatory Powers, renunciation by Great Britain of her rights to intervene in Egypt and the granting to Egyptians of the right to extinguish debts pending in the tribunals and of Egyptian legislation; transfer to H.M. Government of rights exercised by foreign Governments under capitulations; maintenance of existing treaties to which Egypt is a party; continuation of the existing relations with the British Government as to representation in Azhar, women's education, legitimate commerce, and rights of British subjects. The Egyptian Government undertakes to pay such sums as may be required for the purpose of liquidating the Government in the British Concession, to give effect to the said agreements, to modify the present status of the British Concession and to make the necessary legal and administrative arrangements for the exercise of the powers, duties, and responsibilities vested in the British High Commissioner by virtue of the late Agreement and to extend to the Egyptian public and that any attempted opposition had met with complete failure. At the same time they had been urged to support modifications of certain specific points. These contemplated a limitation of the functions of the Financial Adviser and of the officer attached to the Ministry of Justice; abdication of a provision postponing the coming into force of the contemplated Treaty until agreements had been concluded with the Powers for the modification of the Capitulations, and a formal abdication of the protectorate.

The mission adopted the view that no good purpose could be served by further discussion of details at that stage. These points, on which they preferred to express no opinion, as well as others, could be raised when negotiations were opened. Zaghlul Pasha stated that his efforts to create a favourable atmosphere for settlement would be weakened if he could give no undertaking with regard to these reservations and especially the abdication of the protectorate. The Egyptian delegates then
left England and the mission concluded their report, which was forwarded to the Secretary of State for Foreign Affairs on Dec. 9 1920 and presented to Parliament as Egypt. No. 1 (1921).

After the Milner Report.—A period of suspense ensued during which the report was translated into Arabic. Its recommendations reestablished the ascendancy of a moderate party in Egypt. After an effort to constitute a ministry representing a coalition of all parties, Ali Pasha accepted the task of forming an administration. His selection was in accord with the desire of the majority of the delegates who had visited London. It was then announced that "H.M. Government, after a study of the proposals made by Lord Milner, have arrived at the conclusion that the status of protectorate is not a satisfactory relation in which Egypt should continue to stand to Great Britain. While they have not reached final decisions with regard to Lord Milner's recommendations, they desire to confer with a delegation nominated by the Sultan with a view, if possible, to substitute for the protectorate a relationship which would, while securing the special interests of Great Britain and enabling her to offer adequate guarantees to foreign Powers, meet the legitimate aspirations of Egypt and the Egyptian people."

Zaghlul Pasha returned to Egypt from France on April 5 1921 and was received with great demonstrations of welcome. He at once took up a position of hostility to the new Government, and, though offered a place in the official delegation, was only willing to take part if he were himself appointed president. The majority of his former colleagues of the unofficial delegation then separated themselves from him. He declared the new Government not to be representative of opinion and a campaign of protest against the departure of the delegates was inaugurated. Moderate opinion in Egypt was unfavourable to his attitude and he only retained the support of the extremist and the turbulent elements in the country, who were, however, successful in producing demonstrations in Cairo and in Alexandria, in which city very serious riots took place on May 20, continuing through the two following days. They assumed the form of an anti-European outbreak, intensified by the nervousness of the European colonies and retaliation on their part against the demonstrators. The situation in Alexandria passed beyond the control of the Egyptian police and order had to be restored by British military intervention. Some 66 Egyptians and 19 Europeans were killed during the disturbances, and 162 Egyptians and 66 Europeans were wounded, the principal sufferers among the latter being Greeks. The effect of these riots, which were deplored by the majority of Egyptians, was to bring the question of the adequate protection of foreigners once more into prominence. Zaghlul Pasha indeed issued a manifesto denouncing attacks on foreigners and protested that the riot at Alexandria had nothing to do with politics. But the general tone of his subsequent utterances, his continued efforts to undermine the Ministry and to discredit the official delegation, only tended to bring home to him the responsibility for these unfortunate events. In the autumn of 1921, he visited London, where discussions took place between him and the Government as to the proposed new constitution; but an agreement was not reached, and he returned to Egypt without any further progress having been made.

Economic Situation 1900-21.—From the time of the economic crisis of 1907 the record of Egypt had been one of reviving and ever-increasing prosperity. The failure of the Bank of Egypt in 1919 and the consequent rise in prices due to the war were the chief causes. The last of a succession of lean years with low Nile levels in 1919 was surmounted by the Government without recourse to a loan. The disabilities of the World War were more than compensated for by the economic prosperity of Egypt which at one moment, in Feb. 1920, rose to 95d. per lb., ten times its pre-war price. The majority of Egyptian fortunes were invested in real estate and the competition for cotton land made £400 an acre a not uncommon price per feddan, while instances may be quoted of land which reached £500 and even £600. Previously to the war the Egyptian financial year ran from Jan. 1 to Dec. 31. It was then decided to bring the fiscal year into line with the British and the calendar year. It was also decided to re-assess the tax for Egyptian cotton and has since run from April 1 to March 31 of the following year. In 1910 the budget figures were: revenue, £17,177,107; expenditure, £17,077,207. Five years later, for the financial year 1915-6, the increase was not very marked, the figures being: revenue, £17,759,418; expenditure, £16,934,660. But subsequently the rise was more marked and the revenue as well as the expenditure were both estimated at £40,271,000. On the revenue side of this total £35,675,000 represented ordinary receipts, while the balance of extraordinary receipts exceeded £4,596,000. As a result of the large revenue surplus, the financial position of the Government improved, and although the amount of public debt still increased from £33,400,000 in 1907 to £35,675,000 in 1920, the interest charges on the debt were reduced from £2,957,000 in 1907 to £2,594,000 in 1920. The principal source of revenue was the export of cotton. On the expenditure side £32,016,920 represented recurring obligations; £3,564,080 was assigned to new works and improvements; £5,000,000 was to be spent on defense, and £2,000,000 was to be spent on special purposes, e.g. the reorganization and extension of the cotton industry and the irrigation works. The result was, that while the financial year手工 of the total amount of expenditure of the forces police of approximately two million pounds.

In the course of 1920 the universal crisis in production and the cessation of demand for Egyptian cotton caused its price to drop to 20s. a lb., and in May, 1921, to 16s. It was, however, rendered less acute by the large profits accumulated during the preceding period by the class most affected by the paralysis of the commodity. It was estimated in 1920 that the Egyptian savings invested abroad, largely in British Treasury bills, might be reckoned at £300,000,000, more than the whole public debt. The break in cotton prices inevitably affected receipts from customary duties. A large proportion of the increase in the acreage devoted to cereals had entitled large purchases abroad, while the menace of a fuel famine had made it incumbent on the Government to ensure the coal supply in spite of the high prices prevailing. The result was that, while the expenditure was closed with a revenue somewhat short of that estimated, approximately £40,000,000, expenditure rose to £53,000,000, of which £28,500,000 was devoted to food supplies and £6,400,000 for the purchase of coal. Egypt was also compelled to be met by a draft on the Reserve Fund, which had greatly increased in the prosperous years 1917-20, and amounted, after due deductions for depreciation of stock, to £1,581,866, leaving some three millions in hand to face a deficit on the budget for 1921-2.

While Egypt was enabled to meet this formidable deficit thanks to the accumulations of former years, the expansion of revenue had for a long time past fallen far short of the legitimate capacity and requirements of the country. The Egyptian financial system was inequitable and remained inelastic, owing to the impossibility of imposing taxation in proportion to wealth and of making it increase in direct proportion as the wealth increased. The tax reassessed under the scheme of 1895, was fixed for a period of 30 years from the date of valuation. It was then calculated to represent 2 1/2% of the market value. It had, however, passed it had ceased in any way to approximate to that figure, but it could not be altered until the prescribed term had expired. Egypt, one of the richest countries of the world, remained, owing to a combination of circumstances, the most backward in the countries in which the interpretation of local taxation have similarly arrested municipal development. These disabilities have indirectly contributed to the increase of criminality by restricting the extension of the police force, while expenditure on public health and education has been inadequate.

The Egyptian debt on Dec. 31 1919 stood at £93,399 630, distributed between the three categories as follows: guaranteed loan, £57,099,000; privileged debt, £11,177,700; unified debt, £15,000, 000. The Government and the commissioners of the debt held £25,282,260. The amount held by the public was thus reduced to £88,017,360.

EHRlich, PAUL (1854-1915), German bacteriologist, was born in Silesia March 14 1854, of Jewish parentage. He was educated at Breslau and Strassburg, where he studied medicine. He made the drawings for a book published in 1897, and in earlier years carried out various important investigations in aniline dyes. He was at the same time winning fame as a bacteriologist, and in 1907 discovered a red dye, known as "trypan red," which effected the complete sterilization of animals infected with trypanosomes, a work of enormous importance for the treatment of diseases caused by these parasites. He considerably improved the technique of serum preparation, and also discovered a method by which the potency of the anti-diphtheria toxin could be tested. He also investigated the diseases of cancer. Ehrlich's most famous dis-
ever, however, was made in connection with his researches into venereal diseases. It was announced in 1910 that he had prepared an arsenical compound, known as salvarsan or "606," which was a cure for syphilis. He lectured in London in 1907, and in 1913 attended the medical congress held there. He received many honours from his Government and marks of distinction from almost every university and scientific society. He died at Homburg Aug. 20 1915.

See Paul Ehrlisch: eine Darstellung seines wissenschaftlichen Wirkes, Festschrift zum 60. Geburtstage des Forschers (1914).

EICHHORN, HERMANN VON (1848-1915), German field-marshall, was born at Breslau Feb. 13 1848. He took part, as a young officer, in the campaigns of 1866 and 1870-71. In 1897 he was appointed chief of the staff of the VI. Army Corps at Breslau, in 1901 divisional and in 1907 corps commander. In 1905 he was promoted to the rank of general of the infantry and in 1913 to that of Generaloberst, while in the same year he was appointed inspector-general of the VII. Army Inspection at Saarbrücken. At the outbreak of the World War he was incapacitated in consequence of an accident, but was able to play a part in the battle of Soissons in Jan. 1915. In that month he was appointed to the command of the X. Army, which was engaged in the great battle of the Marisaur Lakes in the following February. In Aug. he took Kovno and afterwards the fortresses of Grodno and Olitta, and continued his victorious advance into Russia. From 1916-8 Eichhorn was in command of the army group known by his name in Courland. In Dec. 1917 he was raised to the rank of field-marshall and was sent to the Ukraine as chief-in-command of the German troops on the eastern front. He was assassinated at Kiev July 30 1918.

EINEM, KARL VON (1853-1923), Prussian general, was born at Hertzberg in the Harz Jan. 1 1853. He entered the Prussian army in 1870 and rose to the rank of major-general in 1900. In the same year he was entrusted with the organization of the German section of the international military expedition to Peking. In 1896 he was appointed major-general and appointed Minister of War, an office which he held till 1900. He had meanwhile been promoted to be a general of the cavalry, and in 1909 he was placed in command of the VII. Army Corps, which under Kluck he led in the advance through Belgium in 1914. In Sept. 1914 he was appointed to the command of the III. Army (the army of the Aisne), which he successfully handled throughout the heavy fighting in Champagne in Feb. 1915. He continued his defence of his section of the German position with this army throughout 1917 and the early months of 1918.

EINSTEIN, ALBERT (1879-1955), German-Swiss physicist, was born of Jewish parents at Ulm in Bavaria on March 14 1879. His boyhood was spent at Munich where his father, who owned electro-technical works, settled in the early 'eighties. The family migrated to Italy in 1894, whilst Albert Einstein went to the Cantonschule at Arau in Switzerland, where he passed the abiturienten examination, the indispensable preliminary to any professional career in Central Europe, two years later. He attended lectures while supporting himself by teaching mathematics and physics at the polytechnic school at Zürich until 1903 and finally, after a year as tutor at Schaffhausen, which was succeeded by a period of assistantships at the patent office of Berne, where, having become a Swiss citizen, he remained until 1909. It was during this period that he took his Ph.D. degree at the university of Zürich and published his first papers on physical subjects. These were so highly thought of that in 1909 he was appointed extraordinary professor of theoretical physics at the university of Zürich. In 1911 he accepted the chair of physics in Prague, only to be induced to return to his own polytechnic school at Zürich as full professor in the following year. In 1914 his preeminence had become so evident that a special position was created for him in Berlin, where he was elected a member of the Royal Academy of Sciences and given a sufficient stipend to enable him to devote all his time to research without any restrictions or duties whatsoever. He was elected a foreign member of the Royal Society in 1921, having also been made previously a member of the Amsterdam and Copenhagen Academies, while the universities of Geneva, Manchester, Rostock and Princeton conferred honorary degrees on him.

Einstein's work is so important and has proved fertile in so many various branches of physics that it is not possible to do more than enumerate a few of the most salient papers. The work by which he is best known, the theory of relativity, was begun in 1905 with the publication of the new conception of the nature of the universe (RELATIVITY). Though considered fantastic by many, it has secured fairly general acceptance in Germany in 1912, and was followed by the generalized theory in 1915. But Einstein's work has been by no means confined to such abstract questions. One of his earliest publications gave the complete theory and formulae of the phenomenon known as Brownian motion, which had puzzled physicists for nearly 80 years. He showed that the heat molecules, which is too small to be perceptible when these particles are large, and which cannot be observed in molecules since these themselves are too small, must be perceptible when the particles are just large enough to be visible and gave complete equations which enable the masses themselves to be deduced from the motions of these particles. Much of his time again was spent on the obscure problems usually combined under the heading 'quantum theory.' The importance of these has become more and more evident, and the difficulty of reconciling the apparently inevitable Incompatibilities of the product of energy and time which experiment indicates, with our accepted ideas of space and time, has induced a peculiar fascination for Einstein. Sooner or later he realized, and published the far-reaching consequences of the theory propounded by Planck. His paper on the variation of the specific heat with temperature, which appeared in 1907, was followed by a further extension of the 'quantum theory' and his verification in essentials is one of the most convincing arguments in its favour. Numerous other papers on molecular physics, including an experimental research on magnetism, appeared in the Proceedings of the Russian Academy of Science, the Physikalische Zeitschrift, the Proceedings of the German Physical Society, the Annalen der Physik, etc.

EISNER, KURT (1867-1916), Bavarian Socialist politician and author, was born in Berlin on May 14 1867. He became a journalist, and at an early stage of his career had the first of his many experiences of imprisonment for the subversive tendency of his writings. He was successively on the editorial staff of the reviews Die Zukunft and Der Prophet in Berlin, and in 1891 became a correspondent of the newspapers at Nürnberg and Munich. On the outbreak of the World War at first seemed to be going to side with the Government, but, after having obtained some private knowledge of the way in which German public opinion had been duped, he turned against his own party, the Social Democrats, and attacked them for supporting the war. In Jan. 1918 he was prosecuted at Munich on a charge of treason for inciting munition workers to strike. He was released from prison on the ground that he was a candidate for the Reichstag, and recovered his liberty in time to arrange the mass meeting on the Theresienwiese at Munich on Nov. 5 1918, which ended in the overthrow of the Bavarian monarchy, the flight of the King and the deposition of a Bavarian revolutionary Government under the presidency of Eisner. A red-haired Jew, he possessed a magnetic and artistic temperament, and had various special methods of arousing and restraining the revolutionary masses, including orchestral and vocal concerts of high excellence in the formerly royal theatres and the opera house of Munich. His policy followed exactly the lines in the sense of furthering the Workmen's and Soldiers' Councils system, while at the same time he manifested a Bavarian particularism of his own in his efforts to maintain his conceptions of republican government in conjunction with the councils in Bavaria as against the centralizing tendencies of the Berlin policy. It was with difficulty that he was induced to agree to the arrangements for reestablishing the Federal system of the German Reich and for the election of a National Constituent Assembly. Meanwhile a Bavarian Assembly had been elected, and the Bavarian reactionaries feared that, when it assembled, Eisner's influence might continue to predominate or might even be fortified. He was, further, obnoxious to them on account of his revelations as to the origin of the war, and at an international Socialist conference at Berne he urged the German delegates to make a clean breast of Germany's war guilt. He did his way to do this, and was shot on the street by a young Count Arco on Feb. 21 1919. This crime was speedily followed by the Bolshevik chaos into which Munich was for a brief period plunged in April.
Eisner was the author of various books and pamphlets, which display considerable literary faculty. They include Psychopathia Spiritualis (1852); Eine Junkerreise (1869); Wilhelm Luebkncth (1900); Feude der Feudalen (1913), and Die Neue Zeit (1919).

(G. S.)

ELECTRICAL ENGINEERING (see 9.193).—In the articles on Electricity Supply, Electro-metallurgy and Electrochemistry, Telegraphy and Telegraphy, Pyrometry, Electric Lighting, Wireless Telegraphy and Telephony, various important applications of Electrical Engineering, as developed since 1910, are separately dealt with. This article deals with developments connected with the dynamo (see 8.764), and with progress as regards power stations and electric traction generally.

LARGE ELECTRIC SUPPLY STATIONS

Technical advances on the generation side of the electrical industry have been mainly in connexion with the wider use of the steam turbine on the one hand and with alternating-current transmission on the other. Thus the large turbo-alternator has become the standard machine for all important central stations dependent on steam. A further factor in this development has been the tendency towards the linking-up of supply stations in large areas in order to obtain increased economy—a matter which has so much importance for industry as to call for the appointment in Great Britain in 1919 of special Electricity Commissioners to deal with it. In other countries also the statutory regulation of electric supply has been seriously discussed and in Germany state control has been adopted.

Perhaps the most important feature which affects linking-up problems and standard lines of manufacture is the question of the system, or rather of the frequency, to be adopted. In the course of natural development, the 3-phase alternating current system at a frequency of 50 cycles per second has been more and more widely used until it can now be regarded as the standard throughout Europe. On the Continent, apart from traction work for which 50/3 or 15 cycles per second have been adopted, a few stations only still operate at 42 cycles per second. In Great Britain the chief exceptions are to be found in the use of 30 cycles in the N.E. coast area, and of 25 cycles in Birmingham and the Clyde valley, the 3-phase system being still retained. With 50 cycles as the standard the turbo speeds become fixed at 3,000 revolutions per minute (2-pole machines) and 1,500 revolutions per minute (4-pole machines). Units up to 20,000 kva. have been built at the former speed, and at the latter up to 40,000 kva. In the United States the standard frequencies are 60 and 25 cycles per second, the latter being essentially used for traction purposes. The higher frequency makes the construction of large 2-pole units more difficult, but nevertheless the successful development of high-speed machinery and of reduction gearing is having a marked influence towards the higher frequency. Even 60-cycle rotary converters for traction work are becoming common. Four-pole turbo-alternators running at 1,800 revolutions per minute to give a frequency of 60 have been built up to a capacity of 33,333 kva. Steam-turbine units of as much as 60,000 kw. are in use, but in this case the high-pressure and two low-pressure turbines each drive a separate 20,000 kw. generator at 1,500 revolutions per minute.

Thus the alternator has been able to keep pace with the demands of the steam turbine as regards large powers at high speeds with high thermal efficiencies for the combination. Even comparatively small units of 6,000 to 7,500 kw. have shown an efficiency from the thermal units of the coal to the net kilowatt-hour of 18 per cent. It is possible that the normal units of the future will be in the neighbourhood of 25,000 rather than of 50,000 kw. if an output of 100,000 to 150,000 kw. should come to be regarded as the maximum desirable for any one station.

A longitudinal section through a large 2-pole turbo-alternator of modern type is shown in fig. 1, wherein will be seen the channels provided for air to ventilate both rotor and stator. A fan is attached to each end of the rotor to blow air through the stator channels, and the heated air is discharged at the top of the outer casing.

The design of large turbo-alternators presents many difficult problems. The rotor (particularly at 3,000 revolutions per minute) is commonly of the cylindrical type made from a solid steel forging; the exciting winding being accommodated in slots and the coil ends secured by means of covers forged from special alloy steels. It is only by the most rigid construction that successful rotors can be made to withstand the enormous stresses set up at peripheral velocities in the neighbourhood of 25,000 ft. per minute. The adequate ventilation of such rotors is not easily obtained, and, while both air and water ducts are used, there is a strong tendency to dispense with ducts altogether and rely on non-combustible insulation (mica) for preventing injury from high temperature. The stator also needs especial care— not only is the cooling problem difficult, but the bracing of the coil ends has to be such that no movement of the conductors is possible even under conditions of sudden short circuit. It has doubtless been due to the rapidly increasing demands for large powers and high speeds, and the success achieved therewith, that the frequency of 50 cycles has come to be more widely adopted.

---

than the frequency of 25 cycles. Where the latter frequency has been retained it has been found preferable to use mechanical reduction gears, with capacities of about 5,000 kw. Reduction gear may indeed be said to have revolutionized turbine driving for small outputs, the losses in the gearing being much less than those of the well-known steam turbine. It has further to be remarked that the application of reduction gearing to electrical work is still in its infancy. The greater expense of the geared drive is considered by many to be compensated for by the higher efficiency of the plant.

The development of the continuous-current turbo-generator could not keep pace with the demand for increased output. Though satisfactory units of 1,500 kw. were already built, the more modern continuous current turbo-generator sets were not built until 1915 at the earliest. The demands of large users of continuous-current power, such as railways, chemical works, etc., continued to increase, and the more powerful sets were made by the use of double helical shafting and double reduction gearing) for moderate outputs, or by rotary converters for large outputs. Units of 2,000 to 5,000 kw. are not uncommon.

Both machines and transformers owe much of their development to the further utilization of the means for reducing the losses which occur in the iron and the copper. The use of silicon and other elements in alloy with iron to increase the resistance to the flow of cold currents in iron is the factor which has been mainly responsible for the reduced weight per kva. of transformers, whilst the devices adopted for diminishing the unequal distribution of current in machines and transformers have rendered possible many modern designs.

As an instance of a modern power station may be cited that at Zachornowitz (Golpa), which at the present time is nearly completed. The station was erected in 1915 during the course of the war at the instance of the German Government for the supply of power for the production of nitrate of calcium in order to ensure a sufficient home supply of nitrates for agriculture and other necessary purposes. The engine-room contains 8 steam-turbine sets, each of 22,000 kva. capacity at 1,500 revolutions per minute, and the magnitude of the output may be judged from the daily consumption of about 7,000 tons of coal obtained from the lignite coal-field in the area of the station. There are 64 large tubular boilers with 9 chimneys, each 328 ft. high, and 11 large cooling towers. Current is generated at 6,600 volts; the total output is 60,000 kw., being supplied to the power stations of the Upper and Lower Danube, and to the Czechoslovakian lines. The station is situated on the navigable Rucksee, and the water is supplied to the turbines at a head of 320 ft. More than 100,000 kw. have been transferred by this station.

The lay-out of the plant in modern stations has been mainly governed by principles of economy. Larger boilers, higher steam pressures and temperatures, have been adopted, partly because of the larger load of the modern turbines. However, a large number of small slow-speed sets have all helped in this direction. The design and arrangement of the switch-gear have also been matters on which much care has been bestowed, and the larger networks of countries using both systems to the nitrate of the stretch of the railway, the connection of the station to the line, the power stations, and the consumption of the power. The transmission is large in the United Kingdom, and in the United States, and in the United Kingdom, the German countries, and the United States.

The cooling of the machinery and transformers calls for special consideration in the layout of large plants. Air is still the common medium for cooling, but the quantities needed by modern turbo-generators are so large that special intakes and outlets have to be provided. In addition, measures have to be taken for cooling the generators, for the condenser, near towns or industrial centres, or of the water in the cooling system. With transformers of large size the oil is cooled by water, but in small transformers the water is cooled by water, generally by passing water through a cooling coil immersed in the upper part of the oil or by pumping the oil through a cooling chamber.

The current is always the same and is often customary to generate 3-phase alternating current at the pressure required at the ship rings of the rotary converters, thereby dispensing with transformers. An important feature in connexion with modern switchgear is that of safety devices for preventing wrong connections or danger to the operators.

**RAILWAY ELECTRIFICATION**

The valid reasons upon which the electrification of railways may be advocated have now become more clearly defined, and progress has been made as these reasons have shown themselves to be applicable to specific cases. Before the World War considerable interest had been shown in the desirability of certain countries to make themselves economically independent, and therefore to utilize available water-power rather than to import coal, although it was not always easy to show that any appreciable saving would accrue from electrifying railways under these conditions. The countries chiefly concerned in this way were Italy, Switzerland and Sweden. A great impetus, however, was given to this movement during the war on account of the scarcity and high price of coal, and a stage has now been reached where it is safe to say that whatever the cost of coal may be in the future, certain railway lines will be cheaper by running on electric coal. Another great factor has been the difficulty of dealing with increased traffic. The introduction of the electric locomotive—by increasing the average speed, especially on inclines, and by rendering heavier train loads feasible—has in several cases proved a cheaper solution than doubling or quadrupling the track. The tunnel and terminal advantages will also be recognized.

As an indication of the importance that the electrification of main lines has assumed, reference may be made to the fact that in many countries the question has been taken up by the states concerned. The outstanding features of the developments that have taken place are the following:

- The three systems which call for discussion are:
  - (a) The three-phase system;
  - (b) the single-phase system;
  - (c) the continuous-current system.

From a technical standpoint, all three systems may be said to be satisfactory. It will now be convenient to deal with the several countries separately.

**Great Britain.**—The general electrification of railways has been discussed, but has hardly received serious consideration, and a committee was appointed to advise the Ministry of Transport, and in its interim report advocated as the standard system the continuous-current system at 1,500 volts, the mode of generation of the power to be that prevailing in the district. Up to the present, practically the only lines that have been electrified have been city and suburban railways in and around London, Liverpool, Newcastle-upon-Tyne and Manchester. Until recently, the 600-volt continuous-current system, as used by the New York Central, had been adopted for railways, but with a third rail instead of an overhead conductor. There are now two exceptions—the Newport-Shilton mineral line 18 m. long at 1,500 volts with an overhead conductor; and a few 10 m. long with a third rail. There are only two examples of the single-phase system—the important electrification of the suburban system of the London, Brighton and South Coast railway, with an overhead conductor; and the extension of the Birkenhead electric tramway system on the Wirral peninsula. The large Morecambe-Heysham experimental line on the Midland railway. Extensions on the Brighton system were in progress before the World War, but were not completed in 1919. With the exception of a few electric locomotives for hauling passenger coaches and goods traffic over the electrified sections, motor coaches are used entirely on the English electric railways. Amongst recent extensions of the 600-volt system, which may be mentioned the electrification of the suburban lines of the London and South-Western railway, the extension of the London and North-Western railway electrification to Watford, and the extension of the Manchester and Salford electric trams. A line on the Great Western railway, which was carried out by the Sheepard’s Bush to Ealing.

**United States of America.**—In the United States where so much has been done to develop both the continuous-current and the single-phase systems, many of the electrified railways have been extended both systems; but of late years, the leading firms, the General Electric Co. and the Westinghouse Co., appear to have favoured the continuous-current system. In America a break away from the 3,000-volt system occurred long ago, and 2,400 volts became quite common. Of recent years, the Butte-Anacoda mineral line was equipped on the continuous-current system at 2,400 volts, and served as an experiment for the Chicago, Milwaukee and St. Paul railway at 3,000 volts. This line, over 655 m., was in 1921 the longest in existence, but conditions on this mountainous line through the Rockies differ considerably from conditions in dense populations, and it was thought necessary to use alternating current in about every two hours, it is hard to draw comparisons with the New York Central, the Pennsylvania and the New York, New Haven and Hartford lines.

The single-phase system has been extensively applied in the United States, particularly on the Philadelphia section of the
ELECTRICAL ENGINEERING

Pennsylvania railway and on the Norfolk and Western lines, where the traffic is very heavy. There is a marked difference between the types of locomotives and of motors developed in America and those designed for the single-phase system, and the early history of the railway in America as compared with 25 cycles in America has been much to the advantage of the former continent in single-phase work.

Italy.—Italy was one of the first countries in Europe to consider and experiment with single-phase currents. As early as 1886 the first trials of the single-phase system were made in Italy. One undesirable result of the overhead complications is the limitation of the pressure to 3,000 volts. The objectionable double overhead potential and the choice of two other satisfactory systems have prevented the extension of the three-phase system to other countries. At the same time it should not be supposed that success has been obtained with this system than with either of the others—indeed, the arrangement of the simpler and the system is peculiarly adapted to light traffic. The first tunnel where the single-phase system was extensively used was the Simplon tunnel in 1914, when the Simplon tunnel was opened by the adoption of the three-phase system so as to utilize available plant as far as possible. This tunnel is 14 m. long (from Brig to Switzerland) and is fitted with waterfalls for electric traction. The Simplon tunnel in 1914 was opened and from the electric traction developed was the single-phase system at 15,000 volts and 15 cycles. (This may be changed later to 16 cycles, the frequency used on the Federal railways, and in the locomotives on the Swiss railways.) The overhead system and in the locomotives, the Swiss Government decided to apply the same system on the St. Gothard railway. In this connection mention may be made of the important official commission of the Swiss railways. Several reports were issued by this commission, the labours of which were concluded in 1914. It has been claimed that the economy and efficiency of the single-phase system are greater than those of other systems, and this was particularly the case on the Lötschberg railway, where the single-phase overhead line is fed directly from the single-phase generating station at Spiez at 25 cycles. Without further discussion, the commission report strongly in favour of the single-phase system, but also advocated the generation of single-phase power at railway frequency (16 cycles) rather than 3-phase generation at the industrial frequency. The over-all cost of energy delivered to the locomotive, including attendance, be reckoned as unity when the current is converted from one system to another, this may be reduced to zero by technical means. In this respect the Swiss railways are not at all inferior to other lines. When the intermedium link of transformers is eliminated. Extensive have been made on the lines adjoining the Lötschberg line as far as Berne, and the St. Gothard line from Spiez to Bellinzona. Several of the lines subsidized by the Canton of Berne have recently been electrified and linked up with the Lötschberg line through the single-phase commutator motor for traction work. In Europe there has always been a tendency to use fewer and larger motors and to mount them higher in the locomotive than is the case in America. Though this construction has introduced new problems with connecting the single-phase system to the single-phase motor. Of all the different types of commutator motor—the repulsion motor with fixed and movable brushes (DCI motor), the repulsion motor with phase compensation (Winter-Exbury motor), the repulsion motor with phase compensation (JSF motor), the repulsion motor with phase compensation (Elkington motor) and the various forms of series repulsion motor—the success is doubtless the compensated series motor, the exact form required to that on the British railways, the E.M.F. in the coils short-circuited by the brushes being obtained by suitable winding on auxiliary poles. Though such motors can be built for low terminal pressures only (200 to 300 volts) and therefore necessary when the locomotive, the advantage of being capable of attaining this to obtain economical and ample speed control by providing suitable operating characteristics on the secondary of the transformer.

Germany.—In Germany the single-phase system has also been adopted, and there have been two main examples. The single-phase lines are the Dessau-Bitterfeld section of the Magdeburg Hall line, the Swiss mountain lines and the Wiesental railway in Baden. Early in the present century there had been made on the Berlin Zossen experimental line, and it would appear that the single-phase system at 15,000 volts, 16 cycles, will be adopted as the standard system for the German railways. The power for several of these lines is furnished by Hall motors, and the use of water-power being important in a country without native coal.

Switzerland.—To Switzerland belongs the credit of much pioneer work in railway electrification ever since the Cernikon Co. equipped an experimental single-phase tunnel at Schöttelbach in 1891. The Simplon tunnel in 1914 was opened and from the electric traction developed was the single-phase system at 15,000 volts and 15 cycles. (This may be changed later to 16 cycles, the frequency used on the Federal railways, and in the locomotives on the Swiss railways.) The overhead system and in the locomotives, the Swiss Government decided to apply the same system on the St. Gothard railway. In this connection mention may be made of the important official commission of the Swiss railways. Several reports were issued by this commission, the labours of which were concluded in 1914. It has been claimed that the economy and efficiency of the single-phase system are greater than those of other systems, and this was particularly the case on the Lötschberg railway, where the single-phase overhead line is fed directly from the single-phase generating station at Spiez at 25 cycles. Without further discussion, the commission report strongly in favour of the single-phase system, but also advocated the generation of single-phase power at railway frequency (16 cycles) rather than 3-phase generation at the industrial frequency. The over-all cost of energy delivered to the locomotive, including attendance, be reckoned as unity when the current is converted from one system to another, this may be reduced to zero by technical means. In this respect the Swiss railways are not at all inferior to other lines. When the intermedium link of transformers is eliminated. Extensive have been made on the lines adjoining the Lötschberg line as far as Berne, and the St. Gothard line from Spiez to Bellinzona. Several of the lines subsidized by the Canton of Berne have recently been electrified and linked up with the Lötschberg line through the single-phase commutator motor for traction work. In Europe there has always been a tendency to use fewer and larger motors and to mount them higher in the locomotive than is the case in America. Though this construction has introduced new problems with connecting the single-phase system to the single-phase motor. Of all the different types of commutator motor—the repulsion motor with fixed and movable brushes (DCI motor), the repulsion motor with phase compensation (Winter-Exbury motor), the repulsion motor with phase compensation (JSF motor), the repulsion motor with phase compensation (Elkington motor) and the various forms of series repulsion motor—the success is doubtless the compensated series motor, the exact form required to that on the British railways, the E.M.F. in the coils short-circuited by the brushes being obtained by suitable winding on auxiliary poles. Though such motors can be built for low terminal pressures only (200 to 300 volts) and therefore necessary when the locomotive, the advantage of being capable of attaining this to obtain economical and ample speed control by providing suitable operating characteristics on the secondary of the transformer.

The high price and great scarcity of coal towards the end of the war, and afterwards, made the consideration of the utilization of water-power extremely urgent. The expert commission appointed to study the question confined its attention to the problem of immediate urgency—the Stockholm-Göteborg line. A careful comparison was made between the continuous-current system at 3,000 volts and 3-phase system at 5,000 volts. The single-phase system was not considered, and it was found that the latter was slightly better from an economic standpoint, in addition to which the Swedish railway administration and manufacturers were greatly in favour of working on the single-phase system. The proposals for this scheme were accepted by the Riksdag in 1920.

General.—As general problems connected with electric traction on railways may be mentioned interference with communication circuits, regenerative braking and speed control.

In other countries where the single-phase lines run alongside the track, and all systems have created disturbances in these circuits from electromagnetic or electrostatic influence. Some of these disturbances are periodic and traceable to harmonics in the current in the communication circuit; others appear to be due to lightning. The most important disturbances arise from sparking on switches, earths, short circuits, etc. Numerous remedies have been adopted, most of which are more or less costly. Thus the avoidance of close parallels by removing the communication circuits to a distance, placing them in a metal box, or in a lead or earth and Earth shielded, or putting them in a lead or earth shielded, or putting them in a lead sheath is an expensive expedient. To say, as is usual, that the single-phase system causes worse disturbances than the continuous-current system could not be accepted as a general statement; some of the most troublesome cases have occurred in continuous-current systems fed from rotary
converters. However, the causes are now better understood and successful remedies are in sight. It may be mentioned that, while the French commission in their decision in favour of the continuous-current system were largely influenced by the interference question, the Swedish commission regarded it as no better in this respect than the alternating-current single-phase system.

where such braking is applied, it is frequently impossible to utilize the returned energy, which is accordingly consumed in resistance.

Speed control can be obtained with all systems. With a continuous-current supply system, parallel connection and field weakening together provide a limited number of economical running speeds. It must be borne in mind, however, that weakening the field reduces one of the torque-producing factors, which may entail serious increase in armature heating when the torque rises rapidly with the speed. With three-phase supply two or four speeds are obtained by cascade connexion or poicing devices. The single-phase system, by means of a variable-ratio transformer, provides most only a large number of economical speeds.

Large mercury-vapour rectifiers have recently been constructed and put into commercial use; these entail further auxiliary apparatus as vacuum and water pumps, and their relative advantage or disadvantage as an alternative to the rotary converter work remains to be decided in the future. Fig. 2 shows a small 300-ampere rectifier as made by Messrs. Power Rectifiers, Ltd., which can supply the rectified current at any voltage up to 750 volts. The arc operates in the lower chamber A, between the cathode D and anodes C, of which there are usually six connected to the six-phase secondary of a transformer. The neutral point of the transformer is brought out and forms the negative pole of the continuous-current system, the cathode being the positive pole of this system. The arc is struck by means of the ignition anode E, which is connected by a long rod with the solenoid mounted on the top of the condensing chamber B. This solenoid is a push-button ignition switch, and the connexions are so arranged that when the anode E touches the mercury a portion of the current which was previously flowing through the solenoid coil is diverted; this allows a spring to act in opposition to the solenoid to raise again the ignition anode. The rectifier is cooled by water circulated through the base of the cathode, through a jacket round the arc chamber, and thence through the plate in which the anodes are mounted and the jacket round the condensing chamber. Larger sizes dealing with 600 and 1,000 amperes are manufactured, and for larger outputs two or more rectifier cylinders are placed in parallel and connected to a single transformer.

Hydraulic Electric Stations

Probably in no direction has greater progress been made of recent years than in the utilization of water-power. In all civilized countries throughout the world plants have been installed and projects drawn up for utilizing this natural source of energy. An idea of what is possible and of what has been done in this direction is obtained from the following approximate table, taken from a paper by E. M. Bergstrom (Inst. Mech. Eng. 1920):—

Low, medium and high falls, ranging from 4 ft. (e.g. on the river Main) to 2,700 ft. of head (e.g. at Luchon on the French Pyrenees) have all been brought into service. To take one instance only, the modern water-power station on the river Dal, about 80 m. from Stockholm, contains four turbines, each of 10,000 H.P. coupled directly to dynamos at 125 revolutions per minute, and larger sets up to 20,000 H.P. are not uncommon. The latest (1920) station of the Southern Power Co., operating in S. Carolina, U.S.A., has been installed on the Wateree river for 50,000 H.P. and contains five turbines, direct coupled to generators each of 14,000 kva. The oldest station at No. 3 of the Niagara Falls Power Co., developing an additional 100,000 H.P. at Niagara, is noteworthy for the inclusion of 32,000 kva. 12,000-volt three-phase alternators running at 150 revolutions per minute and a frequency of 25 cycles per second. One of these, manufactured by the Allis Chalmers Mfg. Co., is shown in fig. 3.

For high falls Pelton wheels are employed, and in the case of Luchon, quoted above, each Pelton wheel develops 6,200 H.P. at the high speed of 1,500 revolutions per minute. Such higher heads are being utilized, and owing to the high costs of material and

All three systems used for traction are capable of regenerative braking, by which is meant the use of the electric machine as a generator absorbing the mechanical energy from the train and returning it to the supply system as electrical energy. In this respect the three-phase system is simplest, for all that is necessary here is that the speed should exceed synchronous speed, in which case the induction machines act as generators. Obviously the method is not suited for bringing trains to rest. With the other two systems special devices are requisite, and though regenerative braking was first developed for continuous-current traction, successful solutions have now been developed and applied on single-phase locomotives in Switzerland, which enable the train to be brought to rest by regenerative braking. Hitherto, in the matter of regenerative braking, economy in power has usually been of less importance than the saving in wear and tear of tires, brake blocks and rails. On the lines
labour, the tendency is to favour the development of high-head falls which require less civil engineering owing to their smaller volumes of water. The chief problem in the design of water-wheel alternators is in the construction of the rotor. Owing to the possibility of racing, water-turbine-driven sets have to be capable of withstand- ing overspeeds of 80 to 100%. In many cases the peripheral speed is high on account of the large output, while large diameters become necessary to meet the demands for fly-wheel effect. The result is that a very rigid construction is necessary for the rotor, usually embodying some modification of the dovetail for securing the pole and field windings. The stator windings also, as in turbo-alternator, have to be securely braced in order to withstand the severe conditions of sudden short circuit. It is customary to make water-wheel alternators totally enclosed to reduce windage losses, to assist artificial ventilation and to protect the machine against possible leaks from the turbine.

Small hydro-electric stations are now in action which are either entirely automatic and actuated by a change of water level, or set in operation by remote control in accordance with the demands for power from the network. A case of interest as involving the export of energy is the hydro-electric transmission of power up to 20,000 H.P. from the power-station of Gösgen on the river Aar in Switzerland to a distributing station situated in France, where the supply is placed in parallel with the steam-driven station of Veyta. Transmissions from Norwegian waterfalls to Denmark and Sweden are also contemplated.

One reason for the comparatively small amount of power utilized in Great Britain has been the abundance of coal. In many cases the development of water-power has only become possible since coal became dear and scarce, for it must not be forgotten that hydraulic installations are frequently very costly on account of the civil engineering works that have to be constructed in places difficult of access, and of the long high-tension transmission lines.

In many countries water-power is now being developed in accordance with definite policies. Thus in Switzerland, where the linking-up of stations has been adopted on a wide scale, the low-head power stations in the valleys, which utilize river energy, are designed to supply the mean power and therefore to run on practically constant load, while the "peak" loads are supplied by the high-head stations in the hills, which are fed from natural lakes or reservoirs in which the water is impounded by means of dams.

In Italy power is available from the Alps in summer from the melting of ice and snow, and from the Apennines in winter from rain. By linking up the several stations a continuous supply of energy is assured. In Germany the canalization of rivers is carried out hand-in-hand with the supply of electric energy by building power-stations at the weirs.

Wave-power, tidal rise and fall, and tidal currents in estuaries have all received attention, especially in France, as possible sources of power in the future, and a large scheme for utilization of the water-power available from the Severn has been proposed, but in no case have the projects advanced beyond the stage of discussion.

Applications of Electric Motors

One of the main factors in the development of electrical supply has been the extended use of electric motors for driving machinery of all kinds. In addition to the numerous class of simple, straightforward drives, the electric motor has been applied with success under more difficult conditions, demanding large starting torque, considerable powers and wide variations of speed. Along with this development has been the extension of the three-phase system, in consequence of which there has arisen a wide demand for variable-speed, alternating-current motors. Some directions of their application may be dealt with.
ELECTRICITY SUPPLY

Considering first of all continuous-current motors, it may be said from a theoretical standpoint that the possibilities of continuous-current motors are almost unlimited. The speed of such motors may be exactly and continuously controlled, varying either the armature current or the exciting current. In the case of a constant-voltage supply, the usual method of varying the supply voltage consists in the use of series-parallel connexion. This involves the use of at least two transformers, and, in some cases, of a circuit-breaker between the two.

Occasionally, however, some form of the Ward-Leonard system of control is adopted. This, however, entails the use of a variable-voltage generator, which in turn needs an electric motor or a prime mover. In each case an energy conversion, and with loss, such systems are not only costly but eventually become more or less wasteful. This is particularly the case when the Ward-Leonard control is used on an alternating-current system, because it involves the use of a synchronous or other type of excitation machine. The machine then runs up to speed as an induction motor, and is excited by continuous current and pulls into synchronism, where a continuous-current motor or other synchronous motor can be used. To meet the starting problem, this arrangement is also replacing the induction motor where power-factor correction is important. By its simplicity the induction motor is double the alternating-current motor that finds most favour. Where rapid starting or where speed control is necessary the motor is uneconomical, because the input to an induction motor depends on the torque, and is independent of the speed. Nevertheless it is often preferred in the transmission rather than to install converting sets. It is possible, however, to obtain economical speed control with an induction motor by changing the number of poles or by connecting two induction motors in cascade—in each case, however, with a certain sacrifice of efficiency in the overall performance and with severe windings. There are numerous ways of effecting a change in the number of poles—e.g., by regrouping the coils, by varying the number of turns, and by changing the pitch of the armature coils. The electrical engineer will, therefore, have several solutions to the problem of variable speed, and it is impossible to give a satisfactory answer to the question of how many or which types of motors are the best to use. The problem is solved by the designer and has been left for him to solve it. The designer will, however, have several solutions to the problem of variable speed, and it is impossible to give a satisfactory answer to the question of how many or which types of motors are the best to use. The problem is solved by the designer and has been left for him to solve it.

The commutator motor offers theoretically the best solution for obtaining speed control with an alternating-current motor, and the possibilities of obtaining speed control of this nature are, however, limited, because not only do commutation conditions limit the pressure as in the continuous-current motor, but the transformer pressure induced by the alternating-voltage system limits the large output per pole. The reduced commutator pressure usually entails a transformer beyond which it is not possible to go by this method without economic sacrifice. An advantage can be taken of this to vary the applied pressure by using a variable-ratio transformer. The real trouble occurs when the E.M.F. in the short-circuited coils depends upon synchronism, as in three-phase induction machines, and the control of these motors is rather difficult. However, the limitations are more severe, because not only do commutation conditions limit the pressure as in the continuous-current motor, but the transformer pressure induced by the alternating-voltage system limits the large output per pole. The reduced commutator pressure usually entails a transformer beyond which it is not possible to go by this method without economic sacrifice. An advantage can be taken of this to vary the applied pressure by using a variable-ratio transformer. The real trouble occurs when the E.M.F. in the short-circuited coils depends upon synchronism, as in three-phase induction machines, and the control of these motors is rather difficult.

In addition to the high electrical speeds of the armature reaction, the commutator motor is the only one that possesses this characteristic, and the disadvantage which is a disadvantage in the continuous-current motor is a great advantage in the case of the commutator motor, which has the property of being able to change its speed automatically, or by means other than electrical ones, in order to maintain a constant number of revolutions.

It is at the highest speeds that the commutator motor becomes a serious problem. In addition to the high electrical speeds of the armature reaction, the commutator motor is the only one that possesses this characteristic, and the disadvantage which is a disadvantage in the continuous-current motor is a great advantage in the case of the commutator motor, which has the property of being able to change its speed automatically, or by means other than electrical ones, in order to maintain a constant number of revolutions.

Series motors in which the exciting winding is in series with the armature winding, and in which in consequence the speed becomes a function of the exciting current, are therefore widely used in a variety of respects. There is no doubt that the load being removed—e.g., for traction or for fans, cranes, etc.—the only common application of voltage and field control of series motors is for traction work. The control of the shunt and series characteristics in varying degree, according to requirements. If a series characteristic is required with merely a limiting top speed, it is only necessary to provide the motor with a small shunt winding in addition to the series winding in order to prevent racing. When, however, an increased torque at starting or a fall in speed in the case of overloads is demanded, a small series winding is added to the shunt winding. In the former case the series turns may be short-circuited, and in the latter case, the motor may be started, and the series winding may be added in order to reduce the speed. In the latter case, the series winding may be added in order to reduce the speed.
ELECTRICITY SUPPLY

Two special control orders were imposed on the industry by the Ministry of Munitions. The first—Converter Plant Control Order, 1918 (issued April 3 1918 and cancelled Feb. 28 1919)—was designed to reduce the demand for converter plant and to assist supply engineers in persuading customers (especially shipbuilding firms) that the alternating current available was quite sufficient for their requirements. The second was the Electricity (Restriction of New Plant Orders) Order, 1918, to check the shortage of coal had arisen in the early part of that year owing to large withdrawals of miners for active service, and from other causes; and the coal controller accordingly rationed the use of coal. As the Ministry of Munitions undertook to limit new electrical connexions to consumers wholly engaged on urgent munitions work the rationing was not applied to power stations. Concurrently with the issue of this order the coal controller rationed the use of both electricity and gas for domestic purposes. On Jan. 10 1919 the order was revoked. In spite of the enormous increase in output, which made the four years of war equivalent in electrical growth to the previous 25 years of peace, the financial condition of the undertakings did not on the whole improve. Very few undertakings paid excess profits, and most of them had to raise their prices substantially in order to keep receipts above the rising tide of costs, due to increases in wages and the higher cost of coal, stores and repairs. The position of the smaller provincial undertakings, which had practically no industrial load, became especially difficult. Maximum prices are scheduled in every provisional order, and in many cases they proved too low in the abnormal circumstances created by the war. The Statutory Undertakings (Temporary Increase of Charges) Act, 1918, was passed to afford relief. The Board of Trade was empowered, after inquiry into applications for relief, to permit increases in maximum charges sufficient, in the case of companies, to enable three-quarters of the pre-war dividend to be paid, and, in the case of municipalities, to not more than 90% above the pre-war charges, or more than sufficient to enable the undertaking to be carried on without loss.

Committees on Electricity Supply. The proof afforded early in the war of the great national importance of electricity supply led to a series of official investigations into the question of reorganizing the industry on broader and more efficient lines. The Reconstruction Sub-Committee of the Ministry of Reconstruction and the Coal Conservation Sub-Committee which discussed the subject chiefly from the standpoint of the more economical use of fuel. The supply was not, however, such as to allow the Board of Trade to consider the position of the electrical trades after the war. As the result of a recommendation by this committee a Departmental Committee of the Board of Trade on electric power was formed. A Committee of the Local Government Board was also formed, and in 1917 a special committee was appointed by the Committee of Chairmen of the Advisory Council of the Ministry of Reconstruction. These reports, particularly that of the Board of Trade Committee on electric power supply, led up to the appearance of the House of Commons, in the form of two papers on the subject; the Committee of Chairmen's Trade and Supply bill. In its original form the bill provided for the appointment of electricity commissioners and for the constitution of district electricity boards to secure a cheap and abundant supply of electricity by: (a) the acquisition of generating stations, (b) the acquisition or use of main transmission lines of any authorized undertakers, (c) the supply of electricity within their districts (including the construction of generating stations, main transmission lines, and other works required for the purpose), and (d) the acquisition of the undertakings or parts of the undertakings of authorized distributors and power companies. At dates to be specified all the public generation and main transmission lines in a district were to vest in the Board subject to the payment of the standard price. In the case of municipal undertakings the standard price was defined as one or more annuities sufficient to indemnify the local authority against all liabilities and contingent losses, and the net value of a company it was to be the cost of and incidental to the construction of the generating station or main transmission line, and the acquisition of the undertaking or part, and to bear interest at 5%. To power for borrow for these purposes on terms to be fixed by the electricity commissioners, who were also to be empowered to lend to boards or authorized undertakers, subject to Treasury approval, the money up to £20,000,000, if it were estimated that the boards or undertakers could not otherwise raise the money on reasonable terms. A sum of £50,000,000 was also to be made available out of the consolidated fund to enable the Board of Trade to provide interest on the money up to £1,000,000.

Opposition to the bill was directed chiefly against the compulsory character and operation of joint electricity control, the magnitude
of the sums of public money involved and the inadequacy of the "standard price" in the case of power supplied to the electricity authorities. In the latter case it was employed for the purpose of the difficulty mentioned in the Act of 1920 and again in 1921, the Minister of Transport brought in a bill— the Electricity (Supply) bill—to amend the Act, with the chief object of conferring financial powers on joint electricity authorities. These authorities are authorized to purchase by agreement the revenues and property; and authorized undertakers, county and local authorities, and any local authority, company, or person may lend money, subscribe for securities, be authorized to lend money, subscribe for securities, and pay interest on the capital of interest, or give financial assistance in any other approved form to the joint authorities. The prices charged by a joint author-

ity are to be so fixed that the receipts shall be sufficient to cover the following expenses: (1) the cost of the Electricity (Supply) Act, 1920; and (2) the interest on the capital of the authorities. In the event of there being any surplus, it is to be paid to the Treasury. The Act also provides for the making of the ordinary period of revision of maximum prices three years (instead of five under the Electric Lighting Acts, 1882 to 1909), and the provisions are extended to local authorities.
The total capacity of power installed by companies and municipalities, as might be definitively ascertained, was 2,712,500 K.W. in 1920, with a load connected (equivalent 30-watt lamps) of 1,146,200, and an aggregate maximum load of 1,352,548 K.W. The Board of Trade units of electricity are recorded for 1920 as 3,262,388.

Further information on the above subjects may be gathered from the following publications: "Electric Power Supply during the Great War." (Part I.) by Sir A. B. Gridley and A. H. Humar (A. E. I. E. C.); Report of the Coal Conservation Sub-Committee of the Reconstruction Committee on Electric Power Supply in Great Britain (Cd. 8,880); Report of the Board of Trade Committee on the Electrical Trades after the War (Cd. 9,072); Report of the Board of Trade Committee on Electric Power Supply (Cd. 9,062); Report of the Committee of Chairmen of the Advisory Council of the Ministry of Reconstruction on Electric Power Supply (Cd. 93); The Manual of Electrical Undertakings, Vol. xii.-xxiv.

United States.—The decade 1910—20, perhaps not so rich as its predecessor in fundamental electrical invention, showed so greatly increased a demand for electric current that much effort was applied to improving methods of production and supply. In many sections of the country all sources of water-power nearby were already employed so that it was necessary to transmit power two and three hundred miles. The highest voltages used in 1910 would be too low to be economical for such distances; during 1910—20 the use of transmission voltages in excess of 100,000 became fairly common; in 1920 220,000-volt lines were being completed. Larger generating units, and particularly water-wheels, were used. There were 273 K.W., 632 K.W., water-wheel units, and 50,000 K.W. units to be used in Canada in 1921. Steam turbines of the multiple-unit type as large as 72,000 H.P. were operating in New York City and single-unit types up to 35,000 H.P. were operating successfully.

Because of the better light and smaller consumption of the tungsten lamp, which was made practicable by the discovery of a process for drawing tungsten wire, the demand for electric current grew rapidly. This lamp, by using less current, reduced the expenditure of every establishment using electric light, and it became necessary to develop a commercial organization to sell service. By 1921 virtually every electric light and power company maintained a selling organization. Much of the demand was due to the war. The orders of the Allies for munitions in and after 1915 forced the factories of North America ill-equipped to undertake so sudden an increase of production. It was quicker to buy electric power than to procure and install additional generating equipment. Then, later, a serious coal shortage made it apparent throughout the country that a central power-distributing organization was more economical and reliable than a number of small isolated plants. Added to the industrial demand thus suddenly thrust upon the power companies came a heavy demand from the household for electric appliances. Domesticities had been enticed from service by the munitions plants and electric labour-saving devices replaced them.

There were in 1921 nearly 7,000,000 homes in the United States wired for electric service, served by 5,600 electric light and power companies, the output of which for that year was expected to be about 42,000,000,000 K.W.-hours. From the sale of this current $1,050,000,000 would be obtained. The capital invested in these plants then amounted in round numbers to $4,500,000,000. The growth of retail outlets per capita for electrical merchandise increased nearly 400% during 1910—20, and the output of electrical power plants nearly 300%.

In spite of the lower consumption of current by the tungsten lamp the prices for electric current increased steadily until 1916, when higher wages and costs of materials offset economies of efficient operation. About that time a number of supply companies initiated what was known as "five-day work." This was generally accepted, and in their contracts with consumers, under which the rate varied in a fixed ratio to the fluctuating price of coal. By the end of 1921, however, these clauses had been allowed to disappear. Household rates were not raised during the war, but later were many increases. There was some raising of the London sliding scale of rates but in 1921 only two or three companies were using it. In fact, while during the first ten years of the century a great many new appliances were introduced and put into use, the second decade was free, comparatively, from such activity. Perhaps for a form of household schedule which basis the rate on the number and type of rooms plus a charge for current.

State regulation, which had appeared in a few states before 1910, by 1920 had found in 20 states, and the local regulation was opposed bitterly by the power companies. State regulation did more than anything else to free electric utility from political interference. As a result term franchises were fast disappearing, where being easily renewed or transferred.

No review of the decade's progress of electric supply would be complete without reference to the great expansion of operation and management. Through the control by one company, many plants have been owned by the United States Government, known as a great saving was made. Central organizations have applied to small properties better engineering and management than they would have been able to obtain in the disconnection of small uneconomical plants and the substitution of large unified systems supplying many communities.

The advantages derived from unified systems became so significant that the power to control and regulate the power companies of the United States Government became interested and an appropriation was made for an investigation of the power resources of the industrial region of the Atlantic seaboard, from Washington to Boston, under the auspices of the U.S. Geological Survey. This report was not yet published in Oct. 1921. It was known, however, that a vast network fed by a number of "super-power" plants would be recommended. Other surveys were being made by those locally interested in the Gulf states, from Alabama to Georgia, through the Carolinas and into Tennessee. Another interconnected most of the important New England systems, and a third covers the great variation of resources of the country; however, was greatly retarded during 1910—20 by the threat of unfavourable Federal legislation. Congress considered for twelve years a water-power bill which was finally passed in 1920. Since its passage there has been a sudden development in many water-power projects, and water-power is being sold to California. Applications were on file in 1921 for more than $5,000,000,000 and preliminary permits and licences had been granted to develop 2,505,666 H.P. The bill creates a Federal water-power commission, which can coordinate the Federal, State and other public interests in water-power. Agriculture and the Interior, to which is given authority over all matters over which the Federal Government has jurisdiction, presides over the development of the resource in navigable streams, on the public domain and in the national forests.

The features of the bill are: (1) the erection of a commission (The Federal Power Commission); (2) the granting of a 50-year lease; and (3) the payment of just compensation at the termination of the lease. Priority is given to national, state and municipal governments. On the Colorado river alone one company was planning to develop between three and four million H.P. of electrical energy at a cost of about $70,000,000.

In order further to assure continuity and reliability of central service, and also to make certain economies possible, the interconnexion of large power systems was introduced. One such system extends along the Gulf states, from Alabama to Georgia, through the Carolinas and into Tennessee. Another interconnected most of the important New England systems, and a third covers the great variation of resources of the country; however, was greatly retarded during 1910—20 by the threat of unfavourable Federal legislation. Congress considered for twelve years a water-power bill which was finally passed in 1920. Since its passage there has been a sudden development in many water-power projects, and water-power is being sold to California. Applications were on file in 1921 for more than $5,000,000,000 and preliminary permits and licences had been granted to develop 2,505,666 H.P. The bill creates a Federal water-power commission, which can coordinate the Federal, State and other public interests in water-power. Agriculture and the Interior, to which is given authority over all matters over which the Federal Government has jurisdiction, presides over the development of the resource in navigable streams, on the public domain and in the national forests.

Embraced in these interconnections are certain large industrial plants. They interchange current with the public utilities under an arrangement beneficial to both. The tendency, however, is un- dertaken, although in a few cases toward independent power stations. The only reason this has not gone further is that the power companies during 1915—21 were generating to their full capacity.

A survey made by the Electrical World of New York City shows that in 1920 there were 326,810 consumers of electric power in the United States. These were divided by sections as follows: New England, 35,300; Middle Atlantic, 50,900; South Atlantic, 19,200; North Central, 123,730; South Central, 22,370; Mountain, 10,690; and Pacific, 54,600.

Seventy-one central power companies had in 1921 an output of more than a hundred million K.W.-hrs., and nine in excess of a hundred million K.W.-hrs. The three largest central companies, the largest output were in 1920 the Niagara Falls (N.Y.) Power Co., 2,328,326,064 K.W.-hrs.; the Commonwealth Edison Co., Chicago, Ill., 1,983,570,000 K.W.-hrs.; and the Pacific Gas & Electric Co., San Francisco, Cal., 1,105,730.

Municipal ownership sustained a great setback during the war because high costs of production added too much to city budgets. After the war many of these plants were run down, and in their contracts with consumers, under which the rate varied in a fixed ratio to the fluctuating price of coal. By the end of 1921, however, these clauses had begun to disappear. Household rates were not raised during the war, but later were many increases. There was some raising of the London sliding scale of rates but in 1921 only two or three companies were using it. In fact, while during the first ten years of the century a great many new appliances were introduced and put into use, the second decade was free, comparatively, from such activity. Perhaps for a form of household schedule which basis the rate on the number and type of rooms plus a charge for current.
system, but during 1910-20 there was a marked tendency toward municipal ownership of the system. The energy is purchased at the substation in bulk.

The best statistic available for Canada are as of Jan. 1, 1919 and show 795 central electric power stations in which the capital invested was $94,924,002. The total revenue from the sale of power was $83,490,133, for lighting purposes $52,039,528, and for other purposes $31,960,621. The generating capacity at that time was 1,433,722 kva.

In Canada private operation seemed to be gradually giving way to government operation. The largest single electric system in the country was that of the Ontario Hydro Electric Power Commission which with its latest acquisitions supplied about 1,000,000 horse-power. In 1921 this system was at the disposal of the Canadian National Railways, was being copied in other parts of Canada and was finding admirers in different parts of the United States, particularly California, where a similar system was proposed. The provincial systems were competitive with the railways in many cases but the municipalities were used quite extensively in the homes. A rate as low as one cent a K.W.-hr. was charged for electric cooking.

**ELECTROCHEMISTRY (see 9.208) and ELECTROMETALLURGY (see 9.23).** Although these subjects are essentially connected, it will be convenient here to group separately the principal headings in each case under which notable advances had been made during 1910-21.

**I. ELECTROCHEMISTRY**

**Alkalies and Chlorine.**—The electrolytic methods of producing alkalies and chlorine by the decomposition of brine made remarkable progress during the period 1911-20. Electrolytic alkali works are now being operated in all the leading manufacturing countries where the raw materials of the industry are found; and even those who control the operation of the old Le Blanc process of alkali manufacture in the United Kingdom have found themselves at last compelled, by the force of circumstances and by the changing conditions of the trade and industry, to adopt the newer method of decomposing salt.

The cells now being operated industrially may be classified as diaphragm and non-diaphragm cells. In the former class, a porous diaphragm, containing cement, asbestos or other material not acted upon by the electrolyte (or by the ions produced by the electrolysis), is employed to separate the cell into two or more compartments, and in the case of chlorine, the chlorine liberated at the anode is to a large extent prevented from taking part in secondary reactions with the sodium or potassium hydrate formed at the cathode.

The "Electrol," Hargreaves-Bird, Outhenin-Chalender, Basel, Billiter-Siemens, Nelson, Allen-Moore, Gibbs and Townsend cells are representative of this class. The chief difference between them being in the construction or design of the diaphragm and in the arrangements made for withdrawing the sodium-hydrate solution from the cathode compartment of the cell. Before it was discovered how to obtain and handle this electrolyte the defects of all diaphragm cells were the higher voltage required per cell, and the increased costs of maintenance, due to the lack of durability on the part of the diaphragm.

In the latter class—i.e., the so-called "Russian" cells—the number of cases has always attracted the electro-chemist, and many of these have been patented and tried. Only two types have survived industrial trial—namely, (1) the Castner-Kellner, Whiting and Solvay cells, which employ a moving mercury electrode in the cathode compartment of the cell, and thus produce an amalgam of sodium which can be removed from the cell before it is decomposed; and (2) the "bell" type of gravity cell, which makes use of the different specific gravities of the brine, and of the newly-formed sodium or potassium hydrate solution, in order to effect a separation of the two. The "Russian" bell and the Billiter-Levak cell are the only two representatives of this class in actual operation; the Horlick and Holland cell, which was tried on a large scale at St. Helens in the years 1896-1900, having proved a failure.

The attempts to use molten lead in place of the more expensive metals of the electrolytic bath have also failed, after trial upon an industrial scale; the wear and tear of the cell structure, and the fire dangers with this type of cell, having caused the suspension of operation of the Lenz cell at Le Havre, and the De Harewood of the L. C. Bell cell at Niagara Falls in America. The works where the latter cell and process were operated was, in fact, burnt down some years ago, and has not been rebuilt.

The World War caused a considerable increase in the number and capacity of the works for the electrolytic decomposition of brine, liquid chlorine being required in very large amounts by the military authorities, not only for gas-warfare but also for sterilizing water supplies. The Government, realizing the importance of these, planned and built large works of this type at the Edgewood Arsenal, equipping it with 3,552 cells of the Nelson (diaphragm) type in order to provide the army authorities with all the liquid chlorine they required. At the

</table>

*This cell produces NaClO—not NaOH.*

To produce one ton of solid caustic soda from a solution containing only 50 gms per litre of NaOH (the strength produced by the Finlay cell) means the evaporation of over 12 tons of water; whereas with a cathode liquor containing 240 gms NaOH per litre (the strength produced by the mercury cells), only one-half this weight of water will have to be evaporated to obtain the solid product, and the fuel consumption will thus be reduced 50%.

The answer to the question which cell is the best for the production of sodium hydroxide or potash depends, of course, very largely on the relative costs of electric power and of solid fuel in the locality where the cell is to be operated. The Whiting, Castner-Kellner, and Wilderman mercury cells being known to produce the dry, kindling fuel solution, is of very high concentration—200 to 240 gms NaOH per litre. If the cost of fuel were not so high, these cells would be generally adopted for the production of caustic hydrates and chlorine, in spite of their lower electrolytic efficiencies, since they also yield a specially pure product at both the anode and cathode.

The diaphragm cell types of the Billiter-Siemes, Billiter-Levak, Townsend and Nelson cells all yield a liquor containing 125-160 gms NaOH per litre, and, therefore, come in third in the case of the mercury cells. No figures for the concentration of caustic liquor or the efficiency of the Gibbs cells are available.

The Ausig bell, Griesheim, and Outhenin-Chalender cells, on the other hand, yield a liquor containing only 50-80 gms NaOH (or under) per litre, and in view of the amount of fuel required to produce solid caustic from such weak liquor, it is surprising that these cells have attained so wide a use on the continent of Europe.

**Chlorates, Perochlorates and Persalts generally.**—The electrolytic method of manufacture of chlorates and perchlorates of potassium, soda, etc., has been in use for the past forty years in all countries where cheap electric power was available, the most notable works being that of Messrs. Corbin & Gie, at Chekke, in the Haute Savoie department of France, and at Trollethann in Sweden. The cells used at Chedde are constructed of cement, and are arranged in terraces so that the electrolyte flows through them by gravity. Very thin sheets of platinum-foil fixed in ebonite frames act as bipolar electrodes in series, the number of electrodes per cell and of cells in a circuit being arranged to suit the voltage of the generators. The electrolyte used is a 25 to 30% solution of KCl or NaCl; a current density of 100 to 200 amperes per 95 ft. of anode surface is employed. This leads to a high E.M.F.
being required, even though the electrolyte is heated to 70° C. and the bipolar electrodes are only ⅓ in. apart.

When potassium chloride is employed as electrolyte, the chlorate can be easily separated by crystallization on cooling from the mother-liquor containing the unaltered chloride; but when ammonium chloride is being employed, different treatment is required to obtain separation of the chloride and ammonia, since the sodium salt is much more soluble than potassium chloride. The current efficiency when using ammonium chloride as electrolyte can be kept at 90% when the process is well-managed: and the conversion of chlorine into chloride is completed in one operation. Were it not for the fact that no satisfactory substitute for platinum electrode material for high-grade cells is available, and that consequently the capital costs of the cell installation are very high, the electrolytic process of chlorine manufacture would have been quite supplanted the older chlorate process, which is still operated fairly extensively, for the chlorate process saves the first 4 K.W.-hrs. to make the bromide when used as cathode; and the cathodes may be of much larger surface area than the anode.

Two methods have been employed for the production of hypochlorites by electrolysis, based upon the use of persulphuric acid as intermediate product, and the other upon the use of potassium or ammonium persulphate. The conditions which necessarily should be observed in the first method are as follows:—(1) The density of the cell must be kept up to 22 sq. ft.; (2) the current density should be high, about 950 amperes per sq. ft.; (4) the solution must be cooled, or a hollow anode, made of cooled,九州国际间的万维网.
ELECTROCHEMISTRY

II. ELECTROMETALLURGY

Aluminium.—There were no discoveries or marked advances during the period 1910-20 in the development of new sources of aluminium, and the mineral bauxite remains the chief raw material of the industry. The increased demand for bauxite, however, has led to several new deposits being opened up and worked, and although none of these equal in purity the French bauxite deposits, the mineral has been found to be much more widely distributed over the world than was at one time supposed. With the aim of reducing the cost, numerous attempts have been made to extract aluminium with preliminary purification of the bauxite (see 1767-770) and to operate the baths with the raw bauxite, but these so far have not proved successful. In time this improvement in the electrolytic process and reduction in cost of aluminium manufacture will no doubt be achieved.

The world's production of bauxite in recent years is given in Table I, which is taken from a pamphlet published in 1921 by the Imperial Resources Bureau. As regards alternative sources of supply, silicate of aluminium or clay is one of the most widely distributed materials which occur in the crust of the earth. Weaver, in a recent Canadian patent (No. 190,054 of 1919), proposes to open up this source of aluminium by operating the clay with chlorine in the presence of carbon. This leads to the formation of AlCl₃, SiCl₄, and CO, and with cheap supplies of liquid chlorine the method might be practicable. The chlorides are separated, and the metal aluminium is electrolytically obtained, as described below. Whether this suggested process of using AlCl₃ in place of Al₂O₃ as raw material for the aluminium industry will prove successful remains for the future to decide.

The electrolytic process by which aluminium is produced from alumina, as worked in 1921, differed but little from that by which Heroult, at Neuhausen in Switzerland, and Hall, at New Kensington in America, first started the manufacture upon an industrial scale in 1889. The production, however, is now concentrated in the hands of a small group of powerful companies.

As regards the growth of the industry, the figures in Table II, taken from the pamphlet already referred to, indicate very clearly the remarkable expansion which has occurred in the manufacture during the period 1910-20. Compared with the figures compiled by J. B. C. Kershaw some years previously for the period 1893-9, the expansion of the industry becomes very striking.

In twenty years, therefore, the world's output of aluminium had increased from 5,000 to 150,000 tons, and the metal had come to rank 4th in the list of nonferrous metals, when judged by the by-products consumed. An output of 150,000 tons was employed in large amounts in the arts and industries. The remarkable increase in production which marked the war period was of course due to war requirements; aluminium being used in enormous amounts for the production of aeroplanes and as an ingredient of certain forms of explosives (such as "ammonal"), and of pyrotechnical materials, but also being employed, either as pure metal or in the alloyed state, for the construction of ships, locomotives, motor-cars, fuses, bombs, radiators and many more forms of measuring instruments. The close of the war occasioned, therefore, a very considerable drop in the demand for the metal—but there was little doubt that later the demand for aluminium in the arts and industries would more than absorb the production of the increased plant.

As regards the localities and works where aluminium is now produced, these are in every case operated by water-power, and the names of the companies and combinations of these works are as follows:

United Kingdom.
British Aluminium Co.—Foyers and Kinlochleven, Scotland (Stangford, Vigelands, Norway).
Aluminium Corporation Ltd.—Dolgarrog, North Wales.
France.
Société Electrométallurgique française.—Le Praz, Gardanne.
Compagnie des Produits chimiques d'Alais.—Calypso, St. Jean de Maurienne, St. Félix.
Suisse, Germany and Austria.
Aluminium Industrie Aktien-Gesellschaft.—Neuhausen, Rheinfelden, Land Gastein.
United States of America and Canada.
Aluminium Co. of America.—Niagara Falls, New York, Shawinigan Falls.
Italy and Norway also possess aluminium works, and during the war two or three factories were started in the north of Italy. The production by the Italian ministry of the Electricitäts-Gesellschaft of Berlin. The figures given in Table I show that during the last year of the war Germany produced 25,000 tons of aluminium, and was second only to the United States in her output.
ELECTROCHEMISTRY

961

of this metal; while Norway and Switzerland came next in producing capacity, with 15,000 tons to their credit.

As regards further development of the producing capacity of the works located in the United Kingdom, the British Aluminium Co., which had already developed 25,000 H.P. from water-power at Foyers and Kinlochleven in Scotland, was in 1921 seeking to obtain the necessary parliamentary sanction for developing the much greater water-power of the Lochaber district of Inverness-shire.

Concerning the use of aluminium chloride in place of the oxide for the electrolytic bath. Vowes, in U.S. patent No. 1,297,946 of March 1919, states that if aluminium chloride be fed into a bath containing sodium and aluminium chlorides in the molten condition, at such a rate that the molten chloride is replaced as fast as it is decomposed by the current, the process can be made a continuous one; and the aluminium and chlorine, which are the two products of the electrolysis, can be separately drawn off. An apparatus is described in the patent, by which this method can be carried out.

The application of aluminium has grown enormously in recent years. One very large and increasing field of the metal is in the electrical trade, in which it is used for transmission lines, bus bars, field coils and windings, etc., etc. Its applications in the motor-car industry are well known, for not only is it employed in sheet form for gear and crank cases and for body work, but it is also employed largely for engine castings. Aluminium is being used to an ever-increasing extent in the chemical, brewing, sugar-refining, margarine, dyeing and soap industries, and the manufacture of cooking utensils affords another large outlet for the metal.

Carbide are recognized, and the attempts to apply carbourndum wheels to the grinding and finishing of fine steel goods have ceased, the artificial abrasive industry is on a very sound footing.

Silicon carbide is intensely hard and very brittle, and it is most suitable for grinding and finishing similar materials such as cast iron and marble, and for the finishing of leather goods; while artificial corundum has taken the place of the natural variety (emery) where it has been found more suitable than carbourndum.

Brass and Bronze.—There have been many attempts in the past to apply electric methods of heating and refining to the melting and casting of brass. Until recent years none of these attempts were successful, but during the World War a large amount of experimental work was carried out in America with various types of electric furnace, and the difficulties that surround the electric melting and refining of brass and bronze appeared in the end to be easily overcome.

At the commencement of the World War, there were, according to H. W. Gillett of the U.S.A. Bureau of Mines, no electrically heated brass furnaces in commercial operation in the United States. By the end of 1919 there were 40 American firms using or installing such furnaces, and over 100 of these were in operation. One brass-rolling mill is stated to have installed 30 furnaces, though these were chiefly of small capacity; one smelting

Artificial Abrasives—Carbounndum and Corunndum.—The manufacture of carbourndum or silicon carbide (SiC) in the electric furnace did not undergo any particular change during the period 1910-20, although the industry had developed considerably.

The electrometallurgical manufacture of artificial corundum, i.e. impure fused alumina, is new, however, and has become one of great importance in Canada.

Bauxite and coke are smelted in an arc furnace, the proportions used being as follows:—Calcinated bauxite 1,750 parts; coke 100 parts; iron borings 350 parts. The furnaces used for the manufacture are mounted on water-cooled trucks, and when one is full it is removed on the rails, and another is inserted in its place under the electrodes.

The furnace body is a rectangular iron frame lined with firebrick, the earth made from pitch and carbon. The furnaces operate at 100 volts and 5,000 amperes; about 18,000 kWhrs. being required to produce an ingot of 4 to 5 tons in weight. The reduction must not be carried too far, otherwise the product will be too brittle; the presence of 1 to 2% of iron, silicon, and to some extent oxides, as impurities, improves the toughness of the abrasive.

Brockbank gives this typical analysis of a high-grade artificial corundum:—Al₂O₃ 97-49%; SiO₂ 90-62%; Fe₂O₃ 32%; TiO₂ 1-38%

In the year 1918, Canada alone produced 76,000 tons of these materials; while the value of the total exports of the United States was $1,000,000. Now that the limitations of silicon and refining company was employing four 1-ton and four 1-ton furnaces, while another firm had four 1-ton furnaces, and batteries of two, three furnaces were quite common.

The following types of furnace were stated to be in successful use:

1. The direct arc furnace, of which the Snyder is the only representative.

2. The indirect arc furnace, of which the Rennerfelt and the Detroit are the most successful examples.

3. The vertical ring induction furnace, of which the Ajay-Wyatt is the best known and most successful.

4. The granular resistance furnace, of which the Baily is the only example.

For rolling-mills using yellow brass, the direct and indirect arc furnaces are quite unsuitable, since they would lead to high zinc losses. Likewise the induction type of furnace is unsuitable for foundries where alloys high in lead are made, or where frequent changes in composition are necessary. The type of furnace to be installed, therefore, is determined largely by the alloy or metal which is to be produced, and each works will have to be guided by expert and skilled advice in the selection of the type of furnace best suited to its needs and requirements. The question of power-costs at 1921 has been overcome.

The granular resistance type may be chosen in preference to the more efficient arc type of furnace, because of the savings which follow from the absence of electrodes. Bronze manufacturers who take
power from some small central station may be compelled to select the two-phase. Rennerfelt arc furnace instead of the singlephase Rocking Detroit furnace, because the latter type of current cannot be economically provided for one power user alone.

The figures in the accompanying table are given by Gillett for the output and power consumption of the various furnaces named above, when melting brass and bronze.

Nos. 3, 4 and 5 use from 2½ lb. to 6 lb. of graphite electrodes per ton of metal charged.

**Bullion.** —"Bullion" is the technical term for the alloys of the precious metals silver and gold; the name is also applied to the bars or ingots in which these metals are sold (for coinage purposes) to the mint authorities of the various countries of the world. Although chemical and metallurgical methods are still employed for separating or "parting" the silver and gold in bullion from one another, and from the base metals with which they are often associated, since the year 1895 electrolytic methods have been making steady progress, and at the present time a very large proportion of the silver output of the world is electrolytically refined by aid of the Mochnius process. As regards gold, the electrolytic method is also making progress; and electrolytic refineries for treatment of gold bullion by the Wohlwill process have been operated at Frankfurt, Hamburg, Paris, New York, Philadelphia and San Francisco.

The chief disadvantages of the electrolytic methods of bullion-refining are those resulting from the value of the gold and silver locked up by the processes; and the latest improvements, therefore, are directed chiefly towards reducing the volume of the solutions in the tanks, and also the time required for the refining.

The metalizing process of silver-refining has already been fully described (see 25, 115). The following description of one of the plants erected is of interest, since it shows that the horizontal system of travelling belts which act as cathodes has been dropped, and that a number of anodes enclosed in bags has been reintroduced. The plant is attached to the Amboy Refinery of the American Smelting & Refining Co., and consists of 144 stone-wares, grouped in 24 sections of 6 tanks each. The anodes weigh 250 to 300 lb. and are made of core-rolled silver sheets 3/4 in. thick. Each tank contains 4 anode bags and 5 cathodes, the bags each holding 4 anode bars. The electrolyte is a neutral nitrate solution, containing, per litre, 150 to 200 grammes silver and 30 to 40 grammes copper: 75% of the silver in the anode can be deposited in 24 hours. The deposit upon the cathodes is continuously removed by means of wooden sticks attached to a frame which has a reciprocating motion. A current density of 40 amperes per sq. ft. can be maintained under these conditions since no trefoil of the silver can occur, owing to the continuous removal of the crystalline deposit.

The bars which surround the anode receive all the slime, and are removed at regular intervals for recovery of the gold and other precious metals. The slimes are first boiled with sulphuric acid of 1:8:32 Sp. Gr. in order to remove copper and silver, the residue is then washed, dried, and cast into anodes for treatment by the Wohlwill process.

The gold-recovery installation at Perth Amboy is equipped with 5 centrifugal vessels, and a current density of 150 amperes per sq. ft. is employed. This density is considerably higher than that used in the early trials of the Wohlwill process, the object of the increase being, of course, to reduce the standing charges for interest per unit of output. One of the principal features of the installation is the use of mercury cups on the ends of the copper bus-bars. By all of these cups, and cross bars of copper with bent ends to fit into these cups, any unit can be quickly cut in or cut out of the circuit. The cathodes are thin sheets, rolled from electrolytic silver, and the cathodes are then washed, dried, and cast into anodes for treatment by the Wohlwill process.

The gold-recovery installation at Perth Amboy is equipped with 5 centrifugal vessels, and a current density of 150 amperes per sq. ft. is employed. This density is considerably higher than that used in the early trials of the Wohlwill process, the object of the increase being, of course, to reduce the standing charges for interest per unit of output. One of the principal features of the installation is the use of mercury cups on the ends of the copper bus-bars. By all of these cups, and cross bars of copper with bent ends to fit into these cups, any unit can be quickly cut in or cut out of the circuit. The cathodes are thin sheets, rolled from electrolytic silver, and the cathodes are then washed, dried, and cast into anodes for treatment by the Wohlwill process.

The electrolyte contains 30% free HCl and 80 to 85 grammes of gold per litre, with varying amounts of platinum and palladium. When the amalgam is made, these latter two metals in solution is sufficient to render it worth the expenditure of time and chemicals, a portion is withdrawn, and the platinum and palladium are then separated and can be refined by the appropriate chemical and metallurgical methods of treatment.

**Cadmium.**—This metal was produced during the World War period in America, by the electrolysis of sodium solutions of the sulphate, freed from all impurities by chemical treatment.

The electrolysis was carried out in semi-circular lead-lined tanks, provided with rotating disc-shaped cathodes of aluminium sheet, 3/4 in. in thickness. Under these conditions, smooth coherent deposits of metallic cadmium could be obtained, when using a current density of 15 amperes per sq. ft. of immersed cathode area. The average weight of cadmium deposited per 24 hours in the plant referred to above was 113 lb. per tank, and the current efficiency was 85%.

As regards output in 1914, 91,000 lb. of metallic cadmium were produced in the United States, and the total had increased to 207,000 lb. in 1917. No figures were yet available in 1921 for the German output during the war years, but it was known that they had produced large amounts of cadmium and used it as a substitute for tin, in the manufacture of solders. The low melting-point of cadmium renders it useful also in the manufacture of fusible plugs in sprinkler systems of fire protection; and it has also been employed in conjunction with lead for the manufacture of bearing metals.

**Calcium.**—The method of Rathenau and Suter for production of metallic calcium upon a commercial scale, by electrolysis of the fused chloride, has already been described (see 4, 971).

Up to 1921 no important uses had been found for calcium; consequently there was little demand and the price of the metal remained comparatively high. Before the war calcium was quoted in Germany at M 5.50 per kgm., equivalent to a price of $3.30 to 38.90d. per pound. It could still be produced at this price, if a large demand for the metal were created.

The only application so far suggested for calcium is as an absorbent for the occluded and trapped gases in molten metals; and in this direction it comes into competition with the cheaper and lighter metal aluminium. Soddy, in a Royal Society paper of 1906, referred to the use of calcium for removing the last traces of O. and N. from rared gas, and stated that by its use very high vacua could be obtained, but no practical industrial application of this suggestion appears to have been made.

**Calcium Carbide and Calcium Cyanamide.**—The manufacture and application of these products of the electric furnace have been described (see 13, 8). Whereas the use of calcium carbide for generating acetylene for domestic or public lighting purposes is not extending, its manufacture and use as an absorbent for nitrogen increased rapidly after 1910. The cyanamide process, in fact, when operated in favourable localities, seems likely to remain one of the chief competitors of the Haber and electric-arc processes for the fixation of atmospheric nitrogen. According to reliable authorities, the relative power consumption for the three processes is as follows:

- Haber (taken as unity) 1
- Cyanamide 8 to 10
- Arc processes 25 to 30

Regarding power considerations alone, therefore, and ignoring technical questions, it is clear that the Haber process is of universal application—while the cyanamide process only
advantage over the arc processes if its greater complexity can be counterbalanced by its greater efficiency. There is good evidence, however, for the belief that calcium cyanamide plants have since substantially reduced energy, and whereas in 1908 about 0.75 E.H.P.-year was required to produce a ton of cyanamide, the present energy consumption at Odda is believed to be not over 0.6 E.H.P.-year per ton.

As regards the progress of the three processes, Landis has published the following comparative figures for the years 1913 and 1916:

<table>

<td>6,000</td>
</tr>
</tbody>
</table>

Most of this increase was made in 1915, and 1,000,000 H.P. is now consumed in the three groups of processes.

Before the war, there were 16 calcium cyanamide factories in existence, producing 350,000 H.P. in the manufacture. Even at that time, however, the larger proportion of the calcium carbide manufactured was utilized in the cyanamide industry. According to official reports, Germany possessed in 1920 plant with an annual capacity of 600,000 tons of calcium carbide, equivalent to 1,200,000 tons of combined nitrogen. This plant was distributed among six firms, the largest works being that of the Mitteldeutsche Stickstoffwerke A. G. Piesteritz, with a tonnage of 175,000 per annum. Odda works for production of calcium carbide for casting of the compound are located at Odda in Norway; where an annual output of 300,000 tons eventually will be realized; at Piana d'Urge in Italy, and at Niagara Falls, where the American Cyanamide Company is operating on the Canadian side of the Falls.

Copper—The very remarkable growth of electrolytic methods in the copper industry is, of course, due to the presence of small amounts of silver, gold and other precious metals in the original copper ore. These “impurities” accumulate in the slime from the electrolytic vats, and in most cases the value of this mud more than covers the whole cost of the refining operations. In 1915, the last year for which reliable aggregate statistics were available in 1921, over 1,000,000 tons of copper were produced by the copper mines and smelters of the world; and of this total it is probable that from 70% to 80% had been electrolytically refined. In mere tonnage capacity and in the capital sunk in the industry, the American refining industry therefore easily ranks first among electrometallurgical industries; for the refineries cover immense areas and many millions of pounds’ worth of copper and precious metals are locked up in the vats during the refining process.

The greater number of the electrolytic refineries are located in the United States, because the States still produce between 50 and 60% of the world’s output of copper. The largest refinery is that of the United Metals Selling Co. at Perth Amboy. At Port Kembla in New South Wales, a new refinery has been built to refine the metal produced by the Mt. Morgan and other copper-mining companies of the Australian continent; and a production of 44,000 tons per year had already been attained by 1921.

The improvements made in the electrolytic refining process since 1910 have been directed chiefly towards the reduction of refining costs; and the method of operation is so well established that the only improvements possible are those based upon the substitution of mechanical for hand labour. Travelling cranes, by aid of which the whole of the anodes can be charged and the cathodes removed at one operation, are now used in all up-to-date refineries; and casting machines are also employed for casting the alloy from the blister copper which constitutes the raw material of the refining process.

Addicks, in a recently published article upon the design of copper refineries, discusses the size and capacity of the anode melting furnaces, and states that for smooth and safe operation there should be at least six furnaces (three for anodes and three for wire-bar units), two of each set being in service and one out for repairs. The limit of size in the past has been the ability to charge, refine and cast the charge in 24 hours. With hand-charging and ladling, using the same men for both operations, 60,000 lb. is regarded as a large furnace. If a fresh set of men be used for charging, and many additional employed as can be accommodated at the ladle door, 100,000 lb. can be reached. With hand-charging but mechanical ladling 300,000 lb. is possible; and with full mechanical charging and ladling 500,000 lb. is easily reached. A furnace casting a charge of 300,000 lb. or more, according to Addicks, may be considered reliable; but it is insisted that all the impurities possible should be eliminated at this stage of the process, for it is much more costly, in practice, to throw this burden upon the tank-house and silver refinery. It is also important, he states, to do all that is possible to facilitate uniformity of operating conditions. As a result, the anodes of constant composition, a uniform current density and a single electrolyte should be used throughout the tank-house.

Graphite.—The production of artificial graphite by the Acheson process has grown into one of the most flourishing of the electro-metallurgical manufactures. The original Acheson patent protected the process was dated 1896, and as the 17-year period allowed by American patent law had elapsed, the process after 1913 could be employed in all countries without payment of patent royalties. Consequently, there was a great expansion of the industry in countries where the demand for artificial graphite existed; and the manufacture is now carried on in the United Kingdom. The method described by Acheson in his original patent has undergone little alteration or modification in its general features, since it was first worked upon an industrial scale at Niagara Falls, in the year 1897.

The growth of the industry is shown by the following comparative figures of output at Niagara, for the two periods 1898-1909, and 1915-1917 respectively:

These totals do not include graphite used for electrodes, but only the artificial graphite which comes into competition with the natural variety.

The artificial graphite can be employed for any of the purposes for which natural graphite is used, with the exception of the manufacture of crucibles, and it is of interest to note that a recent American patent covers its use in the manufacture of crucibles. The chief application of artificial graphite, however, is its use for electrodes, for which its high electrical conductivity renders it specially suitable. Its further advantages are that it can be produced in large blocks which can be sawed, tapped or screwed, and turned in the lathe to any desired shape. Some of the artificial graphite electrodes manufactured for electric furnace work have been of enormous size, namely 24 in. in diameter and 72 in. in length; and these could not possibly have been produced from natural graphite.

The production of artificial graphite was greatly stimulated during the war period by the increase in the number and capacity of the electric furnaces used for the production of steel. Not only were there new installations of electric furnaces for the production of steel, but there was a notable falling-off in the demand for these two purposes after the Armistic. In other directions, however, the use of artificial graphite has been growing, and these additional uses are notable. Its use for the manufacture of lubricants, paints, dry-batteries, engine-land packings, and boiler-scale preventives.

Electric Steel Furnaces.—Since 1910 a very remarkable increase has been seen in the number and capacity of electric furnaces, both for the purpose of refining the higher grades of steel and for the production of ferro-alloys, in the leading industrial and manufacturing countries of the world. This increase, no doubt, has been due largely to war conditions. Every country engaged in the struggle, was thrown upon its own resources with regard to the production of iron and steel; and as electric heating oven is a quicker, more efficient method of production, it was natural that ordinary carbon steel and scrap from the shell factories into the special steels required for the manufacture of shell billets, guns, armour plates, etc., etc., as well as for various other military purposes, electric furnaces were installed in all centres of the steel industry.

Descriptions have been given (see 14,824) of the Heroult arc furnace, and of the Kjellin and Rohling-Rodenhanser types of induction furnace. But large masses of furnaces have been installed in the iron and steel industry, for the temperature attained in it has been too low to effect any useful refining work, and as a simple melting furnace for production of special alloy steels it is handicapped by the fact that some portion of the last charge of metal must always be left in the furnace ring to maintain the current. The Kjellin type of induction furnace as modified by Hietor, however, is now used for the production of a specially pure iron for dynamo construction, the principle being to encase the whole secondary of
the furnace in a gas-tight ring, and to melt and cool the metal in vacuo. In this way all occluded gases are removed, and the magnetic permeability of the metal is greatly increased. With this exception, the successful electric steel melting and refining furnaces are now all of the arc, or combined arc and resistance heating type. Detailed figures for all countries are not available, but the following comparative figures for the United Kingdom are striking. In 1912, only nine electric furnaces were operating, or in course of erection, in the iron and steel works or foundries of Great Britain: Messrs. Edgar Allen & Co. of the Imperial Steel Works, Sheffield, being the first to introduce the electric steel refining into Sheffield. Six years later, in October 1918, when the Armistice was declared, the number had grown to 123 (see Table III).

</table>

The average monthly output of these 123 furnaces was 16,500 tons of steel, in the form of ingot-mold, special alloys and castings. Further particulars of the types of furnaces installed, with figures for their output and electric consumption, are given in Table III. The table is not complete, and figures for some years are missing.

As regards the increased use of electric steel melting and refining furnaces, either in the United Kingdom or in the United States, the tendency is to employ larger furnaces than in Great Britain, with improved mechanical equipment for charging and discharging the furnaces. Automatic apparatus for regulating the arc gap and power factor has also been coming into general use, the Thury system of current regulation being widely adopted. As regards electrodes, holders and cooling-boxes, the tendency in American practice has been to use larger electrodes, and to keep the electrodes in a state of circulation by means of reversing type now being employed with a motor brake to prevent "overtravel" of the furnace, and to hold it stationary in any position.

In the United States, for electric steel melting and refining, the tendency is to employ larger furnaces than in Great Britain, with improved mechanical equipment for charging and discharging the furnaces. As regards electrodes, holders and cooling-boxes, the tendency in American practice has been to use larger electrodes, and to keep the electrodes in a state of circulation by means of reversing type now being employed with a motor brake to prevent "overtravel" of the furnace, and to hold it stationary in any position. The largest electric furnaces erected up to 1921 in America for steel melting and refining are the Heroult three-phase arc-type furnaces at the South Chicago works of the Illinois Steel Company. In 1918 this company was stated to be producing electric steel at the rate of 16,500 tons per month, using the "triplex" system referred to above. The other types of electric furnaces used in the American steel industry are:—Booth-Hall, Girod, Greaves-Etchells, Gronwall-Dixon, Ludlum, Snyder and Von Baur.

**Ferro-Alloys.**—Applications of ferro-alloys in the iron and steel industry have increased enormously since 1911, and in 1921 the Sheffield tool-steel trade was dependent for some of its most valuable products upon the ferro-alloys obtained by aid of electric heat. The discovery made many years earlier, that small percentages of chromium, nickel, manganese, vanadium and other rare metals, either separately or in combination, caused profound changes in the physical properties of the metal, led to the introduction of modern steel manufacture; and the production of a rustless or "stainless" steel was one of the most notable advances of the war period. Molybdenum is the latest rare metal to be added to the list of those employed now in steel manufacture; and Prof. Arnold's molybdenum-vanadium steel was expected by some authorities in 1921 to have a great future.

The special steels are called binary, ternary or quaternary, according to the number of elements (other than impurities) which are present, and it is the quaternary steels, which contain carbon and two other elements, that are now finding the widest applications in the arts and industries. The ferro-alloys used in their manufacture include ferro-carbon, ferro-eisen, ferro-manganese, ferro-aluminum, ferro-chromium, ferro-nickel, ferro-vanadium, ferro-vanadium-aluminum, ferro-molybdenum, and ferro-titanium, and are produced in the Sheffield works by the combination of the modified modern steel manufacture; and the production of a rustless or "stainless" steel was one of the most notable advances of the war period. Molybdenum is the latest rare metal to be added to the list of those employed now in steel manufacture; and Prof. Arnold's molybdenum-vanadium steel was expected by some authorities in 1921 to have a great future.

order to prevent loss by oxidation it is held beneath the surface of the molten metal in the refining tanks until it melts. As regards the contents of Mg for alloys designed for various uses, Klaude states that 2 to 5% Mg alloy is best for wire-drawing; 5 to 8% for rolling; 12 to 15% for casting, and that the average strength of a cast 10% Mg alloy is superior in almost every respect. With regard to the minor gases and the fine dust which may be deposited on the aeroplane construction work has the following composition:—Al 80 parts; Mg 12 parts; Cd 8 parts. This alloy is considered to be useful for chemical work, as for example the alloy containing 96% Al, 2% Ca, and 2% Mg. This alloy is very dense, machines well, and has been used with success for the construction of a 3-in. flanged valve, designed for work as high as 1500 lb. per sq. in.

As regards the manufacture adopted for producing pure magnesium, it is known that before the time the Germans were manufacturing the metal by the electrolysis of fused "carnallite," a magnesium chloride, contained along with chlorides. The position at the commencement of the war was, therefore, that Germany had practically a monopoly of the manufacture of magnesium, and used it for the whole world with its elements of the metal. It was only under the stress of war conditions that English and American manufacturers commenced to take an interest in this very interesting metal.

As regards America there were, in 1921, two plants at Niagara Falls producing magnesium, under the control of the American Magnesium Corporation, and there was also one at Rumford Falls, controlled by the Rumford Metal Co. The latter plant employed as anodes a magnesium-nickel alloy by-product from some other process. The Dow Chemical Co. of Midland and the General Electric Co. of Schenectady are two other firms which produced magnesium during the war. Concerning the process of production or extraction used by the plants of Niagara Falls, very little information is available. There is no doubt, however, that the process used is an electrolytic one, and that the electrolysis takes place in the same type of cell and in the same manner that is desired. At Rumford Falls, where MgO is used as raw material, the method in fact is exactly similar to that used for the manufacture of aluminium.

Quartz-Glass and Fused Silica Ware.—This electric-furnace product has been manufactured since 1904 at Wallseed-on-Tyne by the Thermal Syndicate, and at Hanau in Germany by Heineus. Quartz is an impure form of silicic acid (SiO₂); and quartz-glass is, therefore, a glass consisting chiefly of silicic acid, whereas ordinary glass contains silicic acid in combination with lime, soda, potash or lead. The great advantages of quartz-glass as compared with ordinary glass are that it has a much higher melting point and that it is not fractured by sudden changes of temperature. Other important properties are that it is neither hygroscopic nor soluble in acids, and that alkalies affect it less than ordinary glass except at the higher temperatures. It is, therefore, of great value for chemical and research work.

In the early days of the manufacture only tubes were made. The method of production was to embed a graphite rod in sand, and to heat this with an electric current. The white opaque glass of quartz was obtained in this way, of much greater diameter than the graphite core. The opacity was due to the air contained in the raw material, which is absorbed in the molten glass as a perfectly cloudy mass when it is softened under the application of heat. The fastest method of overcoming this defect is to heat the fused tube a second time quickly up to 1800° C. by aid either of an oxyhydrogen flame or of the electric arc. The cellular structure then collapses, and a semi-translucent tube is obtained which is not only stronger but is a better conductor of heat than the original opaque tube. The highest grade of glass-sand and modern methods of blowing-glass manufacture are now employed, with the aid of iron molds similar in construction to those used for glass bottles, to produce any hollow kind of fused silica ware.

Several plants in the United States and in Great Britain are now engaged in the cell and process for the production of metallic sodium by the electrolysis of fused sodium hydrate which has been generally adopted.

In a recent American patent, No. 1,334,179 of March 1920, and assigned to the Union Wire Co. by W. Smith and W. R. Veazey, of Cleveland, proposed to substitute a mixture of 35-6% parts of sodium chloride and 64-4% parts of sodium carbonate for the more expensive sodium hydrate. This mixture melts at 600° C. and yields a product equal in quality and purity to the present commercial sodium.

Tin.—The application of electrolytic or electrothermal methods in connexion with the tin industry has been confined to the recovery of metallic tin from the exhausted ore from refining plants found in the refuse of all large towns. At one time the electrolytic recovery of tin from these two sources became a branch industry of some importance; but these electrolytic methods of treating tin-snap metal and refuse in many places have been displaced by 1921 by newer methods, depending upon the use of liquid or gaseous chlorine. The electrolyte methods, however, continued to be carried on by some municipalities.

The alkaline process of electrolytic tin-stripping was patented first in the United Kingdom (1866) by B. and A. Watson; but the German firm, Th. Goldschmidt & Cie., of Essen, Germany, who first to see and to turn to good account the possibilities of the process. This firm, by organizing the collection of the waste scrap in all kinds and its refining on a large scale, made the best of a very small margin of profit. At that time, the electrolysis of the tin coating, was not done; the tin oxide was continuously regenerated, and the only drawback to the process was that the solution of the tin was not quite complete, and the iron-tin alloy, which existed on the plate under the coating of tin, was not dissolved by the sodium salt. The residual iron left in the vats still carried, therefore, measurable and variable amounts of tin, which diminished its value from the steel-melters' point of view.

At one time before the war, the alkaline process of tin-stripping was being worked at seven different centres in Europe and at one or two in America, and over 40,000 tons of tin scrap was treated annually by this process. A plant which operated in Limehouse, London, was going to be used for the electrolytic treatment of tin scrap. Electrolytic tin-stripping methods, which are based upon the use of ferric and stannic chlorides as solvent for the tin, have been patented and tried also upon a commercial scale. Their great advantage is that a large amount of tin remains present in the tin coating, is removed by the chloride treatment; and that only one-half the electric current required by the alkaline process suffices to deposit the tin from the chloride electrolyte. The Bergsoe electrolytic tin-snap plant (considered by W. & N. with a large amount of tin remaining in the tin coating) was the method most successfully worked by British patents Nos. 122,025 and 122,618 of 1918, and is reported to have been operated in Birmingham.

Zinc.—The many different processes which had been patented or experimented with, up to the year 1910, for the electric deposition of zinc from sulphate or chloride solutions of the metal paved the way for the improved methods and processes of the later period, and there were in 1921 many large plants in operation in America and Australia, producing electrolytic zinc upon an industrial scale. Success depends upon freeing the electrolyte of impurities which interfere with the action of the cell, and depositing zinc free from all impurities free from all impurities. The electrolyte must be electric-negative than zinc—applicable in the same manner to arsenous acid and arsenic. The presence of even very minute amounts of the two last-named impurities (arsenic and antimony) is found, in fact, to lead to low-current efficiencies. The non-recognition of this fact led to the failure of many of the electrolytic processes that were tried upon an industrial scale in the past. The other essential of success is to prevent "treeing" of the deposited zinc, since this leads to short-circuiting in the vats; and "treeing" has been overcome by stripping the cathodes every 48 hours, and by not attempting to form thick sheets of zinc.

The most modern and largest plant in which electrolytic zinc was introduced in the United States that existed in 1918 was the Canada Copper Co. at Great Falls, Mont., for recovery of the zinc from the complex zinc-lead ores of the Butte district, by a sulphate leaching process. The tank-house of this plant contains 946 vats, each 10 ft. long by 5 ft. wide by 5 ft. deep; and each vat will hold 28 anodes and 27 cathodes. The latter are of rolled sheet aluminium from which the deposited zinc can be stripped easily. The anodes are loaded with lead. This plant is supplied with power by a rotary converter of 5,800 K.W. output, 10,000 amperes at 580 volts being required to run this number of cells. At full load the current density employed is 30 amp. per sq. ft. of cathode area, but 20 amp. yields all the required current. Similar plants have been erected and operated at Park City, Utah, by the Judge Mining and Smelting Co., for treatment of the concentrates from a sulphide ore containing zinc, lead and silver; and at Trail, B.C., by the Trail Zinc and Smelting Co., of Canada. This latter company claims to have been the first to put electrolytic slab zinc on the market at a cost which left a profit to the producer. The average composition produced at Trail, B.C., is 68.99-93%; FeO, 0.05%; Pb, 0.03%; Cd, 0.02%.
ELGAR—EMBRYOLOGY

Electroplating.—The electrolytic deposition of a coating of zinc, from sulphate solutions, upon iron articles is now a well-established industry in all the leading manufacturing countries.

ELGAR, SIR EDWARD (1857— ), English composer (see 9.266), received the O.M. in 1911. His first symphony, produced at Manchester 1898, created a furor and was played upwards of 150 times in a twelvemonth. It was followed by the violin concerto; Falstaff (Leeds); the 2nd symphony in E flat; and all these by a wonderful series of compositions written during the World War. The Spirit of England (poems by Lawrence Binyon), Carillons, a pia-noforte quintet, a string quartet in A minor, and a 'cello concerto were produced between 1914 and 1920.

His wife, Caroline Alice Roberts, the daughter of Maj.-Gen. Sir Henry Roberts, whom he married in 1889, was herself an accomplished musician and linguist. She was the author of various poems, including In Haven, set to music by her husband in 1894, and a twelvemonth. It was written by the violin concerto; Falstaff (Leeds); the 2nd symphony in E flat; and all these by a wonderful series of compositions written during the World War. The Spirit of England (poems by Lawrence Binyon), Carillons, a pia-noforte quintet, a string quartet in A minor, and a 'cello concerto were produced between 1914 and 1920.

Elgin, VICTOR ALEXANDER BRUCE, 9th Earl of (1839-1917), British statesman (see 9.268), died at Broomhall, Fife, Jan. 12 1917.

ELIOT, CHARLES WILLIAM (1834— ), American educator (see 9.274), was offered the post of ambassador to Eng- land by President Taft in 1909, but preferred to serve his country in a private capacity at home. The same position was tendered him in 1913 by President Wilson and again declined. He continued to take an active part, by writing and speaking, on all the important public questions of the day. His theories as to needed changes in education toward the concrete and practical had great influence upon American schools. The vocational movement, so marked after 1910, was without doubt accelerated by his continued insistence upon the training of the senses of sight, hearing and touch, as being the sources of the best part of knowledge. In 1914 he was elected president of the American Association for the Advancement of Science. In his educational writings he maintained that the traditional systems had dealt too exclusively with language and literature. In 1916, however, he was awarded a gold medal by the American Association for the Advancement of Science for his work in education. His book, The Religion of the Future and Twentieth Century Christianity, he rejected obscura dogma, emphasized freedom in place of authority, and held that the teaching of Jesus had been 'the undying root of all the best in human history since He lived,' and that He would be the supreme teacher in the new religion, the outcome of which would be the brotherhood of man. Dr. Eliot gave much attention to labour problems and declared that profit-sharing, combined with cooperative management, in which the employees take an active part toward the health and cooperative care of health, education and happiness of employees, and with full knowledge by employees of the employers' account, is the only road to industrial peace." He condemned limited output by labour as well as uniform hours and wages. The settling of industrial strife he considered the next important thing after the establishment of a league of nations. He was a strong supporter of President Wilson's administration, and approved his personal appeal to the country in 1918 to return a Democratic Congress. He favoured prohibition as a war measure, and later as an amendment to the Constitution. He wrote in favour of military training after the Swiss method, but maintained that, after a league of nations was formed, no country should be allowed to have an army "whose officers have entered for life the profession of soldier." In 1920 he was an active worker for the Democratic party because he regarded the immediate adoption of the Covenant of the League of Nations as a moral obligation. He was the author of The Conflict Between Individualism and Collectivism in a Democracy (1910, lectures delivered at the university of Virginia); Some Roads Towards Peace (1914) and numerous articles on educational, religious, political and social questions.

Elliott, Howard (1860— ), American railway manager, was born in New York Dec. 6 1860. After graduating from the Lawrence Scientific School, Harvard (C.E. 1881), he was for several years a clerk in various offices of the Chicago, Burlington & Quincy railway. Later he was appointed general freight agent and then general manager of several lines belonging to the Chicago & North Western Railway System. In 1902 he became second vice president of the company and the following year president of the Northern Pacific. In 1913 he was made president of the New York, New Haven & Hartford railway and at the same time chairman of its board of directors. In 1917 he resigned and was made chairman of the committee on intercorporate relations of the New Haven system. The same year he was named by the American Railway Association as one of the six members of the Railroads War Board. He was again president of the Northern Pacific 1919-20, and then became chairman of its board of directors. He opposed the eight-hour law, urged high freight rates, and suggested the creation of a department of transportation, with a secretary in the Cabinet.

Ellis, Robinson (1834-1913), English scholar (see 9.294), died at Oxford Oct. 9 1913. Among his later publications were editions of the Amores of Ovid (1912) and the second book of Ovid's Tristia (1913).

Elwes, Gervase Cary (1860-1921), English vocalist, son of Valentine Cary Elwes, of Billing Hall, Northants., and Brigg, Lin., was born at Billing Nov. 15 1860. Educated at the Oratory school, Edgbaston, and at Christ Church, Oxford, Gervase Elwes married Lady Winifred Fellding, daughter of the 8th Earl of Denbigh, in 1889, and in 1903, and in London at a concert of the Handel Society. In London he continued his studies under Victor Beigel, sang with conspicuous success at the Monday "Pops," at the Kruse festival and at provincial festivals. His first representative festival engagement was at Leeds in 1904. In 1907 he toured Germany with Fanny Davies; two years later he sang with the Oratorio Society of New York in Bach's St. Matthew Passion and The Dream of Gerontius, the latter a work with which his name became indissolubly associated. He took part in upwards of 150 performances of it. His intensely deep religious convictions undoubtedly aided him in this work, for he was a devout Catholic. It is generally conceded that his performance was exalted. As singer of songs Elwes held an exclusive position. He excelled in the Trier of Brahms; and to him such English composers as Roger Quilter and Vaughan Williams owed a fair proportion of their success, at least in the beginning. Elwes left England late in 1920 for a long-promised tour of the United States, and he was accidentally killed at the railway station at Boston on Jan. 12 1921.

EMBRYOLOGY.—In the earlier article (see 9.314) the growth of the science of embryology was traced from the period of the Renaissance until the beginning of the 20th century. It remains here to deal with the more recent discoveries as to the nature and meaning of the developmental process.

The Cell.—We take for granted (see cytology) a general acquaintance with the structure of the bodies of adult animals. It is now a matter of universal agreement to conceive the active
living parts of these bodies, which are included under the general name protoplasm, as built up of a series of units termed cells, each normally containing a single nucleus and separated from one another by quasi-solid membranes termed cell-walls.

The doubts as to the validity of the concept of the cell, which were raised in the later years of the 19th century, have not been sustained by later discoveries. A more refined technique has enabled us to demonstrate a cell-wall in cases where it was supposed to be absent; and where it really is absent, as for instance in the ectoderm of the Nematode worms, it has been proved that this is a secondary state of affairs, due to the de- generation of the original cell-wall, which in younger stages of the life-history are clearly and sharply delimited from each other. It is true that in many, perhaps in most, cases the cell-walls are perforated so that adjacent cells are connected by bars of protoplasm, but this circumstance in no way invalidates the idea of the cell as the unit of structure.

Scope of Embryology.—The lowest grade of animals, termed the Protozoa, do not exhibit cellular structure. Either their bodies are so small that they possess only one nucleus, and in this case they may be regarded as free-living cells; or they contain more than one nucleus, which attain a greater size, and then their protoplasm is not divided into compartments in accordance with the distribution of these nuclei.

Some of the largest of the Protozoa such as the extant genus *Nannoluides* were disc-like in form and attained a size of an inch in diameter; the bodies of these animals were divided into thousands of compartments by calcareous septa. To judge from what we know of the structure of their nearest living representatives, these must have possessed numerous nuclei; but these nuclei were not distributed in accordance with the divisions of the protoplasm. Some compartments contained several nuclei, some one nucleus only and many none; so that true all-structure was absent.

In other cases the protozoa may be described as a colony of small unicellular forms, connected together either by strings of protoplasm or by a common nucleus. In the cases where these more complex Protozoa are distinguished from the true higher animals or Metazoa by the fact that when reproduction takes place the whole body of the parent breaks up into germs, each containing a single nucleus, whereas in true Metazoa small portions only of the parent's body are set aside for reproductive purposes; in other words, in the Metazoa there is a persistent " soma " or body distinct from the germ-cells. Now of course the development of the Protozoa sought to form part of the subject matter of embryology, but in the case of the smaller species it is exceedingly difficult to say which stage corresponds to the adult condition of Metazoa, since reproduction by budding or by fission takes place in the body itself. In the case of the Metazoa, which are larger than the Protozoa, budding is a characteristic and relatively rare process. These differences between the Protozoa and the Metazoa are of the utmost importance, and the study of the life histories of the higher animals which exhibit definite budding is in a real sense the study of the Aechanin.

Metazoa.—If we now examine the development of the Metazoa we find a few cases where, side by side with other methods, reproduction by fission, that is by the division of the mother's body, does actually take place.

Thus in the marine annelid *Procrastes* described by Allen,1 the male worm breaks up into groups of one, two or three segments and each of these groups regenerates the missing parts and thus constitutes a new worm. In much more numerous cases, the outgrowth of the mother's body, termed a "bud," is produced. The bud consists from the beginning of several tissues, and is slowly moulded into the form of the body of the adult when fully grown separates from it, or in the case of a colonial animal remains connected with it and helps to build up a compound organism. Such compound creatures are found amongst the sponges, the Cnidactera, the Polyzoa, and the Ascidians, the last-named group being regenerate allies of the Vertebrata.

The laws of bud-development have not been as clearly elucidated as those of the germ-cells. Development by germ-cells is universal amongst the Metazoa; and in all but two phyla the form in which they appear is remarkably constant. They are of two kinds, viz. male and female, and are normally incapable of development unless they have previously united in pairs to form what are called "zygotes" (Gr. σέγων, a yoke).

The egg or spermatozoon consists of a head which is a condensed nucleus made up of a compact mass of chromatin, and a tail which is a vibratile filament. Amongst the nematode worms, however, the male-cells are devoid of filaments and appear under the form of small amoebo-cells, whilst amongst the higher Cestacea (i.e., the shrimps, lobsters and crabs) the tail is replaced by a peculiar vesicular structure, which, under the influence of irritation, extends to the head and propels it forwards, thus propelling the body forwards and in this way bringing about the union of the two germ-cells.

The whole subject has been attacked from a new point of view by Herlant and Brachet, who have pointed out that the agent employed to provoke parthenogenesis does not exercise a specific chemical action on the egg but merely acts as a stimulus to which the egg responds. Brachet, accompanied by the Brachet, de Bruchet, and de la Bellique, has shown that the egg "wakes up" so to speak, the nucleus emits something which acts as a centrosome and from it develops a great series of converging rays that form the so-called "monaster" in fact. The chromatin of the egg becomes resolved into chromosomes which are split longitudinally, and which become adherent to the rays of the monaster. In most cases after persisting for an hour the monaster disappears; the egg returns to the state before division, and then another centrosome appears in the same phases, a monaster being again formed. After this process has been repeated about six times over a period lasting twelve hours the egg forms and cytoplasm supervenes. If, however, after the egg has been exposed to the action of the butyric acid and then washed in sea-water it is placed in hypertonic sea-water, and then after a limited period of immersion in this fluid replaced in ordinary sea-water, additional asters are formed in the cytoplasm. When the egg forms a monaster this becomes connected with these other asters by longitudinal fibres so as to form a complex spindle. By properly choosing the period of immersion of the egg in hypertonic sea-water it is possible only one additional aster should be formed; this then joins with the monaster to form a normal mitotic spindle on to which the egg chromosomes migrate; a regular division of the nucleus ensues, and two or three or more cells and so parthenogenetic development is initiated.

The course of events in the frog's egg is fundamentally similar to the process which we have just described, although there are differences in certain details. If prick water is used in the formation of a huge monaster, which then divides into two forming a short mitotic spindle on to which the chromosomes of the egg migrate, the lengths of the spindle alongside one another; the number of chromosomes in the nucleus and as these chromosomes are only present in half the number found in the nucleus of the fertilized egg, the spindle which is formed is only four-fifths of the length of the spindle found in the fertilized egg. If the length of spindle in turn determines the length of the actual rays from its poles, and if these are too short to reach the periphery of the egg the spindle is unable to bring about the division of the egg in the correct manner; in the case of the spindle formed in the parthenogenetic egg, and although abortive and transitory fibres on the egg's surface are formed no division into cells results; the nucleus, it is true, divides, and a multiplication of nuclei follows in which the numerous short spindles formed interfere with one another and make orderly development impossible and so after a short time the egg dies.

However, the egg may be "infected" by being dipped into frog's blood before being used to prick the egg, then the foreign substance thus introduced produces additional asters in the cytoplasm just as dil the hypertonic water in the sea-urchin's egg. These asters have four rays developing. Here again they push the mitotic spindle developed around the egg nucleus over to the one side. If this side happens to be the side of the egg at some stages of development the fusion of the spindle and asters results in the formation of a furrow which cuts right through the egg and divides it into two cells, and so parthenogenetic development is begun. We see that the difficulty of initiating parthenogenesis depends on two factors, viz. (1) the quiescent condition of the egg and (2) the small amount of chromatin present in the egg. If we choose the unripe eggs of the sea-urchin as the subjects of our experiment then it is sometimes possible to induce them to develop by the use of one reagent alone, such as hypertonic sea-water: since in these eggs the "reducing" division of the nucleus has not occurred (see Cytology) and the chromatin is consequently present in undivided metaphase.

Parthenogenetic development is closely related to the problem of heterogeneous fertilization. It has been shown that under certain circumstances it is possible to fertilize the eggs of the sea-urchin with the sperm of creatures so diverse in zoological affinity as the annelid worm (Chlutationus) and the sea-mussel (Mytilus). In the first case the male and female pronuclei fuse but the male chromatin falls out of the zygote nucleus before the first division takes place. In the second case the male pronucleus refuses to enter into union with the female pronucleus at all, but the spermaster brings about the division of the egg. When the eggs of the sea-urchin (Echinus) are fertilized with the sperm of the heart-urchin (Echinocardium), in the vast majority of cases cytolysis results exactly as it does after the exposure of the echinus eggs to the action of butyric acid, but in some few cases the egg develops and produces a hybrid. We conclude that in most cases the sperm of Echinocardium is so alien to the cytoplasm of the egg of Echinus that it is not even able to bring about the formation of a sparsmer.

Under certain circumstances (slight staleness of the egg, excess of sperm, etc.) more than one spermatoozon may enter the egg. In brachytele of the sea-urchin, such as those of cephalopoda, reptiles and birds this seems to be a normal occurrence; only one of these nuclei unites with the female pronucleus and forms the zygote nucleus from which begins the cell-division which initiates development; but the other nuclei remain in the cytoplasm and are expelled. In the cases of the coelomic and the free cells which are characteristic of these eggs. These free cells are gradually broken out and destroyed by the developing cells produced by the activity of the zygote nucleus.

Brachet, however, has shown that when the frog's egg is entered by spermatoozoon in moderate numbers, whereas only one fuses with the female pronucleus, the others form centres for the formation of cells which are built up into the body of the embryo. As these sperm-heads, however, contain only half the quantity of chromatin contained in the zygote nucleus, the cells to which they give rise are markedly smaller than those which contain nuclei descended from the sperm-head. This is demonstrated by the note given by Hyman that the growing tadpole regions which contain cells which have nuclei derived from the zygote nucleus from those which contain cells having nuclei that developed from a sperm-head.

Brachet's observations prove in the clearest manner that the differentiation of organs in the frog's egg is due to the differentiation of regions in the cytoplasm and not to the differentiation of the nuclei as Weismann had proposed, for some of these nuclei can be replaced by spermatoozoon each of which carries in it the potentiality of producing the whole organism—not a mere region of it—and yet no dislocation of development results.

The entry of two or more spermatoozoon into small eggs such as those of the sea-urchin usually produces abnormal development followed by early death. The reason for this comes about when the centres for cell-division are so near one another that instead of leading to the formation of separate spindles they give rise to three- (triaster) or four-poled (tetraaster) spindles along with supernumerary nuclei, if any are produced, in an irregular manner. This causes the formation of abnormal nuclei incapable of properly fulfilling their functions and the embryo dies.

Development of the Egg.—If we now turn to consider the normal development of the egg we find that this can be divided into three stages in which in primitive forms are sharply delimited, but which in more modified forms tend to overlap one another. These stages are (1) segmentation, or the division of the egg into a number of indifferend cells or blastomeres; (2) the formation of the so-called germ layers, i.e., the differentiation of the blasto-meres, viz. the primitive ectoderm (or epibranchial) which is the primitive skin, (b) the endoderm (or hypoblast) which is the primitive lining of the gut, and (c) the mesoderm (or mesoblast) which is the primitive pericardium or lining of the body-cavity; (3) organogenesis, i.e., the formation of the separate organs of the body, such as brain, liver, kidneys, etc., from the germ-layers.

Segmentation of the Egg.—Considering first the process of segmentation, we find, as Balfour pointed out long ago, that the effect of the accumulation of yolk in the egg is to impede cell-division; it acts exactly as if it were a diluent of the cytoplasm in lowering surface tension. Cell-division is accompanied by a great increase in surface tension as is obvious from the way each cell wall rounds itself off from its sister. This is particularly evident in the segmentation of aechaleth eggs, for in them, in the earlier stages of segmentation, all the blastomeres divide simultaneously, and just round itself off from its sister. This is particularly evident in the segmentation of aechaleth eggs, for in them, in the earlier stages of segmentation, all the blastomeres divide simultaneously, and just

5 F. M. Balfour, Treatise on Comparative Embryology, vol. i., p. 95.
When the yolk is very much increased in amount, the nuclei produced by the division of the zygote nucleus are unable to bring about the formation of a blastula. The apices of the blastomeres of the coelom. They get a multiplication of nuclei without the formation of blastomeres. When this happens segmentation is confined to the animal pole of the egg and results in the formation of a thin disc of blastomeres termed the archentome. The wall cells keep them apart and they flow together so as to form a common inner yolk mass. Such eggs are said to exhibit superficial segmentation. Later, the outer protoplasmic layers of these incomplete blastomeres become completely cut off, so as to form egg. In vertebrates, the stage at which this occurs is the blastula stage, in which the yolk of the egg is completely enclosed by a double-walled yolk mass surrounding it. It is evident that this is not the case of the frog the blastula is a hollow ball of which the roof is two cells thick and the floor is many cells thick, while in the case of the pigeon the blastula is represented by a stage in which the blastomeres are in the process of rotation and formation of a slit-like cavity from the immense mass of unsegmented yolk forming the floor in the uppermost layer of which are a few nuclei. These nuclei are representatives of the cells which should constitute the vegetative pole of the blastula but they are utterly unable to cut the yolk up into cells.

Formation of Germ-Layers.—As soon as the blastula stage has been reached, we shall describe the ultra structural articles of the body in the form of a table. The vegetative pole of the blastula has become more and more exposed, and the same applies to the yolk. The tube of the primary gut or "archenteron" is now formed, and the cells forming it are termed the "endoderm." The blastula stage, in which the archenteron is differentiated at one place, the rest of the blastular wall becomes changed into definitive endoderm. What has happened is that the developing egg has assumed the shape of a double-walled cup, the opening into which is termed the "blastopore." This stage is clearly and sharply marked in the development of almost all eggs in which the yolk is small in amount, and especially when it is very small in amount. The blastopore is a well-marked form in the development of large yolky eggs. It is of equal importance to the blastula stage, and it is termed the "gastrula."

The primary body-cavity has now become reduced to the slit intervening between the wall of the archenteron and the outer wall of the gastrula and this slit becomes largely filled up by the development of the third germ layer, the "mesoderm." We have described this layer as the primitive periphery of lining of the body cavity, but the body-cavity now indicated is termed the "coelom" or "second body-cavity" in order to distinguish it from the primary body-cavity. In the eggs of primitive animals, where the yolk is large in amount, the outer layer of the blastula is termed the coelom or the mesoderm. This layer is formed as a series of pouch-like outgrowths of the archenteron which become cut off from this tube. It follows that the mesoderm is differentiated from the primary endoderm. Driesch has shown that the front half of the gastrula of the starfish which includes the apex of the archenteron is the rudiment of the coelom— the first rudiment of the coelom—has appeared, then, although the hinder half will half up and form a perfect larva, forming, of course, the coelom in the normal way. If, however, this operation be carried to a sufficient extent, a second coelom— the rest of it becomes the definitive endoderm devoid of this coelom-forming power. In Echinodermata the coelom arises as a single cavity, hence a single mesoderm. In many lower animals it originates as five pouches of which one is apical and four are paired and lateral; in Chaetognatha and Brachiopoda as a lateral pair of pouches. The remain of the primary body-cavity becomes almost entirely filled up by the spaces in the mesoderm; and in annelids and molluscs, in addition to the mesenchyme given off from the coelomic wall, some is likewise buduled from the ectoderm, and to this the name "mesoectoderm." The research indicates that no mesenchyme is given off from the ectoderm.

Organogenesis.—Turning now to this third stage of development, viz., the formation of special organs, we find that from the ectoderm are derived the central nervous system and the sense organs, and also the lining of the mouth-cavity and of the terminal portion of the alimentary canal near the anus. The endoderm gives rise to the gut and its cavities; and, in Vertebrata and Echinodermata, the mesoderm gives rise to the muscles. We shall attempt to show that the definitive germ-layers do not correspond to one another in different eggs; in a word, that the same name has been given to different things.

Some of the arguments adduced are the diverse origins of the mesoderm in various animals, and the alleged origin of the epidermis of the alimentary canal of insects and some other Arthropoda from the ectoderm. The result of the labours of embryologists during the last 15 years has been to establish the universal homology of the germ layers on an ever firmer basis, and to show that the difficulties alluded to were based on faulty observations.

If, for instance, we define the mesoderm as the wall of the coelom then we shall find that, when it is formed, it may be either as a pouch or a mass of cells. The pouch (recognizable in Chaetognatha, Brachiopoda, Echinodermata, Enteropneusta and the lower Vertebrata) quite clearly originates as an outgrowth of the archenteron; the mass of cells (found in one large cell, the mother mesoderm-cell. This cell, as was first shown by Shearer in the annelid Hydroclor and by Conklin in the mollusc Cephalis, originally forms part of the wall of the archenteron and, by a process of degeneration, gives rise to the formation of the more primitive method of coelom-formation by the outgrowth of a gut-pouch. Attempts which have been made by Meissenheimer and Harms to show that in Mollusca the coelom originates from cells budled from the ectoderm are based on obvious blunders in missing out stages in reconstructing the life-history— that most fertile source of error in embryology. Later workers have exposed this error and have shown that in Mollusca, with which Meissenheimer and Harms dealt, the mother mesoderm cell gives rise to the pericardium which is representative of the coelom in these animals. We have already alluded to the presence of mesoderm in Annelida and Mollusca, which is formed as a series of superficial muscles, but to confound this with the coelomic wall and its derivatives by calling both mesoderm and then to complain that the mesoderm is not an homologous structure in various groups of animals is to introduce a perfectly gratuitous confusion.

We may now turn to the alleged origin of the gut epithelium of certain Arthropoda from the ectoderm. In the earlier article the statement was made that in the aquatic type of the terrestrial Arthropoda Peripatus there is a large slit-like blastopore which later

6 Harms, "Postembryonale Entwicklungsgeschichte der Unioni-
becomes divided by a constriction into mouth and anus, and that a posterior group of globular cells, forming the mesodermic portion, is formed from ectoderm turned in round the edges of the slit. It is practically certain that this last statement also rests on an error of observation. In the primitive annelid Polygodius, Woltereck has described a similar process in the head, where the process of its closure in great detail describing the division of every cell involved. In this case the midventral epithelium of the gut is formed from mesoderm, and the midventral cells are the side-cells of the blastopore—whilst the ectoderm cells lying in the blastopore lips by their union reconstitute the midventral skin. No reasonable doubt can be entertained that a renewed investigation with a more modern technique will reveal this process.

It must never be forgotten that embryological research is based on a comparison of embryos of different ages with one another—not, as would be the ideal method, on a continuous observation of the processes of growth of the same embryo. The age-difference between the embryos examined may give rise to a totally wrong conception of the process which is taking place. So it must be entailed that the so-called "pre-chordal plate" is not a growth from the blastopore, but a result, and may be the same with that of Heymons ⁷ that the mid-gut of the higher insects is entirely formed from ectoderm, and of Watase ⁸ who made a similar assertion about the mid-gut of the cephalopod Loligo. Hirschler ⁹ has shown how the error of Heymons originated, and Watase has been corrected by Faussek ¹⁰; and should further statements of this kind occur in the literature the strong presumption is that they also are founded on mistakes.

**Organ-forming Substances.**—We have arrived at the conclusion that the establishment of the validity of the germ-layer theory is one of the great achievements of embryological research, and we now turn to the question of how the differences which distinguish the various tissues in the embryo are brought about. We have learned that in primitive ascitic eggs like those of Echinoderma all portions of the blastula wall are alike in their potencies and that the differentiation of ectoderm from endoderm only begins when the first traces of gut-formation are visible. We have likewise learnt that all parts of the primitive gut or archenteron are alike in their powers, and that the separation of endoderm from mesoderm only becomes apparent when the first indication of the coelom appears. But this progressive differentiation of the embryo might be due to a differentiation of the nuclei of various regions or of the cytoplasm or of both. We have, however, learnt from the development of the polysermic frog's egg that there is a strong presumption that the nuclei of the egg are alike in their nature and that the differentiation of the layers must be due to the separation of organ-forming cytoplasmic substances from one another. This conclusion is confirmed by a large number of observations on many different kinds of eggs; a few of the more striking may be given here.

Hertwig ¹¹ allowed frogs' eggs to develop under pressure between glass plates and in capillary tubes. Under these circumstances the division of the blastula into two hemispheres instead of twelve occurs, and rows of cells were produced. When the pressure was removed, however, these deformed embryos recovered, multiplication of cells took place and the normal form was regained and normal development proceeded. It was easy to show that nuclei placed under undisturbed conditions would have occupied certain definite regions of the embryo had these been forced into quite other regions, and yet perfectly normal embryos resulted. Hertwig concludes that the nuclei could be juggled about like a handful of balls without affecting the formation of the embryo.

In many eggs the differentiation of the layers is indicated at a far earlier period than that at which it occurs in the eggs of the Echinodermata or even of the lower Vertebrata like the frog. The egg of the ascidian *Cynthia parva* which has been studied in great detail by Conklin ¹² may be adduced as an example. This egg when it has been hatched is converted into a elongated blastula consisting of few cells; this blastula changes into a gastrula of the typical type, and though no distinct cytoplasmic substances are formed, portions of the archenteric wall are directly converted into muscles which lie at the sides of the tail of the tadpole-like larva. In this species the nucleus of the unripe egg is as usual a vesicle filled with fluid (the so-called "endoplasma") and containing numerous yolk globules of a slaty-blue colour and also larger yellowish globules which are concentrated in its superficial layer. When the material is divided into small parts and a few cells that become attached to the vitelline membrane, which is dissolved and the fluid contents escape and form a cap of clear material at the animal pole of the egg. When fertilization takes place profound rearrangements of the substances in the cytoplasm are effected. These yolk globules are reorganized into a single one which enters at the vegetative pole, and they finally form a crescent layer of yellow material round the lower pole of the egg. As the egg develops first into a blastula and then into a gastrula, and finally into the coelomic cavities, the yolk globules are differentiated into two. It is evident that the clear substance forms the ectoderm, the slaty-blue material the endoderm, whilst the yellow material forms the masses of mesoderm which are given to the tail muscles. When the egg is in the four-cell stage the yellow material is confined to the two posterior ova if one of these is killed the remainder of the egg will give rise to a larva with muscles only on one side of the tail. That the nuclei have this power to do with this separation of substances is shown by the fact that at the blastopore. Here we find an arc of which Conklin calls "neurochordal" cells. Each of these has of course a single nucleus, but the cytoplasm of each consists of two zones, a clear and a thick one. At the point where the two blastomers are produced from each neurochordal cell; one of these contains the clear substance and is added to the nerve plate which is a part of the ectoderm; the other is composed of the blue substance and forms the floor of the blastopore. Such a difference between Cynths as in other Vertebrates is a derivative of the endoderm.

From this development we conclude that the germinal layers owe their constitution to the segregation of cytoplasmic substances in the growing egg; that these substances are formed from the yolk itself, and that the influence of the spermatozoon, thus on its path to meet the female pronucleus determines the symmetry of the embryo. Brachet ¹³ has shown that this is a difficult puzzle for which competent observers like Roux ¹⁴ and Hertwig ¹⁵ should differ so profoundly on the results of killing one of the two blastomeres of the frog's egg. Roux asserted that the surviving blastomere develops as if it were a whole egg, and Hertwig maintained that it tended to form a normal tadpole, being only impeded in its development by the mass of dead material constituted by the other blastomere. Brachet has shown that both are right, for the plane separating the first two blastomeres need not by any means coincide with the future median plane of the embryo, but may make any angle up to a right angle with it. If it coincides with this plane by killing one blastomere Roux's result is obtained; if it is oblique the result is the same as with Hertwig's researches.

Thus the potency of each of the first two blastomeres of the frog's egg depends entirely on the cytoplasm it happens to include and in no way on the nucleus. ¹⁶ Has shown that the cytoplasm of the egg determines the symmetry of the frog's tadpole, as in the ascidian tadpole, is effected by the spermatozoon. As the spermatozoon penetrates the egg in its path towards the female pronucleus, it leaves behind it a cytoplasmic material which is the germinative vesicle. This material can be stored for a long time and can be detected at a much later period in the development of the egg. It is found that on the opposite surface of the egg to that at which the spermatozoon enters it, there is formed the so-called "grey crescent." This is in reality the upper lip of the blastopore. It is here that the differentiation of ectoderm from endoderm begins. Therefore we conclude that the arrangement of the organ-forming substances in the frog's egg is caused by the spermatozoon.

In the mollusc Dentalium when the egg has reached the four-cell stage one of the blastomeres emits a proteobranch termed the "ylk-lobes" or "polar lobes." This lobe is devoid of a nucleus and has been termed "inert" by Hertwig. The four-cell stage is reorganized into the blastomere. Nevertheless, if this lobe be cut off, the remainder of the egg develops into a larva which is fataly devoid of mesoderm. That the materials which form the basis of the different substances comprises the germinal vesicle of the fertilized egg. The influence of emissions from the nucleus is rendered certain first by the close relationship of the nucleus to assimilation and secondly by the fact that the new cytoplasm is formed by coalescence (see Chen X. C. ¹⁷) and breaks up into fragments and is extruded into the cytoplasm. It is, however, a surprising fact that the nuclei of the segmenting egg are alike and apparently without influence on the differentiation of the primordial germ.
EMBRYOLOGY 971

in all these "segmentation" nuclei. Now it is common
knowledge that the influence of the father is as potent as that of the
mother in heredity and therefore there must arise a period of
development at which the nuclei again influence the cytoplast.

An attempt to determine this point has been made by Roux, who
utilized the organism Echinocardium with the sperm of Echinus.
As we have seen, the result of this is in most cases to produce
cytopysis of the egg, but in a minority of cases a hybrid
develops. The fact is that in Echinus the shape of the egg is
spherical and the shape of the blastula of each species follows that of
the egg. The blastula of the hybrid is oval, like the maternal
blasta, and the gastrula is also like that of Echinocardium.

Such nuclei are also found in the first segment of the endoderm in
the development of the ascidian Echinus; in the vast majority of cases it is totally
devoid of a large aboral club supported by a special skeleton which is
characteristic of the larva of Echinus. It is in fact certain that the maternal nucleus is
influencing the structure of the organism. When the eggs of Echinus are fertilized with sperm of a
still more divergent character, such as that of the crinoid Antedon, a
hybrid hymenodiscus results in which this gastrula stage, but it
always resembles the larva developed from the normally fertilized
egg in every detail and shows no trace of paternal influence.

Nuclei and Cytoplasm.—We are thus led to the conception of an
intermittent action of the nuclei on the cytoplasm, and it is as if we
were dealing with a kind of reincarnation of the nuclei in the
development of the embryo. We find two cases of this in the
cell nuclei back to their ancestors amongst the nuclei of the first
blastomeres is termed the "germ-germ." Now in the Nemato.
where during meiosis (meiosis is the yzygote nucleus contains only four
chromosomes, but as the egg divides into blastomeres, the nucleus of
one blastomere after another undergoes the change termed
diminution, or in other words, the chromosomes divide to the
ends of the chromosomes, and these portions are ejected into
the cytoplasm and are absorbed; the remainder of each chromosome
becomes fragmented into a large number of minute granules. The
division of the egg begins with a single nuclei.

The nucleus of one blastomere remains from this exchange and
this blastomere eventually gives rise to the genital organs.

Boveri has shown that the fact that one nucleus undergoes
diminution of the chromatin whilst another does not is not in this
seems as if we had reached the deepest point to which analysis
will lead us. Perhaps it would be more accurate to speak of an intermittent reaction of the nuclei
for it is evident that the nuclei undergo alteration as development proceeds. It is on cases like these that
Weismann's theory of development was based. According to
this theory, the germ-line (or germ-bud) forms a "cordon" with which
is the line or descent leading from these germ-
cells back to their ancestors amongst the nuclei of the first
blastomeres of the egg. In the nematode
worms Dugesia and Ascaris the egg nucleus contains only three
chromosomes, but as the egg divides into blastomeres, the nucleus of
one blastomere after another undergoes the change termed
diminution, or in other words, the chromosomes divide to the
ends of the chromosomes, and these portions are ejected into
the cytoplasm and are absorbed; the remainder of each chromosome
becomes fragmented into a large number of minute granules. The

shall be used to build up one embryo or two depends on the special relations which these primary cytoplasmic substances sustain to one another.

If the eggs of a frog be placed dry on the surface of a slide with their animal poles uppermost and fertilized in that position by the addition of small quantities of sperm from the female animal, the division of the egg occurs in such a manner that after the first division, another slide is placed on top of them and the two slides clamped together by rubber bands; if when the eggs have divided into two blastomeres the whole preparation be inverted and a shallow cavity be bored in one or other of the halves; then each half will form two heads or two tails will be developed. The materials in the unsegmented egg are of different specific gravities; the first furrow often (see above) divides them into two symmetrical halves; when this furrow has made its appearance they are arranged in such a way that each cell in the same manner as they would have in the whole egg had it been inverted. Nothing has been added or taken away, yet the altered position has established a decided orientation where normally only one would have been formed.

In the case of the newt's egg a similar procedure leads to the formation of two complete embryos, whilst if the blastula of the newt be constructed longitudinally by a hair a two-headed monster is formed. When a lizard's tail is broken off, if the little regenerating bud which forms at the wounded surface be indented the animal will regenerate two tails instead of one.

**Internal Environment.**—When the higher organs begin to develop we can in many cases prove that the whole course of their development is governed by what may be called their internal environment, i.e., by influences emitted by other organs.

**Development of the sea-urchin Echinus minoris.**—The "echinopluteus" larva of this species is a transparent bilaterally symmetrical free-swimming creature. It is provided with a complete alimentary canal consisting of an oesophagus, a stomach, and a gut which is completed anteriorly and posteriorly by sacs. The ventral side of the larva is divided into two flattened coelomic sacs. As development proceeds each sac becomes divided into anterior and posterior portions, and the latter move backwards so as to be pressed against the stomach. Still later from the posterior end of the left anterior sac, a little bud termed the "hydrocoele" grows out. This is the rudiment of the water vascular system of tubes in the adult. The ectoderm lying on this part is pressed back to form a sac which will be the coelomic cavity from the floor of which grow up the spines which will cover the test of the future sea-urchin.

The hydrocoele bud overlaps the front end of the left posterior sac, and from this part of the sac there grow out five pockets from which will be developed the dental apparatus—the so-called "Aristotle's lantern." From the outer wall of the right posterior coelomic sac cells are given off from which are developed a pair of "pedicellariae" (pincer-organs) which will be situated on the upper surface of the future urchin. If we now allow the young larva at the time the coelom is being formed to grow in hypertonic water, then many of the pedicellariae will develop from the right anterior coelom a second hydrocoele bud. If this second coelom bud grows out, it will receive a plentiful nourishment to be supplied to the larva—then a right anniotic cavity is formed from the overlying ectoderm, whilst the right posterior sac is added to the left anterior sac. As a result the second coelum bud will be slow than one or even two pedicellariae may be formed on the right side as in normal larvae, but if it be rapid the formation of pedicellariae may be inhibited altogether. If after the bud has appeared the larva is nearly starved for a time, both this abnormal bud and the normal hydrocoele may remain small and undeveloped and then pedicellariae may be formed on the left side as well as on the right.

We conclude from these facts that the hydrocoele bud tends to inhibit the formation of pedicellariae on its own side of the larva but to cause their production on the opposite side, and we see further that the right hydrocoele bud can totally alter the development of the right side of the larva, forcing the right ectoderm to form an anniotic cavity and the right posterior coelom a dental apparatus.

Another still more striking case of the influence of the internal environment is furnished by the results of experiments made by T. W. MacBride.2 The vertebrate eye consists of two main parts, viz.: (a) the retina, formed as an outgrowth from the brain; and (b) the lens, formed as a thickening of the ectoderm of the side of the retina. The development of the retina is from an anterior region of the head, and the eye will never grow. recover to the cut-off retina will continue to live and grow in its new position, and it will force the coverings which formed to form a lens—although never in the history of the race has a lens been normally formed in this position. Numerous other similar instances could be adduced—did our space permit of it—suggesting the conclusion that in many embryos the primary organs are indifferent material and that the manner in which the secondary organs will develop out of the common fundamental system of their spatial relations.

**External Environment.**—We now approach the subject of the possible influence of the external environment on the course of development. In the earlier article the attention of the reader was called to the fact that development presents itself under two principal aspects, viz., the embryonic and the larval. In the embryonic phase the young organism is sheltered from the external world, either within an egg shell or in the mother's womb, whereas in the larval phase it leads a free life, using its larval organs to seek its own food and escape its enemies.

We may further add that nearly allied animals such as Salamandra atra and Salamandra maculosa, in the first of which development is mainly embryonic whereas in the second it is largely larval, we arrive at the conclusion that the embryonic phase is secondarily derived from the larval phase, because the organs such as gills which are functionless in the embryo are functional in the larva. It was also pointed out that larval organs frequently resemble the adult organs of other animals of simpler and more primitive structure.

On these facts was founded the celebrated biogenetic law first enunciated by Haeckel3 which affirms that "the embryo in its early stages of development recapitulates the course of development of its species in the race," It is the law which provides a large part of the fascination of embryological research, but it was vigorously attacked in the earlier article and an effort was then made to show that it is not valid, since it was maintained that whilst it is true that larvae retain ancestral characters, the same is true of adults, and that larvae in their structure are not more reminiscent of the former history of the race than are adults.

Now the outcome of recent investigation has in large measure tended to reinstate the doctrine of recapitulation in its former position of preeminence, to show in fact that recapitulation forms the background of most of the phenomena of development, and that the whole life history of all classes of animals may be regarded as a blurred and deflected by secondary influences, as indeed all believers in the biogenetic law have from the first admitted.

The first point to which we wish to direct the reader's attention is that larval and embryonic phases occur in all life histories. Every animal begins its existence as an egg which is quite incapable of feeding or of defending itself and this egg is always protected by an egg-shell although this shell may be very thin, and no animal upon leaving its early shelter and beginning to seek its own food attains at once the structure of the sexually ripe adult. Hence every animal passes through a larval or embryonic period which is the result of the influence of the external environment, and through a larval phase, although the latter phase may be very short and the difference in structure between the larval and adult forms may be relatively slight, is still a very real one.

What is it, then, that is called to the fact that the identification of a larva as the representative of an ancestor must always be hypothetical because we have no direct knowledge of what the ancestor of any living animal was like? It behoves us therefore to look a little more closely at the reasons which actually do induce us to regard a given stage as ancestral.

First, it has been claimed quite recently that direct experimental proof of the validity of the biogenetic law has been obtained.
same environment, became still yellower than their parents until the black pigment had been almost entirely displaced; whilst the offspring of two which had become darker, if reared in cages with black walls and floor, became practically completely black by the time they hatched. From this he came to exhibit two mountain species Salamandra atra. If, however, the offspring of two salamanders reared in yellow surroundings were allowed to grow up under black surroundings, they nevertheless for the first six months of their existence retained the yellow of their ancestors, and only at a later period did the influence of the black environment begin to tell—the yellow patches became invaded by numerous small black spots and grew smaller. Thus young recapitulating the process of "yellowing" that their parents had undergone.

If these results are confirmed the doctrine of recapitulation will change its status from that of an hypothesis to that of a proved fact, and further proof will be furnished that changes acquired by the individual in response to the demands of the environment are to a certain extent at least inherited.

The Recapitulation Theory.—Once we have grasped the mutual relationship of the embryonic and larval phases of development, indirect proofs of the reality of recapitulation begin to crowd in on us. If we find, for instance, one or two aberrant forms in an order or even a family the majority of whose members have a certain type of structure, no reasonable doubt can exist that the ancestors of these aberrant forms had the typical structure of the group. If this conclusion be admitted and we find that the younger stages of the aberrant species also show the typical structure, does any one seriously question that these young forms recapitulate the history of the race? Two very striking instances of this kind have come to light within the group Ctenophora.

The typical Ctenophora are ovoid organisms of a gasy transparency which swim in a vertical position and their tentacles are eight vertical rows of vibratile combs, each comb consisting of a short horizontal row of powerful cilia fused together at their bases. A certain creeping organism resembling a flat worm, named Coeloplana, had been believed by some zoologists to exhibit ctenophore affinities but its relationships were very obscure. Quite recently a Japanese zoologist1 has described its development. Its larva is a small typical ctenophore with eight rows of perfectly formed cilia. It pretends to remembered that for a few hours—its tentacles to the bottom and flattens out and gradually assumes the adult structure. Another extraordinary organism, named by its discoverer Tjaljella,2 was discovered among the gelatinous 'sponge' of the Arctic Ocean. This creature superficially resembled a sponge or an ascidian. It was glistening and sessile and seemed to consist of a pair of upright tubes like towers whence proceeded smaller tubes which ramified in its substance. In pockets connected with these smaller tubes were discovered groups of the larvae. These were small ovoid creatures of typical ctenophore structure with the eight vertical rows of combs.

If recapitulation of ancestral history forms an unquestionable element in the history of life of some animals, it is not probable that it constitutes a factor in all life forms. To do this question it seems that an affirmative answer is conceivable.

Change of Habits.—If we then regard the reality of recapitulation as proven we may now reflect on its meaning. We have seen that the recapitulatory element is most obvious in the latest larval stage of development, the most recently added page of the life history. Now the organs of the larva are adapted to its environment; therefore this environment in its broad outlines at least must represent the ancestral environment of the race.

The present condition of the race both as regards structure and habits has been developed by a gradual transition from those of the ancestors of the race. Change of habits therefore reveals itself as the great driving-force in evolution, and change in habits usually means the choice of a different type of food.

We may conclude that the period of life at which this change most frequently occurred was when the adult organs had developed but before sexual maturity had been attained—in a word, at the stage of what we may call the young adult. As one change of habits succeeds to another in the course of evolution, the life history is not lengthened in the same proportion, since the new phase takes the place of the sexual phase in the previous condition; and as, for instance, in the amphibians,3 when man has reached the adult stage, at least four larval stages are passed through before the

EMBRYOLOGY

which fed on the debris of both animal and vegetable nature in the undergrowth of primeval forests. Such is in fact the life of the lowest insects known to-day, some of which, such as Mauchia, nourish them-
selves upon the hinder parts of other insects which have been torn out by the action of some predatory animal. The first step in this development is the formation of the larva or nympha, which is usually a free-swimming aquatic insect. It is derived from the larval stage of the originating insect. The larva is found amongst the primitive Insecta, in the Orders Diptera and amongst the may-flies (Ephemeroptera). These last-named insects are, in fact, supposed to possess a larval stage showing great similarity to the tadpole of the frog. It is possible that the larval type is a derived form from a larval precursory stage.

Life History of Animals.—It might be supposed that with so many modifying factors at work it would be a hopeless task to attempt to disentangle the recapitulation element from them, and that therefore the ancestral history of animals except in its latest and least modified chapters would remain a closed book.

But when we recollect that the life history of every species constitutes a separate edition of this history, and that the modifying factors have affected no two of them to the same extent, it becomes evident that comparative embryology built on a broad basis can attack the problem with a fair prospect of success.

Bearing in mind the priority of the larval over the embryonic phase, and beginning therefore our survey with the larvae of the simplest metazoa, we are able to recognize the first step in the evolution of the metazoan from the protozoa in the blastula, the hollow ball of cells which may be regarded as representing a colonial protozoan like the living Volvox. This stage was followed by the formation of a gut by the intussusception of one side of the ball, and this second step is represented in many lower forms by the gastrella stage. Following on this stage came the formation of the coelom as a series of pouch-like outgrowths of the gut, and the change of the single opening of the gastrella, the blastopore, into two openings which became the mouth and the anus by the constriction of its middle portion.

It has been possible to show that two groups so utterly diverse in appearance as the Annelida and the Mollusca have originated from a single group of free-swimming ancestors represented by the trochophore larva, and since Arthropoda are admitted by all to be descended from Annelida this conclusion involves the ancestry of all the insects, the crustacea, the arachnida, and the myriapoda.

We can form a very plausible guess as to the nature of the divergence of habits which led to the differentiation of the Annelida and Mollusca from one another. The original stock was free-swimming but both groups derived from it are typically bottom-dwellers. Two modifications of the same general type have thus arisen over the bottom by means of their cilia Young Gastropoda and Lamellibranchiata still do, or they could burrow into it. The first led to the evolution of Molliusca, the second to that of Annelida.

For instance, the larvae of the worm-like creature Balanoglossus, the larval form of Balanoglossus is a free-swimming organism called tornaria which shows the closest resemblance to the typical larva of Echinodermata, the diplozooa. The recognition of this affinity has assisted in the elucidation of a difficult subject to which considerable space was devoted in the 11th ed., viz. the origin of the central nervous system.

It is characteristic of the most primitive Annelida and Arthropoda that they show a remarkable analogism or synchronism of embryological events was made in the 11th ed. to prove that this was originally true of vertebrate embryos also. But it is a peculiarity of the vertebrate-echinoderm alliance which is still unexplained in that the blastopore gives rise to various organs, and whilst the blastopore is first a pouch-like structure it is finally transformed into the vertebral column, along which the nervous system is developed.

ENCEPHALITIS LETHARGICA

Whether or not the observed combinations of symptoms have ever occurred before, the question early arose whether the syndrome should be regarded as a clinical entity or as a special manifestation of some disease previously known in other forms. The three diseases with which its relations have been more particularly considered are botulism, influenza and acute polomyelitis or Heine-Medin's disease. Botulism results from the conversion of carbolized herring or other food. It is especially characterized by paralysis of the eye muscles. The disease is due to infection with a specific bacterium—the bacillus botulinus. Since the most careful search has invariably failed to detect the presence of this bacillus in Encephalitis Lethargica botulism can be firmly excluded. With regard to influenza, the appearance of Encephalitis Lethargica, including Noma as such, has approximately coincided with epidemics of influenza in 1889 and at the present time. On the other hand, there is considerable evidence against their identity. Influenza is highly contagious, while the clinical appearance of Encephalitis Lethargica occurs in an irregular manner and has not attained any great magnitude as an epidemic. When Encephalitis Lethargica commenced in Austria influenza had not yet appeared. There are also histological differences, since in influenza encephalitis there is marked oedema of the brain and an absence of the two special characteristics of Encephalitis Lethargica—vascular congestion and infiltration of the perivascular lymph spaces. Pfeiffer's bacillus, the so-called influenza bacillus, is not found in Encephalitis Lethargica.

The relations of Encephalitis Lethargica to Heine-Medin's disease led to much discussion. Various forms usually occurring in which the diagnosis is doubtful, both on clinical and pathological grounds, but, considering typical forms, there are striking differences between the two diseases. Heine-Medin's disease particularly attacks persons under 20 years of age, and tends to increase in frequency in summer. The onset of the general symptoms and of the paralysis is acute, the course is brief and the spinal cord is mainly affected. In Encephalitis Lethargica, on the other hand, persons of all ages are liable to attack, and the frequency is greatest in winter and spring. The onset is usually insidious, the course is lengthy, and the spinal cord is especially affected. Histologically there are also important differences. Microscopic haemorrhages are constant in Heine-Medin's disease, while perivascular infiltration is slight, the reverse being true of Encephalitis Lethargica.

Symptoms.—Encephalitis Lethargica was primarily recognized by the occurrence of the combination of lethargy and double vision, the latter being due to paralysis of the muscle of the eye. While partial and drowsiness being degrees of lethargy from 70 to 80 per cent of cases at some stage of their course, further observation has revealed the occurrence of numerous other manifestations. The disease is widespread through the nervous system, and the complexity of the structure of the nervous tissues, together with the high degree of specialization of the functions of its various parts, explains the protean nature of its symptoms. Numerous types have been described, but the value of these is slight, as a single patient in the course of a few days often exhibits the characteristics of many such types. The clinical manifestations are probably best classified as Walsh suggested, according to the broad scheme proposed for other nervous diseases many years ago by Hughlings Jackson. In the following description based on this system, "positive" symptoms denote exaltation of function, which may be due either to irritation of nervous tissue or to a loss of the control exercised normally by the higher centres. The "negative" symptoms are always brought about while "negative" symptoms denote depression or loss of function principally due to destruction of nervous tissue.

7. General Symptomatic Treatment. — These include weakness, headache, often occipital with some stiffness of the neck, shivering, vertigo, muscular pains and vomiting or other gastro-intestinal disturbances. The pulse may be rapid and eruptions, usually resembling measles or scarlet fever, appear. Many years ago, and it has no characteristic course. It often rises after some days from 101° to 105° F. for a short period, but may be prolonged, or pyrexia may be absent throughout.

8. General Symptoms. Dura Mater. — These are generally focal, the latter being due to affection of highly specialized portions of the brain.

(1) General Nervous Symptoms. — Positive symptoms are delirium, mania, dysaesthesiae at various degrees of intensity, one more common negative manifestation is the characteristic lethargy, in all grades from simple apathy to complete coma. Innumerable degrees occur of these two extremes, or even combinations. The
patient may slowly drift into a somnolent state or may not uncommonly combine somnolence by day with insomnia or restlessness by night. Rarely an attack commences suddenly with the wildest delirium or mania.

**MILITARY (continued).**

The positive symptoms include the following:

1. Convulsions, which are occasionally generalized, resembling the epileptiform fit.

The voluntary movements. These may develop during the attack or several months later in the course of convalescence. Numerous forms occur. The "myoclonic" type is characterized by short, rapid, rhythmical contractions of the muscles, especially of the abdominal muscles and also the diaphragm, but the entire musculature or any group of muscles, or even a part of a single muscle may be affected. The contractions are 30 or 40 to the minute. Epileptic type, possibly a variant of the myoclonic, choreiform, athetoid and other movements of muscles may develop after the attack, some causing coarse spontaneous movements of large amplitude.

2. Rigidity. This group includes the "Parkinsonian mask" and catalepsy, the latter being a condition of rigidity in which the limbs are retained for long periods in the position in which they are placed by an observer. The Parkinsonian mask, an expressionless face, is common, and combined with rigidity produces the appearance of acute paralysis agitans, or Parkinson's disease.

3. Muscular pains. These may be severe.

The above symptoms are representative of the class. The commonest of these is the characteristic affection of the muscles of the eye, especially those innervated by the third pair of cranial nerves. The principal clinical symptoms are ptosis or drooping of the eyelids, injection or congestion of the eyelids, paralysis of the muscles of accommodation. The pupils are often unequal and their reaction altered, the most common change being loss of reaction to accommodation while stimulation of the third cranial nerve, the Accommodation reaction may be present. Optic neuritis is extremely rare, and never advanced. Less common are affections of the remaining cranial nerves, producing facial paralysis, difficulty in swallowing or in producing speech, etc. No pathological change in the nervous system is immune, and instances occur with paralysis of limbs and other parts, producing monoplegia, hemiplegia, diplegia, or aphasia. The sensory system is much less frequently affected. The deep reflexes are commonly but not invariably absent.

**Morbid Anatomy.**—The small vessels of the brain and meninges are dilated, the congestion being visible both to the eye and under the microscope, but the most characteristic change is infarction with small round cells of the perivascular lymph spaces, surrounding the capillaries. Other less constant and less conspicuous changes include degeneration of the nerve cells and destruction of neurons, proliferation of the mesothelial cells lining the subarachnoid walls and of the glial cells, and the occasional occurrence of haemorrhages and of thrombosis of veins. The lesions are most common in the mid-brain and basal ganglia, but any portion of the nervous system or any organ may be involved.

**Prognosis.**—Excluding mild and abortive cases, and the so-called "forms frustes," the mortality is about 33 per cent. Including all cases the mortality is 60 per cent. The period of survival is variable, but the disease may be expected to occur within three weeks from onset. The duration may be many weeks or even months. Alteration of the mental functions may be prolonged, and paralyses, aphasia and other changes have persistently endured. The case is regarded as hopeless when permanent, but when recovery takes place, it usually becomes complete.

**Treatment.**—This is on the general lines of treatment of acute febrile disease. Hexamine is usually administered. N etter strongly advocates the production of a local abscess by the injection of turpentine, 1-2 cc., into the thigh, but the value of this is not yet confirmed.

*These figures indicate the volume and page number of the previous article.*

**ENGINEERS, MILITARY.**

In the early days of warfare, in Great Britain and also in the armies of the Continent, the engineers were the builders of fortifications, and also the manufacturers and directors of engines of war. In 1716 the first separation of specialists occurred when the Royal Artillery was definitely formed into a separate regiment. British engineer officers, left to their more specific duties of defensive works and of military surveys, were, until 1757, frequently holders of commissions in the infantry, and it was not until the siege of Gibraltar, towards the end of that century, that the engineer officers obtained their full rank and file was added to the corps of officers, while by that time they were called Royal Engineers. This creation of specialist branches of military engineers naturally continued with the progress of engineering in civil life, and its application to military needs. Thus, after the experience of the American Civil War in 1861-5 and the French victory in the Franco-Prussian War of 1870-71, an establishment of engineers in the British regular army consisted of one signal squadron, 5 signal troops (for one cavalry division and 5 cavalry brigades), 6 divisional signal companies, and 4 other units. Some 20 more units were formed on mobilization, the total establishment for the Expeditionary Force being 78 officers and 2,967 other ranks. In the Territorial Force there were 5 army troops and 14 divisional signal companies, the former units being subdivided into wireless, air-line and cable companies. In 1918 the total numbers had increased to 2,499 officers and 60,664 other ranks, exclusive of the Dominion forces and those on the Indian establishment.

The numerical distribution of these units within the British Army was as follows:—

<table>
<thead>

</tbody>
</table>

The Royal Artillery was formed in 1855, the Royal Engineers in 1870. This unit was shortly afterwards utilized by the British Post Office in connexion with civil telegraph duties, and for many years afterwards the connexion between the army and the civil department concerned was maintained in Great Britain to the great advantage of the military engineers, who by constant practice in the working of civil lines of telegraph were being prepared for this task in war. Gradually, however, the military specialties tended to develop, and the units concerned came to have a somewhat special equipment and to be divided into air-line companies (where the wires are carried on light poles rapidly erected), cable companies (where insulated cable is laid in any ground in any convenient way), and wireless companies (where aerostats are employed). Some 300 miles of hot air and 500 miles of cold air balloons were fitted out in the British regular army during the World War for observation, being used also for air-observation in the British regular army during the World War. In the British regular army during the World War there were also 5 signal companies, 6 divisional signal companies, and 4 other units. Some 20 more units were formed on mobilization, the total establishment for the Expeditionary Force being 78 officers and 2,967 other ranks. In the Territorial Force there were 5 army troops and 14 divisional signal companies, the former units being subdivided into wireless, air-line and cable companies. In 1918 the total numbers had increased to 2,499 officers and 60,664 other ranks, exclusive of the Dominion forces and those on the Indian establishment.

The numerical distribution of these units within the British Army was as follows:—

The Royal Artillery was formed in 1855, the Royal Engineers in 1870. This unit was shortly afterwards utilized by the British Post Office in connexion with civil telegraph duties, and for many years afterwards the connexion between the army and the civil department concerned was maintained in Great Britain to the great advantage of the military engineers, who by constant practice in the working of civil lines of telegraph were being prepared for this task in war. Gradually, however, the military specialties tended to develop, and the units concerned came to have a somewhat special equipment and to be divided into air-line companies (where the wires are carried on light poles rapidly erected), cable companies (where insulated cable is laid in any ground in any convenient way), and wireless companies (where aerostats are employed). companies), were needed to carry out work behind the field companies in the front line, electrical and mechanical companies to deal with machinery of all sorts, army workshops companies, base park and advanced park companies to feed the insatiable demands of the fighting line for prepared trench materials and other such requirements. For mining warfare, tunnelling companies, offered by officers, was another matter altogether. There were numerous tunnelling companies, from the Australian and Canadian mines (who did good service in France and in Palestine), and forestry battalions from the backwoods of Canada, who did most useful work in France, and also in Cyprus for the supply of timber to the armies operating in the eastern Mediterranean littoral.

Mention may here be interposed of two cognate organizations, one of which never was actually incorporated in the R.E.; the other was part of the R.E. at one time, but was allowed gradually to disappear, or be merged in corps raised for work other than R.E. These were the railway companies, infantry battalions, to be supplementary to R.E. labour, on the principle well known in India, where such battalions, officered by infantry officers, and trained to a greater extent in field engineering than the R.E., had been most used to construct such a field line as division, and the intention was that they should normally be associated, much more closely than other infantry, with the field companies Royal Engineers. The railway companies, as the name implies, were all of the professional navy class, all over military age, and officered by civil engineers, architects, surveyors, etc. They did excellent work and of a nature which was by no means unskilled. While partly later in absorbing the personnel into rifle companies, who did absolutely unskilled work (unloading ships, etc.), was wise, cannot here be discussed, but it had the effect of removing one of the major bodies of work to the other departments.

One other Indian innovation was also introduced, viz., the appointment to corps and armies of field engineers and assistant field engineers, i.e. officers of civil-engineering experience (either R.E. or R.I.A. for R.E. work) to work with the army officers in the field, in the provinces or by the armies, by means of civil labour.

Organization at Headquarters and in the Field.—At the War Office the organization for developing and controlling not only the personnel, briefly indicated above, but also the design and execution of works and the design and provision for engineering equipment and plant, was divided among three of the principal branches of the Department, viz., one section under the adjutant-general had to raise and maintain all the above units; under the quartermaster-general the director of movements had to organize and control the transportation branches (railways and W.A.), and finally the director of construction and transport, the branch of the master-general of the ordnance were responsible for all the technical design and execution of engineering works at home, and for supplying the varied and complicated machinery and plant for the engineering needs of the armies in the various theatres of war. This involved also the carrying-out of a series of experiments on all sorts of inventions, though after the war had progressed for some time this duty was partly taken over by the Ministry of Munitions, which in other respects did not supply military engineering needs.

The works directorate was divided into 12 branches, each under a senior officer of engineers.—(1) Riffle ranges, artillery practice grounds and lands generally; (2) hatted camps and barrack; (3) coast fortifications (on the E. coast of Great Britain especially); (4) ordnance store buildings; (5) aviation buildings, until Jan. 1918, when the Air Ministry was formed; (6) design branch, for evolving and coordinating all designs; (7) personal matters arising out of the employment of civilian engineers, electricians, foremen, surveyors, etc., on military works, in themselves a large host; (8) mechanical engineers, for designing all of such mechanical work as fitted to armies; (9) electrical stores and experiments, which included the inspection branch, also telephone factories, and a wireless experimental section; (10) experimental section; (11) chemical and biological branch, with all miscellaneous needs; (12) contracts, schedules of prices, and quantity surveying. Temporary training schools and depots were found, not only at Chatham and Aldershot for dismounted and mounted men, but at Longmoor for railway men, at Hitchin and Bedford for signalers, at Newark, Deganwy (N. Wales), Irvine (Ayrshire), Buxton, and Brightlingsea (Essex) for training sappers. The wireless experimental section at Woolwich and the electric light school at Portsmouth also were valuable training depots.

As regards the organization in the field there was at first neither an engineer-in-chief nor a corps of field engineers, but under the senior engineer officers, one at G.H.Q. and one at the H.Q. of each corps, but their duties were advisory only, and they had no power of purchase, or of engaging civil labour. This organization was a development from the one that had been in existence when the nature of the campaign was so different from that in Europe.

On the lines of communication, on the other hand, there was a director of works, with a proper staff and adequate powers, but he had not done much in an army line, except that the old Railway Field Service Regulations, was it contemplated that, except in the rare possibility of a siege, there would be nothing in the nature of engineering, or a war front at least, that could not be handled by the field companies under their divisional generals. These numbered two per division under a lieutenant-colonel. In 1911 a committee under Lord Kitchener had recommended raising the number to three. But in 1914 this had already been carried into effect, many officers of experience considering that such increase, though possibly desirable, was not a matter of urgency. The first few weeks of the war altered all this. A new organization became imperatively necessary, and the increase of personnel was nowhere more marked than at G.H.Q.;
This school owes its origin to the Peninsula War. In that campaign at first there were no trained sappers, and the officers of the head quarters staff and field staffs only had a general knowledge of the art of such minor branch of military engineering as the demolition of bridges. As a result of Lord Wellington's representations, and the advocacy of an able engineer-officer, Col. Pasley, a school of instruction in siege works was begun in 1812 at Brompton barracks, Chatham, with the object of adding to the first permanent establishment already existing at that place for the instruction of military engineers in the work of fortification, construction, surveying, electrical and mechanical engineering, chemistry, astronomy, etc.; was added; and in spite of certain diversions that were taken to improve the school, it was not intended that these troops should be used as infantry except in the gravest emergency, although in some cases this was not borne in mind, and the casualties which resulted made the want of such technical troops more and more felt.

Under the direct orders of the chief engineer of an army corps there were two or three army troops companies R.E., two or three tunnelling companies, a company or two of a labour battalion, and maintenance troops and stores offices.

Field Companies.—As the field companies were the most numerous all of the R.E. units (there were some 160 of them in France in 1918) as well as being the normal organization of military engineers—corresponding to a battalion of infantry, a squadron of cavalry and a field battery of artillery—it may be as well here to say a little about their organization. The field companies of the regular army (of which there were 13 in 1914) were formed about 1879 by adding to a few selected fortress companies a section of mounted drivers with transport to carry ordinary entrenching tools, and the special tools needed for the various tradesmen of which the company was composed. Later, the system was applied to the field company, which was then employed on barrack maintenance, and, while subject to military discipline and trained as infantry in drill and musketry, they were given little or no special training as field engineers. But from the very beginning the idea was that they must be prepared both for the school and line of duty, and there began a steady improvement in their rôle as a valuable tactical army. About 1885 each company was taken off the works annually for five weeks, and a mountainous problem of the regular engineers' pay. Instead of working pay for actual hours spent on works, it was introduced, a matter of the utmost importance, for it enabled men to be taken for military training without penalizing them in respect of pay. The system was immediately in the schools and organizations where they were not otherwise employed. The gradual improvement in the military training of this arm, and its cooperation with other arms, was, after the S. African War, still further developed by the attachment of certain field companies, selected from amongst the R.E. and other corps, to the command of the division headquarters, and the by the participation, by all ranks, in the divisional training schemes. Further, young civil engineers were, by arrangement with the Institution of Civil Engineers, given commissions in the R.E. Special Reserve, and after some preliminary training were attached to field companies.

Each company consisted of six officers, all mounted, with about 220 other ranks of whom about 75% (dismounted) were tradesmen, the remainder being drivers. There were some 60 horses and mules, with the following vehicles:—four double cart tools for carts and equipment, and three pontoon and trestle wagons for bridging plant, and other tools used by sappers and miners, and included in the general transport vehicles appropriate to a unit of this size and composition. The company was organized in four sections, each under a captain, so that each section could be detached, with its own tools, for some special work, as a railway section, a bridging section, or for some other purpose, saving the number of horses needed could use them all. Each vehicle had to take them in hand for war, and to see that rapidity of construction was combined with strength and strength.

Broadly speaking, the duties of the field companies were field demolition, road-making, tunnelling, works, sapping, water-supply and drainage, and the construction of temporary roads and bridges, in the fighting zone. Behind these came the army troops companies R.E. and the many special units which were attached to the general service engineers.

The School of Military Engineering.—It is evident that to train officers and men—the former especially—for the varied tasks that lie before them in war, some very special instruction is needed in peace. This is supplied by the School of Military Engineering at Chatham, to which every R.E. officer after receiving his first commission is sent for a course of instruction, lasting normally two years.

In the United States, officers for the Corps of Engineers are obtained from two principal sources, namely, the U.S. Military Academy at West Point, and the leading civilian engineering colleges. The Military Academy is not an engineering school, and, although the course furnishes a good foundation for an
ENGINEERS, MILITARY

979

engineering education, its graduates appointed to the Corps of Engineers nevertheless require additional instruction in engineering subjects. To that end they are detailed as special students for about a year at the more advanced civilian engineering schools.

Graduate engineers appointed from civil life need military instruction and are sent to the Engineer School of the U.S. Army immediately after completing their basic educational training. Subsequently completing their basic military education, are assigned alternately to duty with troops and on civil construction, where their training is continued for several years in accordance with a scheme formulated by the chief of engineers. This whole procedure is more formal than that prevailing in the British service, has the same end in view, namely, to give the officer a "well-rounded mental and professional training". There is no such thing as any service being "all service". Selected officers of more mature age pursue advanced courses at the Engineer School and become eligible for the School of the Line, the General Staff School, and the Army War College, where they are instructed in the combined use of all arms of the service and the various duties of the general staff and the high command.

Under legislation effective June 2, 1916, the Regular Army of the United States was organized and expanded. Provision was also made for a reserve to be composed of (a) local forces in each state, and (b) a reserve corps of officers and of enlisted men. The former were organized by states and the latter by the federal government. The Reserve Corps was answerable directly to the Federal Government. Under this Act the Corps of Engineers of the regular establishment was to consist of 500 engineers (including 400 officers and 100 enlisted men), 530 officers, and 330 enlisted men. The increase was to be made by five successive increments, so that on April 6, 1917, when the United States declared the existence of a state of war, the Corps of Engineers numbered 2,550 officers and 1,350 enlisted men. The latter being organized in 3 regiments and one mounted company. There were, in addition, a few engineer troops organized as companies.

During the World War, Congress passed a series of acts affecting the military establishment and created a fourth element called the National Army, which name was applied to the organizations raised especially for the purpose of the war, part of which was organized partially by the selective service law.

In Aug. 1918, the distinctive appellations were discontinued and the 4 elements, viz.: the Regular Army, the National Guard, the Reserve Corps and the National Army were merged and the single term "The United States Army" was applied to the entire military force.

At the time of the Armistice, Nov. 11, 1918, the standard combat regiment with its train had a strength of 49 officers and 1,665 enlisted men. At that time the engineer establishment consisted of 7 regiments (foot), 2 battalions (mounted), and 8 engineer trains derived from the regular establishment; 17 regiments with trains derived from the National Guard, 14 regiments (foot) from the National Army, a total of 55 regiments, all assigned to divisions. There were also 6 regiments assigned directly, one to each corps headquarters. These 61 regiments were all of the pioneer-sapper type, and there were then 11 special engineer regiments, also allocated to the National Army, of which 10 regiments were of the standard Pioneer-Sapper regiments. The labour battalions usually consisted of 1,000 men with a proper complement of officers.

Though originally organized under the Engineer establishment, the Motor Transport, the Chemical Warfare and the Armoured Tank Corps later became separate organizations. The Railway Transport Corps was established as a separate service in France, but in America this branch remained under the general supervision of the engineering corps.

During the war, 13,527 commissions were issued to officers of engineers, and on Nov. 11, 1918 there were 10,886 officers holding such commissions. The average establishment of the various engineer units was 285,000, of whom 233,000 were overseas, and 52,000 were in the United States and its insular possessions. Comparing this with the British strength it must be remembered that, on the one hand, in the American army the signal service is entirely distinct from the engineers; on the other hand, the entire amount of military transportation is included, and the Americans made early provision for a large number of navvies for general engineering operations. The strength of the latter are included in the figures given above. The American army is a collection of separate Corps of the American army, which constitutes its general supply service, had also a large number of labour units, generally composed of negroes with white officers.

Several of the enlisting officers and the enlisted men at temporary instruction camps was simplified by the fact that the officers were, in general, drawn from the engineering professions, and the enlisted men were drawn from various branches of the national service. The entire service was facilitated the assignment of each individual to that place in the military establishment for which he was best fitted by his peace-time occupation. The training in the instruction camps was, of course, more elaborate than that required to their military tasks the knowledge they had acquired as civilians in their peace-time vocations. As in England, the voluntary-enlistment principle permitted a number of well-qualified engineers and technicians to join, early in the war, the infantry regiments and other combat units where their special training did not come into play. Their services would have been of far more value in the engineering or other specialist units among them.

Lessons from the War.—It is possible to sum up a few of the lessons which the experience of the World War has taught.

There must be on the one hand the closest connexion and cooperation between the technical and military services. In essence, the commander must dominate the situation, and the engineering work must be coordinated so as to further such intentions, assist and develop them as far as possible. There must therefore be, on the one hand, the general staff officer who is directly responsible to the chief engineer that he may not only work out his technical plans, but may consider whether the possibilities of engineering science may not be used to forward the end in view to an extent hitherto unconsidered.

There must be constant cooperation with other arms, especially infantry, and this must form part of the training in peace.

The engineers must also be regarded as part of the intelligence institutions of the country. Apart from their great knowledge and experience of the developments of the profession of engineering they are in touch, in a way that can hardly be expected from military engineers in the development of technical science, and with the ablest practical exponents of it on a large scale.

There must be the recognition that field defences, as such, are not the monopoly of the engineers. It is the business of the general officer in command—after the advising of the chief engineer of the General Staff—to decide which of the engineer officers should have a voice in the matter, but only in respect of technical matters involved. The training and modern equipment of the infantry enable that arm to carry out much of the required defensive work entirely without any engineer supervision or assistance, and they should be held responsible for such work. There is sure to be some coöperation required on large lines, particularly in the construction of roads for general military purposes, the building of reinforced concrete, or the construction of "dug-outs," and this is clearly the business of the engineers, but in ordinary entrenchments, firing and other obstacles, revetments, and light bridging, infantry must be trained to do the work.

The supply of engineering plant and stores must be under the engineers, and other arms should draw on them as required.

There should be a branch of the War Office dealing with the branch of the Intelligence Department dealing specially with engineering information. While there must be cooperation between the general staff, other arms and engineers in the fighting line, there must be the closest cooperation between the engineers there and the higher engineering authorities immediately in rear, i.e., the corps and army chief engineers, whose business it is to coordinate all technical operations.

As regards execution of work, whether by engineers or infantry, there must be (1) a carefully prepared scheme to ensure that each unit receives in good time clear instructions as to the nature and scope of work devolving on it; (2) rendezvous points must be clearly marked and, in general, every indication given to lead the working parties to the proper place by the best routes; (3) a proper scheme for issue of tools and plant, with definite reserve for the front line. The following points are worth noting:

As regards the tactical employment of engineers the following points are worth noting:

In the encounter battle it may be advisable to attach either an engineer battalion or company to the leading infantry. Should the enemy break through, one, to the troops making the attack, just as some engineers are always told off to accompany an advanced guard on the march, in order to clear away obstacles and to ensure that, while progress is not arrested, important tactical points are not left to the enemy. In the same way, if a unit begins a work, it should not hand it over to another unit while under construction, it is best that as far as engineer assistance is required, it should be in the form of an engineer assistant being "leap frog" fashion, from reserves. Close watching of the tactical situation by the commanding engineer is a vital necessity.

In the deliberate attack, as in trench warfare, there are the three
phases—preparation, assault, and following up. In the preparation the works are so numerous that the utmost care must be taken by the adjutant of the corps and the engineer-commander that all resources are devoted to the most important objects. Then in the assault, the engineers should never be sent with attacking infantry except with specific instructions for definite work for which they can be held responsible, e.g., the production of engineer fire on a forward position or opening up a forward communication. Even then they should not follow the leading waves of attack too closely, as they get mixed up in the fighting and do not remain undamaged. The engineer-commander should retain within his immediate control as much of the personnel as possible for the all-important work of rapidly opening up forward communications during the attack, and as soon as the formation of the engineers in the phase following up a successful attack, when the work is similar to that of the encounter battle, viz. securing the fresh objectives gained.

As regards defence there are (1) attacks, works in the contact with the enemy, and the outposts; (2) the primary position of resistance; (3) one or more rear systems. The first of these will ordinarily be carried out by infantry, with possibly some engineer assistance. The main position will be developed by the divisional engineers, with such additional labour from other arms as may be possible to allot. Rear defensive positions will be undertaken, usually, under the orders of corps and army commanders.

In position warfare the engineer duties also include preparation for attack, arrangements for the comfort, security, and efficiency of the troops behind the line, development of communications, and duties connected with rear works. It is essential that all units should be under the control of the commanding engineer, and that he should maintain a programme of the necessary works to be carried out, and obtain the orders of the divisional general as to their execution. It must be kept in mind in this as well as in other defensive work that the responsibility for construction and maintenance of works on any sector of the system rests with the commander of the troops in that sector.

In the case of a forced retreat in the presence of a pursuing enemy the work of the engineers will be mainly the delay of the pursuit by demolitions, and the erection of obstacles, but will include also the preparation of successive defensive positions, and the construction of special communications to allow the withdrawal of troops and guns. The work requires careful coordination and control under great difficulties. As the movements of the engineer-units depend on the localities where the works are required, they will not usually correspond with the movements of infantry in touch with the enemy. The officers of engineers must keep in close touch with the situation, act with initiative and readily assume responsibility, keep their superior commanders informed of the situation and progress of work, and be ready to respond to any call for assistance, provided they are satisfied that such a call is warranted and is relatively more important than other orders.

Efficient liaison is of the utmost importance.

In all operations of war it is imperative that the engineers should have:—(1) A close and accurate knowledge of all developments of the enemy and the situation both in the front, in the rear and in the other areas; (2) definite schemes and estimates of men, time and materials, sufficiently accurate for practical purposes; (4) well prepared arrangements for materials and for passing information to the commander of the corps. If advanced works have been developed these, an engineer-commander should be able to furnish the general staff with sound and competent advice on the engineering aspects of the position and should be able to utilize to the best advantage the available resources.

ENGLISH FINANCE (see 9.48).—In the period from 1910 to 1921 English national finance underwent a series of very far-reaching changes.

Pre-War Period.—When Mr. Asquith succeeded to the Chancellory of the Exchequer under Sir H. Campbell-Bannerman's administration in 1906 he found that public expenditure had increased rapidly in the previous decade. In 1895–6 the total was £51,700,000; in 1905–6 it had risen to £150,400,000. Mr. Asquith was faced with the Budgets for the three years ended 1906–9. His policy was one of consolidation and retrenchment, which was necessary in view of the costly character of the S. African War and the gradual rise of expenditure generally. On the whole his record at the Treasury during his period of office was good. He managed to check the growth of expenditure, but his work was chiefly distinguished by successful efforts to reduce the National Debt. In the three years ended 1908–9, he reduced the dead-weight debt by £43,500,000 to £711,400,000.

The social reform programme initiated by Mr. Asquith in the Old Age Pension scheme was greatly developed by Mr. Lloyd George and the British audience both at home and abroad so stupendous that it affected in profound degree the national finances for the ensuing decade. Mr. Lloyd George's first measure of expenditure was the National Insurance Act of 1911. In 1911–2 the total expenditure rose to £178,545,000, and in 1912–3 to £188,622,000 or £90,622,000 more than in 1908–9, when Mr. Lloyd George assumed office. The great increase in the Post-Office estimates at this period was due to the acquisition of the National Telephone Company's undertaking.

The policy of the National Insurance Act, that at first was economy, was turned by the pressure of political events into a policy of growing expenditure and taxation. In the period from 1909–10 to 1913–4, the expenditure on the navy rose from £35,807,000 to £48,833,000, on the army from £27,236,000 to £28,346,000, while that of the Civil Service jumped up from £46,070,000 to £53,907,000. Original estimates of the cost of Old Age Pensions were hopelessly wrong, and the total in 1913–4 had risen to £127,600,000 or double the cost as estimated in 1908. About £2,500,000 of the increase was due to the amendment of the law in 1911. Part of the excessive outlays on pensions was attributed to absence of compulsory registration in the first half of the century. A large number of people in the rural districts were able successfully to claim the right to the pension, not because the claim was correct, but because the pension officers were unable effectively to contest the claim.

The policy of social reform to which the Liberal administration was committed produced, in 1909, a Budget, which will rank as one of the most important in English financial history. In the case of the parliamentary elections which followed, Mr. Lloyd George produced a programme of land taxation, based on an all-important theory of Henry George's, proved to be unworkable and fallacious. The Finance bill of 1909–10 was read a third time in the House of Commons on Nov. 4 1909, and was rejected by the House of Lords on the 30th of the same month. The Budget statement anticipated a revenue of £162,500,000, or about £11,000,000 more than in the previous year. It actually produced £1,311,600,000, largely because on the Lords' rejection of the bill the collection of income tax and death duties was suspended. After the general election in Jan. 1910 which kept the Government in office, the Finance bill of 1909–10 was reintroduced on April 20, 1910, and the Lords passed it on April 29

The principal features of this Act were that it made the estate and inheritance duties much heavier, that it raised income tax from 1s. to 1s. 2d. in the £, abolished the abatements granted to those resident out of the country and imposed a super-tax (an additional rate of income tax) of 5s. in the £ on incomes over £5,000, the first £3,000 being excluded from the assessment to this duty. But the big novelty of the Budget was the land value duties, which were chiefly responsible for the conflict with the second chamber. Four duties were imposed, the increased duty on land rising by 20% on the increase in the value of land sites payable on land changing hands, the undeveloped land duty of 4d. in the pound on capital value; the reversionary duty of 10% on benefits accruing from the development of a lease or other estate. There was also a 1s. in the £ on mineral royalties, way leaves, etc. Agricultural land was excluded from the land value duties. The bill naturally involved a prodigious tax of all land in the United Kingdom.

In the end the land duties were found to be very difficult to collect, and the advanced political assumption that there was something wrong with profits derived from the appreciation of the value of land had some extraordinary consequences. It certainly led to the break-up of big estates, but it wholly failed to produce revenue. The land value duties were originally estimated to yield £600,000 in the first year and a great deal more in future years. But the foreseers of the Budget were far too sanguine. The yield was £320,000; in 1911–2 £431,000; in 1912–3 £455,000; in 1913–4 £715,000; in 1914–5 £412,000; in 1915–6 £365,000; in 1916–7 £521,000; in 1917–8 £683,000; and in 1918–9 £1,200,000. Their abandonment in 1920 was the inevitable result of their disappointing yield. Of course the yield of the duties depended a great deal upon the valuation of land establishing a new line for the Liberal administration, which set the pace for many years. In 1920–1 it had not been finished. Meanwhile the larger proportion of the land value duties was derived from the mineral rights duty. The growth of mechanical transport, following the growth of production, a direct result of the imposition of duties on motor vehicles, a part of the proceeds of which was allocated to a Road Development Fund, established in 1909, for the purpose of providing help to Government Departments, colleges, institutions, or persons not trading for profit, by means of loans or grants, agriculture, forestry, drainage, harbours, fisheries, transport by experimental work.
The National Debt, which had been reduced from £762,463,000 in 1909–10 to £707,654,000 in 1913–4, was destined to grow at an enormous rate during the European War. Figures showing the form of the debt are set out below:

<table>

War Period.—The outbreak of war in Aug. 1914 was followed by a number of emergency regulations which were destined to have a profound effect upon the national finances during the war period. The Government decreed a general moratorium, and agreed to advance currency notes to bankers at Bank Rate to the extent of 20% of their deposits. At first the banks availed themselves of this facility to relieve the shortage of cash to the amount of £13,000,000, but by the end of Nov. 1914, when the moratorium expired, this amount had virtually been repaid. The banks found that Government expenditure provided them indirectly with all the currency they required, this of course being the inevitable effect of inflation. On Aug. 1 1914, the Government gave the Bank of England authority to suspend the Bank Act of 1844, but it was never acted upon, because the passage of the Currency and Bank Notes Act on Aug. 6 1914 rendered the suspension of the Bank Act unnecessary. The excess fiduciary issue was always turned into the currency note issue. The next step was the undertaking of the Government to discount at 2% above Bank Rate all pre-moratorium bills of exchange. The amount discounted was nearly £200,000,000, of which about £35,000,000 remained in cold storage until after the war.

The war was financed by means of Votes of Credit. There were 25 Votes of Credit, as set out below:

**Votes of Credit in the War.**

| 1st-Aug. 6 1914 | £100,000,000 |
| 2nd—Nov. 15 1914 | 200,000,000 |
| 3rd—March 1 1915 | 37,000,000 |
| (Financial year) £362,000,000 |
| 4th—March 1915 | £250,000,000 |
| 5th—June 15 1915 | 150,000,000 |
| 6th—July 20 1915 | 250,000,000 |
| 7th—Sept. 15 1915 | 450,000,000 |
| 8th—Nov. 11 1915 | 120,000,000 |
| (Financial year) £1,420,000,000 |
| 9th—Feb. 21 1916 | £300,000,000 |
| 10th—Feb. 21 1916 | 450,000,000 |
| 11th—May 23 1916 | 300,000,000 |
| 12th—July 24 1916 | 400,000,000 |
| 13th—Oct. 11 1916 | 200,000,000 |
| 14th—Dec. 14 1916 | 60,000,000 |
| (Financial year) £2,010,000,000 |
| 15th—Feb. 12 1917 | £500,000,000 |
| 16th—March 15 1917 | 500,000,000 |
| 17th—May 9 1917 | 500,000,000 |
| 18th—July 24 1917 | 500,000,000 |
| 19th—Oct. 30 1917 | 500,000,000 |
| 20th—Dec. 12 1917 | (Financial year) £2,450,000,000 |
| 21st—March 7 1918 | £600,000,000 |
| 22nd—March 7 1918 | 700,000,000 |
| 23rd—June 18 1918 | 700,000,000 |
| 24th—Aug. 18 1918 | (Financial year) £2,500,000,000 |
| 25th—Nov. 18 1918 | £8,742,000,000 |

The average British National Expenditure in 1914–5 was £1,500,000 a day; it grew to £3,750,000 in 1915–6, to £6,587,000 in 1916–7, and to £6,986,000 in 1917–8. A rule was laid down by Mr. Reginald McKenna, who succeeded Mr. Lloyd George as Chancellor of the Exchequer in 1916, that the Budget should provide for all normal expenditure and the war debt charge. This standard of finance was high—higher than that aimed at by any other belligerent. Thus in the year 1915–6, expenditure amounted to £1,150,188,000, of which £336,757,000 was provided by revenue. Tax revenue amounted to £390,688,000 or 18-6% of the expenditure. In 1916–7, £573,428,000 was raised by revenue, or 26% of the total expenditure, tax revenue being £514,105,000, or 23-3% per cent. In 1917–8 tax revenue contributed 22-7% to the expenditure, the total revenue being 26-2 per cent. In 1918–9 tax revenue yielded 29-7 per cent.

Increased taxation was imposed in each War Budget. As far as possible the Government relied upon scrapping up existing taxation, and avoided as far as possible the imposition of new taxes. The only new tax of any great importance was the Excess Profits Duty. This duty (see EXCESS PROFITS) was extraordinarily prolific and ranks as one of the most skilfully devised fiscal measures of the war; it was largely imitated abroad. It sought to appropriate for national purposes a large slice of the exceptional profits accreted by those engaged in business, and at the same time to provide a big new additional source of revenue. The duty was first imposed in 1915, and was applied for a period of seven years to all businesses. At first the rate was 50%; it was increased to 60% in April 1916, and from 60 to 80% in May 1917. No change was made in 1918, but in 1919 the rate was reduced to 40%; and raised again to 60% in 1920. In the budget of 1921 it was brought to an end.

**Income Tax (see Income Tax)** was doubled in the first War Budget introduced on Nov. 17 1914 by Mr. Lloyd George. It was raised from 1s. 3d. to 2s. 6d., and the rate for earned income was hoisted up from 1d. to 10s. 6d. in the pound. Super Tax was also doubled. In the third War Budget introduced in Sept. 1915 (the second was in May, 1915), 40% was added to income tax, the exemption limit was reduced from £160 to £130, and abatement limits from £160 and £120 to £120 and £100 respectively. The deduction made in Sept. 1915 in the limit of exemption to incomes below £130 increased the number of taxpayers by a very large figure, practically every working man being rendered liable to the tax. To meet the convenience of the working class taxpayers’ quarterly assessments were introduced. These classes insulate upon a differentiation between married men and bachelors. This was made before 1915–6 and subsequently. In 1916, the differentiation taking the form of an abatement in income of £25 in respect of a wife living with her husband.

An “entertainments tax” was introduced in the Budget for 1916–7, the tax ranging from 1d. on a 2d. ticket to 1s. on a 12s. 6d. ticket, with an extra shilling for every 10s. over 12s. 6d. In the following year this tax, which proved successful, was increased by 50 per cent. Other new taxes imposed in 1916.
ENGLISH FINANCE

An important feature of English finance during the war period was the borrowing of money abroad, especially during the period of actual hostilities. The first loan was raised in the autumn of 1915, when the British and French Governments jointly and severally issued a loan for $300,000,000 in dollars. The position of Great Britain's foreign debt on March 31 1921 is shown below:

<table>
<thead>

</tbody>
</table>

The total foreign debt, expressed in pounds sterling at the par of exchange, was, on March 31 1921, £1,161,563,000, a decrease of £17,151,000 on the total as on March 31 1920, and of £23,287,000 from the highest point reached on March 31 1919.

The figures of the deadweight debt, which included the foreign debt, were as follows in each of the financial years 1909-20:

<table>
<thead>
<tr>
<th>Year</th>
<th>Amount (Pounds Sterling)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The table shows expenditure and revenue, and the total is the difference between the two.

The total expenditure is £8,665,198,215, and the yield of revenue is £2,220,235,719, making a net surplus of £6,442,103,558.

In the table above and on the next page are shown revenue and expenditure for the 12 years ended March 1920.

The increase in expenditure over the pre-war period was due to the large increase in the cost of living, the increased demands on the Treasury, and the higher interest rates.

Note.—The figures in the above table give the amount of the actual net receipts derived from the Revenue due to the Exchequer.

* The net receipt of Property and Income Tax, etc., represents the amount of tax actually collected within the year (irrespective of the year of assessment) less the amount of Tax refunded, etc., within the year. The amounts under the several schedules show the approximate net receipt of the Tax based on the assessments of property and income under each schedule.

† Including arrears of 1909-10.

‡ Includes Munitions Levy.

After the War.—With the termination of the war, taxation in some directions was stiffened, and the revenue continued to expand until it reached the unprecedented figure of £4,25,95,300 in 1920-1. In the 1919 Budget duty on estates over £2,000,000 were raised to 40% and the tax on the larger incomes was raised slightly, thus hastening the breakdown of the historic country estates, which became a feature of the changes in the post-war period. The tax on beer was raised from 2d. 13s. 6d. per 30 gal. to 6s. 6d., and that on spirits from £1 10s. to £2 10s. for proof gallowms. It may be explained here that the highest pre-war rate of income tax was 1s. 3d. in the pound, in 1919-20 it was 6s. In 1914 an earned income of £500 paid £8 in income tax; in 1919-20 it paid £75, which shows that roughly the income tax was multiplied by four. A feature of the 1919-20 Budget was the introduction of a form of Imperial Preference. In 1920 a Royal Commission which had been appointed to consider the question of income tax made certain recommendations of reform. Some of these were incorporated in the Finance Act of 1920, whereby a radical alteration was effected in the method of granting relief in favour of earned income, and of the method of graduating the burden of the tax. Exemption from tax was granted to single persons up to £135 (and up to £150 in the case of earned incomes) and to married persons (without children) to £15 (and up to £250 if wholly earned). In arriving at assessable income a person was allowed to deduct one-twentieth of all earned income, up to a limit of £200. That is to say, a person with an

*Figures not available.*

**EARNED income of £2,000 was entitled to deduct £200, but if the earned income exceeded £2,000 not more than £250 was deductible. On the first £25 of taxable income arrived at after deducting the various allowances provided for—such as one-tenth in respect of earned income, wife and child allowances, insurance premium, dependent relief, etc.—tax was imposed at half the standard rate; namely 3s. in the pound and at 6s. on each pound in excess of £25. Thus the various rates of tax previously in use were abandoned and two rates of tax put in their place. Super-tax was stiffened and regranted.**

The table above shows the aggregate gross liabilities of the State on March 31 in each of the years 1910–21, together with figures of assets, loans to countries allied to Great Britain during the war, and also to the Dominions, and advances for European relief granted after the termination of the hostilities:

To sum up, the World War cost Great Britain over £10,000,000,000,000, while if allowance be made for the expenditure of the Dominions the total would be very much greater. An analysis of the expenditure of the United Kingdom from 1688 to 1918 disclosed the fact that in the six financial years from March 31 1914 to March 31 1920, Government expenditure exceeded the total expenditure for the 21 centuries preceding 1914. The figures are: for the 226 years 1688 to 1914, £10,944,000,000; for the six years 1914–20, £1,268,000,000. Thirty-six per cent. of this latter sum was paid in revenue, and the remaining 64% was borrowed. The British people provided about £9,000,000,000 out of their own resources towards the six years’ expenditure, or £253 per head. Though this vast expenditure was really the outcome of inflationary methods of finance, the system of inflation was not the same as that practised on the continent of Europe but was based on Treasury Bills or Ways and Means advances. These credit instruments were based not upon gold but upon currency notes. Inflation had the effect of reducing the pre-war unit of value: before the war the unit of value was the sovereign containing 232.74 grains of gold; in 1920 the unit of value was a paper pound representing no definite weight in gold, but varying in gold value from day to day.

(C. J. M.)

**ENGLISH HISTORY, 1910–1921 (see 9.466–582).—I. BEFORE THE WAR, 1910–12.—At the death of Edward VII on May 6 1910, he was succeeded on the throne by his only surviving son as George V. (see GEORGE V.). The coronation at Westminster Abbey took place on June 22 1911, and was followed by State visits to Ireland, Wales, and Scotland; but an even more important act in the public assumption of Imperial authority was undertaken during the winter of 1911–12 in the visit paid by the King and Queen to India. At the Delhi Durbar (Dec. 12 1912), at which the King was crowned as Emperor of India, His Majesty announced that in future Delhi would replace Calcutta as the capital, and that Lord Curzon’s unpopular partition of Bengal would be annulled. No hint of such an impending coup d’etat as was represented by the latter announcement had previously leaked out, and no single act of Government in the history of the British constitutional monarchical had ever exhibited so strikingly the latent resources of the Throne as an extra-parliamentary factor in Imperial administration.**

**Without sending any communication to Parliament, the home Government had deliberately utilized the King-Emperor’s authority to carry out an autocratic act of State policy in India, which otherwise could not have been accomplished without considerable friction.**

(For a full account of the action here involved, see INDIA.)

It is only right to emphasize the interest attaching at the opening of the new reign, to the position of the British Throne, as such. In the varied and exacting functions which it is expected to perform, much inevitably depends on the extent to which popular respect and affection surround the royal family. King George was able to benefit, in this respect, from a long growth of public confidence, and from the general acceptance of the theory that, so far as possible, the Crown should be kept out of politics in the party sense. It was all the more important, at King George’s accession, that the personal popularity of the royal family should have been unquestionable, because of the political crisis amid which King Edward’s death had occurred.

Since the Lords’ rejection of the budget in 1909 the whole course of domestic politics had been quasi-revolutionary; as between the contending political parties the impasse had become complete when the conference of 1910 broke down, and when immediately afterwards the second general election of that year gave the Liberal Government once more a majority. But the Crown remained by universal consent an imperial and social factor of all the more potential value as a moderating influence because of the warning of political factions.

"English" history to-day cannot indeed be written without reference to the British Empire, as a unit greater than is represented by "home" (i.e., English, Welsh, Scottish and Irish) politics (see BARTON EMPIRE). The Imperial "idea," to which Mr. Chamberlain’s administration of the Colonial Office and the emergency of the Boer War had given such a pronounced impetus, was already progressing with rapid strides at the opening of the new reign both in Great Britain and the Dominions. After 1900, moreover, the question of Imperial Defence had become acute, in consequence of the rapid increase of the German navy and its manifest challenge to British sea-power. The most remarkable incident during the Imperial Conference of 1911 was the confidential discussion of British international policy, at which the Colonial representatives were addressed by Sir Edward Grey with a detailed account of the situation in foreign affairs. For the first time, it was felt, the Empire as a whole had been taken into the counsels of the statesmen of the mother country. A naval defence scheme was adopted, providing for the maintenance of the various naval services and forces under the control of their respective Governments, but for making the training and discipline uniform with those of the fleet of the United Kingdom and for arranging an interchange of officers and men, while in war-time the Colonial ships placed at the disposal of the Crown would be under the British Admiralty. The movement for increasing the Colonial naval forces, as part of an Imperial navy acting as a single unit, was also notably forwarded by the visit to England of the Canadian Premier, Mr. Borden, with other Canadian ministers, in 1912,
for the purpose of discussing the whole subject with the home Government and the Committee of Imperial Defence.

In connexion with the Imperial Conference of 1911 it may also be noted that resolutions were adopted by it in favour of:

1) an Imperial Naturalization Act, based on a scheme to be agreed upon, but still undefined, for conferring an uniform British citizenship throughout the Empire;

2) the appointment (carried out in 1912) of a royal commission, representing the whole Empire, to investigate and report on the exploitation of natural resources, and the possibility of their development;

3) the establishment of a chain of British State-owned wireless telegraphic stations within the Empire (under the Marconi agreement of 1912).

The history of domestic British politics up to the outbreak of war in 1914 continued to be dominated by the state of the parties resulting from the general election which was precipitated in Dec. 1910 when the private conference between the Liberal and Unionist leaders on the constitutional crisis broke down (see 20.836, 847).

The result of this second appeal to the constituencies showed that the short interval since the general election of Jan. 1910 had made practically no difference in the balance of party power.

The new Parliament opened in Feb. 1911 with a ministerial majority of 122, the combined forces of the Liberals under the leadership of Mr. Asquith as Prime Minister (270), with the Labour party (42) and the Irish Nationalists (84), numbering 356, while the Unionists numbered 274. In the Cabinet, Mr. Asquith, Mr. Lloyd George (Chancellor of the Exchequer), Mr. Winston Churchill (Home Secretary from Feb. 1910 till Oct. 1911 and then First Lord of the Admiralty), Sir E. Grey (Foreign Secretary), and Mr. R. B. Haldane, who was created a peer as Viscount Haldane in March 1911 (War Minister till July 1912, and then Lord Chancellor), stood foremost in dominating the manoeuvres of the Liberal party. Behind them in the House of Commons the most prominent members of the Ministry holding major offices were: Mr. Birrell (Irish Secretary since 1907); Mr. John Burns (President Local Government Board since 1903); Mr. Sydney Buxton (President Board of Trade since Feb. 1910); Mr. L. V. Harcourt (Colonial Secretary since Nov. 1910); Mr. Reginald McKenna (First Lord of the Admiralty from 1908 till Oct. 1911, and then Home Secretary); Mr. J. A. Pease (Chancellor of the Duchy of Lancaster from 1910 till Oct. 1911, then Education Minister); Mr. Walter Runciman (Education Minister from 1908 till Oct. 1911, then President Board of Agriculture); Mr. Herbert Samuel (Postmaster-General); Sir Rufus Isaacs (Attorney-General since March 1910) and Sir John Simon ( Solicitor-General since March 1910). The Labour party was led by Mr. J. Ramsay Macdonald, and the Irish Nationalists by Mr. John Redmond.

In the Upper House Liberalism had but a small following, until the elevation of the Lord Chichester (Secretary of State for India November 1910), but it included Lord Morley (Lord President of the Council, Nov. 1910) and Lord Loreburn (Lord Chancellor since 1905): Lord Rosebery continued to plough a lonely furrow, and Lord Courtney of Penwith to play the part of a political Aristides.

On the Unionist side, Mr. Joseph Chamberlain being physically incapacitated and now only an abiding inspiration to his political followers, Mr. Balfour had no rival as a parliamentary figure. He was loyally supported in the House of Commons by ex-Ministers in the late Cabinet: Mr. Haldane, Mr. Long, Mr. Bonar Law, Mr. H. Chaplin, Mr. G. Wyndham, Mr. A. Lyttelton, Sir R. B. Finlay and Sir E. Carson (leader of the Irish Unionists). In Mr. F. E. Smith, K.C. (afterwards Lord Birkenhead), who had made a rapid and brilliant success both at the bar and in politics, the party had an indefatigable worker and an audacious orator,—a good foil to Mr. Churchill.

In the House of Lords Lord Lansdowne was the recognized Unionist leader, actively supported by such ex-Ministers as Lord Halsbury, Lord Londonderry, Lord Curzon, Lord Midleton, Lord Selborne, Lord Cawdor, Lord Salisbury, Lord St. Aldwyn; and the Duke of Norfolk, Lord Cromer and Lord Milner were other important figures on the same side.

The Unionists were now united by the common bond of resistance to the Radical-Socialist programme of their opponents. The precise form which the tariff-reform policy would take if the party were returned to power was debated according to varieties of opinion on electioneering tactics; but it was sufficient for the moment that those Unionist politicians who had opposed it altogether, or still wavered as to details, to await events. While a protective national economic policy was advocated by Mr. Chamberlain, as an essential condition of the improvement of industrial and social conditions at home, the Unionist leaders were looking anxiously to the wider Imperial issues beyond the solution of immediate domestic problems.

Hopes were still entertained that, either by agreement between the parties or through the failure of the Ministry to obtain the King’s consent to actual coercion of the House of Lords, the immediate constitutional crisis might be solved or the Government forced to resign or once more dissolve in circumstances more favourable than before to a Unionist success at the polls. It was from the first that the Government could rely on the support of the Irish Nationalist party. The passing of the Parliament bill was an essential preliminary to the successful accomplishment of Home Rule, and it had been Mr. Redmond’s policy ever since the elections of Jan. 1910 to press the destruction of the peers’ veto to its final issue for that purpose. The only doubtful element in the situation was the Labour party. Its parliamentary programme included a “Right to Work” bill which the Liberal party could no more support than the Unionists; and, having successfully exploited the Trade Disputes Act from Parliament in 1906, it was set on obtaining from the Government a bill for reversing the “Osborne Judgment” and freeing the employment of trade-union funds for political purposes. The fact, however, that the “independence” of the Labour party was dominated by reluctance to put Liberalism in a minority, is so far as it stood for causes with which the Labour party also identified itself, made its parliamentary position one over the manoeuvring of which the Government’s Whips had the upper hand.

On Feb. 6, 1911, the first Parliament of George V. was opened. On Feb. 21, the Parliament bill was reintroduced in the House of Commons, and had a first-reading majority of 124 next day; the second reading was carried on March 2; and on the 15th the third reading was carried by a majority of 352 to 241, and the bill was sent up to the House of Lords. A few trivial changes had been accepted in its wording, but all the substantial amendments proposed by the Opposition had been negatived. A Labour party amendment to omit the words in the preamble, pledging the Government to set up a reformed Second Chamber, was rejected (Mar. 18, 1911). Mr. Asquith declared the Government regarded it as an obligation, if time permitted, to propose a scheme for reconstituting the Upper House within the lifetime of the existing Parliament.

Every attempt of the Opposition to modify the operation of the Parliament bill was met by dogged resistance. The principal demand of the Opposition, that important constitutional changes should not become law, if rejected by the House of Lords, until they had been submitted to the judgment of the country, was of no avail. The Government’s reply was that the country, in giving them a majority, knew quite well what the Parliament bill would be used for, and that the two years’ interval it allowed for delay was an ample safeguard against legislation to which the people were opposed.

Meanwhile the alternative policy of the Unionist party was being made clearer in the more congenial atmosphere of the Upper House. A bill proposed by Lord Lansdowne for reforming its constitution was read a second time on May 22. The whole principle of this scheme of reform was that, while the composition of the Upper House would be changed and put on a representative basis, in accordance with the policy of Lord Rosebery’s resolutions in 1910 (see 20.837), its powers would remain as they
were. Under it, the reconstituted House would consist (except for royal princes) of "Lords of Parliament," summoned as such and not because of any hereditary title; 100 would be elected by the hereditary peers from such among their number as were qualified, under a schedule to the bill, by having held various public positions or ranks in the public services; 120 would be elected to represent different districts of the United Kingdom by colleges of electors consisting of the members of the House of Commons for the constituencies within those districts; 100 would be appointed by the Crown (i.e., the Ministry) so as to represent the proportional strength of parties in the House of Commons; seven would be "spiritual lords," i.e., the two archbishops and five bishops to be elected by the Anglican Episcopate; and 16 would be peers who had held high judicial office. Except for the law lords, who would sit for life, and the spiritual lords, who would sit while they occupied their sees, the lords of Parliament would sit for 12 years, subject to one-fourth in each class (selected by ballot); retiring every third year. Peers who were not "Lords of Parliament" would be eligible for the House of Commons, but the creation of new hereditary peerages for commoners other than past or present Cabinet ministers was to be limited to five a year.

In Lord Lansdowne's view, such a reform of the constitution of the Upper House, which followed on the lines of suggestions already thrown out by Lord Curzon and Lord Selborne, would provide a representative Senate, of which the existing Unionist party preponderance would no longer be characteristic.

So long, however, as the Government flatly declined to accept any reconstruction of the Upper House as a substitute for the Parliament bill, any such proposals were mere beating of the air. The actual scheme excited no particular interest on the Unionist side, and was assailed by Liberals on the ground that, according to their calculations, while pretending to be representative, it would simply stereotype a Tory majority. On the day after it was read a second time, the second reading of the Parliament bill was taken (May 23), and the real issue had to be faced; but the approach of the coronation, and the prevalence of a feeling that, in spite of bellicose utterances in the Liberal press as to the creation of 500 new peers for swamping opposition, the Government might still be forced to a compromise, made the debate still only a manoeuvre for position, and Lord Lansdowne decided not to divide against the bill but to propose amendments in committee.

The real fight only began when the coronation was over. The committee stage of the Parliament bill lasted from June 28 to July 6, and, in spite of warnings from Lord Morley that the Government would refuse, in the House of Commons, to accept them, Lord Cromer's amendment (June 28), substituting a joint committee for the Speaker in deciding what a "Money bill" was, and Lord Lansdowne's amendment (July 5), providing for a referendum in specific cases of measures attacking the existence of the Crown, the Protestant succession, or the establishment of national parliaments with legislative powers in Ireland, Scotland, Wales or England, were carried by large majorities. On July 20 the bill, so amended, was read a third time without a division, Lord Lansdowne declaring that the principal amendments were "so essential that we should certainly not be prepared to recede from them so long as we remain free agents." Lord Halsbury went still further: "but for the existence of the amendments, he would have himself moved the rejection of the bill on the third reading, and unless those amendments were accepted in substance, in meaning, and an open position, he would not consent without a division to the passing of the bill."

The next day the Government exploded their bombshell. It had been a mystery up to this moment whether Mr. Asquith had obtained from the King a definite assent to the use of the royal prerogative for creating peers, and the question whether such a course could possibly be resorted to had been freely discussed from the time when the Parliament bill was first proposed. All doubts were now set at rest. On July 21, a letter from Mr. Asquith to Mr. Balfour in the following terms, written the day before, was published:

I think it courteous and right, before any public decisions are announced, to let you know how we regard the political situation. While the Parliament bill has been formally returned, the King returns to the House of Commons, we shall be compelled to ask that House to disagree with the Lords' amendments. In the circumstances they would not only oppose such a surrender to the King to exercise his prerogative to secure the passing into law of the bill in substantially the same form in which it left the House of Commons, and His Majesty has been pleased to signify that he will certainly accept this."

In the subsequent debates in both Houses of Parliament (April and 8) a vote of censure moved by the Unionist leaders, the course taken by the Government was more fully explained. It appeared that the Cabinet had presented a memorandum to the King on Nov. 15 1910, before the general election, as follows:

His Majesty's ministers cannot take the responsibility of advising a dissolution unless they may understand that in the event of the policy of the Government being approved by an adequate majority in the new House of Commons, His Majesty will be ready to exercise his constitutional powers, which may involve the prerogative of creating peers, if needed, to secure that effect shall be given to the elections in the country. His Majesty's ministers are fully alive to the importance of keeping the name of the King out of the sphere of party and electoral controversy. They take upon themselves, as is their duty, the entire and exclusive responsibility for the policy which the people in his election to the electorate have agreed to it, and they would not agree that it would be inadvisable in the interests of the State that any communication of the intentions of the Crown should be made public unless and until the actual occasion should arise.

The King had felt that he had no alternative except to assent, though he did so, as Lord Crewe now stated, "with natural and legitimate reluctance." The Government had hoped that as the result of the general election, the Parliament bill would be allowed to pass without amendments which would be fatal to its purpose, and therefore without a disclosure of the confidential understanding which all the time existed as to the use of the prerogative, but this was no longer possible; the only question now was whether the threat was to be sufficient.

It was clear that, in the House of Commons, the Lords' amendments would be summarily rejected by the Government majority. The further developments of the political crisis depended, therefore, on what would happen in the House of Lords when the bill was sent back to it. A hurried meeting of Unionist peers was held (July 21) at Lansdowne House, at which Lord Lansdowne informed them that the Government had told the Opposition leaders that their intention was not to send the bill up from the House of Commons unless an assurance was given that it would be passed, the assumption being that, in the absence of this assurance, peers would at once be created in sufficient numbers for the purpose; and it was freely stated in the Liberal press that the Government Whips had a list ready of persons who were prepared to accept peerages on condition that they formed part of the Liberal programme. A state of extreme exasperation prevailed, but a considerable majority of Unionist peers agreed with Lord Lansdowne's view that, if this creation of peers were proceeded with, not only would the Parliament bill be passed, but even such opportunities as it left open for subsequent resistance to Home Rule and similar measures would be nullified; the only prudent course, in the interest of the Unionist party or of the peerage, was to sink further opposition, now that they were no longer "free agents." On the other hand a minority, whose view was strongly expressed by Lord Halsbury, bitterly opposed that the bill did not cease to be "free agents" until they were actually out-voted. It was in this sense that they had understood Lord Lansdowne's use of the phrase on the third reading and it was only on that condition that they had not rejected the bill then. They still regarded the Government threat as a piece of bluff. It was asked whether it could be regarded as certain that, when the 500 eligible magnates who were willing to take Liberal peerages had voted for the Parliament bill, they would not take a more independent view of their position.
so far as Home Rule and other measures were concerned. The class of men whom Mr. Asquith was prepared to nominate for the purpose would hardly be different from those who in recent years had been added, quite acceptably, to the House of Lords by Liberal initiation in considerable numbers, and who had in many cases come round there to a different way of thinking. A further argument was that if a creation of peers was avoided now, it would prevent its being resorted to if the House of Lords subsequently rejected the Home Rule bill.

Between these opposing views of the situation, a cleavage in the Unionist ranks was at once manifest. Mr. Balfour decided to "stand or fall" with Lord Lansdowne's advice, and they were followed by much the larger numbers; but public interest centred in what was known as the "Die-hard" movement, which was actively organized under Lord Halsbury's leadership and initiated at a rally attended and enthusiastic dinner in his honour at the Hotel Cecil on July 26, at which Lord Selborne presided, supported by Lord Salisbury, Lord Milner, the Dukes of Northumberland, Marlborough, Bedford and Somerset, Mr. Austen Chamberlain, Mr. George Wyndham, Sir Edward Carson, Lord Hugh Cecil, Mr. F. E. Smith, Lord Willoughby de Broke, and other prominent men. How many peers would follow the lead given by Lord Halsbury and vote against the unamended bill when it was again sent up was still uncertain, but as Lord Lansdowne and the bulk of those who accepted his advice were only prepared to dissent from further opposition, and would not assist the Government affirmatively by voting for a measure they detested, the die-hards it was impossible for him to give Mr. Asquith the assurance he had demanded. A period of extreme tension and uncertainty followed. On July 24, when Mr. Asquith was to move in the House of Commons that the Lords' amendments be disagreed with, he was howled down from the Unionist benches, amid a scene of great disorder, which was repeated the next day, and it was not till Aug. 8 that the motion for disagreeing with the Lords' amendments was carried by 321 to 215, after the Government had agreed to introduce a few minor changes. Meanwhile Mr. Balfour had endeavoured to placate the wrath of the Unionists by moving a vote of censure (Aug. 7), which was rejected by 365 to 246, and in the House of Lords a similar vote of censure moved by Lord Curzon (Aug. 8) was carried by 282 to 68.

The Parliament bill was sent up again to the Lords for their acquiescence in the striking-out of their amendments, and the crucial debate there took place on Aug. 9 and 10. In answer to Lord Rosebery, Lord Morley made the precise statement that if the bill was defeated "His Majesty would assent to a creation of peers sufficient in number to guard against any combination of the different parties in Opposition by which the Parliament bill might again be exposed to defeat." This declaration had a marked effect on the result. Up to the last moment the figures on the two sides were in doubt, but the division showed 131 in favour of passing the bill, and only 114 for insisting on the amendments. The Government had won the day by the help of enough votes from peers who usually acted with the Opposition to counterbalance the "die-hards." Thirty-seven Unionist peers, the two archbishops, and 17 bishops voted with the Liberals; but Lord Halsbury's followers were more than had been expected, several peers, including the Duke of Norfolk, joining them in protest against the action of the Unionists who helped to carry the bill. Lord Cromer, who had been active in getting Unionist peers to support the bill on the ground that only in this way could the danger likely to accrue from a creation of new peers be avoided, was absent through illness; and Lord Curzon's was eventually the most powerful influence exerted in this direction, his action being all the more hateful to the "die-hards" because earlier he had been specially prominent in counselling resistance to the bill at all costs.

The Parliament bill thus became an Act and duly received the royal assent; and a statutory enactment defining the relations between the two Houses of Parliament was substituted for an unwritten British constitution. As compared with the original form in which it was first introduced (see 20., 846, 847), various small drafting alterations were made, including an improved definition of a "money bill," and a more definite exclusion of private bills from the scope of the measure; but the only changes of any substantial importance were the following. (1) A provision by which the Speaker, before giving his certificate (to be endorsed on every money bill sent up to the House of Lords) that a bill is a money bill, "shall consult, if practicable, two members to be appointed from the chairman's panel at the beginning of such session by the committee of selection." (2) Provisions excluding from any public bills, as to which the Lords' consent would not be required after being sent up in three successive sessions, "a bill containing any provision to extend the maximum duration of Parliament beyond five years," and also "any bill for confirming a provisional order." (3) A provision altering the limits of the two years which must have elapsed during the three successive sessions to "between the date of the second reading in the first of those sessions of the bill in the House of Commons and the date on which it passes the House of Commons in the third of those sessions." (4) A provision requiring a certificate signed by the Speaker, stating that the provisions of the Act in this respect had been compiled with, to be endorsed on any bill so presented to the King; for his assent notwithstanding the opposition of the House of Lords. (5) A provision that "in every bill so presented to the King, the words of the enactment shall be as follows:"— Be it enacted by the King's most excellent Majesty, by and with the advice and consent of the Commons of this present Parliament assembled, in accordance with the provisions of the Parliament Act, and by authority of the same as follows." In all vital respects the Parliament Act remained as originally introduced in 1910. Though its preamble declared that reform of the House of Lords itself still remained a task for the future, the supremacy of the House of Commons, both for purposes of finance and for public legislation, was definitely enacted. While the Act, however, on the face of it, made the Government masters of the situation, it was recognized by people who looked a little ahead that in practice it might not work quite as its authors contemplated. In order that its provisions should apply, to the extent of bills becoming law over the resistance of the Lords, these words of the Act had to elapse during the same Parliament and during these two years they had to be sent up again and again without being changed from their original form. As the duration of Parliament was cut down to five (practically four) years, this meant that nothing not sent up in the first year or two would benefit by the Act; and apart from that, it would be difficult to avoid changes in bills sent up year after year. Even as regards "money bills," which the House of Lords was now to have no power of rejecting at all, the prospect was uncertain. The Budget of 1909, the rejection of which was the touchstone of the whole revolution, was probably considered a money bill by most Radical politicians; but the Speaker (Mr. J. W. Lowther) upset any such calculations in Dec. 1911 by ruling, in answer to a question, that the Budget of that year was not a money bill within the Parliament Act—a fortiori, therefore, neither was that of 1909.

On the very day that saw the triumph of the Parliament bill (Aug. 10) yet another great alteration was being made in the essential conditions of parliamentary life. Following an invitation already given by Mr. Lloyd George, a resolution was carried in the House of Commons, 256 votes to 158, providing "for the payment of a salary at the rate of £400 a year to every member of the House, ex-
cluding any member who is for the time being in receipt of a salary as an officer of the House or as a minister, or as an officer of His Majesty's Household." Most of the Unionists were opposed to the proposal, and a good many Liberals did not like it, but the Government had determined to introduce payment of members as a way out of the difficulty they had with the Labour party, owing to the Osborne Judgment having made illegal the payment of subsidies to working-class members out of trade-union funds (see 27.143). To legislate in the way the Labour party demanded, so as directly to reverse the Osborne Judgment, was impossible, though the Government were prepared with a bill—unsatisfactory to the Labour party and not proceeded with, a second edition being introduced in 1912—for enabling trade unions to make special provision for voluntary political funds, separately from the general funds to which every member of the union had to contribute; but it was hoped that payment of all M.P.'s out of public money would do away with the particular grievance of the Labour members. In the country generally a good deal of disgust was felt at the calm way in which M.P.'s had voted themselves £400 a year, and some members who were too well-off to want the subsidy declined to take it.

Further complications with Labour were being threatened all this time outside Parliament. Industrial unrest was taking a peculiarly acute and dangerous form. Though trade generally was busy, and "unemployment" steadily diminished, the demand of the wage-earning classes for a proportionately larger share of the good things of life—better pay, better working conditions, more articulate and better organized, Socialist—and particularly " Syndicalist"—theories had for some time been getting a strong hold of the younger generation of trade unionists; and a growing sense of the impotence of the Labour members in Parliament, added to increasing suspicion that Liberals and Tories alike were in league with the "money power," encouraged the idea that "direct action" by means of strikes was the only way of successfully asserting the claims of the operatives to a larger share of the profits of industry. The fact that wages, under existing agreements, practically amounted to a stationery, while the cost of living, owing to higher prices, was going up, gave a solid basis for discontent. The result was seen, not only in numerous local conflicts between Capital and Labour, but in the threat of more extended "general" strikes, which aimed at holding up whole industries throughout the country and compelling parliamentary intervention.

For the first time in the history of English labour troubles a "national" strike was precipitated in 1911, and private war was made on the whole community by the members of the railway unions. Since 1907 there had been a continual agitation among members of the Amalgamated Society of Railway Servants for better wages and shorter hours, and for "recognition" of their trade union by the railway companies, which had been steadily refused by all except the North Eastern Company (after an arbitration in 1897). A general railway strike was only averted in 1907, as the result of negotiations carried on by Mr. Lloyd George as president of the Board of Trade, by an agreement between both sides to accept a scheme of conciliation and arbitration proposed by him. But the actual working of the conciliation boards then set up proved very disappointing to the railwaymen and the movement came to a head again in Aug. 1911. Strikes had been going on in Liverpool, Manchester, London and elsewhere, among various other classes of transport workers—seamen, dockers and carters. In London a violent dock strike was only terminated early in Aug. by an award of Sir Albert Rollett, increasing wages; and a carmen's strike, which had been accompanied by serious disorder and had driven the Government to order troops from Aldershot, was brought to an end with considerable difficulty at the same time by the intervention of the Board of Trade, the men securing concessions both as to hours and wages. At Liverpool a protracted dock strike had driven the ship-owners on Aug. 3 to agree to "recognize" the Dockers' Union and make other concessions; but a number of strikers refused to go back to work; and the ship-owners then announced a general lock-out to begin on Aug. 14. The answer of the dockers' strike committee, led by Mr. Tom Mann, was to call on all transport workers to assist them by striking in sympathy, and wild scenes of rioting resulted, requiring the introduction of troops to help the Liverpool police. The general unrest now spread in an active form to the railwaymen too. At Liverpool the goods porters at the Lancs. & Yorks. stations struck on Aug. 5 because of the delay in dealing with their grievances, and at other stations the men came out in sympathy.

On Aug. 15 the joint executives of the four railwaymen's unions—Amalgamated Society of Railway Servants, Amalgamated Society of Locomotive Engineers and Firemen, General Railway Workers' Union, and Signalmen's and Pointsmen's Union—decided to order a general strike unless in 24 hours the companies agreed to meet them and discuss terms. The companies at once refused to do so, or to admit that the conciliation scheme of 1907 could be thrown over in this way. The leaders of the men on the other hand contended that the spirit, if not the letter, of the agreement of 1907 had never been carried out, and that they must have direct recognition of their unions. The machinery of the Board of Trade was set to work to try to produce a result, which began to look, though the companies were guaranteed military protection, and preparations were made for placing soldiers along the lines.

On Aug. 17 Mr. Asquith had an interview with the men's representatives, and offered a royal commission to inquire into the working of the conciliation scheme, but at the same time he warned them gravely and firmly that the Government could not allow the railway service of the country to be paralysed. Resenting the tone of his speech, and suspicious of a royal commission as simply a means of delaying the whole matter, they refused this offer and ordered the strike which began on the 15th in spite of continued efforts by Mr. Lloyd George (Mr. Asquith having left further action to him) to overcome what seemed to be a misunderstanding. As the result of his explanations to the men's leaders negotiations still went on; a vote of censure on the Government which the Labour party at first decided to move in the House of Commons was not proceeded with; and instead of Parliament being adjourned on Aug. 18 until the autumn session, as had been arranged, it was decided to meet again on Aug. 22 in order to deal with the situation. The strike was in actual operation for practically two whole days and did not terminated till Aug. 22. On the 15th a settlement was effected. It was agreed that a special commission should at once investigate the working of the conciliation scheme and report quickly what changes were desirable, and that the trade-union leaders should persuade the men to return to work, the strikers being reinstated. The special commission started work on Aug. 23 and took evidence from both sides up to Oct. 3, its report being issued on Oct. 20. It was unanimously recommended that the conciliation scheme should be amended in various ways, the central board being abolished and any differences within the sectional boards being settled by an independent chairman chosen from a panel drawn up by the Board of Trade; trade-union "recognition" by the companies was not directly conceded—the commissioners pointed out that the companies could not permit intervention on the subject of discipline and management—but some satisfaction was given in this direction by a recommendation that the men should have anybody they wanted (e.g. a trade-union official and not actually an employee) on the sectional boards as their secretary and advocate. The Labour party and trade-union leaders were by no means satisfied; however, that the result of the commission's report was decided to take a ballot in Dec. on the question whether the findings of the commission should be accepted or another strike for "recognition".  

The only official figures for "unemployed" issued by the Board of Trade were for the trade unions. In these the percentage, which was 9 in 1908 and 1909, fell to 5 in 1910 and 3 in 1911.
ENGLISH HISTORY 989

started; and when the report of the commission came up for discussion in the House of Commons on Nov. 22 the situation was still a very difficult one. A resolution was moved by Mr. Lloyd George asking the Government to bring about a further meeting between the representatives to the agreement of Aug. 19, but this was only carried after a contest involving the displaying of obstinacy on both sides, Mr. Ramsey MacDonald insisting that the men had not agreed to accept the report and that "recognition" was indispensable, while the view of the companies was that the Government ought to hold the report as binding on both parties. It was not till Dec. 11 that, after a good deal of diplomacy on the part of the Board of Trade officials, a compromise was arrived at. Both parties agreed to accept the report of the commission as a basis for modifying the future working of the conciliation scheme, "recognition" being accepted to the extent of allowing the men to have their trade union secretary as adviser. Various discussions as to wages and hours were also made by the companies.

As regards the strike itself, while in actual operation, the state of the railways during those two or three days was unprecedented. Some 220,000 men altogether, about a third of the workers, were out, and traffic was much restricted, the worst dislocation being in the N. of England, round Liverpool and Manchester. Troops were employed freely to guard the lines and give protection against violence, and in consequence there were only certain particularly disturbed districts where several thousand blacklegs worked with the mob, and large numbers of the men were killed or wounded by the soldiers. A train was blown up at Llanelly, and the soldiers had to shoot two men being killed, while an explosion due to the mob setting fire to some trucks containing gunpowder resulted in five more deaths; and at Liverpool, on the 12th, two men were shot in a riot. The employment of the military was furiously denounced by the Labour agitators, but the intimidation practised against non-unionists and the danger of extended sabotage were such that, on the whole, the comparative peaceableness of the stoppage, which occurred in a summer of unexampled heat, was rather remarkable. To a great extent, and particularly on the lines near London, this was due to the fact that a large proportion of the union men who went out (a certain number remaining loyal to the companies) only did so because they dared not disobey the union orders. One outcome of the railway strike, and of the general unrest of which it was a symptom, was an addition made by the Government to the official machinery applicable at the Board of Trade to the working of the Conciliation Act of 1906. In Oct. 1911 an Industrial Council, representative of employers and workmen, was instituted as a permanent body for considering and inquiring into matters referred to the conciliation trade disputes, and for taking suitable action (but without compulsion) as regards them. The council comprised representatives of lines as the conciliation boards already adopted in particular industries. As chairman of this Industrial Council and "Chief Industrial Commissioner," the Government chose Sir George Askwith (b. 1861), head of the Labour Department of the Board of Trade, who had just been knighted in recognition of the valuable work he had done in recent industrial conflicts.

Meanwhile the National Insurance bill, introduced into the House of Commons by Mr. Lloyd George on May 4, 1911, had gone through various issues into the parliamentary committee stages. The bill covered two main subjects, one being national health insurance, under newly constituted insurance commissioners for England, Wales, Scotland and Ireland (with a joint committee, formed from among them, for adjusting common affairs), assisted in each case by an advisory committee, with county and county borough committees for local administration, and the other unemployment insurance, directly under the Board of Trade.

(1) Unemployment insurance, administered largely through the labour exchanges, was applied to certain trades—building, construction of works (railways, docks, etc.), shipbuilding, mechanical engineering, iron-founding, construction of vehicles and saw-milling—with power for the Board of Trade to extend the scheme to others. Workmen in these trades (other than foremen, clerks, indentured apprentices, and persons under 16) would be entitled under various restrictions to unemployment benefit (up to a standard of 7s. a week for not more than 12 weeks a year, starting at the second week after discharge). Employers, on the other hand, were required to pay, a compulsory contribution, 2½d. a week (paid by employer and deducted from wages), employers 3¢d. a week per man, and the Secretary of State an annual amount equal to a one-fourth part of that portion of the contribution going to the State from the wages (including payment). Provision being also made for certain classes of employed persons to come into the scheme as voluntary contributors. Under the compulsory insurance (except for certain lower rates) making the payments and deducting from wages, employers were to be allowed to give special stamps for the purpose of discharging their obligations, having a view to the possible transfer of those stamps to other employers. The State added to the National Health Insurance Fund an amount (two-ninths in the case of men, and one-fourth in the case of women, of the cost of benefits and administration) reckoned at 2d. a week. Its remaining stages were similarly secured by voluntary treatment at home; (ii.) sanatorium treatment for tuberculosis and other diseases specified by the Local Government Board, the Government allocating £1,500,000 for the building of sanatoria; (iii) payment during sickness of 10s. a week for men and 7s. 6d. for women up to 26 weeks; (iv.) subsequent payment during disablement of 5s. a week, and (v.) maternity bonus of 30s. to women (including substitutes employed per period, not over four periods). In granting these benefits (medical attendance, sickness, and maternity benefits not till six months, disablement not till two years after payments started) or modifying and extending them as funds permitted, the agency of the local government boards was increased (foreign and "approved societies," i.e. the Friendly Societies, trade unions and such similar bodies as the insurance commissioners approved, the intention of the Government being to have as many as possible of the sick and disabled covered as nearly as possible by medical men in the existing medical men's institutions, and to reserve the right to charge the general fund being estimated for at the rate of 6s. (including cost of drugs) per head per annum. This feature of the bill, as explained by Mr. Lloyd George, quickly aroused the opposition of the doctors, who were organized under the British Medical Association to refuse their services unless a larger payment was made; and as a body the doctors stood out for better terms. As medical benefits under the Act became due on Jan. 15, 1913, it became a question for the Government whether, if no terms could be arranged, a regular State medical service would not have to be started. On Oct. 23 1912 Mr. Lloyd George announced the Government's "final" offer to increase the general fee to 6s. (including cost of drugs), and for the offer to be carried out in the Union as a whole, if only a third of their total contribution, the offer was rejected by an overwhelming majority of the profession at a representative meeting of the British Medical Association.

The second reading of the Insurance bill was carried without a division on May 29, and the committee stage went on intermittently from July 5 to Aug. 4, when, with the discussion on the 17th clause finished, Mr. Lloyd George was still able to regard the Opposition as having been defeated to the extent of the number of amendments. The bill was then left over for the autumn session, which began on Oct. 24. But in the interval opposition had been growing, and the political situation in other respects was such that genuine cooperation with anything proposed by the Government was hardly possible if party capital could be made for the Unionists by what was unpopular in its programme. Not only were the doctors in full revolt against the terms proposed for their remuneration, but the working classes themselves were found to dislike exceedingly being taxed for benefits they were not able to appreciate. Mr. Lloyd George, ever an ardent and a tactful exponent of the Union of the Unionists by the working classes as the "basis of the bill as giving the working classes a "nineteen for pence." Among domestic servants the scheme was cordially disliked. Though the bill was planned so as to involve financial cooperation between the State and the Friendly Societies, there was considerable uncertainty, moreover, as to how far a great many of the latter, especially the smaller local societies, would reap advantage rather than loss. Public discussion concentrated on the difficulties and objections. It was inevitable therefore that, so far as the political aspects of the bill were concerned, the attitude of the Opposition should be affected by the discovery of its wide unpopularity.
The result was unfortunate for a scheme which aimed at accomplishing so important a work of social reform. The Government had its programme for 1912 full, subject to the way being cleared by the Parliament Act, by the political necessity of proceeding with Home Rule and Welsh Disestablishment; and Mr. Lloyd George, whose influence on the parliamentary tactics of the Coalition was now supreme, determined to force the Insurance bill through before this time. Both inside and outside the House of Commons resumed its work on Oct. 24, Mr. Asquith carried a time-table resolution for closing the remainder of its stages; and by this drastic method the bill passed through committee on Nov. 21 and was read a third time on Dec. 6. Under such conditions the opportunity for effective Opposition criticism and amendment was so limited that very little was possible, in spite of the activity of Mr. Worthington Evans and other Unionist members, and towards the end it became a question whether the Opposition leaders would actually divide against the third reading, a course to which they were openly challenged by Mr. Lloyd George. Instead of this, an Opposition back-bench amendment was moved by Mr. H. W. Forster, proposing that the bill should be postponed for further discussion, and this was defeated by 320 to 223, the third reading then being carried in a division in which the Opposition as a whole took no part, 21 members recording their votes against it. On Dec. 11 the bill was read a second time in the House of Lords, and, after various Government amendments had been inserted in committee on Dec. 14, it was passed and received the royal assent next day, when Parliament was prorogued.

During all this time both inside and outside Parliament, opinion as to the scheme and its prospects had become more clearly crystallized. While Mr. Lloyd George and his supporters proclaimed it to be the most beneficial reform ever conceived in the interest of the working-classes, and taunted the Opposition with attempting to destroy it, the Unionists dwelt on the injury done by forcing through a measure which ought to have been more carefully considered before it became law, and threw the responsibility on the Liberal party for everything that was objectionable and unworkable in it. The by-elections showed that its unpopularity was continually growing; and under the arrangement made in the Act, that the insurance commissioners should during 1912 make regulations as to details, nobody knew yet what procedure would be adopted to overcome pointless difficulties which under the Act itself remained quite unseated. The medical profession, without whose cooperation, so far as could be seen, the Act would not work at all, continued to refuse it unless they were given better terms, to which Mr. Lloyd George was still unable to agree; and "passive resistance" was organized on their behalf by the British Medical Association.

It was, however, not only the stimulus given by the antagonism to the Insurance Act that was causing a revival of Unionist confidence after the defeat over the Parliament Act. During the autumn session of 1911 the Unionist party had started fresh under a new leader in the House of Commons. The "die-hard" revolt had been a final illustration of the dissatisfaction within the party at the way it had been led by Mr. Balfour for some time past. Had the Parliament bill been defeated in the House of Lords by the "die-hards," it was an open secret that both Lord Lansdowne and Mr. Balfour intended to remain in their positions at the head of the party, and it was largely the dislike of acting disloyally by them that confined the open revolt to a comparatively small section. Exasperation at the result, however, was general. Mr. Balfour himself did his best to smooth matters over, declaring in a public speech (Haddington, Oct. 7) that the question of the peers’ tactics was now a dead issue, of no more practical importance than the controversy as to the identity of Junius; and the "die-hards," though they started a Halsbury Club and kept their organization in being, protested at the same time that the differences within the party were ended with the cause of them, and that they only meant to work for the common good. But after some weeks of reflection, when the hubbub was all over, Mr. Balfour made up his mind that the right moment had arrived, for him to retire from the leadership, though not from Parliament, in view of the arduous political struggles still impending, and the unlikelihood of his being strong enough in health; should the Unionists again return to power, to conduct a ministry. His announcement to this effect was made on Nov. 8, at a hastily convened meeting in the City of London. For a few days the question of who would succeed him was uncertain. Mr. Austen Chamberlain, not only as principal leader of the Tariff Reformers and one whose very name would, on his father’s account, be most representative of the Imperialist movement, but as ex-Chancellor of the Exchequer and officially Mr. Balfour’s deputy on the Opposition front bench, had apparently the strongest claim; but, as a Liberal Unionist, his selection was opposed by many Conservatives, who considered Mr. Walter Long a better choice; and Mr. Long’s great popularity among all sections was much in his favour. It became clear to the partisans of both that if either were proposed, and votes were taken, it would only emphasize the division of opinion and create friction between their supporters.

It was found that Mr. Austen Chamberlain and Mr. Long were both prepared to stand aside in favour of Mr. Bonar Law, nominally a Conservative and at the same time a strong Tariff Reformer; and on their joint proposal he was quickly adopted as leader in the House of Commons (Lord Lansdowne continuing to be leader in the House of Lords), at a party meeting on Nov. 14. Their sacrifice of personal ambition set an example which did much to promote fresh confidence within the party; and Mr. Bonar Law had no sooner become leader than there were signs of improved Unionist prospects in the constituencies. In intellectual range, subtlety of exposition and criticism, and political experience, Mr. Balfour had, admittedly, no rival on either side, but he still remained in the fighting ranks, ready to devote himself to the Unionist cause as much as anybody. His retirement from the formal responsibilities of leadership gave freer play to the respect and admiration felt for him personally as a public man, while relieving the party of the accumulation of doubt as to his policy and tactics, which, rightly or wrongly, had led to undercurrents of dissension. To the plain man his detached and philosophical outlook on public affairs had been rather too lofty; to be "had" or tricked, as the party was openly taunted with being by its opponents, over the Budget of 1909 or the Parliament bill of 1911, simply meant that its leader had failed in astuteness; ardent Tariff Reformers, enthusiastic for Mr. Chamberlain’s policy and pining for Mr. Chamberlain’s aggressive tactics, felt that Mr. Balfour’s balancing support of their proposals was unpractical and was confined to economic generalities. He was perhaps "too much of a gentleman" as well as "too little of a business man" for the situation. Mr. Bonar Law, on the other hand, was more of the Chamberlain type—a successful man of business, the cleverest and most convincing platform exponent of Tariff Reform, a speaker who was accustomed to calling a spade a spade.

It so happened that the result of the Canadian elections at the end of Sept., and the defeat of Sir Wilfrid Laurier’s American Reciprocity proposals, had delighted the Unionists and given them fresh confidence for the future. The Canadian elections had showed the people meant to keep her place in the Empire, and that antagonism to the prospect of becoming simply an annex to the United States was more powerful than the temptation to secure immediate commercial advantages from reciprocity. Up to the last the result of the Canadian elections had been very uncertain, and the Tariff Reformers in England, who had been thoroughly depressed and disheartened by the idea that, if reciprocity between Canada and the United States were established, their hopes for Imperial commercial union would be frustrated, had in Mr. Borden’s success a legitimate
ENGLISH HISTORY

991

triumph for their own views of Imperial policy. Imperial patriotism in Canada had averted the greatest danger yet threatened, in spite of the support given by the Liberal Government at home and the British Ambassador at Washington. Every platform rang with Unionist rejoicings, and the Canadian victory put new heart into the Tariff Reform propaganda.

On yet another question of Imperial moment a rebuff was given to the Government policy. Throughout 1911 the decision of the Government to ratify the Declaration of London had led to a prolonged agitation. Most of the Unionist party, together with a strong body of naval opinion, were actively opposed to it, their argument being that under its provisions the advantages of British supremacy at sea in war time would be seriously diminished. The Government succeeded, however (June 1 1911), in obtaining the support of the Imperial Conference, considerable weight attaching to Sir E. Grey’s view that adhesion to the Declaration would be advantageous in Great Britain’s foreign relations and to the cause of peace. As Parliament had no direct control over the action of the Government in the matter of ratification, political opposition centred on the Naval Prize bill which was introduced to carry out the provisions of the Declaration of London, the second reading being taken on July 3. So much headway was made in arousing antagonism to the Declaration itself that when the third reading of the Naval Prize bill came on in the House of Commons on Dec. 7 the Government only managed to get a majority of 47; and the House of Lords promptly rejected the bill.

The Government was evidently rated to the House of Commons, which was divided. The Prime Minister himself was avowedly opposed to women’s suffrage altogether. On the other hand, Mr. Lloyd George, while professing himself a strong supporter of the cause, which was also advocated by Sir E. Grey and Lord Haldane, objected to any bill which was not thoroughly “democratic”; and because the “militants” regarded his attitude as obstructing the particular measure which they had in view, and held him responsible for a Government bill not being introduced as they desired, he was at once to have as much as if he had actually been an open opponent like Mr. Asquith. The so-called “Conciliation” bill, introduced by Sir G. Kemp, which assimilated the parliamentary to the municipal franchise for women and would give votes to about a million, had been read a second time in the House of Commons on May 5 1911, Mr. Asquith himself pairing against it while Mr. Lloyd George and other ministers supported it; and as there was no time for proceeding with the bill in 1911 the Government promised to give it “facilities” in the following year. But while the various sections of supporters of women’s suffrage disputed about its prospects, and the “militants” raged together, Mr. Asquith suddenly made a new turn on Nov. 7 by announcing the intention of the Government to add to its programme a Franchise Reform bill on the lines of Manhood Suffrage. In answer to a deputation of woman suffragists on Nov. 17 he declared that, while he was personally opposed to women’s suffrage altogether, this bill would be so drawn as to admit of amendment to include women on certain terms; and if an amendment was not adopted the Government would then adopt it. They would also, as had been promised, give facilities for the Conciliation bill.

It had been generally supposed that the Government would take advantage of the passing of the Parliament Act to reintroduce the bill against plural voting which the Lords had rejected in 1906, but this larger measure was totally unexpected, and the announcement was widely construed simply as a device for “dising” women’s suffrage. It was at once denounced for that reason by the “militants” who began to make more than was later than ever. From this moment the internal divisions within the Cabinet on the subject of women’s suffrage, and the necessity of taking administrative action against “militant” violence, remained a source of constant difficulty. When eventually, on March 28 1912, the Conciliation bill was rejected by 222 to 208, owing to disgust at “militant” tactics, the prospect of legislative action rested entirely with the question of an amendment of the Government Franchise bill, which was read a first time on June 17 1912, by 274 to 50, and a second time on July 12, by 290 to 175. In other respects this bill, which abolished plural voting and university representation, made six months’ residence by adult males the only qualification for votes, and did away with existing restrictions as to registration, handing it over for automatic action by the municipal authorities, excited comparatively little public interest. There did not seem likely to be time, even if there were inclination, to pass it into law before the session ended. The Unionists, while objecting to details, opposed it mainly on the old ground that redistribution should accompany reform; while the Liberal rank and file, who for their own electorating purposes were primarily anxious to destroy the plural vote, felt that a simple measure with that object would have sufficed. A bill to abolish plural voting, introduced by a private member, Mr. Baker, was read a second time on March 1 1912.

The main problem, however, before the Government when Parliament met on Feb. 14 1912, was Irish Home Rule, with Welsh Disestablishment and Disendowment in a secondary place. The main interest of the latter measure, keenly as it was opposed in the interests of the Church of England, lay naturally in the financial provisions. The income of the Welsh dioceses in 1906 was £556,964; and £500,000 represented voluntary contributions which would be aban-
doned, and the £205,000 derived from endowments the bill would take away £172,500, representing (according to the Liberal view) the national property; but this reduction would only be gradually effected in about 40 years by the Welsh commissioners appointed to manage the transfer—existing interest being maintained and existing incumbents being paid their present stipends—so that in its whole the Church would have the chance of making good the loss of income by increased voluntary contributions. The disestablished Church was given power to set up a representative body; and to this body the Welsh commissioners would hand over the cathedrals, episcopal palaces, churches and parsonages, and also the modern endowments—and such part of the glebe as was not considered to be part of the ancient endowments—to which the Church as such was strictly entitled; as a dividing line the date of 1662 was taken as that after which property of uncertain origin now owned by the Church might be regarded as her own. The funds which by degrees would be taken from the Church were to be applied partly to charitable and public purposes by being handed over to the county councils and partly to the university of Wales (library, etc., would be unaf-

The rather moderate extent of the disendowment thus proposed was somewhat of a surprise. Extreme Liberationists had to console themselves with the prospect of a success for the principle of disestablishment rather than any considerable acquisition of Church property for secular purposes. On the other hand, from a Church point of view, the smallness of the operation on its financial side made the whole transaction seem one of peculiar meanness; for a paltry result, the work of the Church—admittedly now well done, as had been proved before the Welsh Church Commission, whatever its shortcomings in the past—was to be crippled and hampered. Defenders of the Church could point to the fact that it was the largest single religious body in Wales, and the only one which was represented in every parish by a regular organization. The ecclesiastical indivisibility of Wales and England was a more fundamental objection, the Welsh dioceses being from the Church point of view an integral part of the Church of England. The case for the Government, granted the principle of disestablishment at all, was, however, fairly simple. Their precedent was the case of the Irish Church in 1869: it was equally a part of the Church of England, and disestablishment and disendowment had done it good rather than harm. The answer to those who con-
tended that the Church really was the national Church of Wales that the Welsh people thought otherwise; at election after election, almost unanimously so far as political representation showed, they demanded the change as an act of justice. On the first reading of the bill (April 25), which was carried by means of the closure by 331 to 253, Mr. Lloyd George emphasized this point in a somewhat rhetorical plea for the right of his own nationality to have the religion it chose and not to be nationally misrepresented by a Church which, however well it worked, was English and not Welsh. On May 13 the second reading opened with a slashing criticism from Mr. F. E. Smith, but on the third, carried by 348 to 312, the bill was then hung up till the late autumn. Its introduction satisfied the Welsh party, but otherwise it excited no real parliamentary enthusiasm. In recent years disestablishment had ceased to interest any large section of Liberal politicians; and the bill, while alienating many Liberal churchmen and rallying to defence of the Church numbers of voters who are normally indifferent to political issues, was not of a nature to help Liberal or Labour electioneering outside Wales itself.

In making an Irish Home Rule bill their chief measure in Home Rule bill their chief measure in recognition of the Government more fortunate in one respect than Mr. Gladstone had been in 1886 and 1887, because when the first Irish question was still associated in Great Britain with the prejudice and hostility aroused by the agrarian war, with all its incidents of cattle-maiming and boycotting, the "plan of campaign," the Phoenix Park murders and dynamiting outrages, the downfall of Parnell and the split in the Nationalist ranks (see Ireland). A new generation had grown up, to whom all this was ancient history, with no special application to the existing conditions. Ireland for years had been peaceful and growing in prosperity; the Unionist Government had given her both local government and Land Purchase Act; and the idea of Home Rule (as apart from the forgotten Home Rule bills) was now familiar simply as one of the standing issues of party politics. Lord Rosebery's de- tachment had not prevented Sir Henry Campbell-Bannerman from inscribing it again in 1905 on the banner of the Liberal party; and though the Liberals then came into power, independently of the Nationalist vote, under a pledge not to introduce a Home Rule bill during the 1905-10 Parliament, Mr. Asquith had been quite explicit in saying, when the elections of Jan. 1910 were taken, that if he got a majority this self-denying ordinance would be at an end. It was true that at the elections of Dec. 1910 neither Mr. Asquith nor his colleagues in the Cabinet made Home Rule a direct issue either in their election addresses or in their speeches. On the contrary, when the Unionists warned the electorate that in voting for the Parliament bill they were voting also for Home Rule, they were constantly told that this was only a "boogy." But the fact remained that Home Rule was an integral part of the Liberal programme, and within the Government forces returned as supporters of the Parliament bill the Irish Nationalists held the balance of power. Mr. Redmond, for his part, had been perfectly frank about the extent of his support; on Sept. 27, 1910, for example (to give only one instance out of many), at a moment when it was still uncertain to what lengths the Liberal Cabinet would go in framing a Home Rule bill, he was reported as saying in a speech at Buffalo, U.S., "I believe the leaders of the Liberals are sincerely friendly to Home Rule, but, sincere or not, we have the power and will make them too the line." The real strength of his position for making a good bargain over the terms of the bill was based, however, on the willingness of the Liberal and Labour parties to concede, in all essentials, the Nationalist demand, representing as it did not only a solid vote from three-quarters of Ireland but also an important body of Irish opinion in America and the British colonies. Apart altogether from the older arguments for Home Rule, the Liberals justified their policy by the success attending their grant of self-government to the Transvaal, and by the congestion of business in the Imperial Parliament, which in any case made it desirable to move in the direction of devolution. An Irish Parliament and executive of the colonial type for purely Irish affairs, subordinate to the Imperial Parliament, would not only satisfy the Irish claim, but might be the beginning of a federal scheme for the whole of the United Kingdom. Arguing on these lines,—and Mr. Redmond carefully put the Irish case no higher in his speeches before British audiences—it was much easier in 1910 and 1911 for supporters of the Government than it was in 1886 and 1893 to scott Unionist objections to the principle of Home Rule; they could even appeal to Unionist arguments in favour of an Imperial federal constitution. English Liberal Unionists were not now so much agitated about Home Rule as the Rome Rule; and public opinion in Great Britain generally had become rather apathetic about Ireland altogether, being to a large extent out of touch with its problems. It was only in Ulster that passionate resistance was as yet reawakened.

Mr. Asquith introduced the Government of Ireland bill in the House of Commons on April 11 1912. He laid particular stress on its being intended to be the first step towards parliamentary devolution and a system of federalized parliaments within the British Isles, and on its maintaining the supremacy of the Imperial Parliament at Westminster over the new Irish Parliament equally with any that might later be set up in other divisions of the kingdom. The essence of the bill was that in Ireland an Irish Parliament and Irish executive should be responsible for exclusively Irish affairs. Instead of saying precisely what these affairs were, the bill specified what were the Imperial affairs which the Irish Parliament could not deal with, including certain Irish matters (Clause 2) "reserved" to the Imperial Government. There would be two Houses—an elected House of Representatives of 166 members (of whom, on the existing basis, 30 would probably be Unionists), and a nominated Senate of 40 members, on which Mr. Redmond's view was that there would thus be the opportunity to secure the inclusion of Irish public men of eminence, without reference to their party colour. In case of a conflict between the two Houses they would sit and vote together. For Imperial purposes Ireland would still be represented at Westminster, but only by 42 members, subject to a special provision (Clause 26) for increasing this number in case the question of altering the financial relations should arise at some future time and purely for that purpose. The acts of the Irish Parliament would be subject to veto or suspension by the Imperial Parliament, disputes as to their validity being adjudicated on first by the Irish Court of Appeal and secondly by the Privy Council. It might not enact privilege or disability, endowment or deprivation, for any form of religion, or make any religious belief or ceremony necessary to the validity of marriage. Irish taxes would be settled by the Irish Parliament but would continue to be collected (together with such Imperial taxes as remained) by the Imperial Government, and an annual sum corresponding to the cost of Irish services at the time of the passing of the Act would be "transferred" to the Irish Parliament to deal with Customs and Excise as well as other taxation contemplated the setting-up of Irish custom-houses independently of Great Britain, and (within certain limits) the possibility of varying duties as between goods imported into Ireland or into Great Britain; and as the collection was to be made by the Imperial Government, and allowance for the Irish levy to be made to the Irish by the Imperial Exchequer,
the procedure was necessarily rather complicated. The finance of the bill was indeed admittedly and necessarily provisional, complete data being unavailable, in spite of the Government's having had the advice of a committee of financial experts, whose report, however, was not disclosed. For 1912–3 it was estimated that the revenue derived from Ireland was £10,539,000, and the expenditure there £12,354,000, showing a deficit of £1,815,000. In the next ten or fifteen years a further increase in the deficit was contemplated, bringing it up to over £2,000,000. The sum now proposed was estimated accordingly.

Even before the introduction of the bill it had been seen that the greatest practical difficulty in the way of Home Rule, irrespective of controversy over particular details in the scheme, would be the attitude of Unionist Ulster. Under Sir Edward Carson's leadership, opposition was already being organized in 1911, on behalf of the N. of Ireland Protestants and Orangemen, which, it was openly avowed, would, if necessary go to extreme lengths, even to a refusal to recognize a Parliament in Dublin and to the setting-up of a separate 'provisional government' by the Government to counter this movement as far as possible had been shown early in the session by the announcement that Mr. Winston Churchill was going over to Belfast to speak on Feb. 8 in the Ulster Hall, and violent opposition to the proceeding was at once taken in hand there. It was considered on the Unionist side that for the son of Lord Randolph Churchill, who had said that 'Ulster would fight and Ulster would be right,' had preached Home Rule in a place associated with the campaign against it, was an outrage; and the leaders now proposed was estimated accordingly to make the delivery of the speech in the Ulster Hall impossible. Eventually its engagement for the purpose was cancelled, and it seemed for the moment that the prospects of rioting and bloodshed if Mr. Churchill appeared in Belfast at all were so serious that the Government would be obliged to keep him away. Mr. Churchill, however, was not to be daunted. Arrangements were made for the speech to be delivered in a pavilion in a field outside the city, and for troops to be drafted there in large numbers for the maintenance of order. The apparent denial of free speech at all on the Ulster Unionist side was severely commented upon elsewhere, and justified with some malignings by English sympathizers, but when the leaders had been successful in defeating the plan for holding a Home Rule meeting in the Ulster Hall they went no further. Mr. Churchill duly arrived and made his speech, dwelling particularly on the safeguards which the Home Rule bill would contain against anything to which Ulster could object; but the city was in a ferment of desperate antagonism and he had to be smuggled away afterwards to avoid the hostility of the crowd. Actual rioting was avoided, and peace was kept between Nationalists and Loyalists, at the cost of £2,750 for the expense of the troops engaged, the Ulster leaders having eventually devoted themselves to keeping their supporters well in hand; but the whole incident was an unpleasant revelation of the rebellious spirit that was being aroused. A little later (April 9) Mr. Bonar Law was present at a great demonstration at Belfast, the special note of which was a solemn pledge of Loyalist resistance.

The Liberal press in England made fight of these warnings, but the organization of opposition in Ulster went steadily on. As controlled by the Irish Unionist leaders it was formally independent of actual parliamentary tactics, and therefore of the action of the Unionist party under Mr. Bonar Law's guidance; but Unionist opposition in Parliament and in the constituencies was inevitably concerned with what might take place in Ulster. Mr. Bonar Law, at Blenheim on July 27, and in the House of Commons on Aug. 5, took his side openly with the Unionists of Ulster. If, he said, the Ulstermen were forced into defiance of a measure passed under the Parliament Act without further appeal to the electorate, and by the dictation of a Nationalist vote which had in their view always been dialooy to the Empire, any attempt to coerce Ulster could only mean civil war, and this could not be confined to Ireland; it would be incredible that the Government would contemplate the coercion of Ulster by British bayonets, but if they went to that length the situation would be intolerable,—ministers would be "lunched in London." Many Liberals hoped to find relief by proposing to the Irish Historical Committee, at least temporarily, altogether; but an independent Liberal Government sent to this effect in Committee (July 18), after some ambiguous inquiries from the Government whether Ulster would be satisfied if it were adopted, was rejected by 320 to 252.

Meanwhile, on April 23 an Irish National Convention in Dublin, with Mr. Redmond presiding, accepted the bill, and the doubts as to whether Irish Nationalists might disagree over it and it might be snuffed out like the Irish Councils bill in 1907, were dissipated. On July 10 Mr. Asquith addressed an enthusiastic meeting in Dublin, sitting in the course of a football match at Belfast Prime Minister who had had a welcome there in Nationalist circles. The first reading of the bill was carried in the House of Commons on April 16 by 360 votes to 266, and the second reading (April 30) on May 4 by 372 to 271. The Committee stage began on June 11, and on July 3 the first clause had gone through; discussion was then suspended till the autumn. On the Unionist side the objections to any scheme for a separate Irish Parliament and executive were fortified by criticisms of special features in the new bill itself—the finance, the proposals for Irish representatives to remain at Westminster, the separation of post-offices and custom-houses—but these subjects had still to be further discussed when Parliament adjourned in August. On the Liberal side a good many members disliked the provision for the nomination of an Irish Senate, and this question arose in Committee on Clause 1, but an amendment to exclude it was rejected (June 19) by 288 to 199.

Effective opposition was in Ulster, not in Parliament. Serious rioting between Protestants and Catholics in the Belfast shipyards during July showed the tension there; and on Sept. 14 a free fight between partisans of both sides in the course of a football match at Belfast, at which 10,000 people were present, resulted in injuries to about 100, revolvers and knives being used. Active preparations were on foot for a series of Unionist demonstrations in Ulster, leading up to the signing on Sept. 28 of a Solemn Covenant, pledging resistance to Home Rule. The perplexity on the Liberal side in face of Ulster's determination was shown by a speech of Mr. Churchill's at Dundee on Sept. 12, in which he suggested, purely on his own account, that, to secure a federal system of government for the United Kingdom to which Home Rule for Ireland, however, was an essential preliminary,—it might be desirable to grant separate legislatures to large homogeneous areas in England like Lancs., Yorks., the Midlands, and London; he would not shrink from the creation of 10 or 12 such English bodies, all subordinate to the Imperial Parliament. Mr. Churchill's speculation was effectively criticized by Mr. Balfour at Haddington on Oct. 9, in which it was criticized, as "the application of decimal fractions to the United Kingdom." What Unionist Ulster demanded was to remain under the Imperial Parliament and not be at the mercy of a parliament in Dublin.

The text of the Solemn Covenant, promulgated by the Ulster Unionist Council, was as follows:

Being convinced in our consciences that Home Rule would be disastrous to the material well-being of Ulster as well as of the whole of Ireland, subservative of our civil and religious freedom, destructive of our citizenship, and perilous to the unity of the Empire, we, whose signatures are underwritten, now solemnly declare the covenants of His Gracious Majesty King George V., humbly relying on the God Whom our fathers in days of stress and trial confidently trusted, hereby pledge ourselves in Solemn Covenant throughout this our time of threatened calamity to stand by one another in defending, for ourselves and our children, our cherished position of equal citizenship in the United Kingdom, and in using all means which may be found necessary to
defeat the present conspiracy to set up a Home Rule Parliament in Ireland; and, in the event of such a Parliament being formed upon us, we further solemnly and mutually pledge ourselves to refuse to recognize its authority. In sure confidence that God will defend the right, we hereto subscribe our names, and, further, we individually declare that we have not already signed this Covenant.

Sir Edward Carson signed first, on Sept. 28, at the head of a great gathering in Belfast. And when, just afterwards, he crossed with Mr. F. E. Smith to Liverpool, he had a remarkable ovation, violent speeches being made by sympathizers with the cause of Ulster, 1 in favour of supporting her resistance by force of arms. It was announced later that the total signatures to the Covenant were:—Ulster, men 218,206, women 228,991; Outside Ulster, men 10,162, women 5,055.

Reference must now be interposed to the progress of the industrial unrest in England, culminating during 1912 in the general strikes of coal-miners and transport workers. For some time past trouble had been brewing in the coal industry. In Dec. 1910 a strike had begun at the Cambrian Combine Collieries (of which Mr. D. A. Thomas, afterwards Lord Rhondda, was managing director), owing to the failure of the two referees (representing owners and men) appointed by the South Wales Conciliation Board to agree upon a tonnage price for the working of a seam at the Ely Pit, which had till then been worked on day-work. The rates offered by the owners were denounced by the strike committee as "starvation" wages; but the owners declared it was really a forward move on the part of the younger extremists among the men, who had obtained the upper hand and were influenced by socialist doctrines. A general lockout of the men working in other seams in the Ely Pit was the masters' reply. The Welsh Socialists then sent delegates to enlist sympathy among the English and Scottish miners elsewhere, and to try to bring about a general strike; but the leaders of the miners' Federation of Great Britain were not prepared to support the action of the Ely Pit strike committee, and financial support was refused, so that the miners were in a difficult position.

The miners' Federation next put a claim before the owners in the federated area for the fixing of definite rates of payment in the case of "abnormal places" where the men were unable to earn an average day's wage for no fault of their own. At the Southport conference of miners' delegates in Oct. 1911 the following resolution, proposed by the executive, was unanimously passed:—

‘That the federation take immediate steps to secure an individual minimum wage and benefit for all miners of the federation, without any reference to the working places being abnormal. In the event of the employers refusing to agree to this, the 21st rule be put into operation to demand assent.' At a second conference on Nov. 14, at which the refusal of the employees to accept the minimum wage was reported, an adjournment was resolved on (by 336,000 votes to 238,000) for future negotiations; and on Dec. 21, the situation remaining the same, it was resolved that a ballot should be taken on Jan. 10-12 1912 on the question: "Are you in favour of giving notice to establish the principle of a minimum wage for every man and boy working in the mines of Great Britain?" A resolution was also passed "that each district send to Mr. Ashton (general secretary of the Miners' Federation) a tabulated statement of what it desires to be its minimum wage, and that the executive committee of the Federation meet to consider the statements and report to a national conference in Birmingham on Jan. 18 1912." The result of the ballot showed 445,501 votes for giving notice, 115,721 against—majority 330,080.

South Wales alone giving a majority of 85,107 for stopping work. And on Feb. 2 1912 a definite schedule of the minimum rates asked for was approved.

The coal-owners met on Feb. 7, and the Welsh owners then refused to discuss any minimum wage and retired from the conference. This made a strike inevitable, since the miners were not prepared to settle with any but the whole federated area. Notices were given accordingly, the public being faced with a prospect of a complete cessation of coal supplies. The Prime Minister on Feb. 26 invited both sides to meet him to discuss means of averting a national stoppage, and their representatives met him on Feb. 27, but to no purpose; and on Feb. 26 the first miners went on strike at Alfreton, the rest soon following, in spite of the announcement that the principle of a minimum wage was adopted by the owners. It was decided that they would take steps to give it parliamentary sanction unless an agreement were arrived at. On this point a split occurred between the coal-owners, those of Durham and the federated districts being prepared to fall in with the proposal of the Government, and the others refusing. On March 1 over a million coal-miners were out (Yorks. and N. Midlands 235,500; S. Wales 220,000; Scotland 130,000; Northumberland 120,000; Durham 110,000; Midlands and South 105,000; N. Wales 70,000; N. and E. Lancs. 45,000), and during the whole month the country was convulsed by the calamity.

At last, after the Government had made a further unsuccessful attempt, by a conference, to bring owners and miners to agreement, on March 19 1912 Mr. Asquith introduced in the House of Commons a Minimum Wage Bill as their last resort. It provided that, in the coal industry, every contract for employment should include the payment of a minimum rate, to be settled for each district by a joint board set up under the auspices of the Board of Trade. The bill was read a second time on March 21, after a motion for its rejection by Mr. Balfour, on behalf of the Opposition, had been defeated by 125 votes to 225, and it had passed both Houses on March 28. Having made their protest against a piece of revolutionary legislation which introduced so novel and far-reaching a principle into industrial economics, the Unionists left the responsibility to the Government, and the only parliamentary difficulty was caused by the Labour party, who fought for the inclusion of a precise definition of the minimum in the shape of 5s. a day for adults and 2s. for boys; as the Government refused this and insisted on the rates being fixed by the district boards, the Labour party opposed the third reading. The bill, however, was carried by 213 to 48. It was actually a vote among the miners as to whether the failure of the Labour party to get their own minimum schedule of rates adopted, and for a time the result was doubtful; but it was decided to take a ballot (April 1) on the question of returning to work, and though a majority still voted for staying out (244,011 to 201,013) it was not large enough (two-thirds being required by the rules).

The fact was, the funds were exhausted and the men had had enough of the struggle. The conclusion of Sir A. Markham, the Liberal M.P. and coal-owner, writing in the Quarterly Review for April 1912, "in the belief that he had considered that the "ground of attack was ill-chosen; the men should have stood to their original demand, the payment on account of abnormal places or losses due to bad management. If in addition they had asked for an increase of wages equivalent to 10% on the basis rates, to meet the increased cost of living, they would have occupied strong ground. The great mass of men came out to obtain higher wages, and for no other reason; and when they voted for the formula 'minimum wage' nine-tenths did not know what they were voting for." The result, as the year went on and the minimum rates were settled, was not without friction, was a profound disgust among the coal-miners generally with the operation of the new Act, which was found to do very little to increase the amount paid in wages; but it had done its work for the moment, the crisis being over. In Oct., moreover, an agreement was arrived at between repre-
sentatives of miners and coal-owners of the English federated area, by which about 400,000 workers would at once receive an advance of a shilling a week in wages. This was the outcome of discussions before a Conciliation Board, which had been in existence for some years and was now renewed for a further period; and this addition of about £1,000,000 a year was worth more than all the haggling about minimum rates.

In connexion with the opening phases of the railway strike of 1912, allusion has already been made to the sporadic strikes of other sections of "transport workers" earlier in the year; and Mr. Gosling, in his report for the Strike, 1912. in London on May 20, 1912, was really the concluding phase of the unrest which had been only partially quieted during the previous August. First the lightermen came out, and then a "sympathetic" strike involved all the other unions of transport workers connected with the Port of London.

The nominal reason for the lightermen ceasing work was their objection to one man employed as a watchman having no "federation ticket"; he belonged to the Foremen's Society, a union not affiliated to the Transport Workers' Federation, but refused to join the Lightermen's Society, which was so affiliated, and thus the lightermen demanded his dismissal, on the ground that they would work only with men who belonged to the federation, his employers naturally refused. This was, however, in reality only the culmination of a number of "grievances" put forward by the men, who complained of being victimized under the terms of the existing agreements. Unsuccessful negotiations had for some time been going on between their secretary, Mr. Gosling (himself actually a member of the Port of London Authority), and the Board of Trade, with a view to pressure being put on the employers; and the declaration of a strike on May 20 for the reason given was prompted by the hope that the hands of the Government would be forced. In taking this step the lightermen relied on their privileged position in the Port of London. Their Society held an old licence from the Watermen's Company, whose functions were transferred in 1908 to the new Port of London Authority, and the law was that unlicensed men should not be employed so long as licensed men were available, so that, apart from the difficulty of obtaining substitutes in an emergency, the employers, as they knew, would have to reinstate them when the strike was over. (One result of the strike was that the Port of London Authority took steps to get this law altered.)

The Federation of Transport Workers now took up the lightermen's cause, and in doing so put forward a further grievance on behalf of the Carters' Union, by whom an agreement had been made with the Master Carters' Association when the strike of the previous August was settled. The complaint was that one firm which had joined the association had dismissed their union men, contrary to the terms accepted, and had resigned from the association when it called them to account, so that the agreement was useless. The union demanded accordingly that all employers in the Port should be obliged to belong to a masters' federation, which would have power to guarantee the carrying-out of agreements. As no concession on this point was forthcoming, notice of a general strike of all members of the 'Transport Workers' Federation was given.

The Government at once took action by appointing Sir Edward Clarke, K.C., to hold an inquiry on May 24. He made his report on May 28 to the effect that, while the lightermen were wrong in supposing that the award of the previous August meant that none but members of their federation should be employed, and they themselves had broken their agreement by striking without recourse to arbitration, still there were several points on which the transport workers had legitimate grievances, owing to the employers not having carried out certain terms of their agreements also. The Government on May 29 suggested a conference between the two sides, which was, however, declined by the ship-owners, who insisted that the only point really at issue was the lightermen's breach of agreement in suspending work and thus dislocating the whole business of the Port. Meanwhile a general strike of transport workers was in progress at the docks, some 80,000 men being affected, and the whole food supply of London was threatened; but the ship-owners actively engaged "free" labourers in spite of trade-union picketing and intimidation, and day by day managed more efficiently to get their ships unloaded. Public discussion, influenced by Sir Edward Clarke's report, and its criticism of both sides, centred round the apparent necessity of providing, alike for masters and men, some guarantee against breaches of agreement. Attempts were made by George Gosling, the Home Secretary's temporary absence in the Mediterranean dominated the Government policy, made proposals, which he explained in the House of Commons on June 5, for a Joint Conciliation Board, combined with pecuniary guarantees on both sides. Mr. Gosling, on behalf of the transport workers, gave a general assent to this suggestion, but the employers and the Port of London Authority (with Lord Devonport—formerly Mr. Hudson Kearley, a well-known Liberal M.P.—as chairman), after careful consideration, rejected it on June 10. It was pointed out by them that there was no proper basis, under the conditions prevailing, of the docks, the strike board, the tariff board, the two courses being very different and the employers (some of whom were foreign firms) themselves being competitors; the Port of London Authority moreover was a statutory body, with distinct obligations and responsibilities, and could not well enter into such an arrangement, any more than a Government department could—the Post Office, for instance—with the men in its employment. This was not a case of a strike against some individual firm which had given legitimate cause of offence, but a general strike against the whole Port, defying all agreements.

Negotiations now broke down altogether, and the leaders of the Transport Workers' Federation declared a "national" strike and tried to call out all its allied members at other ports as well as London. But though some 30,000 men responded altogether at Manchester, Southampton, Bristol, Plymouth and Swansea, this appeal for a "national" strike was a thorough failure; the railway unions had had enough fighting the year before and the seamen and firemen, as a body, were not prepared to come out. Scenes of violence were of daily occurrence between unionists and free labourers at the London docks; but by June 18 it was clear that the Port of London Authority and the Home Secretary (which Mr. McKenna, the Home Secretary, provided, though somewhat grudgingly), had the strikers well beaten, having obtained a sufficient supply of labour for the handling of cargo. From this point, the strike degenerated into sheer anarchy. Serious conflicts occurred, in which revolvers were used in self-defence by the free labourers, notably on July 24 and on July 31, but by degrees the strike committee realized that their efforts were in vain. They recommended a return to work on July 27, but a mass-meeting in Hyde Park next day refused to comply with this advice, and it was not till a week later that all pretence of continuing the strike was abandoned. On July 31 the lightermen decided to give in, and the riot among the dockers that day was mainly due to their finding that their old places had been filled up and that it no longer rested with them to say whether they were wanted any more or not. On behalf of the employers, however, and of Lord Devonport, a general assurance had been given that, if the strike were abandoned unconditionally, any outstanding grievances under the old agreements would be inquired into and reinstatement effected as soon as possible for men who had formerly been in regular employment; and, as the result, the committee and the leaders could hold out no longer, further resistance came to an end.

The real object of the strike, in so far as it aimed at being a "national" one, was to compel Parliament to legislate, as it had done for the coal-miners. In this case, however, the Labour politicians and their sympathizers were impotent. The discussions in the House of Commons turned mainly on Unionist criticism of the Home Secretary for the apparent disinclination he showed for using
to preserve order and protect the free labourers. On June 12 Mr. Austen Chamberlain moved a vote of censure on Mr. McKenna, which was rejected, however, by 337 to 260. On July 1 Mr. O'Grady (Labour M.P. for E. Leeds) moved a resolution "that it was expedient that the representatives of the employers and working men's organizations involved in the dispute should meet with a view of arriving at a settlement," and Mr. Asquith left the matter to the House, saying that he himself would not vote on it, as he did not think Government intervention would be justifiable or expedient. Mr. Bonar Law, for the Unionists, having expressed his surprise that in those circumstances Mr. Asquith did not oppose the resolution, moved as an amendment, "that this House regrets the continuance of the strike and the consequent suffering, and approves of the declaration of the Prime Minister that the constitutional and normal attitude of the Government should be one of complete detachment and neutrality, and is of opinion that the intervention of this House in this instance can serve no useful purpose." The amendment was rejected by 260 to 215, and the resolution was carried by 254 to 188. This was the end, however, of any parliamentary action. The strike was already collapsing, and its only political result was to focus public opinion on the desirability of compulsory arbitration, or at any rate some improved machinery for making agreements, once entered into, binding on both sides.

Parliament met again for the autumn session of 1912 on Oct. 7, and the political conflict was once more renewed in the House of Commons. The effect of the Ulster decision on the Government, up to this point, had not been specially terrifying; and Mr. Asquith, speaking at Ladybank on Oct. 5, dealt somewhat scornfully with Sir Edward Carson's movement and the Unionist attitude towards it. The Government, he intimated, were ready to consider any proposals for safeguarding Ulster, but Ulster had nothing to suggest—she simply would not allow Ireland to have what the other four-fifths of Ireland demanded. It was impossible for the Government to give way to intimidation, prompted by the spirit of Orange ascendancy; they meant to go on with their bill. On Oct. 19 he introduced in the House of Commons a series of resolutions for completing the various stages of discussion on it by Christmas under the closure. Including the time already occupied, 59 days (to which two were added a few days later) were on this scheme, to be devoted to debate. An Opposition amendment, proposed by Mr. Bonar Law, was defeated by 233 to 232.

The operation of the guillotine, combined with the "Kangaroo" system by which the chairman of committees was left to choose which among the various amendments proposed should be discussed in the time available, made the resumption of the committee stage simply a question of whether the Government could maintain their majesty: any the Irish men of the House was obviously impossible, and Mr. Bonar Law bluntly declared that the Government might as well have moved that the bill should be passed without further delay. On the other hand it was equally true that, without such a time-limit, the Opposition would have protracted the debates indefinitely; the Government had no option in the matter if they were to send the bill up to the House of Lords during that session, as they must, in order to obtain the benefit of the terms of the Parliament Act. Even if the Home Rule bill were to be passed through the House of Commons by Jan., the Government programme was too overloaded, for they had announced their intention also to pass the Welsh Disestablishment bill, the Franchise bill and other measures, before the session ended.

At the same time, with Mr. Lloyd George's active encouragement, yet another political issue was being made prominent throughout the constituencies, in the shape of an organized agitation for land-reform and increased taxation of land-owners, promoted more particularly by a section of the Radical party who had long been advocates of the single tax theory. As Henry George's lines. The Budget of 1910 (as incorporated and passed by the House of Commons) with its provisions for effecting a complete valuation of the land, paved the way for such a movement, and the land-reformers saw their opportunity now for pushing their views and preparing for legislation. The fact, indeed, that the yield of the new land-value duties in 1911 and 1912 proved disappointingly meagre had even driven them to seek this extension of policy. For, with the comparatively humble budgets of those years, the critics of "Lloyd George finance" in that respect were already taunting it with utter failure. The unpopularity of the Insurance Act made it opportune, moreover, for Mr. Lloyd George's section of the party to try to divert electioneering attention on the Radical side to something more attractive, and at the summer and autumn by-elections the new land campaign was made a leading feature by Radical candidates. Intense exasperation was created on the Conservative side, representing as it did to so large an extent the landed interests of the country, by the organization of an unofficial committee of inquiry under Mr. Lloyd George's auspices with the authority of the Cabinet, in order to obtain evidence of various sorts of agrarian grievances in furtherance of a new Radical policy.

An important change in the Home Rule bill was made when on Oct. 30 the discussion in committee reached clause 8, concerning the composition of the Irish Senate. It was suddenly announced by Mr. Asquith that, while the proposed nomination of the first senators by the Imperial Government would be adhered to, the Government had decided to abandon the idea of their successors being nominated by the Irish Government. Instead of this, the bill provided for the election of 14 Irishmen by the people in each of the four Irish provinces, taken as units, on a plan of proportional representation, each elector having a "transferable vote" (see 23,115). The term of office for senators would be five years, and all would retire together at the end of the fifth year so that the elections might then be taken. The next day (Oct. 31) the revised clause was introduced and carried.

Mr. Asquith insisted that it would be an additional safeguard for the Unionist and Protestant minority in Ireland, but Mr. Bonar Law regarded it as worthless for any such purpose, and Mr. Healy frankly declared that in his opinion the Irish Unionists would have been better off with the method of nomination. Mr. Redmond, while accepting the Government's decision, expressed much the same view. The fact was that the whole idea of a nominated Senate was distasteful to most of the Liberal party, and it seemed a favourable opportunity for putting the experiment of proportional representation, which had recently made many converts, into practice.

On Nov. 8 Mr. Asquith introduced a "guillotine" timetable for the Welsh Church bill, allocating 14 days to the committee stage, two to report, and one to third reading. So short a shift excited much bitterness on the Opposition benches, the discussion that day being adjourned; and on Nov. 11 the situation in the House of Commons was changed by an unforeseen event. On a resolution required as a preliminary to discussion of the financial clauses of the Home Rule bill Sir F. Banbury moved an amendment without notice, providing that the total payment from the Imperial to the Irish exchequer in any one year should not exceed £2,500,000. It was early in the afternoon, when the Unionists were in unaccustomed force, and the Government was defeated by 238 to 260. Mr. Asquith immediately moved the adjournment of the House; and next day it was announced that the Cabinet had decided to move a resolution rescinding the vote and providing (so as to regularize further proceedings under the timetable, which was entirely upset by the incident) that the next day on which business was taken on the Home Rule bill should count as the "16th allotted day," though, as previously fixed, the 16th day was Nov. 11; when this had been done, they proposed to reintroduce their financial resolution and proceed as though nothing had happened. On the 13th Mr. Asquith accordingly moved to this effect. This proposal to rescind the vote and set up the resolution aresh was, however, as the Speaker agreed in reply to Unionist objections, absolutely unprecedented in parliamentary procedure.
It had always been held, and was laid down by Erskine May, that no question or bill could be brought up in the House that was substantially the same as one on which judgment had already been expressed in the current session; and when the Speaker nevertheless ruled that Mr. Asquith's motion, though unprecedented, was in order, Opposition exasperation became intensified to a point beyond control. After Mr. Bonar Law had argued the case at length, and had moved the adjournment of the debate, which Mr. Asquith curtly declined to accept, a state of organized disorder prevented any further proceedings. The Speaker at last took the only course open to him, and adjourned the House. There seemed likely to be renewal of the same scene next day, but calmer counsels prevailed. At the opening of the sitting the Speaker suggested that, if more time were given for reflection, a less objectionable way might be found for regularizing the proceedings. Mr. Asquith promptly accepted this suggestion, and moved that the House should adjourn for the purpose till Monday the 18th. As Mr. Bonar Law concurred, this course was adopted, and the anticipated storm was avoided. The air had previously been cleared to some extent by amendments being made by Mr. Ronald McNeill for the most violent incident in the disorder of the previous evening.

In the heat of the moment he had thrown a book at Mr. Winston Churchill which struck him a severe blow on the face; but he now offered a handsome apology.

The Liberal press was inclined to treat the opposition to Mr. Asquith's motion as purely factious, and the organized disorder as a further mark of deterioration in parliamentary manners. But the historian cannot well take this simple view. The defeat of the Government was certainly an accident, but it was the sort of accident that happens when a number of nominal supporters are not personally enthusiastic for the particular cause involved, or are being tired out by excessive demands on their attendance. The opinion of a high independent Liberal authority on procedure, Mr. James Caldwell, ex-M.P. and formerly chairman of committees, was moreover that Mr. Asquith's proposal for meeting the new situation was "clearly out of order" (The Times, Nov. 16), although not so ruled by the Speaker owing to the critical state of the situation. The attack on the situation in the Balkan War, a change of government, as Mr. Bonar Law frankly admitted, was not at this moment desirable; and if the Government chose to ignore what was formally a parliamentary defeat their normal majority was still available. But the Opposition were naturally not prepared to forgo what, according to the practice and precedent of Parliament, was a legitimate opportunity for impeding the execution of the Government's programme of legislation for the session; and they gained their point. On Nov. 18 Mr. Asquith moved an amended proposal, which was agreed to without further discussion. It had not been in a financial matter, but if the financial resolution should simply be negatived that day and the committee stage on the financial clauses of the Home Rule bill set up afresh on the 19th by the introduction of an amended resolution, the report stage of which would be taken on the 20th, so that the next "allotted day" (the 17th day under the timetable) would be on Thursday Nov. 21. This course was accordingly pursued.

After the scare in the Government ranks caused by the misadventure of Nov. 11 and its immediate consequences, the resumption of proceedings on the financial clauses of the Home Rule bill saw their normal majority well kept up, and the guillotine fell with mercurial regularity. Faced with a hostile and unrelenting House of Lords, whose certain antagonism could only be defeated by sending the bill up in time to obtain the benefit of the Parliament Act, the Coalition were compelled to restrict discussion in the House of Commons; and it might well be thought on their side that at this stage, since in any case the Parliament Act involved nearly two years' delay, it was futile to attempt to examine every detail in a scheme which was approved in principle, but which still had a long fight before it. On the other hand it was incontestable that, for a measure of such profound importance, supposing it to be one that might come into operation as it left the House of Commons, the discussion of the various difficult and obscure aspects of the new financial relations proposed between Ireland and Great Britain was entirely inadequate. Clause after clause was carried, undiscussed, under the closure, full of complicated provisions, the working of which very few of the rank and file in Parliament even pretended to understand. For judicial examination in debate, reflecting the careful conclusions of the House of Commons, was substituted the opinion of the ministers in charge of the bill, alike as to the powers it gave and the way those powers were likely to be used. Just as the Insurance Act had left all sorts of obscure questions to be settled by the commissioners, so the Home Rule bill left some of the thorniest problems of the financial relations with Ireland to be solved by the proposed Joint Exchequer Board, an entirely new official body, whose real status was highly questionable; and clause 22 providing for this, with the remaining financial clauses, 23, 24 and 25, were duly guillotined on Nov. 27. Eventually, under the guillotine, the bill passed its third reading on Jan. 17 1913. The committee stage had ended on Dec. 12, clauses 26-48 and the final schedules having been carried since Dec. 2 by the operation of the guillotine without any concession to Unionist criticisms. The committee stage had lasted altogether 36 days, including the 25 provided under the timetable; two clauses (1 and 37) had been fully discussed, and 22 partly discussed, while 24 had received no discussion at all.

For the Welsh Church bill the time-table resolution had similarly been carried on Nov. 28, at the end of an all-night sitting, though the Government agreed to a further 24 days, instead of the 14 originally proposed, to the committee stage, which began on Dec. 5; and by Christmas 1912 this bill too was well on its way through the House of Commons. The discussions were marked throughout by much bitterness of feeling on the part of the defenders of the Church, among whom Lord Robert Cecil was specially prominent, but they were notable also for some important expressions of the desire of Liberal churchmen to make the disendowment proposals less harsh than what the Welsh Non-conformists considered to be in accordance with their rightful demands. A concession was made on clause 8, the Government accepting (Dec. 18) amendments proposed by Sir Ryland Adkins and Mr. Atherley Jones (both Liberals), by which, much to the disgust of the Welsh members, the Church would retain possession of the Queen Anne's Bounty funds and property. On another amendment, proposed by Mr. Ormaby Gore (Conservative), for keeping all the glebe as church property, the Government majority fell (Dec. 19) to 55, the figures being 277 to 222; and clause 8 was only carried by 284 to 221. The fact that the majorities in both these cases were smaller than the number of Irish Nationalists voting with the Government showed that there was a good deal of sympathy with the opposition among some sections of Liberals.

The actual proceedings in the House of Commons were being followed, however, with marked apathy in the country. Everybody felt that the real struggle had to come by 1913. During the past month the critical state of European affairs monopolized public interest; and the party conflict took a secondary place when larger issues were at stake. Mr. Asquith and Sir Edward Grey, by common consent, were making British influence a powerful factor in the peace in the settlement of the Balkan crisis. The administration was strengthened for the moment simply by the fact that it represented the whole nation in the councils of Europe. Meanwhile trade was booming, and in some other respects also the position of the Government was more favourable than it had seemed likely to be a few months earlier. At Bolton, when there was a by-election on Nov. 23, the Liberal candidate surprised his own party by retaining the seat with only a slightly diminished majority. Moreover, the Unionists were again in the throes of further discussions over their Tariff Reform policy. Since Mr. Bonar Law had become the Unionist leader little had been heard of any vaver-
The doctrine, as to whether they would accept Mr. Lloyd George's latest terms for ordinary medical service under the Insurance Act. Out of a total vote of 13,731, 11,306 were for rejection. On Dec. 20 the representative meeting of the British Medical Association was held, and by 182 votes to 21 a resolution was passed rejecting the Government proposal and advising the profession to declare service under the Act. In the previous Feb. practically the whole profession—at all events, that part which had been formed into a constitution, and together by the policy to be decided upon by the British Medical Association, and if they held to their pledge this meant a complete breakdown in the provisions of the National Insurance Act for medical benefit, which were to become operative on Jan. 15 1913. On the other hand, a scheme for an alternative policy was coupled with this flat refusal of Mr. Lloyd George's own proposals. It was recommended that the profession should express its willingness to treat insured persons, under arrangements to be made between local committees of doctors and the insured or their representatives (i.e., the approved societies) for a minimum rate of 2s. 6d., inclusive of drugs, or a minimum fee of 2s. 6d. a visit, on condition that each insured person should have free choice of doctor and that the doctor should consent to act. Under this plan the doctors would not be dictated to by the lay insurance committees, but the financial terms would be practically the same that Mr. Lloyd George had last offered. It was promptly announced that the Government could not fall in with this proposal, which would involve handing over public money without public control; and the question now was whether there would be sufficient breaking-away from the pledges given to the British Medical Association for the insurance to be made secure and to bring their panels of doctors in accordance with the regulations under the Act. Only about half of the 27,000 doctors who had ranged themselves with the Association in Feb. had actually taken the trouble to go to the poll in Dec., and though this was generally believed not to indicate in itself any corresponding failure in the solidarity of the profession, there were now signs of a good deal of independent action in certain localities, and notably in Scotland. Already in Nov. a few doctors who thought it a public duty to fall in with the Government scheme had started a new organization in opposition to the British Medical Association, called the National Insurance Practitioners Association; and its influence, backed by Government support, was being exerted in the same direction. On Jan. 2 1912 Mr. Lloyd George, addressing the Advisory Committee, took a sanguine view of this situation, and declared that some 8,000 doctors were available. Nevertheless the strike now proclaimed against the Insurance Act by the recognized leaders of the medical profession was a very awkward fact for the Liberal party.

The year thus ended with the promise of a full crop of domestic political difficulties to be harvested in 1913. (H. Ch.)

II. From Jan. 1913 to July 1914

The political difficulties bequeathed by 1912 to 1913 were still unsolved 19 months later, at the outbreak of the World War in Aug. 1914. The medical opposition to the National Insurance Act, as the result of a memorial from the bulk of the Unionist M.P.'s, Mr. Bonar Law, on Jan. 13 1913, stated in a letter that he and Lord Lansdowne, while remaining leaders of the party, were willing to agree that food duties should not be imposed without the approval of the electorate at a subsequent general election.
ance Act did indeed melt rapidly away in 1913. In spite of a vehement professional meeting of protest on Jan. 7, the British Medical Association found itself forced by the independent action of doctors in all parts of the country to release its members from their pledge not to serve on the panels; and, though the Act remained for long unpopular, medical benefit was brought generally into operation, as arranged, on Jan. 15. At first the panel doctors were greatly overworked, and there were many hitches in administration. To obviate these, and to meet objections raised by the great Friendly Societies and by the trade unions, a substantial amending bill, involving a further charge on the State of £200,000 per annum, was introduced and carried by the Government. The Opposition did not fail to point out that this immediate necessity for amendment proved their charge that the provisions of the original Act were hasty and ill-considered; but Mr. Lloyd George was able to claim in Aug. that there were 18,000 doctors and 9,000 chemists working under the Act and prospering through it; that 270,000 workers were receiving sickness benefit, and that 20,000 consumptives—13,000 in sanatoria—had been already treated. In Feb. of the following year he boasted that there were over 20,000 general practitioners on the panels out of 22,500 in Great Britain; that nearly £4,500,000 had been distributed among them, besides £535,000 for the payment of unbalanced balances between doctors and chemists of £350,000.

The internal controversy among the Unionist party about Tariff Reform was also settled, at any rate temporarily, at the beginning of 1913. Mr. Bonar Law’s Ashton declaration did not satisfy the opponents of food taxes, who were strongly supported by important organs of the Unionist press, and early in Jan., a memorial was presented to him signed by almost the whole body of Unionist M.P.’s, advocating a further modification of the proposed procedure but strongly decrying any consequential change of leadership. The leaders acceded to their followers’ wishes. After stating that the Unionist policy would be not to impose new duties on food, in order to secure the most effective system of preference, until they had been submitted to the people at a general election, Mr. Law added that he and Lord Lansdowne would have preferred that this change of method should be accompanied by a change of leaders, but in deference to the expression of opinion in the memorial they would remain. In a speech at Edinburgh on Jan. 24, Mr. Law claimed that, in spite of the modification, the flag of Imperial Preference was still and strong, and the Unionist policy remained perfectly definite. They would impose a lower tariff than that of any industrial country on manufactured goods; they would give the Dominions the largest preference possible without food duties; and they would try to establish cooperation throughout the Empire in trade as well as in defence. They would work out with the Dominions the best scheme to this end, and put it before the electors for their assent. The solution was welcomed by the bulk of the Unionist party, and was accepted by Mr. Austen Chamberlain, though he said in Dec. that his submission to the conditions laid down at Edinburgh was the bitterest sacrifice he had ever made. There were protests in extreme Tariff Reform circles, but these did not seriously impair the regained unity of the party.

But no solution was found, before the war broke out, of the franchise question, of the grave problems of industrial unrest, or of those involved in the two great measures going forward under the provisions of the Parliament Act—the Welsh Disestablishment bill and the Irish Home Rule bill. The Franchise bill which the Government had introduced was to serve two main purposes: to abolish plural voting, and introduce a system, by way of amendment, of testing the opinion of the House of Commons on women’s suffrage. The abolition of plural voting was strongly resented in the City of London, the most famous constituency in the country, as thereby an electorate containing the principal bankers and merchants of the Empire would be transformed into one consisting of a small number of resident caretakers and messengers. But it was the proposal to enlarge the bill by including women’s suffrage in it that proved fatal. On Jan. 27 the Speaker ruled, as a matter of order, that, if any amendments of the kind were inserted, the bill would become a new bill and would therefore have to be withdrawn. The Reform bills of 1832, 1867, and 1884 had been designed to enfranchise new classes of the people: this bill was not, and therefore could not properly be amended in the sense desired by the advocates of women’s suffrage. The Government accordingly withdrew the measure, promising, however, to give facilities for a private member’s suffrage bill in the next session. This contritum was a blow both to the prestige of the Government and to the suffragists. Militancy, which the movement had sooner or later been forced to adopt, was rapidly spreading throughout the year; Mrs. Pankhurst, the leader of the movement, announced that she would hold nothing sacred except human life. Shop-windows were smashed; golf links were defaced; telegraph wires were cut; church services and public meetings were interrupted; a woman lost her life in attempting to interfere with the race for the Derby. But arson was the principal weapon of the extremists, and during the year many railway stations, grand stands, boat-houses, pavilions, unoccupied country-houses, and even churches were by them wholly or partially burnt down. Popular feeling, in consequence, ran high against the people in London who were suspected of having been guilty of this act, and had to be prohibited by the police. A large proportion of the women who were convicted of committing outrages and sent to prison started a hunger-strike. This move was met by forcible feeding—a practice against which public opinion revolted, and for which was substituted, under an Act passed ad hoc and nicknamed the “Cat and Mouse” Act, a system of releasing prisoners on licence. The atmosphere produced by these events was not favourable to the Women’s Suffrage bill, which was rejected on May 6 by 267 votes to 156, all parties being divided except the Labour members who solidly supported the bill. The “Cat and Mouse” Act proved a failure. The women released under it qualified for prison once more, directly their strength was restored, by committing fresh outrages, and the authorities, who could not let their prisoners die on their hands, resorted again to forcible feeding in spite of the protests of many clergy and humanitarianists. Meanwhile the non-militants, who formed the great majority of the supporters of the women’s suffrage movement, were not inactive. Under Mrs. Fawcett’s leadership they constantly pressed ministers to introduce a Government bill; and they advertised their cause by promoting a performance of women who paraded the London front and breadth of England at the height of summer in eight separate contingents, uniting at the end in a great demonstration in Hyde Park on July 26. In spite of the efforts of both sections, the Government maintained its neutral position. But it introduced a simple Plural Voting bill in April, with a view to passing it ultimately into law under the Parliament Act. It was carried through Committee in the House of Commons, and in spite of opposition protests, by the “Kangaroo” closure, and was rejected, because it was unaccompanied by a measure of redistribution, on second reading by the House of Lords. There was a repetition of this process in the session of 1914; but, owing to the outbreak of war, the bill was not introduced in 1915, and so failed. A compromise was arranged on another measure, the Temperance (Scotland) bill, to which it had been intended to apply the Parliament Act. In the shape in which the House of Lords passed the bill, it provided for local option on the question of liquor licenses in certain areas in Scotland; the popular vote, however, was postponed until 1922—when, it may be added, the Protectionists met with a severe defeat.

Militancy was continued and intensified in the first half of 1914. Outrage so frequently took the form of wanton damage to valuable pictures in the National Gallery, Royal Academy, and other exhibitions that public galleries had to be closed. Arson was rampant. Bombs were exploded in well-known churches, the coronation chair in Westminster Abbey having a narrow escape from serious injury by this method. An unsuccessful attempt
was made to force a way into Buckingham Palace to petition the King in person; and His Majesty was subjected, on several public occasions, to rude interruption. The number of militants actually committing crimes was small, but they had a large number of enthusiastic sympathizers who kept them well supplied with funds. Formal protests and condemnation by the nonconformist section of the church had no effect on the campaign, which was only terminated by the coming of war.

Although the labour conflicts of 1913 and the first seven months of 1914 were not on the scale of the great strikes of 1912, there was constant unrest, and many signs that serious trouble was brewing. The Labour party in Parliament marked their increasing divergence from the principles accepted by both the historical parties by moving, at the beginning of the session of 1913, an amendment to the Address, which was of course easily defeated, in favour of a general system of nationalization. While they were sporadic in various parts of Great Britain in the autumn and winter of that year, the principal disturbance was in Dublin and the neighbourhood, where, under the leadership of James Larkin, of the Irish Transport-Workers' Union, a series of strikes was organized, which lasted, despite official and other efforts at settlement, from Aug. to the close of the year, and which, during part of that time, brought the trade of the port of Dublin to a standstill. Larkin conducted his campaign with violence, was more than once arrested, was convicted of using seditious language, imprisoned, and the usual amount of suffering. There was much sympathy from the Trades Union Congress and other representatives of English labour; the Dublin strikers were supplied with funds from England, and there were some half-hearted attempts at sympathetic strikes. But Larkin's revolutionary attitude, which had already antagonized moderate Irish Nationalists, eventually alienated British labour leaders, and left him only the support of the extremists, who held the first Syndicalist congress in Great Britain that autumn and declared in favour of "direct action." Early in 1914 there was great indignation in British labour circles over the deportation by the South African Government of the labour leaders concerned in strike disturbances in Johannesburg. They were received, on their arrival in England, with great demonstrations at the London Opera House and in Hyde Park; and an unsuccessful attempt was made by the Labour party in Parliament to interfere with the discretion of a self-governing dominion. The irritation caused by this deportation was symptomatic of the general labour unrest, which in the first half of 1914 affected miners, engineers, gas-workers, char-workers, municipal employees, dockers, transport-workers, coal-porters and many other groups of artisans. The abnormal industrial relations with a non-unionist had so disorganized the London building trade that a stubborn struggle, which lasted for months, was begun by a general lockout in January. In May the railway servants decided to demand the recognition of their trade union, a 48 hours' week, and an increase of wages by 5s. weekly; and in June they gave a final approval to the "Triple Alliance" of their union with the Miners' Federation and the Transport Workers' Federation. The industrial prospect was dark.

The opening of the year 1913 found Parliament still in session, and engaged in completing the final stages of the Home Rule bill by the intervention of the Welsh Disestablishment bill. The report stage of the Home Rule bill did not produce any serious amendment except the introduction of proportional representation in the nine proposed Irish constituencies returning three or four members. There was a notable debate on New Year's Day on Sir Edward Carson's motion to exclude the province of Ulster from the operation of the measure. Mr. Asquith, while expressing his readiness to consider additional safeguards, denounced the proposal as a claim by Ulster to veto Home Rule. Mr. Bonar Law solemnly promised support by the Unionist party after the bill was defeated on a division on the vote, but he recommended the Government not to accept the proposal. The Government had its normal majority of about 100. The third reading debate on Jan. 15 and 16 did not reveal any new arguments, but Mr. Redmond stated that the Nationalists accepted the bill as a final settlement. In spite of Unionist predictions of immeasurable calamity, the third reading was carried by 367 to 257. The Lords debated the bill on second reading for four days (Jan. 27, 28, 29 and 30) before rejecting it by 326 to 69. The impossibility of working the scheme in face of the resistance of Ulster was the main ground put forward by the Unionists for rejection. But the most interesting feature of the debate was the strong advocacy by Lord Grey, ex-Governor-General of Canada, of a solution on federal lines—a proposal supported in a striking speech by the Archbishop of York (Dr. Lang). Neither the passing of the bill by the Commons, nor its rejection by the Lords, evoked any serious popular excitement.

Before the Welsh bill left the Commons its provisions were further mitigated in some slight degree. An amendment was adopted, favoured by Liberal churchmen, giving the Church body the option of commuting the life interests of the clergy on a 3½% basis. There was a strong attempt made by the Unionists to confine the purposes to which the confiscated Church property should be applied to the advancement of the Christian religion by grants to Nonconformist churches. But, as the spokesman of the Nonconformists repudiated the idea of concurrent endowment, the amendment was rejected by 273 to 200, though the Government agreed to limitation to charitable and eleemosynary purposes. The third reading was carried on Feb. 5 by 223 to 116. There was no further protest, after this, by Mr. Lloyd George of the sentiments of the Welsh people. The measure was debated on second reading by the Lords on Feb. 11, 12 and 13, and rejected by 252 to 51. Sixteen bishops voted in the majority; those of Hereford (Percival) and Oxford (Gore) in the minority.

The rejection of these two bills by the Lords, and the determination of parties and of their majority in the Commons to override the veto of the Upper House through the use of the powers conferred by the Parliament Act, were the considerations governing the whole course of politics of Lords they were both met with identical resolutions that "this House declines to proceed with the consideration of the bill until it has been submitted to the judgment of the country." This was carried in the case of the Irish bill by 302 to 64; in that of the Welsh bill by 242 to 88. Thus the second stage for both under the Parliament Act was duly completed.

In all the debates on the Home Rule bill the Unionist leaders dwelt with insistence on the serious prospect before the country. We were "on the verge of a great national tragedy," said Mr. Balfour. The Liberals were crying peace, while there was no peace on the laundром front, said Sir Edward Carson; Ulster had been behind her in her resistance the whole force of the Conservative and Unionist party. The Liberals and Nationalists, however, still maintained that the Ulster attitude
was largely bluff. Mr. Redmond on behalf of his party disclaimed any desire to establish ascendency, and averred that Ulster would not be attacked. But the Unionists relied more on speeches in the great towns and on events in Ulster than on Parliament for the enlightenment of the country. Immediately after the division on the second reading, in June, Sir Edward Carson started on a political tour in Great Britain, making eloquent speeches in Glasgow, Edinburgh, Norwich, and Bristol—a demonstration of主旨was of so great a surge that the Cabinet had to neutralize by following in the Ulster leader’s footsteps. In July Sir Edward Carson spent several weeks in organization and speech-making in Belfast and the neighbourhood. He overshadowed the establishment of a Provisional Government for Ulster, and assured his hearers that the Cabinet could not rely upon the army in forcing Home Rule upon them. Volunteers continued to drill, and provided themselves with the usual accompaniments of a modern army. More definite steps were taken in the autumn. On Sept. 25 the Ulster Unionist Council formally organized itself into a Provisional Government with central authority whose chairman was Sir Edward Carson, and a guarantee fund intended to reach £1,000,000, to which the leader contributed £10,000. He formally reviewed the Volunteers, who then numbered 60,000 and increased to nearly 100,000 by the winter. On Nov. 3 there was a great demonstration in Belfast in favour of his policy by Ulster men of business, presided over by the president of the Belfast Chamber of Commerce. And on the 28th there was an enthusiastic meeting in his support in Dublin, where Mr. Law repeated his pledges to Ulster.

The Liberals returned to these proceedings with jeers at “King Carson” and “his Unionists,” and suggested that the army was too wise to accept, for his arrest. But many of them began to realize that there was a substantial difficulty in Ulster which could not be any longer ignored.

Suggestions for a conference to arrange a compromise were thrown out in the Lords debate in July, and became more definite as the year drew towards a close. Mr. O’Brien, for the Independent Nationalists, pleaded for some such course; Lord Lorneburn, the Liberal ex-Chancellor, proposed it in The Times of Sept. 11; Lord Grey urged the advantages of a federal solution; and on Oct. 9, Mr. Churchill, an important member of the Cabinet, advocated at Dundee a solution by agreement. Though Mr. Redmond, on Oct. 12, refused to contemplate anything beyond an increase in the safeguards for the minority, Mr. Asquith, in his annual address to his constituents at Ladybank on Oct. 25, said that the Government were prepared to consider proposals within the scope of the bill; that they were anxious for a settlement by consent, not through a conference, but through a free and frank exchange of views. Two days later Sir Edward Grey, at Berwick, suggested that they might by a new Home Rule bill for Ireland. Mr. Law replied at Wallasey on Oct. 29 that he would consider any proposals with a real desire to find a solution, and Sir Edward Carson, who was present, expressed his agreement, but the offer must be consistent with the Covenant. A fortnight later, at Norwich, Mr. Law said it was the duty of the Government to submit their proposals to the judgment of the people either at a general election or by a referendum. Mr. Redmond, speaking at Newcastle-on-Tyne next day, described the Unionists as trying to intimidate the people of England. Still he expressed a preference for a settlement by consent, but it must be based on national self-government for Ireland. Mr. Lloyd George on Nov. 29 treated Unionist demonstrations against Home Rule as a red herring drawn across his campaign for social reform. There was much speaking on both sides during the last weeks of the year, but apparently no advance towards an agreement. Mr. Law said the sands were running out and nothing had been done, but Sir Edward Grey replied that there were still some months to spare. In the beginning of the new year Lord Curzon intimated at Manchester that the conversations between leaders had had no result. Sir Edward Carson went to Belfast and advised “peace but preparation,” and Mr. Redmond assured his constituents at Waterford that the bill would that year automatically become law. The Unionists were strengthened in their resistance by some gains in by-elections during 1913 and early in 1914; but perhaps the most striking feature in the polls was the increasing support given to Labour at the expense of the Liberals.

It was in these conditions of doubt and apprehension that Parliament reassembled on Feb. 10 1914. The King’s speech, while admitting that efforts at solution had so far been unavailing, pressed a hope for a settlement before the elections. Mr. Asquith laid stress upon these words in the debate on the Address. Sir Edward Carson said that, if the Government were in earnest, there must be an amending bill—a suggestion which Mr. Redmond ridiculed. No move was, however, made by the Government in the next week or two, and the organization of public opinion in England in support of Ulster was rapidly proceeded with. A British Covenant, similar to the Ulster Covenant, was promulgated on March 3, headed by the signatures of influential men, not closely identified with political parties, such as Lord Roberts, Lord Haldane, Lord Milner, Prof. Dicey, Dean Wace, and Mr. R. G. Collingwood. A Woman’s Covenant followed; and both documents were eagerly signed, an appreciable proportion of the signatures being professing Liberals. On March 9 Mr. Asquith, in moving for the third and last time the second reading of the Home Rule bill, announced the projected concessions. The Government would propose that any county in Ulster, including the county boroughs of Belfast and Londonderry, might vote itself out of the jurisdiction of the Irish Parliament for a term of six years, and after it would automatically come within that jurisdiction. The Prime Minister pointed out that under the Parliament Act, there would necessarily be two general elections in Great Britain before the six years expired. This scheme of provisional exclusion entirely failed to satisfy either the Opposition or Ulster. Mr. Law said that, if this was the last word of the Government, the position was very grave; Ulster was asked to destroy her future. Mr. Redmond insisted that this was the extreme limit of concession; and the Independent Nationalists protested vehemently against partition. Sir Edward Carson took note of the gains involved in admitting the principle of exclusion, but said emphatically: “We don’t want sentence of death with a stay of execution, for six years.” The situation became sensibly gravier when Mr. Churchill at Bradford, on March 14, said that the Prime Minister’s offer appeared to him to be final, reproached the Unionists and Ulster for not being satisfied with it, and maintained that, in the event of violence, the larger issue, between parliamentary government and armed force, once fought out at Masston Moor, would become dominant. If there was any attempt in action to subvert parliamentary government there was no lawful measure from which the Cabinet would shrink. They had sent out soldiers during the railway strike with Unionist approval. If the British civil and parliamentary systems were to be brought to the challenge of force, he could only say “Let us go forward together and put these grave matters to the proof.” This utterance, which was endorsed a few days later by Mr. Lloyd George, and the refusal of the Prime Minister to give details of his proposals unless the general principle were adopted, led to an Opposition motion of censure on March 10. In the debate Mr. Law made a formal offer: if the new suggestions were put into the Home Rule bill and accepted by the country on a referendum, he had Lord Lansdowne’s authority to say that, so far as his influence in the House of Lords went, he would not oppose the will of the people. Mr. Lloyd George would not accept. Sir Edward Carson then left the House, amid a great Unionist demonstration, and, accompanied by eight Irish Unionist members, proceeded to Ulster. An explosion in some form seemed to be imminent. Mr. Law had said in the censure debate that, in a case merely of disorder, the army would and ought to obey; if it were a question of civil war, “soldiers are citizens like the rest of us.” This was speedily proved. It was determined to protect certain military stores in the N. of Ireland from possible raids by Ulster Volunteers, and a considerable
force was ordered on March 30 to move N. from Dublin with naval support. To the officers on duty at the Curragh this appeared to be the beginning of a movement to coerce Ulster by the army—an impression which was confirmed by certain questions asked them and alternatives put before them; and Gen. Sir Hubert Gough, in command of the cavalry brigade, with many of his subordinate officers, preferred to accept dismissal rather than to take part in active military operations against Ulster. They were informed by the General Officer Commanding that it was merely a measure of precaution, and the senior officers concerned were ordered to report themselves at the War Office. There, in answer to a letter in which Gen. Gough asked the Adjutant-General to make clear whether, if the Home Rule bill became law, the officers "could be called upon to enforce it in Ulster under the expression of maintaining law and order," the following minute (dated March 23 1914) was written in reply, initialled by the Secretary of State, the Chief of the General Staff (Sir John French), and the Adjutant-General:

"You are authorized by the Army Council to inform the officers of the 3rd Cavalry Brigade, that the Army Council are satisfied that the incident which has arisen in regard to their resignations has been due to a misunderstanding. It is the duty of all soldiers to obey lawful commands. They, therefore, expect the proper authorities to bring the matter before the Army Council, either for the protection of public property and the support of the civil power in the event of disturbances or for the protection of the lives and property of the inhabitants. This is a matter that has been pointed out to the officers in the course of questions of the General Officer Commanding, and the Army Council have been glad to learn from you that there never has been and there never will be a clash between the Imperial and the military forces. His Majesty's Government must retain their rights to use all the forces of the Crown in Ireland, or elsewhere, to maintain law and order and to support the civil power in the ordinary exercise of its duties. But they have no intention whatever of taking advantage of this right to crush political opposition to the policy or principles of the Home Rule bill."

On receiving this document Gen. Gough asked Sir John French if it meant that he would not be called on to order his brigade to assist in coercing Ulster to submit to Home Rule, and Sir John French wrote across it, "I should read it so." The precautionary movements were carried out and all orders were duly obeyed. These facts came out gradually in the week following Sir Edward Carson's removal from Westminster to Belfast, and there were many scenes and much recrimination in the House of Commons. On hearing the news of the officers' action, the Unionists asserted that there was obviously a plot to provoke Ulster, which the reluctance of the officers had defeated; the Prime Minister replied that the movement of troops was purely protective, and that, if officers and soldiers were to discriminate between the validity of different laws, the fabric of society would crumble; while the Labour party claimed that, as any option given to officers must logically be extended to men, the army could no longer be used in labour troubles. When the minute of the Army Council was published the Liberals were dismayed, while the Unionists accepted it as making the coercion of Ulster impossible. Ministers explained to their bewildered followers that the first three paragraphs were settled by the Cabinet, but that the last two, which, in connexion with Gen. Gough's letter, seemed to constitute a bargain with the officers in regard to a hypothetical contingency, had been added by the War Secretary without Cabinet authority. Amid prolonged Liberal and Labour cheers Mr. Asquith repudiated any bargain of the kind, and caused a new minute to be issued, under the heading "Discipline," as follows:

1. No officer or soldier should in future be questioned by his superior officer as to the attitude he will adopt or as to his action in the event of his being required to obey orders dependent on future hypothetical contingency.

2. An officer or soldier is forbidden in future to ask for assurances as to orders which he may be required to obey.

3. In particular it is the duty of every officer and soldier to obey all lawful orders given to them by the proper authority, whether for the safeguarding of public property, or the support of the civil power in the ordinary execution of its duty, or for the protection of the lives and property of the inhabitants in the case of disturbance of the peace.

Mr. Asquith as Prime Secretary did not seem to be prepared for the natural result of these proceedings, the resignation of the three members of the Army Council who had initialled the minute of March 23—Col. Seely (the War Minister), Sir John French, and Sir Spencer Ewart. The Prime Minister endeavoured to persuade all three to reconsider their determination, as there was, in his view, no difference of opinion amongst them; but, having failed, he assumed himself the office of Secretary of State for War in addition to that of First Lord of the Treasury. In an address to his constituents on seeking reflection, he illustrated the spirit in which he proposed to act by quoting the words of Chatham: "The army will hear nothing of politics from me, and in return I expect to hear nothing of politics from the army." The Unionists noted with satisfaction that both Col. Seely himself, and Lord Morley who assisted in drafting the previous paragraphs, stated that they did not see that these differed in spirit and substance from the three preceding paragraphs. The conclusion seemed to be that the Government repudiated the intention to make use of the army "to crush political opposition to the policy or principles of the Home Rule bill." A gigantic demonstration of protest against the coercion of Ulster was held on April 4 in Hyde Park; there were 22 separate processions and 14 platforms, and men of the public eminence of Mr. Balfour, Sir Edward Carson, and Lord Milner attended and spoke. The gravity of the situation led to many expressions in the Home Rule debate of a desire for an agreed settlement. Sir Edward Carson said their object was only of discussion and propaganda; "If Ulster out until you have won her consent to come in." But ministers made no advance beyond their previous proposals, and the second reading was carried by 80 votes, as compared with majorities of 110 and 100 in the previous year. There was a similar decline in the majority for the second reading of the Welsh bill.

Meanwhile events were moving in Ireland. Easter week saw a series of reviews by Sir Edward Carson of large bodies of Ulster Volunteers; and on the night of April 24-25 some 35,000 rifles and 3,000,000 cartridges were landed at Larne and distributed throughout the Protestant north. This successful feat of gun-running, and the publication of papers with regard to the alleged military "plot," produced heated debates in Parliament, followed, however, by further private negotiations between leaders. Before the third reading of the Home Rule bill, the Prime Minister gave notice that the Government would introduce—in the House of Lords—an Amending bill, which might pass simultaneously with the Home Rule bill. It was only, however, after a scene of disorder in the House of Commons that he disclosed its nature: it would give effect to the terms of agreement if arrived at, and, if not, to the proposals outlined on March 9. This was far from satisfying the Opposition, and the third reading of the Home Rule bill was only carried by 351 to 274, that of the Welsh bill having been secured by 328 to 251.

The two bills left the Commons before the Whitsuntide recess, which was spent by Sir Edward Carson in Ulster in making "preparations for the final scene." While there was every sign of resolute determination about Ulster and her Volunteers, Nationalist Ireland had retorted by enrolling Volunteers of her own, who were estimated to exceed 100,000 men. This force was started independently of the official Nationalists, and it was only with some difficulty that Mr. Redmond obtained control by the end of June. There were thus two armed bodies of many thousands of men facing each other in Ireland in a state of what Lord Milner called "smouldering war." In these alarming circumstances the Amending bill, introduced in the Lords on June 23, which merely offered option of exclusion by counties for six years, seemed inadequate. It was read a second time in the beginning of July, after a prolonged debate, in the course of which Lord Roberts warned the Government that it was not competent to use the army to coerce Ulster would break and ruin the army. In committee the Unionist majority transformed the measure by amendments
permanently excluding the whole province of Ulster, Nationalist counties no less than Unionist, from the operation of the Home Rule bill. It was certain that the Liberal and Nationalist majority in the Commons would indignantly reject this solution. At the same time the urgency of the Ulster problem was again enforced by enormous demonstrations on the Boyne anniversary, emphasizing Sir Rufus Carson’s words: ‘Give us a chance, the international right is on our side.’

The Amending bill was to be taken in the Commons on Monday July 20; but the King and the wiser heads in the Cabinet were determined to make a further effort for peace; and on that morning The Times announced that the King had issued invitations to a conference on the Ulster question at Buckingham Palace, consisting of two members each from the Government, the Opposition, the Nationalists and the Ulster Covenanters. Moderate men in all parties hailed the announcement with relief, but keen partisans were suspicious and critical. The conference met on Tuesday under the chairmanship of the Speaker. The Government were represented by Mr. Asquith and Mr. Lloyd George; the Opposition by Lord Lansdowne and Mr. Bonar Law; the Nationalists by Mr. Redmond and Mr. Dillon; and the Ulstermen by Sir Edward Carson and Capt. Craig. The King opened the proceedings in a brief but weighty speech. He said:

“My intervention at this moment may be regarded as a new departure. But the exceptional circumstances under which you are brought together justify my action. For months we have watched with deep misgivings the course of events in Ireland. The trend has been surely and steadily towards an appeal to force, and to-day the War Office is in the hands of the most responsible and sober-minded of my people.

His Majesty urged on the conference “a spirit of generous compromise,” reminded them that the time was short, and expressed his confidence that they would be patient, earnest and conciliatory. In spite of a considerable display of these qualities, the conference failed. The members met on four days, from Tuesday to Friday, and at the close the Speaker announced that they had been unable to agree, either in principle or in detail, on the area to be excluded from the operation of the bill. It was understood that the deadlock arose over the question of the exclusion of Fermanagh and Tyrone, both of them counties greatly divided in political opinion. The position seemed to be desperate, and passions were once more more fiercely excited by a fatal affray in Dublin on the following Sunday between British soldiers and the populace—an affray which followed on a successful gun-running on a considerable scale by the National Volunteers. The Amending bill was put down for July 30, and a great Liberal meeting in the London Opera House on the previous day urged the Government to go forward with their programme. But already the lips of the most responsible and sober-minded of my people were on the lips of the most responsible and sober-minded of my people.

The Marconii’s "Scandal."

Some of these were resold by their purchasers in the next few days at a profit, but the total net result of the transaction after a year was a loss. The advice to purchase the shares given to Sir Rufus by his brother Mr. Godfrey Isaacs, managing director of the American company, and also of the English company. These facts were not told to the House of Commons when in the previous autumn the Marconi contract was discussed and a committee was appointed to inquire into it. They only came out in March 1913 during the trial of an action for libel against a French newspaper which had given currency to the rumours of corruption that were rife throughout the winter. Thereupon the Attorney-General and the Chancellor of the Exchequer appealed before the Committee and explained what they had done. Lord Murray, who had bought further shares in the company on behalf of the Liberal party fund, was abroad. The committee found that the gross charges of corruption were unfounded, but could not agree upon a united report. The majority, consisting of Liberal, Labour, and Nationalist members, awarded no blame to any one except those who circulated the charges of corruption, thereby setting aside their Liberal chairman’s draft report, which concluded that ministers had been ill-advised both in their purchase of shares and in their delay in disclosing the facts. The minority, consisting of Unionist members only, found that ministers had acted with grave impropriety. In the debate which followed in the House of Commons on June 18 and 19, both the Attorney-General and the Chancellor of the Exchequer, while protesting their good faith throughout the transaction, admitted that the original purchase was indiscreet, and that the delay in disclosure was a mistake of judgment. After a heated discussion, during which the Unionists vainly endeavoured to secure the passing of some amendment expressing the regret of Parliament for what ministers admitted to be indiscretions, a motion was carried by 516 to 480 accepting the two ministers’ statements and repudiating the charges of corruption. Public opinion was more severe than Parliament.

What humbug it was for Conservatives, he said, in a speech on July 1 at a luncheon given to himself and the Attorney-General at the National Liberal Club, to set up an ideal standard for Liberal ministers, when it was notorious that parliaments of landlords in the past had been guided in their legislation by their private interests! The Radical land campaign, started in the previous year, was pushed on, and the subject formed the staple of Mr. Lloyd George’s numerous speeches in the country in the autumn of 1913. The Unionists countered the movement by a programme of their own, approved by the two ministers’ statements and repudiating the charges of corruption, which involved the encouragement of small ownership, and the provision of advances by the State to assist the building of cottages and the purchase by tenants of their holdings. At Swindon, on Oct. 22, Mr. Lloyd George announced the ministerial scheme. The Government proposed to set up a Ministry of Lands to take over the functions of the Board of Agriculture, together with registration of title, settled estates, and land valuation—in short to have a general supervision of land and of all dealings with it of whatever kind. Commissioners, having a judicial character, would be appointed, who would be given large compulsory powers in respect of rent, eviction, compensation for improvements, and wages. Tenants would be protected against damage by game. The new ministry would have power to acquire at a reasonable price all waste, derelict, and neglected lands, and to afforest, reclaim, equip, and cultivate them. Housing and cheap transit were also to be provided. While Unionists denounced the extravagance of the scheme, and the “horde of officials” with despotic powers which it proposed to set up, they did not take it very seriously. The event proved them to be right. But Mr. Lloyd George took advantage of his budget for the next year, 1914, to advance his programme of social reform in other ways. He made provision for an extended series of grants to local authorities...
for various sanitary and educational purposes, and he largely increased the sum allocated to national insurance. In order to obtain the necessary funds he proposed to establish a national system of valuation for local taxation, separating site from improvement values; he increased the income tax and super tax, and took a million from the sinking fund. The proposals, though welcomed by Radicals and Labour men, were not popular with many of his own party; and he had to give up an extra penny on the income tax, and postpone the operation of most of his increased grants for a year; and even so, he only escaped defeat on an Opposition amendment by 503 to 265 votes.

During 1913 and the first seven months of 1914 the King and Queen strengthened their hold on the loyalty of their subjects by popular processes through the Potteries in April, through Lancashire in July 1913, through the Midlands in June, and through the Lowlands of Scotland in July 1914. They also took the occasion of the marriage of their cousin Prince Ernest Augustus of Cumberland to the Kaiser’s daughter to pay a courteous visit in May 1913 to Berlin, where they were courteously received. Of more political importance was the State visit of President Poincaré to London, in the following June, as the King’s guest. The cordiality of the official welcome was reflected in the enthusiasm of the people in the streets. In April 1914, the King and Queen, accompanied by the Foreign Minister, paid a return visit to Paris, where they were welcomed with similar enthusiasm by President and people. It was felt in both countries that by these mutual visits the system of friendly cooperation between France and England had received a fresh impetus.

Unwillingness to the national defences in view of the naval preparations and restless diplomacy of Germany gave a considerable impetus during 1913 to Lord Roberts’ campaign for universal military service. In spite of his advanced age he addressed great meetings in large provincial towns—at Bristol in Feb., at Wolverhampton in March, at Leeds in April, and at Glasgow in May—being everywhere received with respect and even enthusiasm. But no party, as a party, was prepared to take up his cause, which received little support from the organized workers; and the Government, by the mouth of Col. Secy. the War Minister, denounced compulsory service as “a political and military disaster.” They pinned their faith to the “Territorial Force,” which Lord Haldane had created. The reluctance of many patriotic men to aid Lord Roberts’ movement was due to a fear lest compulsory service should divert effort and money from the navy, the principal defensive force of Great Britain. In introducing the navy estimates for 1913, which involved an increase of over a million, Mr. Churchill, the First Lord of the Admiralty, threw out a suggestion that the Powers who were building ships in competition with each other might agree upon a “naval holiday” for a year; but the idea met with no response.

In spite of this lack of response, the Chancellor of the Exchequer, in an interview published Jan. 1 1914, called loudly for a reconsideration of the expenditure on armaments. A large section of the Liberal party, whose spokesman was Sir John Brunner, chairman of the National Liberal Federation, strongly supported Mr. Lloyd George. But neither in the Cabinet, nor with the nation at large, did this view prevail. Sir Edward Grey said at Manchester on Feb. 3, that to reduce the British naval preparations would be playing a gambler’s chance. The navy estimates introduced in March by Mr. Winston Churchill were the largest on record, amounting to £51,550,000; and yet they were attacked by Lord Charles Beresford and by the Unionists generally, with considerable public support, as insufficient. On the army estimates, which also showed a slight increase, Col. Secy. declared that the British army was much better trained and was much more formidable as a fighting machine than any continental army, and that the Expeditionary Force was absolutely ready. The power and readiness of the fleet were shown by a great review and test mobilization, on a scale never seen before, at Spithead in the third week of July.

### III. The War Period

The murder of the Archduke Francis Ferdinand at Sarajevo on June 28 horrified public opinion in Great Britain, and led to the expression, in Parliament and elsewhere, of much sympathy for the aged Emperor Francis Joseph. But comparatively few Englishmen realized that the crime might start a general conflagration in Europe; and the week in which elapsed before Austria made any overt move encouraged the belief that the effects would be isolated and localized.

Even the drastic and peremptory ultimatum addressed by Austria to Serbia on July 23 failed to impress the public with a due sense of its gravity, absorbed as they were in the Buckingham Palace Conference of July 21-4, in the Dublin shooting affray of July 26, and in the apparent imminence of civil war in Ireland. It was only in the very last days of July that Austria’s rejection of Serbia’s conciliatory reply and her immediate declaration of war, followed rapidly by the Russian and German mobilizations, and by the evidence of French resolve to rally to France’s ally Russia, aroused the British people to the fact that a great European war was impending. Even then the general expectation was that Great Britain would not be involved in it. On July 27 Sir Edward Grey gave Parliament an account of his anxious and earnest endeavours to bring the Powers together and avert hostilities. On July 30 the Prime Minister announced that the Government were doing their best to “circumscribe the area of possible conflict.” At last on July 31 Mr. Asquith postponed the Irish Amending bill and all controversial business, announced that the issues of peace and war were hanging in the balance, and that it was of vital importance that Great Britain should present a united front. Mr. Bonar Law expressed his full agreement, stating that he spoke for Ulstermen as well as for Unionists.

The implications of the entente with France and of the subsequent understanding with Russia were not generally grasped even yet. Serbia had few sympathizers in England, the brutal murders of King Alexander and his Queen having never been forgotten. Germany’s apparent readinessness in the Balkan negotiations had lured for the time public and even ministerial suspicions of her designs. Some leading journals, and notably The Times, did yeoman’s work in insisting on the necessity, even from the most selfish point of view, of Britain standing by France. The principal Liberal journals, however, notably the Daily News and Manchester Guardian, protested vehemently against any departure from neutrality. The Cabinet were as divided as the public, the bulk of the more Radical members pronouncing for neutrality, while Sir E. Grey, supported by the Prime Minister and others, insisted on British obligations to France. In consequence Sir E. Grey could not give, on July 31, the promise to cooperate with France for which M. Cambon, the French ambassador, asked; nor could the King respond in anything except friendly generalities to an earnest appeal from the French President. But on Saturday Aug. 1, the day on which Germany declared war on France, there was a hurried summons of such members of the Unionist Opposition as could be collected at the week’s end, and as a result of their meeting Mr. Bonar Law wrote on the Sunday to the Prime Minister as follows:—

> Lord Lansdowne and I feel it our duty to inform you that in our opinion, as well as in that of all the colleagues whom we have been able to consult, it would be fatal to the honour and security of the United Kingdom to hesitate in supporting France and Russia at the present juncture; and we offer our unhesitating support to the Government in any measures they may consider necessary for that object.”

This, the natural outcome of the patriotic support which, in spite of acute domestic differences, the Opposition had throughout afforded to the foreign policy of Sir E. Grey, immensely strengthened the stalwarts in the Cabinet, Sir E. Grey’s Speech of Aug. 3.

Accordingly, on Monday Aug. 3 the Foreign Minister was in a position to make a speech of vast historic moment, inviting the House of Commons to act up to the obli-
gations that England had incurred. These involved, he explained, with regard to Russia, no more than diplomatic support. With regard to France, he had told her, at the crisis which led to the Agadir Conference, that, if war were forced on her about Morocco, he believed that British public opinion would rally to her support. Since that time conversations had taken place between French and British naval and military experts, which, however, did not bind their Governments. In the Agadir crisis he had taken the view that the moral posture of the two nations, the public opinion of France and the public opinion of England, was so directed that, if either Great Britain or France had grave reason to expect an attack by a third Power or a menace to the general peace, both Governments should consult whether, and if so how, they should cooperate. There was no definite promise of intervention; but in the existing crisis, in view of Anglo-French friendship, he invited every man to look into his own heart and construe the extent of the British obligation for himself. In view of that friendship, France had concentrated her fleet in the Mediterranean; Britain could not let France's unprotected coasts be bombarded. Accordingly he had told the French Cabinet that, if a hostile German fleet came into the Channel or the North Sea, Britain would give France all the assistance in her power. The German Government had offered, in the event of British neutrality, to refrain from attacking the northern ports of France; but that was far too narrow an engagement. Then came the urgent question of Belgium. He had asked France and Germany whether they would respect Belgian neutrality. France had agreed, Germany had delayed replying, and had now issued an ultimatum to Belgium. Germany had asked if Britain would be satisfied with the preservation of Belgian integrity after the war, but the Government had refused to barter away British interests and obligations. The King of the Belgians had appealed to King George. If Great Britain stood aside, she could not prevent Europe falling under the dominion of a single Power. Ireland was the one bright spot. The feeling there made it unnecessary to take the Irish question into account. Unconditional neutrality was precluded by the commitment to France and the consideration of Belgium. To stand aside would be to sacrifice the good name of Great Britain without escaping the most serious economic consequences. The forces of the Crown were never more ready or efficient; the ambassador, which had wished for peace, appealed to the country for support.

The speech finally convinced the country and the Empire of the righteousness of the cause. Mr. Law promised full support.

Entry into the War.

British troops might be withdrawn, as Ireland would be defended by her own armed sons. Mr. Ramsay Macdonald, indeed, the leader of the Labour party, and some individual Liberals and Labour men, condemed any departure from neutrality; but it was made clear that the bulk of the Liberals and even of the Labour men were with the Government. Only two Cabinet ministers, Lord Morley and Mr. Burns, resigned. Next day Great Britain issued her ultimatum to Germany to respect Belgian neutrality; and, Germany refusing, she declared war.

Sir Edward Grey had said that the forces of the Crown were never more ready or more efficient. The navy, through the foresight of the First Lord (Mr. Churchill), and First Sea Lord (Prince Louis of Battenberg, afterwards the Marquess of Milford Haven), was already mobilized, the demobilization of the magnificent fleet which the King had recently reviewed at Spithead having been countermanded in view of the European crisis; and it proceeded at once to its stations in the North Sea, under the command of Sir John Jellicoe. The German mercantile marine was soon swept, with slight exceptions, from the seas, and a blockade of Germany set up. Though the army was small and unequal to a great continental war, the Expeditionary Force, which Lord Haldane had fashioned, was also ready, and Sir John French, the Inspector-General of the Forces, was its commander. The Army Reserve was at once called out and the Territorial Force (also Lord Haldane’s creation) embodied. It was necessary immediately to appoint a Secretary of State for War, the seals of the office having been held since the spring by Mr. Asquith in addition to the Premiership. In response to public demand, Lord Kitchener, who was starting to resume, after a visit to London, his duties as British Agent in Egypt, was kept at home to take over the War Office as a non-political chief. There was some disposition at first, both in the Cabinet and in the Liberal press, to endeavour to confine the British share in the war to the sea, and to object to sending soldiers to fight in France. No more was heard of this after Lord Kitchener’s appointment. The Expeditionary Force was despatched in perfect secrecy and perfect safety in the first half of the month, and was ready for action in France on Aug. 21. Another great service which Lord Kitchener rendered his country and the world was to bid the British Empire prepare for a three years’ war and raise troops to be reckoned in millions rather than thousands. He started to organize a new army, which was popularly known as Kitchener’s Army; applications for commissions poured in, and recruiting was extraordinarily brisk and general during the remainder of the year, especially after the news of the retreat from Mons. The disposition of all classes of young men to go to the front was sensibly increased when the young Prince of Wales went to join Sir J. French’s staff in October. Large camps were formed in all parts of the country, the most extensive training ground being Salisbury Plain. From all the dominions and colonies and from India came immediate offers of help.

The dislocation of business in London, the financial capital of the world, promised at first to be extremely serious. On Aug. 9 the Bank of England made the announcement of a War Measures Committee, with the Lord Mayor as chairman. The Bank noted the rise in the rate of discount, and urged the Government to take prompt measures to prevent this from becoming a general increase in the rate of interest. It recommended the formation of a War Measures Committee, with the Lord Mayor as chairman. The Bank noted the rise in the rate of discount, and urged the Government to take prompt measures to prevent this from becoming a general increase in the rate of interest. It recommended the formation of a War Measures Committee, with the Lord Mayor as chairman.

Safety-Securing of Business and Finance.

Naval and Military Action.

The German Fleet was destroyed, the Army Reserve was embodied, and the Territorial Force was called up. The Expeditionary Force was despatched in secret, and the war was declared with Germany. The army was mobilized, and the navy was warned. The country was prepared for a long war, and the public was informed of the danger.

War Measures.

The Government took immediate steps to secure the safety of the country, and to provide for the needs of the nation. A War Measures Committee was appointed, with the Lord Mayor as chairman. The Committee advised the formation of a War Measures Committee, with the Lord Mayor as chairman. The Bank noted the rise in the rate of discount, and urged the Government to take prompt measures to prevent this from becoming a general increase in the rate of interest. It recommended the formation of a War Measures Committee, with the Lord Mayor as chairman.

Voluntary Effort.

The Government took immediate steps to secure the safety of the country, and to provide for the needs of the nation. A War Measures Committee was appointed, with the Lord Mayor as chairman. The Committee advised the formation of a War Measures Committee, with the Lord Mayor as chairman. The Bank noted the rise in the rate of discount, and urged the Government to take prompt measures to prevent this from becoming a general increase in the rate of interest. It recommended the formation of a War Measures Committee, with the Lord Mayor as chairman.

As with any text, this is just a natural language representation and does not include images, tables, or figures.
The abandonment of party strife entailed upon the Ministry one difficult decision. Were the Home Rule bill and the Welsh Disestablishment bill, which had passed in three successive sessions through all their stages in the Commons, but which had been vehemently opposed by the Unionists, and rejected by the Lords, to be allowed to become law automatically under the Parliament Act? Ministers, influenced no doubt largely by the desire to meet Mr. Redmond’s magnanimous attitude at the outset of the war, determined to submit them to the King for signature, with the reservation that neither should be put into operation during the war, and that special arrangements should be made to meet the case of Ulster. The Opposition protested that this decision was a breach of faith, and denounced the Suspensory bill which the Government introduced and passed; but they maintained their patriotic attitude unchanged. Their leaders generally had placed themselves at the disposal of the Government, and the services of Mr. Austen Chamberlain, Mr. (afterwards Lord) Long, and Mr. F. E. Smith (afterwards Lord Birkenhead) had been accepted. Mr. Smith was himself a Press man, in order to give out “a steady stream of information.” The press had shown as a body a remarkable discretion about naval and military secrets, so that the arrival of the Expeditionary Force in France was a complete surprise to the Germans. But the secrecy necessarily observed gave rise to extraordinary rumours which were widely accepted as fact. The most notorious was the story, for which there was no foundation whatever, that trainloads of Russian troops, arrived from Archangel, had passed through England to aid the French in their fight against the German invaders.

Internal strife came to an end, not merely between parties in the House of Commons, but throughout the country. Political propaganda ceased. All strikes were promptly settled, including the great building strike in London. A general amnesty was proclaimed for offences in connexion with industrial disturbances and for suffragist prisoners. The women’s agitation for the suffrage was suspended; “militancy” on their part was dropped; suffrage societies organized themselves for the relief of women and children who suffered by the war; many of the leading militants diverted their oratorio talents to the promotion of recruiting. The nation was at one. The Churches impressed upon their adherents the need for endurance and sacrifice, and upheld the righteousness of the national cause. Friday, Aug. 21 was appointed as a special day of intercession for soldiers and sailors, and crowded services were held all over the land, the King and Queen attending at Westminster Abbey.

There was considerable alarm in the country, for a long time, in regard to German spies. Railways, bridges, and waterworks were in consequence guarded by Territorial troops and Boy Scouts. Aliens were registered, and restricted in their freedom of movement and residence. The outcry against all persons of the name of Battenberg, the First Sea Lord, to retire owing to his German origin. Several spies were arrested and tried, and a certain number shot.

The control of the war, as of all other portions of British policy, rested with the Cabinet. It was assisted by the Committee of Imperial Defence, and the War Office and Admirality acted as executive agents. But a Cabinet of over 20 members, a large proportion of whom were immersed in details of internal policy, was obviously unfitness for the duties of superintendence of naval and military operations. On Nov. 25 a War Council was constituted, consisting mainly of the members of the Committee of Imperial Defence, to whom the Cabinet delegated (subject to ultimate reference to itself) the ordinary management of the war. While Mr. Lloyd George, Sir Edward Grey, Lord Haldane, and Lord Crewe had seats and influence on the Council, the principal responsibility lay with the Prime Minister, Lord Kitchener, and Mr. Churchill; instead, as was afterwards revealed, the meetings of the War Council were so intermittent that the authority of these three was but little controlled. The public gained its authentic knowledge of military progress mainly from Lord Kitchener’s statements in the Lords, and similar statements about naval operations by Mr. Churchill in the Commons.

The varying fortunes of the early weeks of the war—the German check at Liège, the retreat from Mons, the burning of Louvain, and the outrageous conduct of the Germans in Belgium and France, the escape of the “Goeben,” the exploits of the “Archuas” at sea, the advance of the Russians in East Prussia and their expulsion by Hindenburg, the brave resistance of Serbia to the Austrian attack, the threat to Paris and the removal of the French Government to Bordeaux, the victory of the Marne, the German stand on the Aisne, the torpedoing of three British cruisers in the North Sea, the death of the veteran Lord Roberts when on a visit to the army in France—were all, in one way or another, calculated to stiffen the resolution of the nation. The session of Parliament was brought to a close on Sept. 19 amid unprecedented scenes. Cheers greeted the announcement that the Home Rule and Welsh Church bills had been duly passed under the Parliament Act. The King’s Speech struck a lofty note, “I address you,” His Majesty began, “in circumstances that call for action rather than speech. After every endeavour had been made by my Government to preserve the peace of the world, I was compelled, in the assertion of treaty obligations deliberately set at naught, and for the protection of the public law of Europe and the vital interests of my Empire, to go to war.” And he summarized British policy when he declared: “We are fighting for a worthy purpose, and we shall not lay down our arms until that purpose is fully achieved.” Mr. Crooks, of the Labour party, before the members separated, started singing, “God save the King,” in which all present joined upstanding; and then he exclaimed, “God save Ireland,” to which Mr. Redmond responded, “God save England.”

The Prime Minister had already, before the close of the session, started, with the cooperation of leading men of all parties, a great educational campaign, by means of meetings throughout the United Kingdom, to vindicate the justice of the British cause and to organize public opinion and effort. The first meeting was at the Guildhall on Sept. 4, and was addressed by Mr. Asquith, Mr. Bonar Law, Mr. Balfour, and Mr. Churchill. Others were held in rapid succession in different parts of the country, the Prime Minister speaking himself not only in London but in Edinburgh, Cardiff, and Dublin. In Dublin the Lord Mayor was in the chair, and the speakers included (besides the Prime Minister) the Lord Lieutenant, the Chief Secretary, Mr. Redmond, Mr. Dillon, and Mr. Devlin. Mr. Redmond said that Ireland, which was largely moved by the sufferings of Belgium, would feel bound in honour to take her place beside the other autonomous portions of the King’s Dominions. At a meeting in the London Opera House Mr. Crooks said that the fight was for liberty and home; he would rather see every living soul blown off the face of the earth than see the Kaiser supreme anywhere. One of the most striking speeches was delivered by Mr. Lloyd George, the Secretary of Welshmen in the Queen’s Hall in London. The German Chancellor, he said, has called treaties “scrap of paper.” So were bank-notes; so were bills of exchange. Treaties were the currency of international statesmanship. It was a great opportunity, and a new and more exalted patriotism was emerging. Britain had been living, he said, in a sheltered valley; the stern hand of fate had sequestered her to an elevation whence the great peaks of honour were visible—Duty, Patriotism, Sacrifice. The Prime Minister summed up the position of the
country in his speech at the Guildhall on Lord Mayor’s Day. Britain, he said, would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed.

Meanwhile England was facing day by day more and more what it meant to be at war. On the coasts, and especially the east coast, houses were destroyed which might either obstruct the British line of fire or serve as landmarks for a hostile fleet; lamps were extinguished on the sea front and all streets leading to it; no lights were allowed to be shown from private houses; and lighthouses and lightships were temporarily extinguished. The development of air warfare shortly caused the streets of London and all towns accessible from the east to be darkened, and searchlights, special guns, and an increasing number of air machines to be held in readiness against attack; while all trains in the south-eastern quarter of England had to have their blinds drawn after nightfall. The fall of Antwerp and the loss of the Belgian coast to the enemy brought the imminence of the danger home. These events in Belgium brought also a great accession to the number of Belgian refugees who had already sought shelter in England, and a vast organization of public and private benevolence catered for their needs. On the other hand, public opinion in England was cheered about this time by the arrival of the first contingent of Canadian troops, the forerunner of a mighty force from all the Dominions, and by the sending over of the little line in France of native troops from India. This was unfortunately succeeded by the news of the defeat of Adml. Cradock at Coronel.

The new parliamentary session, which opened on Nov. 11, followed immediately upon a serious development of the conflict—the entry of Turkey into the war as an ally of the Central Powers (which had as one result the proclamation of Egypt as a British Protectorsate). The King, in his Speech, said that “the only measures which will be submitted to you, at this stage of the session, are such as seem necessary to my advisers for the attainment of the single purpose upon which the efforts of the Empire are set.” The most burning question of the moment was the scale of pensions and disablement allowances for sailors and soldiers and their dependents.

Mr. Asquith welcomed a suggestion made by Mr. Law that it should be referred for decision to a small committee of all parties. Mr. Arthur Henderson, who had succeeded the pacificist Mr. Ramsay Macdonald as chairman of the Labour party, promised the full support of organised labour in maintaining unity.

The finance of the war claimed the immediate attention of Parliament. The Prime Minister moved a Vote of Credit for £250,000,000, and a further addition of a million men to the army. On Nov. 17 the Chancellor of the Exchequer explained how it was proposed to raise the money. He had to provide for a deficit of nearly 340 millions.

Following the precedents of Pitt in the French War and Gladstone in the Crimean War, a substantial part of this must be obtained by increased taxation levied on all classes. He proposed to double the income-tax (bringing it up to 2s. 6d.), and super-tax, to add the equivalent of a halfpenny a half-pint to the taxation of beer, and to raise the duty on tea from 5d. to 8d. In a full year, he calculated that these increases would bring in another 65 millions. He further announced the immediate issue of a loan of £350,000,000, at 3½ per cent., which was promptly subscribed. He calculated the cost of the first full year of war as at least £450,000,000. Other important war measures taken at this time were the purchase by Government of £18,000,000 worth of sugar—a forerun of the coming control of food supplies, not yet expected; a scheme for the manufacture of aniline dyes, hitherto made exclusively in Germany—the consumers to subscribe three millions, and the Government to guarantee debit interest on another million and a half; the setting up by statute of a custodian of enemy property in the person of the Public Trustee.

At the end of November the King crossed to France, and spent a week with his army in the field. The visit, which was repeated in subsequent years of war, greatly cheered and sustained the troops. Almost immediately afterwards came the news of Adml. Sturdee’s victory off the Falkland Isles. But the war was not thoroughly â€œsettledâ€‍ by Valdemar’s first attempt to invade England in force might be too hazardous to be attempted, the country was exposed to harassing and destructive attacks by sea and air. On the morning of Dec. 16 German warships appeared off Hartlepool, a great business port, and Scarborough and Whitby, two much-frequented watering-places, and bombarded all three towns, doing considerable damage, and killing some 140 people, and wounding many others, mostly civilians, including women and children. The ships only remained for half an hour and then disappeared in the mist, before any portion of the British fleet, save patrol boats, could come up. On Christmas Eve a German seaplane dropped a bomb in a bed of cabbages near Dover Castle, and at midday on Christmas Day another got up the Thames as far as Erith, but was then chased off. These events produced no panic, but stimulated recruiting, which remained brisk in England, though in Ireland Mr. Redmond’s efforts were only moderately successful.

Speaking in December, Mr. Bonar Law, while rightfully claiming that the Opposition had distinguished itself from previous war-time oppositions by its patriotic reticence, remarked that perhaps, indeed, they had criticized the Government enough. The early months of 1915 witnessed a change. It was clear that the war, which in the west had settled down into trench-fighting, would last for a considerable time, even assuming that the “steam-roller” of the Russian advance would eventually cause the German strangle-hold on north-eastern France to relax; it was not so clear that all that the Government had done and left undone was judicious. Criticism therefore arose, and became steadily more insistent till the formation of the first Coalition Ministry. But it was criticism, not on party lines, directed to the more efficient conduct of the war; the criticism from the pacifist side was negligible. It was urged that voluntary enlistment, though hitherto fairly adequate, could not possibly give the army all the men it would want; that the half-hearted British policy of search and blockade, though it provoked reasoned objections from the American Government, failed to do any serious harm to Germany; that steps should at once be taken to regulate the price of food, which was steadily mounting; that the Press Bureau, under Sir Stanley (afterwards Lord) Buckmaster, was unduly harassing; that quite undue mildness was shown in the treatment accorded to enemy aliens, who should all be interned; that insufficient attention was paid to the development of the air force; that the Government had entirely failed to meet the requirements for munitions of war.

Feeling in England was hardened by the German proclamation of Feb. 4, declaring a blockade of Great Britain from Feb. 18, claiming the right in the war-region to destroy British ships without providing means of escape for passengers and crew, and warning neutral ships that they might incur the same fate. “This,” as Mr. Asquith said, “is in effect a claim to torpedo at sight, without regard to the safety of crew and passengers, any merchant vessel under any flag.” It was resolved, in consequence, to detain, and take into port, ships carrying goods of presumed enemy destination, ownership or origin; and also to discriminate against submarine prisoners, as having disregarded the laws of war. The sinking of the “Lusitania,” in accordance with this proclamation, by the Germans on May 7, with a great loss of life among innocent passengers, largely American, brought the aliens question in England to a head, as it produced violent anti-German riots and demonstrations all over the country. It was decided to intern or deport all enemy aliens, and to scrutinize carefully the cases of naturalized Germans. Widespread indignation had already been aroused this spring by the
reports of American agents about the treatment meted out to prisoners in Germany; and this was increased in May by the publication of the report of a committee, presided over by Lord Bryce, confirming the stories of outrage committed by the Germans in Belgium and France. The Prime Minister had no difficulty in obtaining a supplementary Vote of Credit for £37,000,000, and a fresh Vote of Credit for £250,000,000, the cost of the war having already reached two millions a day.

The great difficulty with which the Government had to cope this spring was the insufficient supply of munitions of war, due mainly to strikes, to trade-union practices favouring slow production, and to the action, and the hours during which public houses were open, of the Ministry of Munitions. On March 17 the Chancellor of the Exchequer met the representatives of 35 trade unions, and pointed out to them that the duration of the war depended on the rate at which munitions could be turned out. Ultimately an agreement was reached under which there was to be in no case any stoppage of work upon munitions and equipments of war; all differences were to be the subject of conference between the parties and in case of disagreement to be referred to arbitration; and the hours during which public houses might be open during the war period. In harmony with the spirit of this agreement there was enrolled at Liverpool, under Lord Derby's command, a Dockers' Battalion. With regard to drink Mr. Lloyd George told a deputation of shipowners who advocated total prohibition during the war: "We are fighting Germany, Austria, and drink; and, as far as I can see, the greatest of these three deadly foes is drink." In order to set a good example in the King announced that he would give up all alcoholic liquor till after the war, and issued orders against its consumption in the Royal Household. Lord Kitchener, and a considerable number of local subjects, favored His Majesty's example. On April 29 Mr. Lloyd George introduced the ministerial proposals which increased enormously the taxation on all alcoholic liquors, and included powers to close and control publichouses in munition areas. But public opinion was not ripe for so stringent a measure, and compelled the withdrawal of these proposals; and the Government contented itself with setting up a Liquor Control Board with Lord D'Abernon (formerly Sir Edgar Vincent) as chairman, which drastically reduced the alcoholic strength of beer and spirits, in munition or production areas, and the hours during which public-houses might be open and liquor sold. Only for some two hours in the middle of the day and for some three hours in the evening could drink be procured; and the arrangement worked well.

The question of munitions became critical in April and May. The battle of Neuve Chapelle in March had been indecisive owing to a deficiency of ammunition, which was revealed to the people of England by a dispatch from the Military Correspondent of The Times (Col. Repington). Mr. Asquith indeed, in a speech at Newcastle-on-Tyne mainly devoted to encouraging munition workers to deliver the goods "more promptly" and to "amaze and anger the public by denying that operations in the field had been crippled through lack of ammunition. But Lord Kitchener confessed that "the output is not equal to our needs"; and Mr. Lloyd George dwelt in the House of Commons on the unprecedented expenditure of artillery ammunition and the new importance given to high explosives. The problem, he said, was to produce munitions not only on a much larger scale than ever before but of a different kind. To the anxieties caused by the deficiency of munitions were added those due to the desperate resistance with which the troops, just landed with high hopes on Gallipoli, had been met. "Disagreement between the Dardanelles operations between Mr. Churchill, the First Lord of the Admiralty, and Lord Fisher, the First Sea Lord, came to a head; and the Prime Minister, who had on May 12 contradicted the current rumours of coalition, formally told the House a week later that the Government was to be reconstructed "on a broader personal and political basis."

The reconstruction took place during the Whitsuntide recess, it being carefully explained by Mr. Asquith that there was no change of policy and no sacrifice by any minister of his political ideals. The Coalition was "for the purpose of the war alone." Mr. Asquith, Sir Edward Grey and Lord Kitchener retained their respective offices, and Lord Crewe remained Lord President and leader in the Lords; Lord Lansdowne joined the Ministry without portfolio; Mr. Bonar Law became Colonial Secretary; Mr. Balfour took over the Admiralty from Mr. Churchill, who became Chancellor of the Duchy; Mr. Austen Chamberlain went to India, and Lord Herbert Long went to India (afterwards Lord) Long, and Lord Selborne also entered the Cabinet. Mr. Asquith sought the coöperation of both the Irish leaders in his Cabinet; but, while Sir Edward Carson accepted the Attorney-Generalship (having Mr. F. E. Smith as Solicitor-General), Mr. Redmond declined to enter. Mr. Henderson, the leader of the Labour party, became President of the Board of Education. Public opinion would not tolerate the retention of Lord Haldane, with his German associations, as Lord Chancellor. The post was declined by the Attorney-General, Sir John Simon, and he became Home Secretary. The Solicitor-General, Sir Stanley Buckmaster, was accordingly promoted to the woolsack as Lord Buckmaster. The vital importance of guns and ammunition was recognized by the creation of a new Ministry of Munitions, at the head of which was placed the most energetic member of the late Ministry, already rivalling Mr. Asquith in reputation, Mr. Lloyd George. Mr. McKenna succeeded to the Chancellorship of the Exchequer, and Mr. Runciman, Mr. Birrell, Mr. McKimmon Wood and Mr. Harcourt remained in the Cabinet. The Liberal ministers who retired, besides Lord Haldane, were Lord Beauchamp, Mr. Hobhouse, Mr. Pease, Lord Lucas and Lord Emmott; Mr. Herbert Samuel became Postmaster-General, but was excluded from the Cabinet; and Mr. Montagu became Financial Secretary to the Treasury, Lord Robert Cecil Under-Secretary for Foreign Affairs and the Duke of Devonshire Civil Lord of the Admiralty; Mr. Brace, the Labour member, was appointed Under-Secretary for Home Affairs.

The country, which was cheered this May by the entry of Italy into the war on the side of the Allies, welcomed the new Ministry as giving promise of a more strenuous conduct of hostilities. Mr. Lloyd George threw himself with arduous into his new work, enlisted the aid of business and practical men and men of science in its organization, and made a personal appeal to the great towns, Manchester, Liverpool and Cardiff, to concentrate on enlarging the output, and to consent to the modification of such trade-union rules as conflicted with rapid and efficient production. It was in the workshops of the country, he said, that success must be sought. He urged the conversion of workshops engaged in the arts of peace into factories for turning out munitions of war. Mr. Lloyd George got at once to work on the lines he had laid down. He brought in on June 23 a Munitions of War bill, embodying his plans for increasing output outside the arms establishments by decentralization. There were to be 10 munition areas, managed by local business men. There must be no strikes or lockouts; disputes must be referred to arbitration. Skilled men must be brought back from the army; Munition Courts appointed, representative of Government, employers and workmen; trade-union regulations restricting output must be suspended; and employers' profits limited. These proposals, with some modifications, were accepted by the Labour leaders; and the bill promptly became law.

But the Act by no means put a complete stop to labour troubles. In July the South Wales miners suddenly demanded a new minimum rate of wages higher than the previous maximum. Mr. Runciman, President of the Board of Trade, in vain endeavoured to compose the quarrel. The Government applied the provisions of the Munitions Act with no result, and a card vote gave a majority for a strike. Mr. Lloyd George went down to Cardiff and effected a settlement by an advance on
Mr. Runciman’s conditions, after a week’s strike had cost the country £1,500,000,000. The continued increase in the price of coal consequent on these events caused the Government to pass a Price of Coal (Limitation) bill, which was only accepted by Parliament with reluctance. The King made in July a tour of the munition centres in the Midlands to thank and hearten the workers of both sexes. Mr. Lloyd George was able in the debate on adjournment on July 28 to give a reassuring account of the success of his department, which had enrolled nearly 1,000,000 volunteers, and brought back thousands of qualified engineers from the ranks, and had set up some 20 national factories. But, as a result of a recent conference at Boulogne, it had been decided to embark on a new programme of great proportions which would necessitate 10 new establishments and need further volunteers, and especially the assistance of women.

Once more he appealed to trade-union leaders to bring pressure upon their men to suspend trade-union practices restricting output, and he attended a conference in the London Opera House on the following day with representatives of the coal-mines industry, and obtained Parliament by sanction for a 12 hr. War Loan, to be issued at 4½%, at par, with special arrangements, through the post-offices, trade unions, friendly societies, and factories, for the encouragement of the small investor, who could obtain bonds of £5 or vouchers for 5s. A great campaign was at once started in support of the loan and of war economy, beginning with a meeting of bankers, merchants, manufacturers and shopkeepers of the City of London in the Guildhall. Mr. Asquith and Mr. Bonar Law were the principal speakers. The Prime Minister commended the loan as the first great democratic loan in British history, and he urged the imperative necessity of reducing all expenditure on luxuries. The loan was a great success, and realized nearly £600,000,000, including 200 millions from the big banks. At the end of July the Prime Minister had to apply for a further Vote of Credit amounting to £50,000,000. A Refundment Committee, with Mr. McKenna as chairman, was appointed to inquire into civil expenditure.

The formation of the Coalition Ministry did not abate the movement for compulsory military service, a movement which was met by strong demonstrations in favour of retaining the voluntary system, including a pronounce ment of the Unionist Congress in the autumn. The Government adopted the intermediate measure of introducing a National Registration bill — applicable to all persons between 15 (eventually changed to 16) and 65. This, though resisted by some Radicals and Labour men, was carried into law without much difficulty. They also passed an Elections Registration bill, postponing local elections and suspending registration of voters. But they could not bring themselves to take strong steps to secure the production of food, declining to accept the recommendation of a committee of agricultural experts over whom Lord Milner presided, that there should be a guaranteed minimum price of wheat for the four years following the 1916 harvest.

The agitation for compulsory service increased in the autumn, and dominated the internal politics of the country and the proceedings of Parliament. Lord Kitchener, who had hitherto resisted the movement, confessed that the provision of adequate forces in the field caused him anxious thought. Independent members of Parliament pressed the compulsory solution upon the Government. While Radicals and Labour men and Irish Nationalist politicians deprecated the trend of public opinion, the unsatisfactory course of the war spoke loudly. Zeppelin raids had brought home the hard facts of war both to the Londoner and to the countryman; and the defence was clearly inadequate. Russia, on whose early successes optimism had fastened, had been driven back by the Germans. Before the autumn was far advanced, it was evident that some decisive action must be taken in regard to the gallant, but fruitless, Gallipoli adventure. Bulgaria, on a shrewd, but shortsighted, appreciation of the situation, came into the war on the German side. Great put to the test, declined, under the influence of her King, to honour her pledge to aid Serbia, which was in consequence heavily defeated and overrun. In France the British offensive at Loos, and the French in Champagne, had seemed to promise well, but no real progress had been made; and Sir John French, after 14 months’ incessant strain, gave up in October the command of the British forces, and was succeeded by Sir Douglas Haig. In the effort to save off a decision on compulsory service Lord Derby was asked, and consented, in October to assume the direction of recruiting. He inaugurated a most strenuous campaign, ushered in by a spirited letter from the King. Men were divided into various groups, and the unmarried men were to be taken in preference to the married men. Lord Derby spent himself without stint, and there was a great rush of recruits; but before the end of December it was clear that an adequate number of unmarried men would not be obtained. In November Mr. Asquith had said that, if Lord Derby’s scheme was not a success, he would, "without the faintest hesitation or doubt," ask the House to sanction some form of legal obligation. The time had come. Mr. Asquith moved on Nov. 21 for an additional of a million men to the previous three millions voted for the army, and the Cabinet accepted the principle of compulsion, at the cost of losing Sir John Simon, the Home Secretary.

In the press the principal demand for compulsion came from The Times, which had throughout been a strong advocate for more strenuous prosecution of the war. Another vital matter, to which it called attention again and again this autumn, was the necessity of entrusting the uncontrolled conduct of the war to a very small Cabinet. This demand was echoed in the House of Lords on Oct. 26 by Lord Cromer, who said that what the public wanted to see was a small, strong, executive body chosen from men representing the best talent in the country; and on Nov. 2 by Sir Edward Carson, who had resigned office owing to dissatisfaction with the Balkan policy of the Government, and who said that responsibility could only properly be concentrated by the reduction of the Cabinet to five or six members. Mr. Asquith endeavoured to meet this demand by promising to commit the strategic conduct of the war to a committee of not less than three and not more than five members, having elastic relations with the Cabinet. Apparently the War Council had been allowed to become obsolete. Mr. Asquith announced, on Nov. 11, that, in the absence of Lord Kitchener, who went in that month to Gallipoli to acquaint himself with the situation, the new War Committee would consist of himself, Mr. Balfour, Mr. Lloyd George, Mr. Bonar Law, and Mr. McKenna. The exclusion of Mr. Churchill from the conduct of the war brought about his resignation from the Cabinet and his departure for the western front as a British military officer.
The secrecy enforced upon the press produced many protests, until the Press Bureau was placed under the competent headship of an able journalist, Sir Edward Cook, and a leading ex-colonial administrator, Sir Frank Swettenham. One urgent matter dealt with by Parliament (which sat continuously, with short intervals of protraction or adjournment, throughout the war) was the question of its own existence, which under the Parliament Act should have been abolished in December of this year but which was prolonged by statute this autumn, and by subsequent statutes in subsequent years, till after the conclusion of the war.

Further powers were given to the Munitions Ministry by a bill passed in December; and Mr. Lloyd George, while granting that the output of munitions had been prodigiously increased, urged the imperative need of further efforts, especially by the method of "diluting" skilled labour by the introduction of women. The footsteps of the Allies, he warned Parliament, had been dogged by the spectre of "Too late."

One vitally important matter, the finance of the war, was resolutely grappled with this autumn by the Coalition Government, and by Mr. McKenna, its Chancellor of the Exchequer. The cost of hostilities was rapidly mounting. In moving a Vote of Credit in Sept. for £250,000,000, the Prime Minister said that it had risen in the past half year from £5,700,000 to over £25,000,000 a day; in moving a similar Vote for £100,000,000 in November, he estimated for an expenditure of £5,000,000 a day. In these circumstances a strenuous effort was made in the third war budget in September to raise a large portion of the outlay by taxation. In the previous year Mr. Lloyd George had doubled the income-tax and super-tax, and greatly increased the taxes on beer and tea. Beer, which was now severely limited by the Board of Control, Mr. McKenna left alone. But he increased the income-tax once more by 40%, and reduced the exemption limit, while permitting payment in half-yearly instalments. Super-tax was also increased. He imposed a new excess-profits tax—tapping the lucrative gains of war manufacture—of 50 per cent. He increased the taxation on sugar enormously; added 50% more in duties on tea, tobacco, cocoa, coffee, chicory and dried fruits; raised the duty on motor spirits by 3d. a gallon, and doubled the patent-medicine duty. He abolished the halfpenny post, increased the telegraph rate, doubled the income and made the press telegraph charges self-supporting. He undertook an entirely new departure by taxing foreign luxuries, putting a 3 1/2% ad valorem duty on imported motor-cars and cycles, cinema films, clocks, watches, musical instruments, plate-glass and hats. These new taxes were estimated to bring in £107,000,000, but he placed the expenditure at £1,500,000,000, and the revenue, on the basis of existing taxation, at £72,110,000, so that there was a wide margin still to be filled by borrowing. There was some attempt to raise in debate the issue of Free Trade and Protection; but with the exception of the plate-glass and hat taxes, which were abandoned, the budget had an easy passage through Parliament.

When the year 1916 opened there was a general agreement that the war had become to an enormous extent a war of attrition, and the Cabinet therefore proceeded at once to bring in the Compulsory Service Bill, to which circumstances had, however reluctantly, driven them. It was far from being universal. It merely treated unattested single men and childless widowers between the ages of 18 and 40 as if they had attested under Lord Derby's group system.

Ireland was excluded from the bill, and exemptions were allowed for ministers of religion, men medically rejected or physically unable to do any of the work: those who were the sole support of dependents, and "conscientious objectors" to combatant service. Tribunals were set up to deal with claims for exemption. Sir John Simon led a small and dwindling opposition; but many of the Labour members, including Mr. Henderson, the leader of the party, supported the bill; Mr. Redmond, who led 60 Nationalists into the lobby against the first reading, withdrew Nationalist opposition on receiving the united demand in Great Britain in its favour; and the second reading was carried by 431 votes against 39. No hostile amendment received any serious support in committee, and the bill was read a third time by 383 votes against 36. In the Lords the measure was passed without a division, Lord Derby explaining that there were at least 650,000 unattested single men who would be affected by it. There was some fear that the labour organizations, who suspected the possibility of industrial conscription, would place serious difficulties in the way of enforcing its provisions. They did indeed condemn it by a considerable majority at a labour conference held while it was passing through Parliament; but they decided not to agitate against it. Little practical effect was given to their condemnation save in the Clyde district, where in March and April strikes were organized in munition works with a view to getting this Act, and the Munitions Act facilitating dilution of labour, repealed. The ringleaders, however, were arrested and deported.

The local tribunals, which were set up, proved to be, on the whole, generous in continuing the exemptions; and there was in consequence strong criticism, in the press and in Parliament, both on behalf of the married men, who considered that the pledges of comparative immunity made to them were imperilled, and on behalf of those who were eager for the efficient conduct of the war, and who held that the purpose of the Act was being defeated. There had been organized in the House of Commons, in each of the two great parties which supported the Coalition, a War Committee, having for its sole concern the strenuous prosecution of the war. On March 21 the Liberal War Committee passed a resolution approving the extension of the principe of compulsion to married men; and powerful organs of the press, notably The Times and other journals of which Lord Northcliffe was the principal proprietor, proclaimed that the needs of the army could not be properly supplied without universal compulsion. On March 28 the Unionist War Committee resolved that there ought to be equal sacrifices from all men of military age; and Sir Edward Carson, a leading spirit in that Committee, urged the Government to extend compulsion universally, criticizing their hesitations. Lord Derby was also very critical in the House of Lords, and Lord Milner in that House implored the Government to put recruiting on the only satisfactory basis. The soldiers also pressed ministers hard. Asquith announced on April 10 the setting up of a Secret Committee, Mr. McKenna, Lord Lansdowne, and Mr. Austen Chamberlain came unanimously on April 14 to an adverse decision. The Cabinet did not accept their Committee's alternative scheme, but could not reach a decision. Not for the first time the Prime Minister had to ask the House of Commons for leave to postpone his official statement on the subject, telling the House that there were still points unsettled, and that the break-up of the Cabinet would be a national disaster of the most formidable kind. At length it was announced that a satisfactory decision had been reached; and on April 25, after the Easter holidays, in secret session in both Houses (the first of seven such sessions held during the war), ministers explained their proposals, which, it was found, only involved universal compulsion in case a number of other expediens which it is unnecessary to enumerate should fail to provide sufficient men. When the bill embodying the proposals was introduced by Mr. Long two days later, neither conscriptionists nor anti-conscriptionists found anything to say in its favour. It was withdrawn at once, and five days later Mr. Asquith announced that the Government had accepted universal compulsory service. The bill, which was introduced on May 3, brought within its operation every male between the ages of 18 and 41 to the army.

The exemptions remained as before, and Ireland was not included. In spite of Sir J. Simon's opposition, the bill passed easily through both Houses, though the method of dealing with conscientious objectors was felt to be a serious difficulty. The final step had been taken at last; but the Government had lost much of its prestige owing to the "wait and see" attitude which it had adopted.
There were other matters relating to the conduct of the war on which the press and the public and the two Parliamentary War Committees were dissatisfied with what seemed to them the slackness and hesitation of ministers. Dissatisfaction was particularly acute in regard to two questions, which had long given anxiety, the blockade of Germany, and the development of the British air force. It was urged that huge quantities of foodstuffs and other sources of military supply were going to neutral ports adjacent to Germany, and it was suggested that the navy was hampered in the strict enforcement of the blockade by the interference of the Foreign Office. This latter charge Sir E. Grey denied on Jan. 26, but he appealed to neutral countries to make it easy for Great Britain to distinguish and discriminate. Business men were not reassured, and an excited meeting was held in the City of London on Feb. 14, with Lord Devonport in the chair, to demand a fuller and more effec- tual use of British sea-power. Thereupon a Ministry of Blockade was set up, with Lord Robert Cecil as its Parliamentary chief, and he shortly afterwards issued a very comprehensive list of contraband articles, and increased the stringency of the blockade. In June, after consultation with the Allies, he took the further important step of abandoning the Declaration of London, which hitherto, contrary to its interests, the British Government had observed.

Evidence of discontent with the position and development of the air forces were constantly recurring. The Germans were known to be very active in building such as the Zeppelins, and a great raid over the centre of England on Jan. 31, 1916 called attention to their capacity for destruction. The system which made the British air forces ancillary to the army and navy, and divided the responsibility between Admiralty and War Office, was vehemently called in question. A demand was made for an Air Ministry; but the only changes which the Government announced in February were the transference of the British defences against aircraft from the Admiralty to the War Office, and the appointment of a joint naval and military committee to stimulate production, under the chairmanship of Lord Derby. Public dissatisfaction was strikingly shown by the return on March 10 to Parliament of a flying man, Mr. Pemberton Billing—who had no local connexion but who advocated a strong air policy—for the conservative constituency of East Herts by a large majority over a Coalition candidate. The new member took an active, if somewhat indiscriminate, part in stimulating the Government, who shortly added Lord Montagu of Beaulieu, a keen promoter of aviation, to Lord Derby's committee. But this arrangement did not last long, and in the second week in April Lord Montagu withdrew with resignation, as they found the committee had no real power.

Accordingly in May the Government went further, and established a Joint Air Board representing both army and navy, with Lord Curzon as president and Maj. Baird as parliamentary secretary. This departure was welcomed, though it was doubted whether even this Board would have sufficient independent power; and not only the critics, such as Mr. Winston Churchill, but Lord Curzon himself, proclaimed that an Air Ministry was destined to come—a prediction fulfilled in the following December, when Mr. Lloyd George formed his Government. The reforms already effected bore fruit in the autumn, when a Zeppelin was brought down at Cuffley by an intrepid British airman, the first of a long series of successes which constrained the enemy to rely upon aeroplanes rather than airships.

It began to be realized in the winter of 1915-6 that it was not only in arms that it was necessary to conquer Germany, but also in the field of economics. Success in arms might be compatible with defeat in the economic sphere. In January a resolution, proposed by Mr. Hewitt, who had been secretary of Mr. Joseph Chamberlain's Tariff Reform Commission, and supported by Mr. Prothero, a great agricultural authority, demanding measures to bring the whole economic strength of the empire to bear in the struggle against Germany, was accepted by Mr. Runciman, President of the Board of Trade, and carried without a division. This conflicted with the free-trade tradition, but even in Manchester, the home of free trade, the Chamber of Commerce came into line. The Chancellor of the Exchequer, Mr. McKenna, addressing the Association of Chambers of Commerce in February, said that the Government were prepared to assist in the development of foreign trade so as to ensure that England's bitterest foes and rivals should not have their former control; and Mr. Bonar Law next day announced that an economic conference would be held in Paris in the summer on this vital question. Lord Selborne, President of the Board of Agriculture, said in March that the whole attitude of Parliament towards agriculture would have to be changed; the agricultural laws must be so framed as to obtain the greatest possible national security. A great reinforcement of this propaganda was found in Mr. Hughes, the Prime Minister of Australia, who had come on a visit to England, and who made several speeches on the text that not merely must Germany's military power be destroyed, but that German control and influence in British trade and industry must be extirpated. Mr. Hughes's public appearances were received with acclamation; and he was appointed one of the British representatives at the Paris Conference, which met in the middle of June. In its final conclusions the Conference recommended (1) during the war period, coordination of regulations of allied countries prohibiting trading with the enemy; absolute embargo on importation of enemy goods, sequestration of enemy businesses, and stringent measures for restriction of enemy supplies; (2) in the reconstruction period after the war, restoration and reequipment for despooled countries, denial of most favoured treatment to enemy powers, and measures for conservation of allied resources and against enemy dumping; and (3) for the peace period, measures to render allied countries independent of enemy countries in raw materials and key industries, to facilitate interchange of allied products, and to assimilate allied legislation as to patents, trademarks and copyrights. These recommendations were received enthusiastically in England; but a minority objected to the idea of " war after the war."

The stringency of war conditions began to grip England and particularly London this spring. Public museums and galleries were to a great extent closed; and, in order to economize tonnage, the importation of many bulky cargoes, especially paper pulp and grass for paper-making, was prohibited. To ensure rapidity of production the Whitstable bank holiday was postponed. Economy in all directions was preached and practised; to economize coal and gas and electricity a " summer time " Act was passed giving people an extra hour of daylight in the summer evenings; the tourniquet was tightened; those who ate too much and wasted too much, made a free gift of £100,000 to the national exchequer; an elaborate system of war savings was set up, under which £15, 6d. lent to the Government was to mature into £1 in five years. None of these restrictions or economies affected the spirit of the country; a debate raised in Parliament in February, by the small body of pacifists who ingenerated peace, only drew from the Prime Minister a repetition, amid enthusiastic cheers, of his declaration at the Guildhall on Nov. 9, 1914, that Britain would never shentle the sword until the military domination of Prussia was wholly and finally destroyed. The only criticism of the navy estimates was Mr. Churchill's complaint that the Board of Admiralty which had succeeded him was deficient in energy and push.

Once again, perhaps the most satisfactory feature of the ministerial policy was the resolute way in which the financial problem was faced. On Feb. 21 the Prime Minister introduced and carried two votes of credit—one a supplementary vote of £120,000,000 to cover the remainder of the current financial year, and the other of £480,000,000 to prepare the new year on April 1. This brought the total of credit since the outbreak of war to £782,000,000. The Chancellor of the Exchequer, in his
budget introduced on April 4, estimated the net revenue at £5,000,-
c000,000 and the expenditure at £18,250,000,000; so that there
was a deficit of £1,323,000,000, to be met by borrowing, which
would mean a new charge, for interest at 5% and sinking fund at
1%, of £79,000,000. He tackled this unflinchingly; raised
income tax to a maximum of 5% in the pound, thus gaining
£4,500,000; increased the excess profits tax from 50 to 60%;
imposed an amusement tax on tickets for all public shows and a
railway ticket tax on all journeys costing more than 9d.; he also
took toll of matches, table-waters, cider and Kerry. Then he
increased the duty on motor-cars, wine, and sugar, cocoa, coffee and
chicory. Colossal as the budget was, involving £1,825,000,000 of new taxation since the war began, it passed through Parliament substantially unchanged.

Mr. Asquith took advantage of Mr. Hughes's presence this spring to repeat an experiment which he had successfully made in the previous year when Sir Robert Borden, the Canadian Prime Minister, was in England; namely to invite the visiting Dominion minister to sit in Cabinet, and share in the imperial decisions on the war. He also continued to maintain the system of closer co-operation between the Allies into closer cooperation by attending a war conference in Paris on March 27, and then proceeding to Italy to consolidate
relations with the new Ally.

Shortly after his return, he had to deal with a sudden out-
break of rebellion at Easter in Ireland, principally in Dublin.

Rebellion in Ireland.

The rebellion was put down by military force under
Sir John Maxwell; the ringleaders were tried by court-martial and shot; Casement, who had landed from Germany, was put on his trial for treason and hanged; the Chief Secretary, Mr. Birrell, and the Lord Lieutenant resigned; a commission was appointed to inquire into the causes of the insurrection (and, it may be added, reported that it was largely attributable to weakness in administration); and in the middle of May Mr. Asquith went himself to Dublin with a view
to arriving at some new arrangement for the future government
of Ireland. On his return he told the House of Commons that he
had been deeply impressed by the breakdown of the existing
machinery, and by the universality of the Irish feeling that there
was now a uniqueness opportunity for a new departure. Accordingly
he announced that ministers had unanimously commissioned their colleague, Mr. Lloyd George, to endeavour to effect
a settlement.

Mr. Lloyd George's good-will to Ireland was well
known, and his reputation for getting work done had
enormously increased since the outbreak of war. It
was believed, moreover, that a Coalition would have a
better chance than a party Government to arrange
terms. At first the negotiations appeared to promise
well. Mr. Redmond told a meeting of the Irish Parlia-
mentary party in Dublin on June 10 that Mr. Lloyd George's proposals were:—(1) to bring the Home Rule Act into immediate
operation; (2) to introduce at once an Amending bill, to cover
only the period of the war and a short interregnum after it, passing
during this period for the retention of the Irish members at Westminster in full number, and of the six Ulster counties under the imperial Government. Sir Edward Carson persuaded the Unionist
Ulstermen to accept these terms, and Mr. Devlin obtained a
vote in their support from the Nationalists of the six counties. But the growing body of Sinn Feiners regarded the negotiations with great disfavour; and, on the other hand, the Southern Unionists protested, and many Unionists in Parliament and the Cabinet objected, Lord Lansdowne resigning his office in consequence. The Cabinet was recorded to have been. The Government was not bound by Mr. Lloyd George's communications; and certain modifications were introduced in order to meet Unionist objections. The main alteration was that the Government could not agree to retain the Irish members at Westminster in undiminished numbers after the next election. The Government also proposed during the transition to appoint
an Irish minister responsible to Parliament, having a military officer
associated with him with forces sufficient to maintain
order. These modifications were the reason, or the excuse, for
Mr. Redmond to raise the cries of "coercion" and "breach
of faith," and to withdraw from the negotiation; though Mr. Lloyd
George, the Government negotiator, protested that in his opinion
the terms were such as the Irish members might well accept. The negotiations having broken down, Mr. Duke, a Unionist,
was appointed Chief Secretary, and a month later, Lord Wim-
bome, a Liberal, was appointed Lord Lieutenant.

The summer of 1916 was marked by the sudden death of the great soldier upon whose experience and power of organization
the majority of Britons at the outset of war placed
their special reliance. Lord Kitchener, on a mission
to Russia, left the north of Scotland on June 5 in H.M.S. "Hampshire," which that evening struck a mine to the east of the Orkneys and sank. There were only
2 survivors, and he was not among them. His services, in
the early days of war, were of incalculable value. If, sub-
sequently, he had failed in some degree to adapt himself to his
environment, nevertheless his disappearance was felt all over the world as a heavy blow to the Allied cause. Its effects were to minimize, so far as might be, the appoint-
ment to the Secretaryship of State in his place of the civilian
minister who had shown the greatest energy and resource
in the war, Mr. Lloyd George. Lord Derby, who had rendered exemplary services to recruiting, became Under-
Secretary for War. At the same time, Sir Edward Grey, the trusted Foreign Secretary, whose eyesight had been failing, went
to the House of Lords as Visct. Grey of Fallodon. He retained the
Foreign Secretaryship, and had an efficient representative
in the House of Commons in Lord Robert Cecil, at once his
Under-Secretary and Minister of Blockade.

Public opinion in England was disturbed this summer over
many subsidiary matters relating to the war—the ill-treatment
of British civilian prisoners at Ruhleben, and of
British military prisoners in German camps, and the slight attention which the German Government paid to the reports of American diplomatic visitors
and to British diplomatic representations; the in-
creasing shortness of food, the difficulties of agriculturists whose labourers had been taken under the Military Service Acts and who had not been able as yet to obtain an ade-
quate supply of capable women in their place, and the nearing
prospect of rationing; the judicial murder by the Italian Consul
Fyatt, of the s.s. "Brussels," for endeavouring to ram a German
submarine; and—what loomed largest in Parliamentary debate—
the failure of British arms in two exclusively British theatres of
action, the Dardanelles and Mesopotamia. The remaining troops
had all been brought safely away from the Gallipoli peninsula
in the winter of 1915-6, but the causes of the failure of a promising
venture were still hotly disputed; in Mesopotamia, Gen. Town-
hend had been forced to retire before reaching Bagdad, and had
been besieged in Kut, and had finally, on April 29, been driven
to surrender with all his force to the Turks. The Government re-
sisted inquiry until public opinion proved too strong for them;
but at the end of July two Royal Commissions were appointed;
that for Mesopotamia under the chairmanship of Lord George
Hamilton, a former Secretary of State for India; that for the
Dardanelles under the chairmanship of Lord Cromer, the most
venerated of British empire-builders.

Stirring events happened this spring and summer in the
war nearer home. The German fleet ventured out into the North Sea,
and, after being held and fought for several hours by
Sir David Beatty and his battle-cruiser squadron,
was brought to action on the 31st. The decision
of John Jellicoe, the main fleet off the coast of Jutland, was severely handled, and only
got back to harbour under cover of night. But British losses
were serious, and many doubted whether the most had been
made of a unique opportunity. Then the determined German
attempt to take Verdun was resisted most heroically by the
French in a fight lasting many weeks; and on July 1 the British
army, partly with the view of relieving the pressure on its Allies,
began a furious assault on the Somme, which, though successful
and productive of glorious deeds, was terribly costly, and lasted till late autumn without breaking through the German lines.

In the midst of this long-drawn-out battle, Britain entered the third year of war, with ample indications from King, ministers, Empire and people that the struggle would be pursued without flinching. Votes of credit multiplied.

At the end of September Mr. Asquith obtained one for £300,000,000; at the end of July another for £450,000,000; and in October yet another for £100,000,000. Mr. Lloyd George, who was felt more and more to incarnate the spirit which possessed the British people, told an American interviewer in September that the war could not be ended except by a complete victory. "The fight must be to a finish," he said; "to a knock-out." Lord Grey of Fallokon endorsed this opinion in October. There must be no peace, he said, except a peace which would ensure that Europe should henceforth live free from the shadow of Russian militarism. And in November, in a telegram to Mr. Taft, on the occasion of a banquet in New York of a league to enforce peace, he expressed a sincere desire to see a League of Nations formed and made effective, to secure the future peace of the world—after the end of the present war.

Labour was restive this autumn. The railwaymen agitated for increased war bonuses, the South Wales section being particularly insistent, and made arrangements for a strike which was avoided by a doubling of the previous war bonus of 5s. in some cases and 2s. 6d. in others. The Labour Congress in September was not particularly fruitful in suggestions, save that there was a call for a Labour Ministry. The coal-mining industry occupied much public attention. Mr. Asquith pointed out, at a conference of owners and men on Oct. 25, that the output had seriously fallen off, thus imperilling the supply of munitions. Avoidable absenteeism, the main cause, must be reduced, if not eliminated. Both masters and men promised cooperation. But serious trouble broke out in November in the South Wales coal-field, owing to demands for higher wages. The Government made a new regulation, with the Defence of the Realm Act by which the Board of Trade were to have power to issue a coal monopoly. Under this they took over the South Wales coal-field, but found it necessary to grant an advance of 15% in wages.

The restiveness of Labour was largely due to difficulties about food. A Board of Trade Committee on food prices was appointed in June with Mr. J. M. Robertson as chairman; and, with its report before him, Mr. Runciman announced that the Government had determined to control the importation of wheat, by the agency of a Royal Commission, with Lord Crawford as chairman. They had already made a large purchase of Australian wheat. A week later he mentioned that the Government had spent another £60,000,000 in the purchase of meat; and he explained that the bulk of the mercantile marine was running under Government control. But he declined the suggestions made by Mr. Barnes from the Labour side for appointing a Food Controller, or instituting bread tickets or coupons, or any system of rationing. A month later he announced that the Government had decided to appoint a Food Controller, that war bread would be instituted, that the Government would take drastic steps to deal with the wheat and potatoes, that maximum prices would be fixed and that the amount of tare issued would be seriously reduced. Another matter in which the Government were driven against their will to accept the view of the House, and especially of the Labour members, was the creation of a unified and comprehensive Ministry of Pensions, instead of adopting the middle course of a Pensions Board of inadequate scope.

But the principal preoccupation of a confused autumn was the constantly recurrent problem of man-power. The army authorities believed that many young men had managed illegitimately to escape the obligations of the Military Service Acts; and they tried for a time, with little success, the system of "rounding up" men of military age at theatres, railway stations, football fields, parks, and other places of public resort. A more legitimate demand was for the "combing out" of suitable men from Government offices and in reserved trades; and a Man-Power Distribution Board was appointed, with Mr. Neville Chamberlain as chairman, which set about this necessary job. The question of raising the military age was considered by the War Office, but put aside for the time being. Arrangements were however made, by which a considerable number of suitable young men were released from civil occupations and drafted for military service. At the same time recognition was given to the new volunteers, elderly men who had come forward to perform such military duties in the Home defence of the country as their age and their disabilities permitted. The public in England and Scotland naturally resented the exclusion of Ireland from the Military Service Acts, and there was pressure for her inclusion, in which Irish Unionists joined; but Mr. Redmond declared that any project of the kind was impossible. At the same time, he pressed forward the idea of a system of Government in his country as entirely inconsistent with the principles for which the Allies were fighting in Europe. While ministers praised Mr. Redmond's labours for recruiting, they could not but acknowledge the poor contribution of Ireland in men to the war compared with the rest of the Empire.

As autumn passed into winter, and the prolonged Somme battle died down without the hopes with which it had begun having been realized, and news came that the Germans had overrun the new Ally of the Western Powers, Rumania, and occupied Bucharest, the irritation of ardent spirits against the delays and the apparent want of efficiency of the Government gathered head. Criticism was largely focussed upon what was considered to be the "wait and see" temperament of the Prime Minister. New blood was also demanded for the Admiralty, the public having been disturbed by the comparative success and immunity of a recent German destroyer raid in the Straits of Dover; and at the end of November it was announced that Adml. jellyco would come there as First Sea Lord, Adml. Beatty succeeding him in command of the Grand Fleet. This change was welcomed, but more was desired, and was loudly called for by a considerable section of the press, led by the Times. The Prime Minister, who, within the Ministry, shared the full public desire for greater energy and coordination in the conduct of the war, recognized that this was the moment to enforce his ideas. He concentrated upon the point which had been treated as vital more than a year before by the Times and by competent critics in Parliament, the ultimate responsibility for the civilian day by day conduct of the war. The War Committee, at the moment, consisted of Mr. Asquith, Mr. Bonar Law, Mr. Lloyd George, Mr. Balour, Mr. McKenna, Lord Curzon and Mr. Montagu. But it was merely a Committee of a Cabinet set of offices subject to the constant check and control of this miscellaneous and unwieldy body. On Dec. 1 Mr. Lloyd George, in a letter to the Prime Minister, demanded—and enforced his demand with a threat of resignation—a radical change of organization; namely that the conduct of the war should be placed in the absolute control of a small War Committee sitting daily and consisting of not more than four members, himself, Sir Edward Carson (a convinced supporter of an energetic policy), Mr. Bonar Law, and a Labour member. Mr. Asquith was pointedly omitted from the proposed body. He refused to agree, but determined, with the King's assent, to reconstruct his Government. Mr. Lloyd George endeavoured to build a golden bridge by consenting to admit the Prime Minister as a consultative and advisory member of the Committee, with the power of ultimate reference to the Cabinet. Mr. Asquith at first assented, but on second thought refused. After all, the essence of the scheme was that Mr. Lloyd George, with a very limited council of advisers, should direct the war, rather than Mr. Asquith. On Mr. Asquith's refusal, Mr. Lloyd George resigned, on Dec. 5. The defection of the most powerful man in the Ministry made it impossible for Mr. Asquith to continue, and he too resigned. The King sent for Mr. Bonar Law, the Unionist leader, but Mr. Law could not secure Mr. Asquith's
cooperation, and also considered that Mr. Lloyd George had shown the qualities which the nation wanted at this critical period. So the commission passed to Mr. Lloyd George, the statesman whose reputation had steadily grown throughout the world conflict, who had already played such a decisive part, as Chancellor of the Exchequer, Minister of Munitions, and Secretary of State for War, and who more than any of his colleagues embodied the will to victory of his countrymen.

Mr. Lloyd George was assured of the close cooperation of Mr. Bonar Law, and of the support of the Independent Unionist party. He came to power upon the help of the Labour party, one of whose members, in his view, ought to sit on the small Committee or Council directing the conduct of the war. Meetings of the Parliamentary Labour party and the National Executive were held, at which, on the advice of all the labour members who had been ministers in the First Coalition and of the chairman of the party, it was decided by a majority to take part in the new Government—a decision which was ratified by the annual Labour Party Conference in the following month. This inclusion of the Liberal party was thought at first to be doubting, because Mr. Asquith, and all his principal Liberal Cabinet colleagues, such as Lord Grey of Fallodan, Lord Crewe and Mr. McKenna, refused to serve under Mr. Lloyd George. But the Liberal War Committee pledged itself at once to active support; the Welsh Liberal members rallied in a body to the side of the Welsh Prime Minister; and a party meeting at the Reform Club, following the advice of Mr. Asquith, recorded its determination to give support to the King’s Government engaged in the effective prosecution of the war. Mr. Lloyd George and Mr. Bonar Law, therefore, had a wide field of selection, only Mr. Asquith and his immediate friends, and Lord Lansdowne, who took the occasion to retire, being ruled out.

Having a free hand Mr. Lloyd George carried through an even more revolutionary change than that which he had submitted to Mr. Asquith. He constituted a small Cabinet of four members, who were relieved entirely of serious departmental duties, who were to sit daily, and to concentrate themselves upon the war, of the conduct of which they were to have absolute control. He himself, as Prime Minister, was the chairman of this War Cabinet; and, in order to perform this his main duty satisfactorily, he deputed the leadership of the House of Commons to Mr. McKenna, who was indeed already the leader of the largest numerical section of its members. Mr. Law also became Chancellor of the Exchequer, and was an additional member of the War Cabinet, but was not expected to attend regularly. The Prime Minister’s three regular Cabinet colleagues were Lord Curzon, who became Lord President of the Council and leader of the House of Lords, and two ministers without portfolio, Mr. Henderson, the Labour leader who had held high office in the first Coalition, and Lord Milner, the only statesman of marked administrative ability and experience who had not joined that Coalition. It was urgent, at this critical moment, to the man who had borne the civil responsibility in the last British war, that with the Boers; and from this time onward Lord Milner’s share in the conduct of the war from the British side was second only to Mr. Lloyd George’s. The War Cabinet sat daily in Whitehall Gardens, having Sir Maurice Hankey, the secretary of the Committee of Imperial Defence, as its secretary, with a competent staff under him. Other ministers were summoned to its deliberations, whenever these concerned the departments for which they were responsible. The one serious loss which Great Britain suffered through this was that Lord Grey of Fallodan, who had conducted the external affairs of the country, with increasing reputation and success, for 11 years. It was vitally important for Mr. Lloyd George to secure, as Lord Grey’s successor, a statesman in whose character and record the Allies could have full confidence. He was fortunate in obtaining Mr. Balfour’s consent to accept an office with whose work he had become familiar when acting Secretary of State in Lord Salisbury’s absence. For the other important posts in his Ministry Mr. Lloyd George relied very largely upon the services of business men and experts, hitherto in many cases outside politics and the Houses of Parliament, of whose aid he had made such excellent use in developing munitions. The country saw with satisfaction the Board of Trade entrusted to Sir Albert Stanley, who had previously directed the Underground railway and the motor-omnibus system; the Board of Education to Mr. H. A. L. Fisher, the Oxford scholar and historian, vice-chancellor of the university of Sheffield; the Local Government Board to Lord Rhondda, the South Wales colliery magnate; and the Board of Agriculture to Mr. R. E. Prothero (afterwards Lord Ernle), M.P. for Oxford University, who had managed for many years the vast agricultural estates of the Duke of Bedford. For the more efficient conduct of the war, five new ministries were created—Air, Labour, Pensions, Food Control, and Shipping Control—for two of which, Pensions and Food Control, some inchoate provision had been made in the last weeks of the first Coalition Ministry. Lord Devonport, who had large experience in the grocery business, became Food Controller; Sir Joseph Maclay, a Glasgow ship-owner, was appointed Shipping Controller; the new Air Board was constituted with Lord Cowley, the head of a great firm of contractors, as president; while Labour and Pensions were fittingly assigned to two outstanding Labour members, Mr. Hodge and Mr. George Barnes. Seats were found in the House of Commons for Sir Albert Stanley and Mr. Fisher; but Sir Joseph Maclay preferred to work outside Parliament, and his office was represented in the House by Sir Leo Chiozza Money, the parliamentary secretary. Where Mr. Lloyd George appointed experienced parliamentarians to office, he chose those who had shown special keenness in the prosecution of the war. Then Sir Edward Carson went to the Admiralty; Lord Derby to the War Office; Mr. Walter Long to the Colonial Office; Dr. Addison to the Ministry of Munitions; and Sir Frederick Cawley, chairman of the Liberal War Committee, to the Duchy of Lancaster. Mr. Chamberlain remained Indian Secretary, Lord Robert Cecil Minister of Blockade, Mr. Duke Irish Secretary and Sir F. E. Smith Attorney-General, Sir Gordon Hewart becoming Solicitor-General in the place of Sir George Cave, who went to the Home Office. Sir Robert Finlay, who had been Attorney-General in 1900-6, was made Lord Chancellor as Lord Finlay. There were joint parliamentary secretaries to the Treasury, Lord Edmundesbury, and Lord Haldane, who was Home Secretary; Mr. McKenna, Lord Fitzalan, and Hon. Neil Primrose, Lord Rosebery’s son.

In addition to these appointments, Mr. Lloyd George announced, in his statement on Dec. 10 of the policy of the new Government, that the time had come for complete mobilization of the labour reserves, and therefore the Cabinet had adopted the principle of universal national service, and had appointed Mr. Neville Chamberlain, Lord Mayor of Birmingham, Director-General of National Service. He would schedule all industries, and set labour free from essential industries, so as to be available for war and for essential industries. The new Prime Minister also announced that the Government would take complete control of all ships and of the whole mining industry. There must also, he said, be real sacrifices made in the matter of food. Every available square yard must be made to produce; and as to luxuries and indulgences there must be a national Lent. These exhortations were supplemented by Mr. Prothero, the Minister for Agriculture, who said that the War Office and the country must realize that Britain was as a becalmed city, and that victory might well be lost or won on her corn fields and potato lands; and by Lord Haldane, the Food Controller, who pushed further the restrictions which Mr. Runciman had already enforced, limited dinners to three courses and luncheons to two courses in all public eating places, and hinted at rationing as the only way of ensuring that unpatriotic people did not get supplies in excess of their wants. In another direction the Government developed boldly a policy tentatively adopted by their predecessors. The Colonial Secretary summoned immediately by cable the Prime Ministers of the self-governing dominions to a special war conference of the
Empire, explaining that they would for the purpose of these meetings be members of the War Cabinet, and so directly responsible for the conduct of hostilities. The enormous share which the colonies bore had taken in military action by land and sea fully justified this development.

The public were gratified by the evidences of energy and resolution shown by the new Government. Mr. Asquith, though he took his seat on the front Opposition bench, protested that he did not appear as leader of an Opposition, or even of the Liberal party, but would give his successors the benefit of his experience. The Government had to deal immediately with a peace offer from Germany, based on the assumption that the Central Powers had won a decisive victory at the Battle of the Somme. If the Allies would negotiate on these assumptions, Germany would bring forward peace propositions; if not, the Central Powers were resolved to carry on the war to an end, "while solemnly declaring any responsibility for this before humanity and history." Mr. Lloyd George at once in Parliament said that it was necessary to know whether Germany was prepared to accept the only possible terms which the Allies could offer—namely restitution, reparation and guarantee against repetition. The formal reply to the Central Powers was based on this idea, and treated the German offer as empty and insincere.

Before this reply had been drafted, Mr. Woodrow Wilson, who had been re-elected President of the United States in the previous month as the man who had kept his country out of the war, addressed a Note to the belligerent Powers suggesting that they should issue a statement of their war aims—which, he somewhat strangely asserted, seemed to be much alike on both sides. Though this intervention was not welcomed in England any more than on the continent of Europe, the Allies sent in Jan. 1917 a courteous answer, explaining in some detail their objects of restoration and liberation, while the Central Powers merely expressed their readiness to enter a peace conference.

It soon became evident that the peace manoeuvres of the German Government were put forward in order to obtain an excuse for entering upon that indiscriminate submarine warfare on which their most active naval and military leaders were coming to base their main hope of success. The new system was put in force at the beginning of February. The German Government notified that they would regard all the waters surrounding the British Isles and the whole of the northern and western coasts of France, as well as the eastern Mediterranean, as barred zones within which German submarines would sink all ships at sight; save only that one passenger steamer would be allowed each way weekly between America and Falmouth, and one paddle-steamer daily between Flushing and Southold. While this policy of desperation brought the United States within a couple of months into the war, it undoubtedly created a very serious situation for the Allies—especially for Great Britain, though it never deterred British ships or British sailors from sailing. The Prime Minister spoke early in February at Carnarvon of the "great and growing menace of German piratical devil"; at the opening of Parliament on Feb. 7, Mr. Asquith denounced "this wild war ... a declaration of war against humanity," and Mr. Bonar Law warned the House of Commons that the country had reached the very crisis of its fate.

The note of sacrifice, which Mr. Lloyd George said had hitherto been confined too much to the trenches, was sounded loudly in Great Britain from the very beginning of the year. From Jan. 1 train services became much slower and less frequent than before, while the fares were raised 50%; and from the same date it became compulsory to bake standard bread in which the proportion of wheat-flour was comparatively small. Prices were fixed at once for wheat, oats and potatoes, and a little later for tea, coffee, bacon, butter, cheese and lard; the amount of beer to be brewed was considerably reduced, so as to economize barley, sugar, tonnage, transport, labour and fuel. Lord Devonport, in view of the urgent necessity for some curtailment of the nation's food consumption, issued on Feb. 2 a scheme for voluntary rationing; he called upon heads of families to limit their weekly purchases to the possession quantities for each person comprising the household: bread 4 lb., meat 2½ lb., sugar 2 lb. The King at once put himself and the Royal family and household on rations; and his example was widely, but far from universally, followed in the country. The attempt to limit consumption by prescribing the number of courses at meals in public eating-places proved a failure, and a new order was issued in April, providing for a weekly meatless day, for five days without potatoes, for rationing bread and meat by bulk on a scale which allowed 2 oz. of bread for each meal, a 2 oz. of meat for each dinner and a 4 oz. lunch; but the order did not apply to any public eating-place where the charge for a meal, exclusive of drinks, did not exceed 15, 3d. Orders were issued restraining food hoarding, the making of rich pastry, and the undue consumption of food at afternoon tea. Apart from the submarine depredations, the harvest of two essential crops, wheat and potatoes, had failed in a greater or less degree, this year throughout the world. With regard to potatoes, Lord Devonport asked people who could afford substitutes, such as rice or sowed, to use them, so as to prolong the supply of potatoes for the autumn, and Mr. Prothero, in his advice to the rural classes in small villages, said: "It is quite possible for a family to live on bread and potatoes if it has plenty of vegetables, and even beans and chick peas, if not." The milk supply of hundreds of towns and small villages must therefore, if not be reduced, at least be limited through the whole of May and June. With regard to wheat and flour, the order was that bread should be sold only by weight and must be at least 12 hours old; maximum prices were fixed for home-grown wheat, barley and oats; the use of wheat, rice and flour for any other purpose except for human food was prohibited: importation of feeding-stuffs for cattle was limited; and power was given to the Food Controller to take over the flour-mills and issue regulations for their management. Mr. Prothero, in order to stimulate food production at home, made arrangements for turning German prisoners and a large supply of women on to the land. But the main contribution of the Minister of Agriculture to native food supply was a Corn Production bill, which was calculated to turn pasture into arable land on a large scale. It provided for the payment of a bounty to the occupier of any land on which wheat or oats were produced, if the average price of wheat or oats should fall below a certain minimum. A minimum wage of 25s. was also to be secured for agricultural labourers, landlords were restrained from raising rents in consequence of the measure, and powers were given to the Board of Agriculture to enforce proper cultivation and to take possession of unanted land. In introducing the bill Mr. Prothero said that, with three-fifths of the total cultivated area under the plough, the nation would be free of the nightmare of the submarine menace. Under the bill the State would go into partnership with the agricultural interest, and stand security against loss. So complete a breach with the Victorian attitude of laissez faire towards agriculture could not, of course, pass without challenge from rigid free traders like Mr. Runciman. But the second reading was carried by 288 to 27; and in committee an attempt by the Labour party to raise the minimum agricultural wage from 25s. to 30s. was rejected by 307 to 298. The House of Lords, it may be mentioned, approved the bill, after the House of Commons, both an eminent free trader and an expert agriculturist, and duly became law. At the beginning of the session of 1918 the President of the Board of Agriculture testified to the patriotic way in which landowners and farmers were ploughing up grass-lands and taking advantage of the Act. Besides these measures of Lord Devonport and Mr. Prothero, steps were taken to save tonnage by prohibiting or restricting the import of non-essential articles, notably alcoholic liquors, timber and paper. Such were the precautions taken to economise food and tonnage, and to stimulate production. The measures employed by the Admiralty to meet the menace included the establishment of a large new minefield in the North Sea, the arming of merchantmen as rapidly as possible and the appropriation of the shipbuilding programme mainly to making good the losses in the mercantile marine. An anti-
submarine department was also set up, composed of the most experienced men serving at sea, who invited suggestions from any sailor in the fleet. Then there was the Board of Inventions, presided over by Lord Fisher, and containing some of the greatest men of science in the country. But Sir Edward Carson, the First Lord, did not claim that any certain remedy had been found. The figures proved this only too clearly. In the first three months of unrestricted submarine warfare, Great Britain lost nearly 1,500,000 tons of shipping (out of a total of some 20,000,000 tons of which 8,000,000 tons were being used for war purposes), and April, the last of these months, was the worst of them all. In one week alone of April 41 British vessels of over 1,600 tons and 16 under that tonnage were sunk.

These alarming figures naturally suggested the advisability of compulsory rationing, and both in the press and in Parliament there were loud calls in May for its immediate institution. Lord Milner told the House of Lords that the Government would only resort to it if convinced of its absolute necessity, but that meanwhile they were studying the various methods of rationing. The returns of shipping losses during May and subsequent months, though grave enough, showed a marked improvement on the April record, and the Food Ministry stated that the prospect of compulsory rationing was steadily receding. But people were worried by the shortness of food, especially bread, sugar and milk, which led to queues at shops, by the high prices of meat and by the uncertain policy of the Food Controller. He instituted a campaign to explain to people why they should eat less bread and meat. He asked people to give up the use of starch. But he was slow to fix retail prices, and a large part of the public systematically to be robbed by profiteers owing to his inaction. Steps were eventually taken in June to curb speculation in food, by prescribing that meat salesmen should sell only to retail butchers or consumers, and that the prices charged on resale should not exceed a certain maximum. More confidence was felt in the Food Ministry when in the middle of June Lord Devonport resigned the controllership over unsatisfactory, and Lord Rhondda, whose reputation for getting things done had been increased at the Local Government Board, was prevailed upon to accept the post.

Mr. Neville Chamberlain's proposals for national service were formulated in February. The object was to secure substitutes to replace the men taken for active service, and to draft labour from unessential to essential trades. He called for volunteers from men between 18 and 60, asking willing workers to enter their names on a register; and the Government introduced a bill establishing a Ministry of National Service. The bill was not, however, well received; the Labour party were afraid lest industrial conscription should be introduced by a sideway; and the whole scheme proved somewhat abortive. But the need of the army for more men was urgent, and the Government introduced towards the end of March a new Military Service bill, providing for a fresh examination of discharged and rejected men; the authorities hoped by this means to secure 100,000 fresh recruits in three months. Drastic as this measure was, Lord Derby in the House of Lords said that larger measures would be necessary.

The new Chancellor of the Exchequer, Mr. Bonar Law, lost no time in making a further effort to raise money on a large scale for the war. At a great meeting at the Mansion House on Jan. 5, with the Prime Minister by his side, he announced the conditions of a new loan. It was to be a 5% Government stock issued at 95, and arrangements were made for converting previous war issues into the new stock. The lowest individual sum accepted would be £50, or £5 through the Post Office, and bankiers would give facilities to their customers to subscribe. There was also a tax-compounded 4% loan to be issued at par. The new loan was a great success, yielding over a thousand millions sterling subscribed for by five and a quarter million people. The money was badly needed, as the expenses of the war were mounting rapidly. Mr. Law obtained a vote of credit in December 1916 for £400,000,000, and on Feb. 12 1917 two votes of credit amounting together to £550,000,000, the largest sum ever asked hitherto at a single sitting in the financial history of the country. He told the House that the average daily cost of the war had risen to £5,750,000. It is not surprising that in these circumstances, and with the enormous development of Government offices and staffs, there should have been an outcry in Parliament against what Lord Midleton called an uncontrolled orgy of expenditure. But in spite of protest, the expenses continued to mount. Before the introduction of the budget, Mr. Law had to obtain in March a further vote of credit for £60,000,000 to meet unforeseen items of expenditure. In the budget he proposed no new taxation, but increased the entertainments tax and the tobacco duty, and raised the excess-profits duty from 60 to 80 per cent. He explained that 26% of the war expenditure had been provided out of revenue. Immediately after the budget, on May 9, he came once more to the House of Commons, this time for a vote of credit of £500,000,000, and on July 4 the largest vote of all, £650,000,000, had to be obtained, and it was recognized in debate that the country was rapidly reaching the limit of its possible expenditure. Two more votes, for £400,000,000 in September, and for £550,000,000 in December, were needed before the end of the year. In this autumn, Mr. Law put "on tap" an entirely new form of "continuous" loan, unlimited in amount, in the form of national war bonds, bearing interest at 3% and 4% free of income tax. By Jan. 11 1919 £1,446,625,013 of these bonds had been sold, and nearly £2,500,000,000 of small post-office bonds had been subscribed for. It may also be mentioned that the pressure of war was shown this year to have broken down many cherished financial prepossessions. A committee on commercial and industrial policy, of which Lord Balfour of Bealghie, a life-long free trader, was chairman, recommended in February:

(1) the taking of special steps to stimulate, where economically desirable, the production of food-stuffs, raw materials and manufactured articles throughout the Empire; (2) the adoption of Colonial Preference; and (3) the establishment of a wide range of customs duties. Moreover the Government of India, in spite of determined opposition from Lancashire, increased, and was supported by the Government at home and by the House of Commons in increasing, for revenue purposes, the import duties on cotton, without imposing any counterbalancing excise.

These tendencies were accentuated by the proceedings of the Imperial War Cabinet and Imperial Conference. The Imperial War Cabinet began its sittings in March, the Prime Ministers of Canada, S. Africa, New Zealand and Newfoundland and the Secretary of State for India (advised by Indian and Anglo-Indian councillors) sitting, along with the British Prime Minister and the members of his War Cabinet, to determine matters essential to the conduct of the war, as well as to consider imperial policy in regard to terms of peace. Mr. Hughes, Prime Minister of Australia, was unfortunately detained at home by political complications. Sir Robert Borden explained, in a speech on April 2, that the various Prime Ministers met in the Imperial War Cabinet as equals, though the British Prime Minister presided, primus inter pares. Each nation of the Empire thus had its voice upon questions of common concern, while preserving perfect autonomy. "For many years the thought of statesmen and students in every part of the Empire has centred round the question of future constitutional relations. It may be that now, as in the past, the necessity imposed by great events has given the answer. At the end of April Mr. Bonar Law announced in the House of Commons that the Imperial War Cabinet had accepted the principle of Imperial Preference; but there was no intention of making any change during the war, nor did it involve the taxation of food. Mr. Lloyd George, when receiving the freedom of the City of London, said at the Guildhall that one of
for the convey of troops. It was felt that, if the Allies could hold out sufficiently long, which there was no reason to doubt, the numbers and wealth of the United States must finally turn the scale against the Central Powers. One immediate advantage of American belligerency was the removal of the last obstacle to a stringent blockade of Germany, and Lord Robert Cecil could claim this spring that there was now a complete cessation of oversea importation into enemy countries.

The Russian Revolution, which began in March, was also hailed at the time in England as a favourable portent for the Allies. It was, said Mr. Lloyd George, the sure promise that the Russian military autocracy would, before long, be overthrown. But, as a matter of fact, from the first days of the revolution, there was an informal armistice and overtaking of hostilities on the eastern front, and in an attempt by Gen. Brusilov to renew fighting in July and August came to an end before long through the spread of insubordination. Henceforward it was realized that the Germans would be able to transfer almost the whole of their forces hitherto in the east to the west, and that in consequence the task before the British army had become appreciably heavier. The revolution had also an unsettling influence on British workmen, already showing symptoms of restlessness under the strain of war. There was in March a serious strike of engineers at Barrow, disapproved by their union, but handled by shop stewards, which collapsed after a fortnight only on the threat of the Government to use their powers under the Defence of the Realm Act. Another unaugmented strike of engineers took place in S. Lancashire in May, largely as a protest against dilution; and there was trouble in other trades and in other parts of the country. In August a railway strike was threatened, owing to long hours and overwork, but was abandoned on a promise by the Government to continue the control of railways for a time after the cessation of hostilities, and meanwhile to do their best to secure a shorter working-day. A further railway crisis occurred in November, about wages, recently reduced, and an advance estimated to cost the companies £500,000 a year. To set against these unsatisfactory features, there was published in June the Whiteley Report, so called because the chairman of the Reconstruction Committee which compiled it was the then Chairman of Committees of the House of Commons, afterwards Speaker. This recommended the setting up of Joint Industrial Councils of masters and men in each industry, to settle all points of difference and wages and management. Such councils were set up in many trades, with beneficial results.

The features in the Russian Revolution which attracted a section of British working-class opinion were the war aims put forward by the Socialists, "No annexations and no indemnities," and the power obtained by the Soviets, or workmen’s committees, culminating in a Soviet Government in October. In answer to pacifists in the House of Commons Lord Robert Cecil explained that imperialist aims based on force and conquest were absent from the British programme, but that, in view of Armenia, the German African Colonies, Poland, Alsace-Lorraine, and Italy Irredenta, it was impossible to accept the programme of "no annexations," and in view of the wanton damage in Belgium, Serbia, and northern France, and of the destruction of merchant vessels, that of "no indemnities" was equally out of the question. The Independent Labour party in a conference at Leeds took up an attitude of sympathy with the Russian position, and advised the formation of Soviets in England. A large section of Labour opinion, comprising both moderates and extremists, desired that, in accordance with the wish of the Russian Socialist Government, English Labour should be represented at a conference, at which German representatives would be present, to be held at Stockholm at the instance of the International Socialist Bureau. But the Seamen’s and Firemen’s Union, which had suffered heavily through Germany’s outrageous policy at sea, refused to carry the delegates: and neither American, Belgian nor French representatives would appear. The
only result of the movement was that Mr. Henderson, who had been active in its promotion, had to resign his seat in the War Cabinet. Even the Trades Union Congress at its annual meeting in September declared by an overwhelming majority against an International Conference at Stockholm at the present moment. But before the end of the year the Labour party, suspicious of militarist or imperialistic designs among the Allies, drafted on its own account a statement of war aims of a somewhat idealistic character, demanding in particular the establishment of a league of nations,—a demand which Lord Robert Cecil welcomed on behalf of the Government.

During this autumn the Labour party also busied itself with a reorganization of its constitution, which was to transform it from a federation of Labour and Socialist societies into a national democratic political organization open to every worker who laboured by hand or brain. The work was completed during the winter, and the new constitution was adopted in March 1918. The aim was, by forming local associations, and by appealing to middle-class workers and to the newly enfranchised women, to secure sufficient support from the electorate to warrant the hope of a Labour Government in power before many years.

The new Labour party, thus constituted, held its first annual meeting in London in June 1918, promulgated a comprehensive socialistic programme, and in spite of the protests of Labour ministers, determined no longer to recognize the political truce, thought it did not insist that these ministers should withdraw from office so long as the country was at war. The increasing detestation of the Germans was inspired by their merciless submarine campaign and by their recurrent air-raids insured a warm welcome for certain measures which the King took in the summer of 1917 for dissociating the royal family from German connexions. In June he decreed that those princes of his family who were his subjects and bore German names and titles should relinquish those titles and adopt British surnames. Accordingly the family of Teck became that of Cambridge and that of Battenberg Mountbatten, and the following peerages were conferred: the Duke of Teck, Marquess of Cambridge; Prince Alexander of Teck, Earl of Athlone; Adml. Prince Louis of Battenberg, Marquess of Milford Haven; Prince Alexander of Battenberg, Marquess of Carisbrooke. In July the King abandoned all German titles for himself and family, and issued a proclamation that his house and family should henceforth be known as the house and family of Windsor. The King also heartened the munition workers of Lancashire and Cheshire and the shipping and engineering workers of the Clyde district by making tours among them, and he paid a visit in the summer, not for the first time, to the Grand Fleet. He instituted, moreover, two new orders—the Order of the British Empire, and the Order of Companions of Honour.

The reports of the Dardanelles and Mesopotamia Commissions were published, the one in the spring, and the other in the summer of the year 1917; and the revelations they contained of mismanagement and muddle in high quarters confirmed the public in its satisfaction that the two War Administrations presided over by Mr. Asquith had given way to Mr. Lloyd George's War Cabinet. The report of the Mesopotamia Commission, with its reflections on the Government of India, brought about Mr. Austen Chamberlain's resignation of the Secretaryship of State for India. Other ministerial changes took place about the same time—Lord Rhondda succeeded Lord Devonport as Food Controller; Sir Auckland Geddes succeeded Mr. Neville Chamberlain as Director of National Service; Mr. Barnes succeeded Mr. Henderson as Labour representative in the War Cabinet; Sir Edward Carson left the Admiralty to become a member of the War Cabinet without portfolio—a position from which he resigned in Jan. 1918; Sir Eric Geddes became First Lord of the Admiralty, Dr. Addison President of Reconstruction without portfolio, Mr. Hayes Fisher (afterwards Lord Downham) President of the Local Government Board; Mr. Hodge Minister of Pensions, and Mr. G. H. Roberts Minister of Labour. Mr. Lloyd George took the opportunity to bring back into high office his friend Mr. Churchill, and to attract to his banner Mr. Edwin Montagu, one of the ablest of the younger Liberals. Mr. Churchill became Minister of Munitions, and Mr. Montagu Secretary of State for India. Mr. Lloyd George also formed Gen. Smuts to remain in England as a regular member of the War Cabinet.

Several of these appointments had a special interest. The public looked askance at the return to office of Mr. Churchill, after his responsibility for the Dardanelles fiasco; but Mr. Lloyd George had a high opinion of his friend's energy and capacity in office, and realized the inadvisability of leaving him to become the nucleus of a critical and aggressive opposition. Mr. Montagu took office with a mission to satisfy, so far as might be possible, the aspirations of a large body of Indian opinion after a wide measure of self-government. He visited India in the winter of 1917-8, and drew up, in conjunction with Lord Chelmsford, the Viceroy, a report on Indian Constitutional Reform—published in the summer of 1918—which was well received in the House of Commons, but which was met with considerable criticism in the Lords, where the appointment of a joint committee to consider it was rejected by a majority of only four. Dr. Addison's appointment as Minister of Reconstruction showed a laudable desire on the part of the Government to be prepared for the end of hostilities, which might come with little warning. So zealously did he work that he was ready to announce, in the autumn, the very plans of the Government for demobilization, for the resettlement of officers and men in civil life, and for the re-establishment of industry on a peace basis. His main expedient for tidying over a difficult time was the establishment of an out-of-work donation—to be in operation for six months for civil workers and for twelve months after demobilization for soldiers. The advent of the brothers Geddes to Cabinet rank was due to admirable administrative work done by Sir Auckland under the War Office, and by Sir Eric both under the War Office and in the Admiralty. Sir Auckland changed Mr. Neville Chamberlain's original scheme of national service, which had involved somewhat elaborate office expenses and had produced only moderate results. He saved some £100,000 a month by reducing the expenses of a central office, and worked instead through employment exchanges, trade unions and societies of employers' federations. He effected a drastic comb-out of civilians, card-indexed the whole of the army at home, transferred workers from luxury trades and occupations to essential industries, and recruited a further large supply of female labour.

Sir Eric Geddes went to the Admiralty to complete and work a reorganization which his predecessor (Sir Edward Carson) had initiated. When in May, a new naval staff was created, it constituted the First Sea Lord, as chief of the staff, was freed of all administrative detail in order that he might give his undivided attention to questions of policy and strategy; and he had the assistance of a director of operations, a director of intelligence, and others. There was also revived the office of Admiralty Controller, who was to organize the whole of the supply of the navy including transport, victualling, manufacture of ordnance, and shipbuilding. Sir Eric had then been brought in from the outside to fill this important post, as a great civil administrator who had successfully organized the military railway system behind the lines in France; and in July, when Sir Edward Carson's vigorous counsel was needed in the War Cabinet, he became himself First Lord. The two main tasks of the Admiralty under him were to defeat the submarine menace, and to stimulate shipbuilding. They were more successful in the first than in the second. By provision of various ingenious methods of attacking and destroying underwater vessels they steadily reduced the losses of British ships, and they were able to announce the details of some 150 German submarines destroyed. But in spite of obtaining the assistance of Lord Pirrie, the great Belfast shipbuilder, as Controller-General of Mercantile Shipbuild-
ing, and of the institution of national shipyards, they were unable till the last month of the war to make shipbuilding overtake ship destruction. The destruction of British ships in 1917 amounted to a tonnage of 4,009,537, and the ships built only reached a tonnage of 1,165,474. In the first nine months of 1918 the figures were extremely small, as 974,174. In Dec.
1917, Sir Rosslyn Wemyss became First Sea Lord.

In 1917 German air-raids on England, especially on London, took a new form. They were carried out mostly by aeroplanes of a greatly enlarged type; and on the first two occa-
sions, on June 15 and July 7, a fleet of these new vessels bombarded with some effect the East End and the City of London in business hours in broad day-
light. Subsequent raids, which began early in September and continued at fairly frequent intervals throughout the winter, were, owing to improved defences, carried out by night, with comparatively slight damage and casualties. The enormous development of aerial fighting determined the Government in October to transform the Air Board into a Secretaryship of State for Air, and a bill was introduced and carried for that purpose. The Prime Minister invited Lord Northcliffe to become the first Secretary of State, but he declined, and his brother, Lord Rothermere, was appointed.

Such was the vigour of the Government that, despite the exacting cares and anxieties of the war, they were able to grapple with business of the House and to pass into the last months of the war, with some success, a number of important Bills; and the last months of the war were dominated by the question of the Armistice. The proposal for armistice was first made by the Allies on the 1st of November, and was submitted to the German authorities on the 3rd of November.

The Irish Conven-
tion.

SECRETARY OF STATE FOR AIR.

Reform Bill.

Education at Reform.

Mr. Fisher's Bill.

Women's Suffrage Granted.

House of Commons. It was found that the enormous services rendered by women to the nation during the war had broken down most of the opposition to their enfranchisement. Not only had they cooperated heartily in the time-honoured female occupations of nursing, housework, and knitting for the sailors and soldiers, but they had supplied the place of men in countless occupations at home, and even in France—on the land as labourers, in the factories as munition workers, textile workers, and oxy-acetylene welders, as workers in canneries, as car and van drivers, as police, as ammunition con-
ductors, as clerks and typists throughout an overgrown Civil Service, and in three semi-military uniformed organizations, Queen Mary's Women's Army Auxiliary Corps (W. A. A. C.), the Women's Royal Naval Service (Wrens), and the Women's Royal Air Force (Penguins). One after another, the most prominent op-
opponents of woman's suffrage, such as Mr. Asquith and Mr. Walter Long, announced their conversion; and the House of Commons accepted the proposal to give women the vote by an enormous majority—the clause being added to by 214 to 17. The gift of the franchise to 60,189, unless they had received it in the autumn of 1917 by the passing, with little opposition, of a bill enabling them to sit in Parliament. Proportional representation, after many vicissitudes, and a disagreement between the Lords who supported and the Commons who rejected the system, was finally excluded from the measure, save in regard to university elections. Further interesting provisions in the bill disqualified conscien-
tious objectors, unless they had done national service, until five years after the war, and gave the vote to sailors and soldiers at 15 (other men not being qualified till 21), on the ground that if they were qualified to fight for the country they were qualified to vote. Arrangements were also made for taking their votes in their absence on service. There were some warm debates as to whether there should be redistribution of seats in Ireland as well as in Great Britain; but finally Ireland was included, the quota for a member there being fixed at 43,000, as compared with 70,000 in Great Britain. Thirty-seven members were added to the House of Commons, making 707 in all. It was calculated that this Reform bill, which became law in Jan. 1918, enfranchised 8,000,000 new voters, of whom 6,000,000 were women.

Mr. Fisher's Bill.
Ireland, but exempting north-east Ulster for five years, and providing for delegations representing both areas, with power to unify Irish legislation. If this plan was not satisfactory, he suggested that a convention of Irishmen of all parties should be assembled in Ireland in order to produce a scheme of their own to submit to the British Parliament. Neither the Nationalists nor the southern Unionists would accept Mr. Lloyd George’s specific plan; but all parties except Sinn Fein accepted the idea of a special convention. Representative men, many of them non-political, were chosen to take part in the assembly; and, in order to produce an atmosphere of harmony, the Government released without reservations all the political prisoners in confinement for connexion with the Dublin rebellion. One of these was Mr. De Valera, who refused to have anything to do with the convention, and who was almost immediately elected M.P. for East Clare by an enormous majority. In spite of this ominous event, which showed that popular favour in southern Ireland was deserting the Nationalists for Sinn Fein, the Convention duly met on July 25, at Regent House, Trinity College. Disputes and unanimously appointed Sir Horace Plunkett as their chairman. The Convention sat for many months, but, though there was an unexpected amount of agreement in some respects, it failed to arrive at anything approaching a unanimous report. The spread of the Sinn Fein movement in Ireland, the death from hunger strike of a Sinn Fein prisoner, and the illness and death of John Redmond, the Nationalist leader and a leading member of the conference, contributed to this untoward result. It was in April 1918 that the report was issued; and Sir Horace Plunkett claimed, in a letter to the Prime Minister, that “the Convention has laid the foundation of Irish agreement unprecedented in history.” The Government, with no definite guidance from the Convention, proceeded to draft their own proposals; but these were not submitted to Parliament, as Lord French and Mr. Shortt, newly appointed Lord Lieutenant and Chief Secretary, discovered in May a further treasonable conspiracy between the Sinn Fein leaders and Germany, by which the Germans were to supply munitions for a rebellion to follow a successful German offensive in France. The Sinn Fein headquarters were raided by the police and 150 Sinn Fein leaders were arrested under the Defence of the Realm Act. In view of the disturbed state of Ireland, ministers, though they were harassed by the Nationalists in Parliament for their inaction, determined to postpone legislation.

Lord Rhondda, at the outset of his Ministry, obtained a much larger control and wider scope than had been possessed by his predecessor as Food Controller. He took over the Oils and Fats Department from the Ministry of Munitions and was given by Order in Council the same powers as the Admiralty, Army Council, and Ministry of Munitions already possessed, for requisitioning and controlling prices. The new crop of potatoes enabled him to abolish potatoless days; but it was to prices, which had risen enormously owing not merely to speculation and profiteering, but to deficient harvests, shortage through submarine depredations, and the depreciation of currency caused by the vast issues of paper money all over the world, that he mainly directed his attention. He explained his policy, in the House of Lords on July 26 1917, as being one of determining prices at every stage from the producer to the retailer, on the principle of allowing a reasonable pre-war profit. Existing agencies were to be used for the purpose; but it was provided that the Food Controller should be appointed under the supervision of local food controllers to be appointed by the local authority. He took over all the flour mills, and at heavy cost to the Exchequer reduced the price of flour so as to enable bread to be sold at 9d. per quarter loaf instead of the existing price of 1s. He fixed a sliding scale for prices of live cattle, but left the fixing of retail prices for joints to the local food committees. The appointment of local committees and fixing of prices went on regularly during the autumn of 1917 till hardly any kind of food was left at market price; and a vigorous economy campaign was organized under the direction of Sir Arthur Yapp, of the Y.M.C.A., as Director-General of Food Economy. Sugar cards were issued in October. The sale or use of cream, save for children and invalids, was prohibited during the winter months. A new scale of voluntary rations, not applying to children, was issued in November. The bread ration varied from 8 lb. per week for men on the heaviest manual labour to 3 lb. 8 oz. for women on sedentary work. For other foods the weekly ration was to be: cereals other than bread, 12 oz.; meat, 2 lb.; butter, margarine, oils and fats, 10 oz.; sugar, 8 oz. In December there were sporadic shortages of food of all kinds, and food queues at butchers’, grocers’ and bakers’ shops became longer and more frequent, creating great dissatisfaction among all classes, especially the working-classes. To meet the difficulty in part Lord Rhondda gave powers to local committees to transfer stocks of margarine from retailers who were well supplied to those who were deficient; he also set up a Consumers’ Council to advise the Ministry of Food; and he gave permission to the Birmingham Control Committee to try an experiment with a scheme whereby each household should be supplied with a card entitling them to prescribed rations of tea, butter and margarine to be procured from a particular registered retailer. As the year drew to a close, it was obvious, and Lord Rhondda admitted it himself, that compulsory rationing would have to come.

It should be noted that Government control was extended during 1917 over other staple industries besides those dealing with food. In July the cotton trade was brought under a board of control consisting of spinners, manufacturers, importers, distributors and workmen, together with representatives of the three countries. The German conciliation board was a similar board was set up by the Army Council to regulate the woollen and worsted trade. Railways, the liquor trade, shipping, and mines had already passed successively under ministerial direction; as the strain of war grew more severe, the tendency inevitably was for each trade to set up a representative body to direct its functions and activities, through consultation with the Government. It may be added that, though it was no part of ministerial intention to discourage amusement and recreation, it was found necessary to suspend racing in May 1917. Mr. Lloyd George followed Mr. Asquith closely in his statements during the year of the war aims pursued by the Allies, and in his repudiation of an inconclusive peace. At Glasgow in July he said that “we should continue to fight for the great goal of international right and international justice, so that never again can brute force sit on the throne of justice, nor barbaric strength wield the sceptre of right.” Mr. Asquith at Liverpool in October said that the worst that could happen to the world would be a patched-up peace; Gen. Smuts, who made several speeches while he remained in England as a member of the War Cabinet, said at Cardiff in the same month that the present struggle was deciding upon what basis the future would be built, whether on freedom, or on the will to power and the will to force. An entirely different note was struck by Lord Lansdowne, advocating in November, in a letter to the Daily Telegraph (which The Times had previously declined to publish), a negotiated peace. He received no support, save from professed pacifists; and Mr. Lloyd George took occasion to warn people against the man who thought there was a half-way house between defeat and victory. He admitted that it was a bad moment for the Allies in the war, because Russia had stopped and America was only entering the War. For the Allies, the course of the war in the autumn was unsatisfactory. Italy had been invaded in October and her armies driven back to the Piave, the fruits of Sir Julian Byng’s brilliant victory, by the first use of tanks at Cambrai in November, had been largely neutralized by a German counterstroke, and in December a regular armistice was concluded between Germany and Russia, to be finally turned in the beginning of March 1918 into the humiliating treaty of Brest-Litovsk. Russia went out of the war; but Great Britain had a gleam of success in the end of the year through the capture of Jerusalem by Sir Edmund Allenby.
The prospect was sufficiently anxious fully to warrant the renewed call of the Prime Minister in the new year for sacrifice—sacrifice worthy of the sacrifices made by those at the front. "To every civilian," he wrote in a message to the nation, "I would say: Your firing-line is the works or the office in which you do your bit; the shop or the kitchen in which you spend or save; the bank or the post-office in which you buy your bonds." Sir Auckland Geddes immediately demonstrated this by introducing a bill, the chief effect of which was to call up from civil employment a number of young men who had hitherto been exempt from military service; and he announced that it was necessary to raise immediately 420,000 to 450,000 from this class. After some demur the trade unions agreed to cooperate in making the measure effective, and it became law on Feb. 6.

The finance of the war called this year for greater sacrifices from the taxpayer than ever before. The money voted for military purposes exceeded that of any previous year. Mr. Law obtained votes of credit for £6,000,000 in March; £500,000,000 in June; £700,000,000 (the largest amount ever voted in one sum) in August; and again for £700,000,000 in November. This made a total of £8,712,000,000 for the whole war (of which £1,450,000,000 had been lent to the Allies down to the Armistice). The average daily expenditure, which was £6,088,000 in 1917-8, fell in the seven war months of 1918-9 to £6,058,000. In his budget, introduced in April, Mr. Law made unprecedented demands on the taxpayer, in order to raise sufficient revenue to cover the peace expenditure and the increased debt charge. He imposed additional taxation estimated to bring in £1,140,000,000. Mr. Law's Second Budget.

Income tax was raised from 5s. to 6s. in the £; the farmers' tax was doubled; rates of superstax increased up to a maximum of 4s. 6d. in the £; and the limit of exemption lowered from £3,000 to £2,500; a 2d. stamp tax was placed on cheques; beer and spirit duties were doubled, and sugar, tobacco, and match duties raised; letter rate was raised to 1½d. and post card rate to 1d.; and there was to be a luxury tax of 2d. in the shilling. This last tax was eventually dropped, after a select committee of the House of Commons had spent many weeks in examining and reporting on its possibilities. There was little opposition to the rest of the proposals, save to the doubling of the stamp on cheques, against which there was considerable protest in the City, which the Chancellor of the Exchequer disregarded. Protests, however, were raised against extravagance and waste, without which the estimates of expenditure and revenue would hardly have reached the gigantic totals of £2,972,107,000 and £842,950,000, leaving a deficit of £2,130,117,000 to be met by loan. It was estimated in January by Mr. Herbert Samuel, chairman of a select committee of the House of Commons on national expenditure, that the following increases had taken place since the preceding August: the £6,900; £45,000,000; bonus to potato-growers, £5,000,000; to miners, £2,000,000; to munition workers, £40,000,000; to railwaymen, £10,000,000; and to civil servants, £3,000,000; increases in pay to officers, over £7,000,000; to soldiers, £65,000,000. The increases of pay voted to navy and army by Parliament in 1917 were, it may be explained, overdue, and were only a fitting acknowledgment of their heroic service. It should be added that in the autumn of 1918 the Government made provision for the intellectual welfare of soldiers by establishing a new department, under the charge of Col. Lord Gorell, to direct and coordinate education in the army.

It was in the matter of food that the sacrifices demanded were most felt by the bulk of the population. In January the quantity of staple foods which might be consumed by visitors in hotels and by people taking casual meals was limited by order; and in February compulsory rationing of meat was enforced in London and the Home Counties. Meat cards were issued, with coupons attached, under conditions that restricted the weekly adult ration to 15.5 oz. of butcher's meat, together with other meat equivalent to 5 oz. of butcher's meat. At the same time butter and margarine were rationed, 4 oz. being allowed per head per week. At first there was a good deal of outcry against Lord Rhondda, as there had been against Lord Devonport, and attacks were made upon him in both Houses of Parliament, on account of his interferences with the course of trade, his "meddling and muddling." But in the Lords he was defended with spirit by Lord Milner, who said "that we were in a better position as regards food than any of the other countries engaged in the war; the army had been promised food in abundance; but we might have embarrassed us, it had certainly not starved us and had not diminished the necessary supplies of our armies in the field." Mr. Clynes, the parliamentary Under-Secretary of the Department, claimed with justice that, under its arrangements, the poorest people were going to have an equal chance with their richer brethren, and that men, women and children, and not money, would be the consideration that would determine the appropriation of food. The Government, he said, had taken the place of the merchant and importer. The shortage of coal demanded further sacrifices by the general consumer. It was found necessary to supplement the "summer time" arrangement, but the new measures were greatly diminished, and fares increased.

The Government was criticized at the opening of the parliamentary session of 1918 for failing to reach the high standard they had set themselves in the departments of man-power, food production and shipbuilding. But Mr. Law pointed out that in 1917 they had put into the army 800,000 additional men; had brought a million more acres under the plough, producing an additional 850,000 tons of cereals and 3,000,000 tons of potatoes; and had built 1,161,474 tons of shipping, compared with a tonnage of 359,000 built in 1916. Another subject of criticism was the arrangement made with the Allies for the joint conduct of the war. Here the Government had been very active. The unity and continuity of direction which Mr. Lloyd George had ensured in the prosecution of the war, so far as the British forces were concerned, by the institution of his small War Cabinet in permanent session, he and his Cabinet earnestly desired to see more completely realized in the joint councils of the Allies. At a meeting of leading ministers of the principal Allies, held at Rapallo in the autumn of 1917, a plan of coördination was approved. A war council, composed of the Prime Minister and another member of each of the three Governments of France, Italy and Great Britain, was constituted to meet at Versailles normally not less than once a month, and it was hoped that other Great Powers, especially the United States, would join the council. Mr. Lloyd George was in Paris in November 1917 for the first meeting; but he was disappointed with the results, and, at a luncheon there, he made an appeal to public opinion in the various Allied countries, by delivering a very pessimistic and, as it seemed to many, a very injudicious speech, in which he declared that unless some change were effected he could no longer remain responsible for a war direction doomed to disaster from lack of unity. He succeeded in drawing public attention; but the critics were disposed to suggest that this was a new device to enable politicians to interfere with work properly belonging to soldiers. One of Mr. Lloyd George's difficulties in securing coördination had been the instability of French ministers during 1917. M. Briand's Ministry, after a tenure of 18 months, fell in March; M. Ribot, who succeeded him, was overturned in September; M. Painlevé, the next prime minister, only lasted two months; but, fortunately, in his successor, M. Clemenceau, France obtained a chief whose whole thoughts, like Mr. Lloyd George's, were devoted to winning the war. With his cooperation the Versailles Council was strengthened, and arrangements were made to coördinate it with the general staffs of the various Allies by each appointing a staff officer as permanent military adviser at Versailles. This arrangement cost the Government the services of Sir William Robertson, the chief of the staff, who refused either to take the military advisery,
which fell to Sir Henry Wilson, or to continue in office unless the military adviser at Versailles were merely his deputy.

In fact, Mr. Lloyd George and his Cabinet had by no means reached their aim of satisfactory coordination when the great German advance began on March 21. The British and French armies were both driven back in a series of bloody battles, and they were seriously menaced with a rupture of their contact with each other by a fierce attack which the Germans directed against Amiens. Then it was realized that without Allied forces in France needed for success was not an Allied council but a single military head. Sir Douglas Haig agreed in this with Lord Milner, who was then representing the War Cabinet in France, and with M. Clemenceau; and Gen. Foch, the most scientific of French soldiers, who had already distinguished himself highly in the war, was appointed Generalissimo, to the general satisfaction.

The next few months in Britain were perhaps the most anxious time of the whole war. A fresh Military Service bill was at once introduced, raising the military age to 50 and in certain cases to 55; and Ireland was for the first time to be included in a compulsory measure, ministers an vigrously at the same time that they were about to introduce a fresh Home Rule bill based on a consideration of the reports of the Irish Convention. The bill was hotly opposed, not only by the Nationalists, but by many experienced members who doubted whether it would really give ministers the men they needed. But Mr. Law insisted on carrying it as it stood, and told the Nationalists that they did not realize the growing bitterness in England at the exemption hitherto of Ireland from the sacrifices demanded of Great Britain. The bill was carried by majorities of 100; but it was categorically rejected in Ireland. The Roman Church joined the Nationalists and Sinn Feiners in denouncing conscription, and the Government, having to abandon this project, abandoned also the attempt to pass this year a Home Rule bill.

Besides this new Military Service Act, the Government strengthened the forces in France by sending at once to Sir Douglas Haig a large proportion of the men hitherto retained in the island as a home defence army, and they instituted a vigorous comb-out once more of munition workers, miners, and the Civil Service. They strengthened the War Office by making Sir Frederick Maurice a member of the War Cabinet after the Prime Minister, Secretary of State for War; Lord Derby going as British ambassador to Paris, where he admirably reinforced the good understanding of the two Powers. The vacancy in the War Cabinet was filled by Mr. Austen Chamberlain. About the same time Sir William (since Lord) Weir succeeded Lord Rothermere as Air Minister.

The strain engendered by the serious situation of the British forces in France produced some regrettable recriminations in Parliament à propos of the substitution of Gen. Sykes for Gen. Trenchard as chief of the air staff, and of a letter which a distinguished general, Sir Frederick Maurice, late director of military operations, thought fit to write to The Times, accusing ministers of making statements to Parliament, giving "a totally misleading impression" of the military situation. Ministers in this latter case opposed to refer the charges to two judges, but the leading Liberals refused this tribunal, and Mr. Asquith, for the first time definitely acting as leader of opposition, moved to refer the allegations to a select committee of the House of Commons. Mr. Lloyd George, in debate, categorically and in detail maintained the truth of the Ministerial statements, and the motion was rejected by 293 votes to 106 votes. Gen. Maurice, for his breach of discipline, was placed by the Army Council on retired pay, and became a military correspondent for the press. The anxieties of the time also revived the strong feeling about the alien danger; and, in deference to public opinion, certificates of internment and naturalization were revised, no aliens were allowed to be employed in Government offices during the war, new measures were taken to establish the identity of aliens, and drastic restrictions were imposed on changes of name. Enemy banks, too, were finally wound up, and it was provided that no such banks should be established for a period after the war.

The food condition was better this summer, owing to Lord Rhondda's admirable arrangements for securing supplies from all quarters of the world, and to the diminution of the menace from submarines owing to the provision of submarine chasers and other methods. Compulsory rations of meat, however, continued, though a larger quantity was allowed, too, was rationed, and though milk was not rationed its price was fixed according to the season. Arrangements were made to get in the harvest, in the absence of men at the front, by a great volunteer contingent of public-school boys in their holidays, and of women. The Food Controller established with great success national kitchens, and afterwards, in a few great towns, national restaurants. On July 3 Lord Rhondda died, just when he had arranged to introduce, in place of the loose cards hitherto used, a system of ration books. These were brought into use by his successor, Mr. Clynes, on July 14, and contained coupons for sugar, butter or margarine, lard, butcher's meat, bread, and milk. This a satisfactory national system was at last evolved, which worked well and favoured none.

While it was generally admitted that the War Cabinet was a much better organ for the conduct of the war than any of the previous arrangements, there was frequent complaint that the result of concentrating all real directing power in the hands of four to six men, all deeply engrossed in the war, was that domestic affairs were insufficiently attended to. Accordingly in June 1918 a Committee on Home Affairs was appointed, which was to meet, at least once a week, under the chairmanship of the Home Secretary. All domestic questions requiring the cooperation of two or more Departments and calling for Cabinet decision were to be referred to it. The Committee were to have the power of decision, on behalf of the Cabinet, but larger questions of policy were to be referred to the War Cabinet.

The fourth anniversary of the war, being a Sunday, was observed as a day of national intercession, to invoke the Divine Blessing on the country's cause. Marshal Foch's offensive had been in progress for three months, but it was still far from clear whether it could proceed without a check. Mr. Lloyd George sent a stirring message on the day to the Empire, bidding Britain to "hold fast." The little battle that held them, was not yet won. "We cannot seek to escape the horrors of war for ourselves by laying them up for our children. Having set our hands to the task we must see it through till a just and lasting settlement is achieved." The appeal was timely, but many of the workers paid little heed to it.

Throughout August and September, while the Allied troops in France, and especially the British armies, were winning victory after victory and steadily driving the Germans out, and while Bulgaria and Turkey were being forced to surrender, a series of strikes broke out all over the country, in many cases promoted not by the unions but by the shop stewards. Women workers in London on omnibuses and tubes struck to obtain the same war bonus as that accorded to the men. The strike spread to Bath, Bristol, Brighton, Folkestone, Hastings, and Weston-super-Mare, but the women returned to work in a couple of days on a promise of full consideration of their demand, which was eventually conceded. A much more serious matter was the London police strike which, without notice, deprived London for two days, Friday and Saturday, Aug. 30 and 31, of police protection. Unfortunately the Metropolitan Police refused to participate in regard to wages and allowances, which had been under consideration of the authorities for an unconscionable time without result, but it was a shock to public confidence that the defenders of law and order should have thought themselves at liberty to leave the public defenceless in order to call attention to their claims. Sir Edward Henry, the Commissioner of Police, resigned, and was succeeded by Gen. Macready; but it was believed that it was the Home Office that was mainly to blame. Mr. Lloyd George settled the strike by granting the men liberal terms; but he
declined to recognize any union of the police. There was a strike of Lancashire operative cotton-spinners in September against the advice of their union, but the men returned to work on an appeal by Mr. Lloyd George, who promised to appoint at once a tribunal of inquiry. The tribunal allowed an increase of wages, but rejected the men's claim to decide the nature of their unemployability benefit. The most serious strike was that of midway men, especially in the South Wales district, in the same month. There was a dispute as to the extent of the advance to be granted in wages, and the National Union of Railwaymen and the War Cabinet agreed upon a certain scale. But the men threw over their leaders, and were only brought to reason when the Courts prohibited the unions from paying strike pay to their members. Mr. J. H. Thomas resigned the secretaryship of the National Union, and was only induced to return after a while on a promise of better observance of discipline. These and other less important strikes caused the Trade Union Congress at Derby to impress upon trade unions the desirability of a frank acceptance of the Whitley Report and joint industrial councils.

Other causes of anxiety of the autumn were a severe attack of influenza, which spread rapidly from July onwards, caused the weekly death roll by the end of October to rise in London to 761, and in 96 great towns to 1,856, and only began to wane in November; a great deficiency in coal which led to household rationing, and to great economies in lighting and heating arrangements by municipalities and other public bodies; a reduction in the meat ration; and the sufferings of the British fighting men. The British Empire was consulted at the Hague agreement for reciprocal return of prisoners which had been negotiated by Sir George Cave and Lord Newton.

But from the end of September onwards the persistent and accumulating good news from every seat of war gradually changed the attitude of the country from one of anxiety to one of increasingly hopeful expectation. In opening a war bond campaign at the Guildhall on Sept. 30, Mr. Bonar Law concluded his speech with a new accent: "I do not say that this is the end, but I do say that this is the beginning of the end." For the purpose of the appeal Trafalgar Square was turned into a realistic representation of a shell-shattered French village. The "Feed the Guns" week, which was started by the opening of this show on Oct. 7, was all the more successful, as President Wilson was already in correspondence with the Central Powers as to the general principles on which peace could be based. By the time that Nov. 9, Lord Mayor's Day, came round, terms of armistice, amounting in effect to surrender, had been handed by Marshal Foch and Adm. Wemyss to a German delegation, and the news of their acceptance was hourly expected. The Lord Mayor's Show, with tanks and aeroplanes in the procession, Imperial and Allied troops and of Women's Auxiliary Corps, typified the magnificent effort of the Empire now being crowned with victory; but on that Saturday evening the Prime Minister could only say at the Guildhall banquet, "I have no news for you."

It was on Monday morning, Nov. 11, at 11 o'clock, that the bursting of maroons announced to London that the Armistice had been signed, that hostilities had ceased, and that the war, in all human probability, was over. Almost instantly crowds poured into the streets, flags and decorative rugs and tapestries were hung out of windows throughout the centre of the town, from public offices and private houses, and a great throng assembled at Buckingham Palace to cheer the King, who appeared with the Queen on the balcony, and showed how fully he shared the rejoicings of his subjects. The scenes of enthusiasm and public jubilation in the streets throughout the day were indescribable. When the House of Commons met, the Prime Minister read out the terms of the Armistice, and added, "This is no time for words. Our hearts are too full of gratitude, to which no tongue can give adequate expression." Immediately the two Houses of Parliament, led by the Lord Chancellor and the Speaker, proceeded to St. Margaret's church to give thanks to God. Next day the King and Queen attended a special service of thanksgiving at St. Paul's. The general rejoicings lasted throughout the week. Before Parliament was prorogued both Houses voted addresses of congratulation to the King, which were presented to him in the Royal Gallery of the Palace of Westminster; and His Majesty, recalling the splendid services of the sailors and soldiers from all parts of his Dominions, pledged himself anew to uphold the honour of the Empire and to promote the well-being of the people. Before the month was out, in accordance with the terms of the Armistice, the German submarines came and surrendered off Harwich, and the main German fleet, battle cruisers, light cruisers and destroyers, steamed into the Firth of Forth and there surrendered to Adm. Beatty. It was a fitting tribute to the sea-power which had been the main factor in deciding the issue.

IV. AFTER THE WAR, 1918-21

The conclusion of hostilities was immediately followed by the prorogation and dissolution of Parliament, and a general election. Though protests were raised in some quarters, especially by the Independent Liberals, this was quite the natural procedure. Under the Parliament Act, the now expiring Parliament should have been dissolved three years previously, in Dec. 1915, and its life had only been prolonged from time to time by special Acts in order to avoid an election during the war. A Reform bill which enormously enlarged the electorate, adding two million male and six million female voters, had been passed in Feb., and it was right, and in accordance with precedent, that the new constituency should be consulted on the earliest moment compatible with national safety. It was evident that the Government to whom the new Parliament should give its confidence would go to the Peace Conference with its hands strengthened.

Was the Coalition to continue? The two heads of the Government, the Prime Minister, Mr. Lloyd George, and Mr. Bonar Law, the leader of the Unionists, decided, to the public satisfaction, that it should, on the ground that it would be disastrous to deal on party lines with the peace negotiations and the problems of reconstruction. They issued a joint appeal for support to the Coalition Government "in the interests of no particular class or section, but, so far as our light serves us, for the furtherance of the general good." They asked the nation to preserve the same unity in peace that it had manifested in war. They promised, among other things, to promote disarmament and a league of nations; to take special care of the soldiers and sailors who had served in the war; to increase production, especially in agriculture; to forward housing, aeronautics, and transport; to give a preference to the colonies, and to preserve key industries at home; to reform the House of Lords; to develop responsible government in India; and to explore all the possibilities of Ireland, with the proviso that there must be no separation and no coercion of Ulster. One element of the Coalition, the Labour party, had determined to secede; and accordingly Mr. Clynes, Mr. Hodge and Mr. Brace resigned, though Mr. Barnes preferred to leave his party and remain in the Government, and Mr. George Roberts accepted Mr. Clynes's post of Food Controller. The Labour party made great preparations to capture a large number of constituencies, but they committed the mistake of adopting among their candidates those Labour leaders who had opposed the national policy and had been notorious pacifists, as well as those who represented the patriotic majority. This attitude helped to increase the electoral support of the National Democratic party, who favoured the claims of Labour but approved of the Coalition. The Liberal party were divided. Those who had hitherto regularly supported Mr. Lloyd George were prepared to continue their support; but Mr. Asquith and those of his colleagues who had resigned with him, and a large section of the party, declined to commit themselves to any further support, and stood as Independent Liberals. In these circumstances, the Government asked for a pledge of support from candidates, and refused to assist those who declined to give it. The certificate that the pledge had been given was commonly called a "coupon," and was the subject of indignant protest by
Independent Liberals and some others. In response to a popular agitation for the trial of the Kaiser, for punishment of war criminals and for full reparation from Germany, Mr. Lloyd George on the eve of the election announced that these points were included in the Coalition programme, and further that he was against conscript armies in all lands.

The election was held on Dec. 14 1918, but owing to the arrangements which had been made for taking the votes of sailors and soldiers, the votes were not counted and announced till the end of the year. The result was an overwhelming victory for the Coalition, 478 of whose official candidates were returned, constituting a majority of 249 over all non-Coalition parties. The Labour party obtained 63 seats, a number which was sufficient to constitute them the official Opposition, as the Independent Liberal party came back only 28 strong, Mr. Asquith and all his former colleagues of Cabinet rank being defeated. The same fate befall the whole of the pacifists, whether among the Labour or among the Liberal party. The defeat of Labour and Independent Liberalism would not have been so overwhelming had there not been an extraordinary number of three-cornered contests. But the resolve of the electorate that the Government which waged the war to a successful issue should make the peace and begin the reconstruction of the country was clearly manifest. In Ireland the returns indicated the collapse of the Nationalists and the triumph of Sinn Fein in the south and west. Only seven Nationalists survived, compared with 73 Sinn Feiners and 25 Unionists. The only woman returned was Countess Markievicz, a Sinn Feiner.

Near the close of the campaign Sir Walter Milner, Mr. Sankey, and Mr. Lord Milner were elected Members of Parliament. Mr. Lloyd George immediately undertook a reconstruction of his Ministry. The changes were not so numerous as had been expected. Mr. Austen Chamberlain relieved Mr. Bonar Law of the extra burden of the Chancellorship of the Exchequer; Sir Frederick Smith, the Attorney-General, became Lord Chancellor, with the title of Lord Birkenhead; Lord Milner became Colonial Secretary; Mr. Walter Long was appointed First Lord of the Admiralty; Mr. Churchill was entrusted with two secretariats of State, that of War and that of Air—combination much and reasonably criticised; Sir Robert Horne became Minister of Labour, in succession to Mr. Hodge; Mr. Andrew Weir, created Lord Inverforth, was made Minister of Munitions (rechristened "Supply"); a new Ministry, that of Ways and Communications (afterwards better named "Transport"), was created for Sir Eric Geddes; and an Indian, Sir S. P. Sinha, who had been the first native to sit on the Viceroy's Council, was made Under-Secretary for India, and created a peer. In view of the approaching Peace Conference, the system by which the Prime Minister was relieved of the labours of leadership in the Commons, by entrusting them to Mr. Bonar Law, was continued.

The last days of 1918 witnessed the reception in London of the first detachments of the returning British troops, of their victorious commander, Field-Marshal Haig, of Marshal Foch and M. Clemenceau; and, especially, of President Wilson, passing through England on his way to the Paris Conference. This great assembly was opened formally by President Poincaré on Jan. 13, 1919, and henceforward for several months Mr. Lloyd George and many of his principal colleagues were absent for long periods in Paris. These tokens of victory and peace-variance with the symptoms of domestic life in Great Britain. Within a few days of the Armistice deputations from workers, especially munition workers, were demanding of the Prime Minister a living wage. The railwaymen decided to withdraw the truce in their industry and demanded an 8-hour day, which the Government promptly conceded. Other industrial troubles followed. Demobilized soldiers, miners, police, boilermakers, dock workers, engineers, all made urgent demands, with strikes declared or threatened. At first the trouble was worst on the Clyde, but the outlook was soon gloomier, and peace-variance with the symptoms of domestic life in Great Britain. advocated in the final reports. But, in Oct., Mr. Lloyd George emphatically repudiated this, and said that the nation, and not a fraction, must decide a political and economic question of this magnitude. As time went on it became increasingly evident that the nation’s experience of Government control during war did not incline it to extend the system during peace. People were thoroughly sick of “bureaucracy.”

The Government showed their good faith towards the Labour party by introducing a treaty from Russia, and, through a bill restoring pre-war “trade practices.” In spite of the growing evidence that many of these practices were hindrances to that increase of output which the situation needed.

There was a comparative lull in trade disputes during the summer, though discontent was rife among the police both in London and in Liverpool. The threatened London police strike took place on Aug. 1, the object being to compel the Government to recognize the men’s union. It was a fiasco; those who came out were less than 900 out of a total of 20,000; and they were all dismissed. The labour situation became acute in September. The Trade Union Congress, which met at Glasgow on Sept. 8, was mainly concerned with “Direct Action,”—that is, the application of the industrial strike to secure political change. In spite of a spirited protest by Mr. Clynes, who adjured the Labour men to adhere to constitutional methods, the Congress passed a resolution calling for the repeal of the Conciliation Acts, and the immediate call-out of a lull of public opinion by the Government, for a special Congress “to decide what action shall be taken.” This was almost immediately followed by a sudden and formidable railway strike.

Railway Strikes.

There had been negotiations for a standardization of wages for six months. Dissatisfied with Government concessions already amounting to £65,000,000 a year in the railway wage bill, and necessitating an advance of 50% in passenger rates and more in goods rates, a national strike was declared without warning on Sept. 26. Prompt and decisive measures to meet the threat to the nation were taken by Government. Volunteers were called for and responded in great numbers. Domestic restrictions were placed on light and fuel. Hyde Park was used as a milk depot for London. The motor lorries, which were the product of the war, proved an enormous resource. After the first few days, the railway companies began to run trains in increasing numbers. An attempt was made to involve other unions, but their officials, as a rule, promised conciliation, and on Oct. 5 an agreement was reached, by which the Government promised stabilization of wages at their existing level till Sept. 30, 1920, instead of Dec. 31, 1919—a concession more of form than of substance. The strike ended on Oct. 6, having only lasted 10 days. Another dispute, not so spectacular, but gravely affecting the whole engineering trade, an iron moulders’ strike, was in progress throughout all the last quarter of the year, and was finally settled at the end of the following Jan. by the concession of a 3s. increase in wages instead of the 15s. demanded.

Fortunately this dismal record of industrial conflict does not exhaust the story of 1919. First of all, after many vicissitudes and uncertainties, peace was made and signed at Versailles on June 28. There were royal proclamations and public rejoicings. Parliament accepted the treaty at Mr. Lloyd George’s hands with only a few expressions of dissatisfaction, and on July 19 there was a great victory march through London, ending up with a de luxe before the King, in front of Buckingham Palace, of the armed forces of the Empire and of those of the Allies. Sir David Beatty and Sir Douglas Haig led their men; Gen. Pershing commanded the Americans; and the Allied commander-in-chief, Marshal Foch, was himself present with his staff. The friends of the most novel portion of the Treaty of Versailles, the Covenant of the League of Nations, organized in the autumn a campaign in the country in its support,—beginning with a meeting on Oct. 13 at the Mansion House, presided over by the Lord Mayor, and addressed by Mr. Asquith, Lord Roberts Cecil, and Mr. Clynes. One result of the peace was the termination in Oct. of the exceptional methods of government improvised by Mr. Lloyd George in order to win the war, and the reversion to a Cabinet in the pre-war sense. It consisted of 20 members, being for the most part the holders of those offices which usually conferred Cabinet rank in pre-war days; but Mr. Balfour was without a portfolio, Lord Trevelyan and the Chief Secretary for Ireland were to alternate, whichever happened to be in London at the moment being summoned; and the new Minister of Transport, Sir Eric Geddes, was also included. The Cabinet Secretary and his staff were retained.

Besides the measures necessary for demobilization and for restoring the navy and army to a peace basis, ministers passed in this year several bills of great importance. Two new ministries were established, one of Health, into which the old Local Government Board was converted and to which were allotted various departments, relating to national health, from other offices; and one of Transport, which was to have control of railways, light railways, tramways, canals and inland navigation, roads, bridges, and traffic generally. Even electricity was included within its general scope; but a special Electricity Supply bill was passed, constituting commissioners who were to control the supply of electricity for domestic and industrial purposes. It was said in debate that the task of the Transport Ministry would be one for a “superman”; and eventually docks and harbours were exempted from his direct control. Then a Housing bill was passed, compelling local authorities to provide housing plans; and a scheme was adopted empowering such authorities to issue £1,000,000 of local bonds, free of income tax for holders of less than £500. A subsidy of not exceeding £1,000,000 was also provided by Government. There were bills also facilitating the acquisition of land for public purposes, and for the settlement of soldiers and sailors on the land. The emancipation of women, moreover, was practically completed by the passing of a bill providing that no person should be disqualified by sex from the exercise of any public function, or from being appointed to any civil or judicial office or post, or from entering or resuming any profession or vocation. Women were also made eligible as jurors, the House of Lords still refused to admit women holders of peerages in their own right to sit or vote. At a by-election for Plymouth in Nov. Lady Astor was returned as member in place of her husband, who had succeeded to the peerage, and she was the first woman to sit and vote in the House of Commons. The last Government bill which deserves notice was a Profiteering bill, to endeavour to cope with the great inflation of prices. A central tribunal, presided over by Mr. McCurdy, was set up; and there were also local tribunals, with powers of fining and imprisoning those found guilty before them of undue profit-making.

The object and general tendency of this legislation were greatly to improve the health and social and industrial conditions of the masses of the people; to make, in Mr. Lloyd George’s full-blooded phrase, “a land fit for heroes to live in,” but at the price of setting up costly new ministries, and a considerable expenditure in rates and taxes. Mr. Chamberlain’s budget was conceived on the same large lines. He estimated the expenditure at the gigantic sum of £1,434,910,000, and the revenue on the existing basis of taxation at £1,459,650,000. Therefore, though the war was over, he proposed to increase rather than diminish taxation, except that he reduced the excess profits duty—a war tax for excellence—from 80 to 40%. But he greatly increased the taxes on spirits and on beer, and raised the death duties on large estates. The main feature of the budget was the establishment at last of imperial preference, by giving an abatement of a sixth on the duties levied on such imports as tea, coffee, cocoa, sugar, tobacco and motor spirit, and of a third on those levied on cinema films, clocks and watches, motor-cars and cycles. He calculated that, by the changes proposed in taxation, he would bring the revenue up to £1,201,100,000. For the balance he looked to a Victory Loan, which was
The year 1920 opened with the final severance of all direct connexion between the Government and organized labour by the resignation of Mr. Barnes, Minister without portfolio, and of Mr. George Roberts, the Food Controller. These resignations were, however, of small importance by the side of the reappearance of Mr. Asquith in Parliament as member for Paisley. Mr. Asquith's platform was that of a strong opponent to the Coalition, which he said ought now to be dissolved; he advocated Free Trade, retrenchment, and for Ireland Dominion Home Rule. At first it seemed as if he might provide the Government with what they sorely needed, a competent and determined Opposition. But his followers in the House were so few that, after a while, he was discouraged and transferred his main activities to the constituencies, where he succeeded in rallying most of the local Liberal associations to his banner.

The principal matters which occupied the attention of the country in the year were the labour unrest, Ireland, and Government expenditure. Mr. Chamberlain's budget dealt with figures of the same magnitude as in the previous year. In spite of the fact that the estimates for the navy and army showed a diminution of about £40,000,000 compared with those of the previous year, he nevertheless contemplated a total expenditure of £1,418,300,000, and in order that he might make a serious attempt at reducing the weight of the debt he increased the charges for letters, newspapers and telegrams, and also for receipt and stamp duties; he increased, moreover, still further the duty on beer; doubled that on wine with a special 50% duty on imported sparkling wines and on non-vintage champagne. He lowered the limit of exemption from super-tax t £2,000; but made various readjustments of income tax which would ease the burden to the taxpayer of small means, while taxing the rich man still more severely. Finally he imposed a new tax of 1s. in the £ on company profits, and raised the excess profits duty (which it had been hoped might be repealed) to 60%. To this last provision most serious exception was taken in the City of London and by the industries of the country; and an agitation was started which did not rest till it had finally secured a promise from the Chancellor to repeal the excess profits tax altogether in the coming year. The general result of the budget was to stimulate the "Anti-waste" party, who began to count seriously in by-elections.

The labour unrest during the year mainly affected the great coal-mining industry, which never settled down during the two and a half years that succeeded the war. It was but a patched-up truce that was arranged after the Sankey Commission, and the men still hankered after higher wages (to correspond with the still rising prices) and for nationalization in some form. The Government absolutely refused nationalization, but promoted a Coal Mines (Emergency) Bill which should continue the war pooling arrangements and the Sankey wage till the termination of State control. This did not at all content the men, who demanded in March an immediate advance of 3s. per shift for miners over 16, and of 1s. 6d. below that age. After many negotiations the Government made a proposal of a guaranteed minimum advance of 2s. for adults, 1s. for youths between 16 and 18, and 9d. for boys under 16. This was accepted on ballot in April. It was estimated that this concession implied an extra charge of more than £30,000,000 a year on the industry, the surplus available to meet it being only about £5,000,000. The Government passed an session a Mining Industry bill, constituting a Department of Mines under the Board of Trade, dropping their original and wasteful idea of constituting a brand new ministry. This was unpopular among the miners, and perhaps contributed to the new demand sprung in Aug., on the Government. In 1919 ministers had had unfortunate dealings with the price of coal. In July of that year they had increased the price by 6s. a ton on the reasonable ground that this was the necessary result of the increased wages granted in accordance with the Sankey report. Then suddenly in Nov. they decreased the price of domestic coal by 10s., on the ground that it was fair that the consumer should share in the large profits which, owing...
to the high prices ruling in America, were made on exported coal. But this could not be maintained, and in May 1920 the price of domestic coal was raised by 14s. 2d. a ton, and that of industrial coal by 14s. 2d. In view of these facts the miners at the end of July struck. Organized with a demand for a further advance of 2s., 1s. and 6d. a shift for the three grades, a demand for a reduction of price to the consumer of 14s. 2d. a ton. It was thought that this bribe would make the public sympathetic to their claims. The calculation was that the increase of wages would cost the industry £27,000,000, and the reduction of price would add another £30,000,000,—thus more than accounting for the £60,000,000 made by the Government as profits on exported coal, and badly needed by them for their general revenue. These demands the Government could not meet, and the miners, with the payment of the Printers’ Fund, which had been temporarily suspended, the end of August the miners determined to strike in order to obtain them. But the opening of the strike was postponed for more than a month and a half, pending a series of negotiations between the Government, the representatives of the owners and the Miners’ Federation, and also the spokesmen of the railway men and of the transport workers, who intervened as members of the Triple Alliance to support the miners’ claims.

Nationalization, though Mr. Smillie, one of the leaders, said the miners would never rest till they got it, was not actually claimed on this occasion; the ultimatu demand for a large reduction of the price of coal to the consumer was soon dropped, and the strike became one merely for increased wages—a claim based by the miners on the still rising prices. The Government and the owners pointed out that, since the increases in wages under the Sankey award, output had decreased,—and maintained that increase in wages would only be justified by increase of output. The miners insisted on an advance of 2s. as a preliminary, and the strike began in the middle of October and lasted a fortnight.

The National Union of Railway Men threatened to strike in support of the miners, but it is doubtful whether the railway men were much interested. Many complaints had already been made to the Government, and the question was never put to the test, as a provisional arrangement was come to, and confirmed on ballot, by which the miners got their 2s. a day (and could get more by increased output) till Jan. 3, after which wages were to be governed by a sliding scale, ultimately to be superseded by an agreed scheme for their permanent regulation.

Sir Robert Horne, who, with the Prime Minister, bore the brunt of these negotiations, greatly enhanced his reputation by his firmness, adroitness and geniality.

There were disputes in the cotton and engineering and other trades during the year, but nothing comparable to that in the coal industry. There was, however, a very considerable effect from the Russian Revolution of any attempts to interfere in arms with the Soviet Government, formed, in this summer of 1920, in view of the strained relations between Poland and Russia, a Council of Action to prevent any such interference, with the implied threat of a general strike at its back. This unconstitutional proceeding was justified in a half-hearted manner by the moderate leaders, Mr. J. H. Thomas and Mr. Clynes. But the French Government refused to allow delegates of the Council of Action to remain in France; and as an independent Poland and in out in Russia were soon to be secured, Mr. Thomas discreetly hurried the Council with an appropriate eulogium at the Trade Union Congress.

The financial offers made by the Bolsheviks to the Daily Herald, the labour organ, which were revealed in the summer, added to the growing discredit of Bolshevist rule in Labour circles. The “war” of murder and outrage waged by civilian Republicans in Ireland against the civil and military forces of the Crown, and against prominent loyalists in all parts of the south and west, was intensified from the beginning of the year onwards. To meet the crisis the Royal Irish Constabulary were increased, an auxiliary force of cadets, mainly young English officers who had served in the war, was created, and the troops reinforced. In August Sir Harum Greenwood, who had succeeded Mr. Macpherson in April as Chief Secretary, hurried through Parliament a Restora-

**The** of Order in Ireland bill which provided for the suspension of trial by jury in disturbed areas and the substitution of trial by court martial. The strain of outrage and assassination to which military and police were subjected proved too much for the nerves of some members of the forces of order, especially among the insufficiently disciplined auxiliaries, and in considerable number of cases unauthorized reprisals were carried out, in which, individuals, not always guilty, were shot, and dwelling-houses and shops and warehouses and creameries were sacked and burnt. The British public, as a whole, was so conscious of the widespread conspiracy and the appalling crimes that had to be faced and got under by inadequate but courageous forces, that it was disposed to conduct occasional acts of reprisal, provided that due efforts were made to prevent excesses and to maintain discipline. That was eventually done and certain definite reprisals were carried in definite cases, but not until after a delay of several months, during which Mr. Asquith and Sir John Simon and the Independent Liberals in general, with the aid of some bishops and other ministers of religion, conducted a violent agitation against the misdeeds of a small portion of the forces of the Crown—in which the crimes and the “war” against which these forces were struggling seemed to be unduly disregarded. The police and troops were successful in so far that they prevented Sinn Fein officers and tribunals from functioning openly, as heretofore, in many parts of the south and west. But, in order of occasional boasts by ministers, like Mr. Lloyd George’s assertion at Guildhall on Lord Mayor’s day “We have murder by the throat,” crime was not stopped, and there was little improvement in the state of the southern and western provinces by the summer of 1921. Indeed the “war” was carried in the spring of 1921 into England; and in Liverpool and the neighbouring country, and in London and the Home Counties, outrages were committed.

It was not merely by force that the Government proposed to meet the crisis in Ireland. The conjunction of Unionists and Liberals in one coalition seemed to give an opportunity for an agreed settlement of the Home Rule dispute. As a result of the labours of the Cabinet Committee presided over by Mr. Long, the Government introduced in Feb., a Home Rule bill of a novel character. It provided for the establishment of two Irish Parliaments, one in Belfast, for the six north-eastern counties, and one in Dublin for the remaining counties, and of a Council of Ireland “with a view to bringing about a harmonious action between the Parliaments and Governments of Southern Ireland and Northern Ireland.” The Council was to consist, in the first instance, of a President appointed by the King, and of delegations of 26 members of each of the two Irish Parliaments, and in future the Council might vary its constitution, and provide for it being elected by Parliamentary electors. Further, the two Irish Parliaments had power given them to establish, in place of the Council of Ireland, a Parliament for the whole of Ireland, consisting of one or two Houses. Thus the bill, which recognized the necessity of partition for the present, made provision for unity in the future. As originally drafted, the bill provided only for one House, a House of Commons, in each area; but the Lords added a Senate in each case, which the Government accepted. The executive power in the two areas was to be exercised by the chief officers of the Government, and the King might delegate his authority to the lord lieutenant. The number of Irish members of Parliament at Westminster was to be 42. Of the Irish contribution of £18,000,000 a year to Imperial expenditure, 56% was apportioned to Southern, and 44% to Northern Ireland. There was to be a separate judiciary in each area, with a High Court of Appeal for the whole of Ireland. The powers reserved for the Imperial Parliament were roughly those reserved under the Act of 1914 which Mr. Redmond had accepted, save that further taxes were placed at the disposal of the two Parliaments; and in case of an Irish Parliament being constituted, all powers over customs and excise were to be extended to it. If the southern Parliament refused to function, that part of Ireland was to be governed as a Crown colony. The reception of the bill was very unfavourable in southern and western Ireland, by Nation-
alists and Sinn Feiners. It was a scheme, said the Freeman's Journal, for the "plunder and partition" of Ireland. Protestant Ulster, after a little hesitation, took the line that she was quite satisfied with her present leader, the Unionist, that, if Parliament thought such a measure right, she would accept it and do her best to make it a success. The bill was opposed, on the ground that it involved partition, both by the Labour party, who were prepared to concede the absolute right of self-determination, and by Mr. Asquith, who proclaimed his adherence to a Dominion Constitution. That also was the view of Sir Horace Plunkett; and several southern Unionists, such as Lord Dunraven and Lord Midleton, demanded complete fiscal autonomy for Ireland. The bill eventually passed into law in Dec., 1918, and was signed on April 4, 1920, by Michael Donoghue, Lord Talbot, who became Viscount Fitzalan, an English Roman Catholic, was appointed Lord Lieutenant, and elections were duly held for the two Parliaments in the spring. As the campaign of Sinn Fein terrorism was still in full swing in southern Ireland, Sinn Feiners were everywhere returned in that area unopposed, save in Trinity College. In northern Ireland the Unionists had a great electoral success, returning 40 out of the 52 members of the new House of Commons. As Sir Edward Carson had retired and taken a Lordship of Appeal, Sir James Craig continued as Prime Minister of the Parliament which was created after a Government of Nationalists was formed, with Mr. Asquith as Prime Minister. The King and Queen opened the Ulster Parliament in state on June 22, the King, in moving language, expressing the hope in his Speech from the Throne that Irishmen would forgive and forget. Thereupon Mr. Lloyd George, while making every arrangement for strengthening the authority of the Crown in southern Ireland against the forces of disorder, issued a public invitation to Mr. de Valera, the Sinn Fein leader, and to Sir James Craig, to come and confer with him at once in London without conditions. Sir J. Craig accepted immediately; and Mr. De Valera, after confusion, joined the Sinn Fein leader and with some of the southern Unionists, also came to London; while a truce was called in the "war" (see further the article IRELAND).

Several important changes took place in the Ministry in the early months of 1921. Mr. Long retired from the Admiralty for ill health and was subsequently created a viscount. Lord Milner, after remarkable service to the State, resigned the Colonial Office, and retired into private life, being succeeded by Mr. Churchill. Mr. Bonar Law had a sudden breakdown, which entailed immediate abandonment of political work, and which, as he was the leader of the Unionist party in England, naturally resulted in serious political complications. But Mr. Austen Chamberlain was immediately elected by the Unionist party to be leader in the House of Commons in his place; and he stepped into the same confidential relation that Mr. Law had held in regard to the Prime Minister. He became Lord Privy Seal. Sir Robert Horne succeeded him as Chancellor of the Exchequer, and was succeeded at the Board of Trade by Mr. Stanley Baldwin. The Government bills which attracted most attention in this session were one by Sir Eric Geddes for grouping the railways of the country in the interests of efficiency and economy; and another promoted by the Board of Trade for the safeguarding of special industries. The Independent Liberals, in their opposition to the Protection which they discovered in this latter bill, made use of the well-known arts of obstruction, and all-night sittings were resumed. The budget dropped the excess profits duty, and the higher rates of duty imposed in the previous year on sparkling wine and cigars. Postal rates were however further increased. Otherwise taxation remained at the same height.

This heavy burden was more felt this year, because the period of indated trade which had succeeded the war had come to an end in the previous autumn; prices tumbled down; it was impossible to find markets for goods; wages had to be reduced and men dismissed in one great industry after another; and unemployment steadily increased. It was borne forcibly in upon every individual that economy in public and private expenditure was imperative. By-elections, as might be expected with so huge a majority, had on the whole gone against the Government from the beginning. But their losses this spring and early summer had this exceptional character, that the victors in the three contests which attracted most attention, at Dover, St. George's (Westminster) and East Herts., ran simply and purely as "Anti-waste" candidates. The tendency of the Government, already manifested, to restrict its ambitions and curtail its schemes, was intensified. Already practically all the new war ministries, except the Pensions Ministry, had been disbanded; the putting into complete effect of Mr. H. A. L. Fisher's comprehensive but somewhat extravagant Education Act had been postponed; and urgent admonition had been issued that the economy had been circulated to the departments.

Now it was announced by Mr. Churchill that he had formulated a scheme by which the enormous outlay in Mesopotamia and Palestine, against which there had been a great public outcry, might be materially reduced. Dr. Addison, who was thought to have studied thoroughly rather than economy in regard to his housing schemes and his medical staff at the Ministry of Health, resigned that Ministry; and so strong a protest was roused by his retention in the Cabinet without a portfolio but with a salary, that the Prime Minister felt it necessary in June to declare that the Ministry for the Health of the People would be kept in existence, and that the salary would be halved. Dr. Addison's successor in the Ministry of Health, Sir Alfred Mond, announced an administration on much less ambitious lines. Ministers also abandoned their guarantee of agricultural prices and wages; and further determined to terminate their control of the coal industry on April 1, four months earlier than the date originally announced. This resulted in yet another coal strike, or stoppage, the most serious of all the strikes in the industry in these years. The men could not reconcile themselves to the great reductions in wages necessary to make the industry self-supporting. And the Government demanded in vain that the form of their old demand for nationalization. They alienated public sympathy at first by withdrawing the pump men from the mines—a position from which they had to recede. The Government offered a temporary subsidy of £2,000,000 to tide over the difficult early weeks; but terms could not be arranged, and the strike lasted for three months—April, May and June,—and was settled in the end on terms which the men might have held early in the dispute, if they had not clung to the national pool, which of course had to be abandoned. The Government also demanded in vain that the industrial share upon coal had one after another to close down their works. But the employers in these industries could support the stoppage better than the men, as, owing to the depression of trade, they would have been manufacturing during these months at a loss. The funds of the great unions were depleted, and many of them got deeply into debt; and there was some want and hardship amongst women and children. Happily, it was a season of warmth and brilliant sunshine, so that the domestic fire was needed only for cooking.

A momentous conference was held in London in the summer of 1921 between the Prime Ministers of the United Kingdom, the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand and the Union of South Africa, together with representatives of India. The main object of the conference was to formulate a common foreign policy for the sister nations composing the British Empire, and to come to a decision as to the renewal of the Anglo-Japanese alliance (see BRITISH EMPIRE).

There were symptoms of uneasiness in the latter part of 1920 and in 1921 in the extreme wings of both parties to the Coalition. On the one hand there was some remaining between Independent and Coalition Liberals; and on the other Lord Salisbury was the spokesman of those Tories who urged Unionists to come out of the Coalition and resume their independence, a course which had already been taken by a few individuals, conspicuous among whom were his brothers, Lord Robert and Lord Hugh Cecil. But neither move-
ment appeared to be strongly supported, though much greater independence had been shown of late by the Ministerial majority in the House of Commons. The Labour party, though alternately upbraided and cajoled by the Independent Liberals, showed no disposition to enter into a political compact with them; and without such an arrangement it did not look as if Mr. Asquith and his friends could command anything approaching adequate support in the country to regain office. Many Liberals indeed had gone over to Labour; but the Labour party, whose programme demanded a continuance of heavy expenditure and therefore high taxation, were for the time out of accord with public sentiment.

Mr. Lloyd George, in spite of virulent abuse, partly political, partly personal, still remained throughout 1921 by far the greatest individual force in the country. He strengthened his position, indeed, from every point of view but one, by the course of events during the closing months of the year. The fact that, after general expectations of a break-down in the Irish negotiations, the conference which began in London in October between delegated representatives of Sinn Fein and the Government ended on Dec. 6 in a unanimously signed agreement for the setting-up of an Irish Free State, was a great personal triumph for his patient diplomacy. Though he was too much engaged in this matter to be able, as he had intended to do, to attend the Conference for the Limitation of Armament held in Washington, at which Mr. Balfour took his place, the Prime Minister could claim for his Government a very satisfactory issue from the Conference, to the initiation of which by President Harding and his Secretary of State, Mr. Hughes, Mr. Lloyd George himself had given the strongest encouragement earlier in the year. Incidentally, the question of a prolongation of the Anglo-Japanese alliance—which had been a difficult point at the Imperial Conference in the summer—was successfully removed by the substitution of the Four-Power Agreement adopted in Washington; and thus Mr. Lloyd George had the satisfaction of clearing away two important obstacles to the consolidation of the Anglo-American entente for which he was always striving in international affairs.

The only point of view from which Mr. Lloyd George's indispensability at this moment as Prime Minister could be said, therefore, to have been weakened was that of his success. Paradoxically enough, the mere fact that his long struggle to reconcile Irish national aspirations with inclusion within the British Empire had at last been rewarded might appear to leave him no longer l'homme nécessaire for that purpose. How far this possibility might react on the political situation, in the later regrouping of parties, had now to be shown. But individually Mr. Lloyd George, at the end of 1921, held the dominating place among political leaders. Mr. Asquith had lost his hold both over the country and over his old party. The Labour party, though practically certain of a large increase in Parliamentary representation whenever the country should be appealed to, had several prominent leaders but no really outstanding chief. The Conservatives, as such, were without any striking personality; Mr. Austen Chamberlain had shown no disposition to break away from the alliance with Mr. Lloyd George, and Mr. Bonar Law, though his health was restored, had ignored every suggestion so far that he should return to the political arena as an independent Conservative leader. Among the rest, the only men whose reputations had notably grown in 1921 were Lord Birkenhead and Mr. Churchill; and it was to them, either in rivalry or in combination, that current political talk usually pointed, should occasion arise for alternatives to a Lloyd George Ministry. As Lord Chancellor, Lord Birkenhead had won golden opinions on all sides, and he had never shown his capacity for statesmanship more prominently than during the past year, when he had put all his pre-war record as an aggressive sympathizer with Ulster aside in helping to secure an agreement with Sinn Fein. He and Mr. Churchill were still sufficiently young, as well as able and experienced, to make their political futures incalculable.
